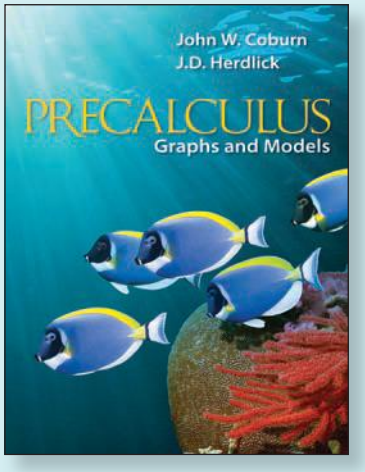
About the Authors

John Coburn

John Coburn grew up in the Hawaiian Islands, the seventh of sixteen children. He received his Associate of Arts degree in 1977 from Windward Community College, where he graduated with honors. In 1979 he earned a Bachelor's Degree in Education from the University of Hawaii. After working in the business world for a number of years, he returned to teaching, accepting a position in high school mathematics where he was recognized as Teacher of the Year (1987). Soon afterward, the decision was made to seek a Master's Degree, which he received two years later from the University of Oklahoma. John is now a full professor at the Florissant Valley campus of St. Louis Community College. During his tenure there he has received numerous nominations as an outstanding teacher by the local chapter of Phi Theta Kappa, two nominations to *Who's Who Among America's Teachers,* and was recognized as Post Secondary Teacher of the Year in 2004 by the Mathematics Educators of Greater St. Louis (MEGSL). He has made numerous presentations and local, state, and national conferences on a wide variety of topics and maintains memberships in several mathematics organizations. Some of John's other interests include body surfing, snorkeling, and beach combing whenever he gets the chance. He is also an avid gamer, enjoying numerous board, card, and party games. His other loves include his family, music, athletics, composition, and the wild outdoors.

J.D. Herdlick



J.D. Herdlick was born and raised in St. Louis, Missouri, very near the Mississippi river. In 1992, he received his bachelor's degree in mathematics from Santa Clara University (Santa Clara, California). After completing his master's in mathematics at Washington University (St. Louis, Missouri) in 1994, he felt called to serve as both a campus minister and an aid worker for a number of years in the United States and Honduras. He later returned to education and spent one year teaching high school mathematics, followed by an appointment at Washington University as visiting lecturer, a position he held until 2006. Simultaneously teaching as an adjunct professor at the Meramec campus of St. Louis Community College, he eventually joined the department full time in 2001. While at Santa Clara University, he became a member of the honorary societies Phi Beta Kappa, Pi Mu Epsilon, and Sigma Xi under the tutelage of David Logothetti, Gerald Alexanderson, and Paul Halmos. In addition to the Dean's Award for Teaching Excellence at Washington University, J.D. has received numerous awards and accolades for his teaching at St. Louis Community College. Outside of the office and classroom, he is likely to be found in the water, on the water, and sometimes above the water, as a passionate wakeboarder and kiteboarder. It is here, in the water and wind, that he finds his inspiration for writing. J.D. and his family currently split their time between the United States and Argentina.

Dedication

With boundless gratitude, we dedicate this work to the special people in our lives. To our children, whom we hope were joyfully oblivious to the time, sacrifice, and perseverance required; and to our wives, who were well acquainted with every minute of it.

About the Cover

Most coral reefs in the world are 7000–9000 years old, but new reefs can fully develop in as few as 20 years. In addition to being home to over 4000 species of tropical or reef fish, coral reefs are immensely beneficial to humans and must be carefully preserved. They buffer coastal regions from strong waves and storms, provide millions of people with food and jobs, and prompt advances in modern medicine.

Similar to the ancient reefs, a course in Precalculus is based on thousands of years of mathematical curiosity, insight, and wisdom. In this one short course, we study a wealth of important concepts that have taken centuries to mature. Just as the variety of fish in the sea rely on the coral reefs to survive, students in a Precalculus course rely on mastery of this bedrock of concepts to successfully pursue more advanced courses, as well as their career goals.

From the Authors

In the last two decades, mathematics education has seen some enormous changes. From the introduction of graphing calculators and the advent of the Internet, to online homework and visual supplements we could only dream about decades ago, the changes have been unrelenting. Together, John Coburn and J.D. Herdlick share a combined 40 years of experience teaching precalculus with graphing calculators and other technologies, and have developed a wealth of firsthand experience related to the endeavor.

In the Coburn/Herdlick Graphs and Models text, we have combined the conversational style and the wealth of applications that our texts are known for, with this depth of experience. As one of our primary goals, we set out to help students think visually, to a point where they see functions like $f(x) = x^2 - 4x$ as one of a family of graphs, with attributes that immediately lead to a discussion of maximums and minimums, end-behavior, zeroes, solutions to inequalities, the nature of the roots, and the application of these attributes in context—instead of merely an equation that must be solved by factoring or by interpreting a graph on the screen of a calculator. And while graphing calculators may relieve some computational drudgery, we believe our text offers much more than a simple side-by-side comparison of algebraic methods versus graphical methods, with the calculator playing a more significant role than simply checking answers to work done manually. Graphing calculators are used to work and investigate far beyond what's possible with paper and pencil, with the technology used to solve more true-to-life equations, engage more applications, and explore more substantial questions of interest. In the end we believe you'll see this text is built on strong fundamentals, yet one that offers a visual and dynamic excursion that accentuates the organizational planning and problem solving acumen that students will use in all areas of their lives. To this end we offer the Coburn/Herdlick Graphs and Models text as an ideal tool for the teaching and learning of mathematics. —John Coburn and J.D. Herdlick

Making Connections . . .

Precalculus tends to be a challenging course for many students. They may not see the connections that Precalculus has to their life or why it is so critical that they succeed in this course. Others may enter into this course underprepared or improperly placed and with very little motivation.

Instructors are faced with several challenges as well. They are given the task of improving pass rates and student retention while ensuring the students are adequately prepared for more advanced courses, as a Precalculus course attracts a very diverse audience, with a wide variety of career goals and a large range of prerequisite skills.

The goal of this textbook series is to provide both students and instructors with tools to address these challenges, so that both can experience greater success in Precalculus. For instance, the comprehensive exercise sets have a range of difficulty that provides very strong support for weaker students, while advanced students are challenged to reach even further. The rest of this preface further explains the tools that John Coburn, J.D. Herdlick, and McGraw-Hill have developed and how they can be used to ***connect*** students to Precalculus and ***connect*** instructors to their students.

The Coburn/Herdlick Precalculus Series provides you with strong tools to achieve better outcomes in your Precalculus course as follows:

- *Making Connections Visually, Symbolically, Numerically, and Verbally*
- *Better Student Preparedness Through Superior Course Management*
- *Increased Student Engagement*
- *Solid Skill Development*
- *Strong Mathematical Connections*

▶ *Making Connections Visually, Symbolically, Numerically, and Verbally*

In writing their Graphs and Models series, the Coburn/Herdlick team took great care to help students think visually by relating a basic graph to an algebraic equation at every opportunity. This empowers students to see the "Why?" behind many algebraic rules and properties, and offers solid preparation for the connections they'll need to make in future courses which often depend on these visual skills.

▶ *Better Student Preparedness Through Superior Course Management*

McGraw-Hill is proud to offer instructors a choice of course management options to accompany Coburn/Herdlick. If you prefer to assign text-specific problems in a brand new, robust online homework system that contains stepped out and guided solutions for all questions, Connect Math Hosted by ALEKS may be for you. Or perhaps you prefer the diagnostic nature and artificial intelligence engine that is the driving force behind our ALEKS 360 Course product, a true online learning environment, which has been expanded to contain hundreds of new College Algebra & Precalculus topics. We encourage you to take a closer look at each product on preface pages **x** through **xiii** and to consult your McGraw-Hill sales representative to setup a demonstration.

▶ *Increased Student Engagement*

There are many texts that claim they "engage" students, but only the Coburn/Herdlick Series has carefully studied and implemented features and options that make it truly possible. From the on-line support, to the textbook design and a wealth of quality applications, students will remain engaged throughout their studies.

▶ *Solid Skill Development*

The Coburn/Herdlick series intentionally relates the examples to the exercise sets so there is a strong connection between what students are learning while working through the examples in each section and the homework exercises that they complete. This development of strong mechanical skills is followed closely by a careful development of problem solving skills, with the use of interesting and engaging applications that have been carefully chosen with regard to difficulty and the skills currently under study.

There is also an abundance of exercise types to choose from to ensure that homework challenges a wide variety of skills. Furthermore, John and J.D. reconnect students to earlier chapter material with Mid-Chapter Checks; students have praised these exercises for helping them understand what key concepts require additional practice.

▶ *Strong Mathematical Connections*

John Coburn and J.D. Herdlick's experience in the classroom and their strong connections to how students comprehend the material are evident in their writing style. This is demonstrated by the way they provide a tight weave from topic to topic and foster an environment that doesn't just focus on procedures but illustrates the big picture, which is something that so often is sacrificed in this course. Moreover, they employ a clear and supportive writing style, providing the students with a tool they can depend on when the teacher is not available, when they miss a day of class, or simply when working on their own.

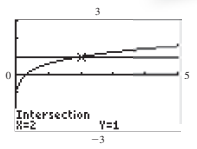
Making Connections . . .

Visually, Symbolically, Numerically, and Verbally

"It is widely known that for students to grow stronger algebraically, the concrete and numeric experiences from their past must give way to more symbolic representations. In this transition from numeric, to symbolic, to algebraic thinking, the importance of visual connections and verbal connections is too often overlooked. To reach a deep understanding of rich concepts or subtle ideas, students must develop the ability to mentally "see" and discuss the concept or idea using the terms and names needed to describe it accurately. Only then can they begin seeing the connections that exist between each new concept, and concepts that are already known. A large part of this involves helping our students to begin thinking visually, to a point where they're able to see functions like $f(x) = x^2 - 4x$ as only one of a large family of functions, with graphical attributes that immediately lead to a discussion of maximums and minimums, end-behavior, zeroes, solutions to inequalities, the nature of the roots, and the application of these attributes in context. And while it's important for students to see that zeroes are x-intercepts and x-intercepts are zeroes, and that the intersection of two graphs provides a simultaneous solution to the equations forming these graphs, these should not remain the sole focus of the tool. Graphing calculators allow explorations, investigations, connections, and visualizations far beyond what's possible with paper and pencil, and we should use the technology to aid the development of these mental-visual skills, in addition to solving more true-to-life equations, engaging more applications, and exploring the more substantial questions involving real data, domain and range, anticipated graphical behavior, additional uses of lists and tables, and other questions of interest. We believe this text offers instructors the tools they need to be successful in these endeavors."

—The Authors

EXAMPLE 1 ▶ **Solving a Logarithmic Equation**



Solve for x and check your answer: $\log x + \log(x + 3) = 1$.

▼ Algebraic Solution

$\log x + \log(x + 3) = 1$	original equation
$\log [x(x + 3)] = 1$	product property
$x^2 + 3x = 10^1$	exponential form, distribute x
$x^2 + 3x - 10 = 0$	set equal to 0
$(x + 5)(x - 2) = 0$	factor
$x = -5$ or $x = 2$	result

▼ Graphical Solution

Using the intersection-of-graphs method, we enter $Y_1 = \log X + \log(X + 3)$ and $Y_2 = 1$. From the domain we know $x > 0$, indicating the solution will occur in QI. After graphing both functions using the window shown, the intersection method shows the only solution is $x = 2$.

Check: The "solution" $x = -5$ is outside the domain and is ignored. For $x = 2$,

$\log x + \log(x + 3) = 1$	original equation
$\log 2 + \log(2 + 3) = 1$	substitute 2 for x
$\log 2 + \log 5 = 1$	simplify
$\log(2 \cdot 5) = 1$	product property
$\log 10 = 1$	Property I

You could also use a calculator to verify $\log 2 + \log 5 = 1$ directly.

Now try Exercises 7 throug

"I think there is a good balance between technology and paper/pencil techniques. I particularly like how the technology portion does not take the place of paper/pencil, but instead supplements it. I think a lot of departments will like that."

—Daniel Brock, Arkansas State University-Beebe

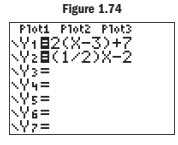
▶ **Graphical Examples** show students how the calculator can be used to supplement their understanding of a problem.

EXAMPLE 1A ▶ **Solving an Equation Graphically**

Solve the equation $2(x - 3) + 7 = \frac{1}{2}x - 2$ using a graphing calculator.

Solution ▶ Begin by entering the left-hand expression as Y_1 and the right-hand expression as Y_2 (Figure 1.74). To find points of intersection, press 2nd TRACE **(CALC)** and select option **5:intersect,** which automatically places you on the graphing window, and asks you to identify the **"First curve?."** As discussed, pressing ENTER three times in succession will identify each graph, bypass the "**Guess**?" option, then find and display the point of intersection (Figure 1.75). Here the point of intersection is $(-2, -3)$, showing the solution to this equation is $x = -2$ (for which both expressions equal -3). This can be verified by direct substitution or by using the **TABLE** feature.

Figure 1.74



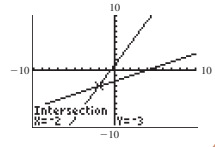


Figure 1.75

"I have certainly found the Coburn/Herdlick's Precalculus: Graphs and Models textbook the best approach ever to the teaching of Precalculus with the inclusion of graphing calculator."

—Alvio Dominguez, Miami-Dade College-Wolfson

▶ **Calculator Explanations** incorporate the calculator without sacrificing content.

Most graphing calculators are programmed to work with imaginary and complex numbers, though for some models the calculator must be placed in complex number mode. After pressing the MODE key (located to the right of the 2nd option key), the screen shown in Figure 3.2 appears and we use the arrow keys to access "$a + bi$" and active this mode (by pressing ENTER). Once active, we can validate our previous statements about imaginary numbers (Figure 3.3), as well as verify our previous calculations like those in Examples 3(a), 3(d), and 4(a) (Figure 3.4). Note the imaginary unit i is the 2nd option for the decimal point.

"The technology (graphing calculator) explanations and illustrations are superb. The level of detail is valuable; even an experienced user (myself) learned some new techniques and "tricks" in reading through the text. The text frequently references use of the calculator—yet without sacrificing rigor or mathematical integrity."

—Light Bryant, Arizona Western College

To help illustrate the Intermediate Value Theorem, many graphing calculators offer a useful feature called *split screen viewing*, that enables us to view a table of values and the graph of a function at the same time. To illustrate, enter the function $y = x^3 - 9x + 6$ (from Example 6) as Y_1 on the Y= screen, then set the viewing window as shown in Figure 4.4. Set your table in **AUTO** mode with ΔTbl = 1, then press the MODE key (see Figure 4.4A) and notice the second-to-last entry on this screen reads: **Full** for full screen viewing, **Horiz** for splitting the screen horizontally with the graph above a reduced home screen, and **G-T,** which represents **Graph-Table** and splits the screen vertically. In the **G-T** mode, the graph appears on the left and the table of values on the right. Navigate the cursor to the **G-T** mode and press ENTER. Pressing the GRAPH key at this point should give you a screen similar to Figure 4.5. Scrolling downward shows the function also changes sign between $x = 2$ and $x = 3$. For more on this idea, **see Exercises 31 and 32.**

As a final note, while the intermediate value theorem is a powerful yet simple tool, it must be used with care. For example, given $p(x) = -x^4 + 10x^2 - 5$, $p(-1) >$ and $p(1) > 0$, seeming to indicate that no zeroes exist in the interval $(-1, 1)$. Actual there are two zeroes, as seen in Figure 4.6.

```

Figure 4.6

☑ **B.** You've just seen how we can use the intermediate value theorem to identify intervals containing a polynomial zero

"The authors give very good uses of the calculator in every section. I have been using TI calculators for 15 years and I learned a few new tricks while reading this book."

—George Hurlburt, Corning Community College

▶ **Technology Applications** show students how technology can be used to help apply lessons from the classroom to real life.

Use Newton's law of cooling to complete Exercises 75 and 76: $T(x) = T_R + (T_0 - T_R)e^{kx}$.

75. Cold party drinks: Janae was late getting ready for the party, and the liters of soft drinks she bought were still at room temperature (73°F) with guests due to arrive in 15 min. If she puts these in her freezer at −10°F, will the drinks be cold enough (35°F) for her guests? Assume $k \approx -0.031$.

76. Warm party drinks: Newton's law of cooling applies equally well if the "cooling is negative," meaning the object is taken from a colder medium and placed in a warmer one. If a can of soft drink is taken from a 35°F cooler and placed in a room where the temperature is 75°F, how long will it take the drink to warm to 65°F? Assume $k \approx -0.031$.

Photochromatic sunglasses: Sunglasses that darken in sunlight (photochromatic sunglasses) contain millions of molecules of a substance known as *silver halide*. The molecules are transparent indoors in the absence of ultraviolent (UV) light. Outdoors, UV light from the sun causes the molecules to change shape, darkening the lenses in response to the intensity of the UV light. For certain lenses, the function $T(x) = 0.85^x$ models the transparency of the lenses (as a percentage) based on a UV index x. Find the transparency (to the nearest percent), if the lenses are exposed to

77. sunlight with a UV index of 7 (a high exposure).

78. sunlight with a UV index of 5.5 (a moderate exposure)

80. Use a trial-and-error process and a graphing calculator to determine the UV index when the lenses are 50% transparent.

Modeling inflation: Assuming the rate of inflation is 5% per year, the predicted price of an item can be modeled by the function $P(t) = P_0(1.05)^t$, where P_0 represents the initial price of the item and t is in years. Use this information to solve Exercises 81 and 82.

81. What will the price of a new car be in the year 2015, if it cost $20,000 in the year 2010?

82. What will the price of a gallon of milk be in the year 2015, if it cost $3.95 in the year 2010? Round to the nearest cent.

Modeling radioactive decay: The half-life of a radioactive substance is the time required for half an initial amount of the substance to disappear through decay. The amount of the substance remaining is given by the formula $Q(t) = Q_0(\frac{1}{2})^{\frac{t}{h}}$, where h is the half-life, t represents the elapsed time, and $Q(t)$ represents the amount that remains (t and h must have the same unit of time). Use this information to solve Exercises 83 and 84.

83. Some isotopes of the substance known as thorium have a half-life of only 8 min. (a) If 64 grams are initially present, how many grams (g) of the substance remain after 24 min? (b) How many minutes until only 1 gram (g) of the substance remains?

"I think that the graphing examples, explanations, and problems are perfect for the average college algebra student who has never touched a graphing calculator. .... I think this book would be great to actually have in front of the students."

—Dale Duke, Oklahoma City Community College

connect™ MATH

Hosted by **ALEKS Corp.**

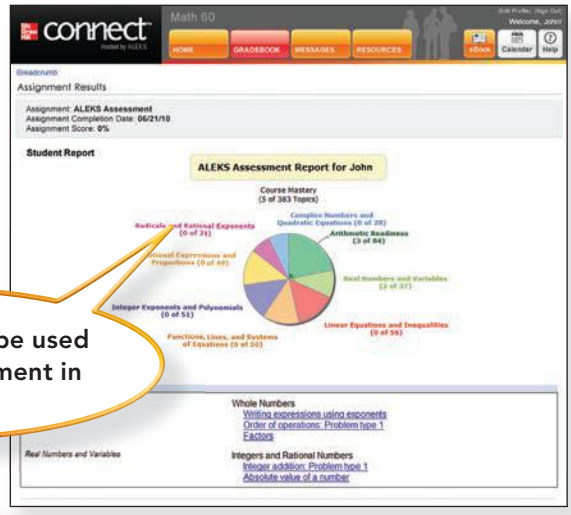
Connect Math Hosted by ALEKS Corporation is an exciting, new assignment and assessment platform combining the strengths of McGraw-Hill Higher Education and ALEKS Corporation. Connect Math Hosted by ALEKS is the first platform on the market to combine an artificially-intelligent, diagnostic assessment with an intuitive ehomework platform designed to meet your needs.

Connect Math Hosted by ALEKS Corporation is the culmination of a one-of-a-kind market development process involving math full-time and adjunct Math faculty at every step of the process. This process enables us to provide you with a solution that best meets your needs.

Connect Math Hosted by ALEKS Corporation is built by Math educators for Math educators!

1 *Your students want a well-organized homepage where key information is easily viewable.*

Modern Student Homepage



- This homepage provides a dashboard for students to immediately view their assignments, grades, and announcements for their course. (Assignments include HW, quizzes, and tests.)
- Students can access their assignments through the course Calendar to stay up-to-date and organized for their class.

2 *You want a way to identify the strengths and weaknesses of your class at the beginning of the term rather than after the first exam.*

Integrated ALEKS® Assessment

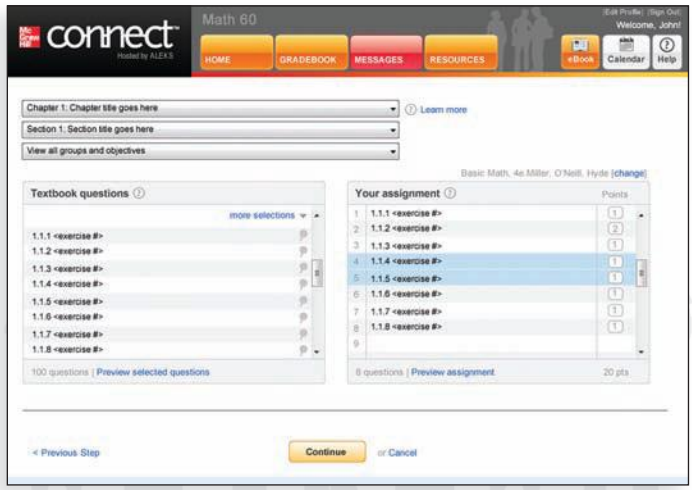
- This artificially-intelligent (AI), diagnostic assessment identifies precisely what a student knows and is ready to learn next.
- Detailed assessment reports provide instructors with specific information about where students are struggling most.
- This AI-driven assessment is the only one of its kind in an online homework platform.

ALEKS is a registered trademark of ALEKS Corporation.

Built by Math Educators for Math Educators

3 ***Your students want an assignment page that is easy to use and includes lots of extra help resources.***

Efficient Assignment Navigation



- Students have access to immediate feedback and help while working through assignments.
- Students have direct access to a media-rich eBook for easy referencing.
- Students can view detailed, step-by-step solutions written by instructors who teach the course, providing a unique solution to each and every exercise.

4 ***You want a more intuitive and efficient assignment creation process because of your busy schedule.***

Assignment Creation Process

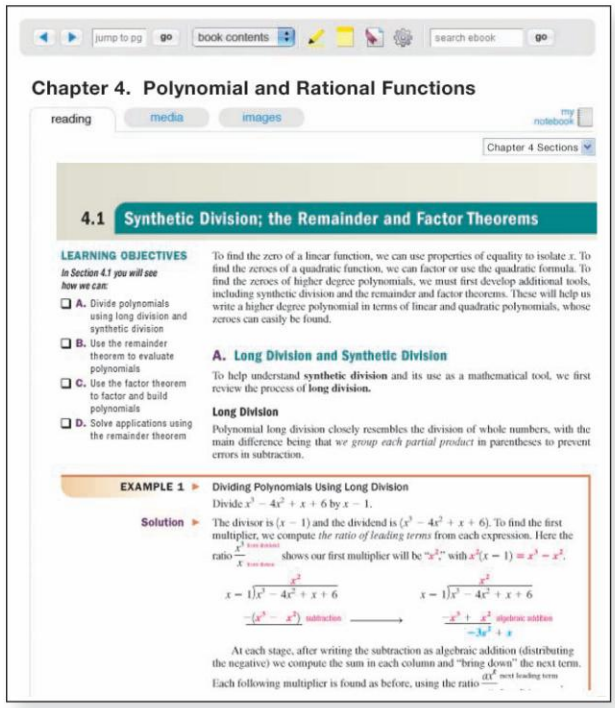
- Instructors can select textbook-specific questions organized by chapter, section, and objective.
- Drag-and-drop functionality makes creating an assignment quick and easy.
- Instructors can preview their assignments for efficient editing.

Mc Graw Hill Connect Learn Succeed™

www.connectmath.com

Mc Graw Hill connect™ MATH

Hosted by ALEKS Corp.



5 *Your students want an interactive eBook with rich functionality integrated into the product.*

Mc Graw Hill connect™ plus+ MATH

Hosted by ALEKS Corp.

Integrated Media-Rich eBook

- A Web-optimized eBook is seamlessly integrated within ConnectPlus Math Hosted by ALEKS Corp for ease of use.
- Students can access videos, images, and other media in context within each chapter or subject area to enhance their learning experience.
- Students can highlight, take notes, or even access shared instructor highlights/notes to learn the course material.
- The integrated eBook provides students with a cost-saving alternative to traditional textbooks.

6 *You want a flexible gradebook that is easy to use.*

Flexible Instructor Gradebook

- Based on instructor feedback, Connect Math Hosted by ALEKS Corp's straightforward design creates an intuitive, visually pleasing grade management environment.
- Assignment types are color-coded for easy viewing.
- The gradebook allows instructors the flexibility to import and export additional grades.

Instructors have the ability to drop grades as well as assign extra credit.

Built by Math Educators for Math Educators

7 ***You want algorithmic content that was developed by math faculty to ensure the content is pedagogically sound and accurate.***

Digital Content Development Story

The development of McGraw-Hill's Connect Math Hosted by ALEKS Corp. content involved collaboration between McGraw-Hill, experienced instructors, and ALEKS, a company known for its high-quality digital content. The result of this process, outlined below, is accurate content created with your students in mind. It is available in a simple-to-use interface with all the functionality tools needed to manage your course.

1. McGraw-Hill selected experienced instructors to work as Digital Contributors.
2. The Digital Contributors selected the textbook exercises to be included in the algorithmic content to ensure appropriate coverage of the textbook content.
3. The Digital Contributors created detailed, stepped-out solutions for use in the Guided Solution and Show Me features.
4. The Digital Contributors provided detailed instructions for authoring the algorithm specific to each exercise to maintain the original intent and integrity of each unique exercise.
5. Each algorithm was reviewed by the Contributor, went through a detailed quality control process by ALEKS Corporation, and was copyedited prior to being posted live.

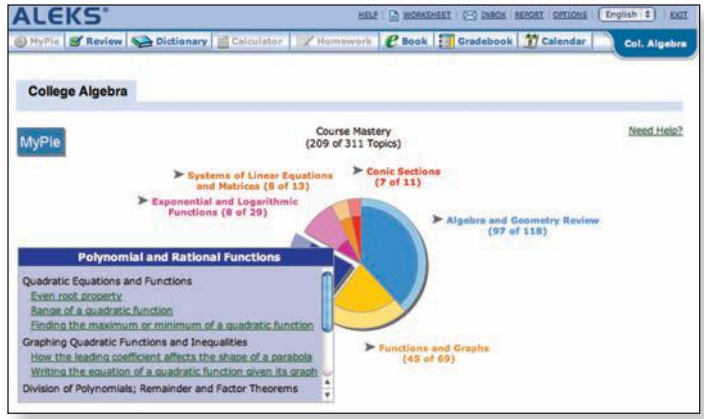
Better Student Preparedness . . .

ALEKS® Precalculus

Enhanced Course Coverage Enables Seamless Integration with Textbooks and Syllabi

ALEKS Precalculus features hundreds of new course topics to provide comprehensive course coverage, and ALEKS AI-2, the next generation intelligence engine to dramatically improve student learning outcomes. This enhanced ALEKS course product allows for better curriculum coverage and seamless textbook integration to help students succeed in mathematics, while allowing instructors to customize course content to align with their course syllabi.

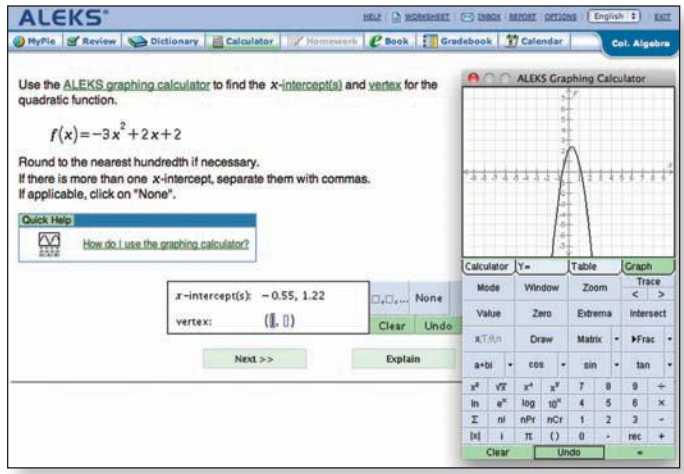


ALEKS is a Web-based program that uses artificial intelligence and adaptive questioning to assess precisely a student's knowledge in Precalculus and provide personalized instruction on the exact topics the student is most **ready to learn.** By providing individualized assessment and learning, ALEKS helps students to master course content quickly and easily.

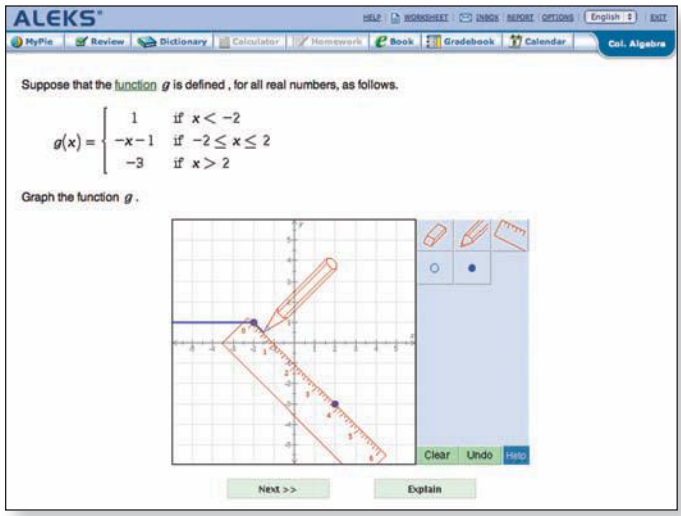
Topics Added For Comprehensive Coverage:

ALEKS Precalculus includes hundreds of new topics for comprehensive coverage of course material. To view Precalculus course content in more detail, please visit:

www.aleks.com/highered/math/course_products



The ALEKS Pie summarizes a student's current knowledge of course material and provides an individualized learning path with topics each student is most ready to learn.



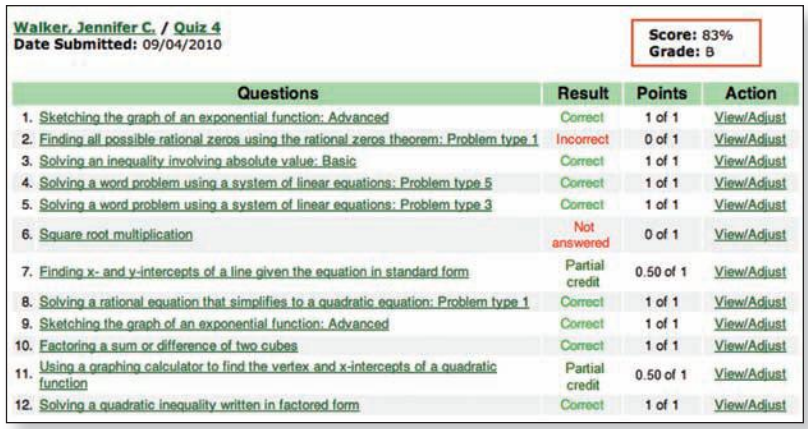
Robust Graphing Features:

ALEKS Precalculus provides more graphing coverage and includes a built-in graphing calculator, an adaptive, open-response environment, and realistic answer input tools to ensure student mastery.

The ALEKS Graphing Calculator is accessible via the Student Module and can be turned on or off by the instructor.

Realistic Input Tools provide an adaptive, open-response environment that avoids multiple-choice questions and ensures student mastery.

ALEKS is a registered trademark of ALEKS Corporation.

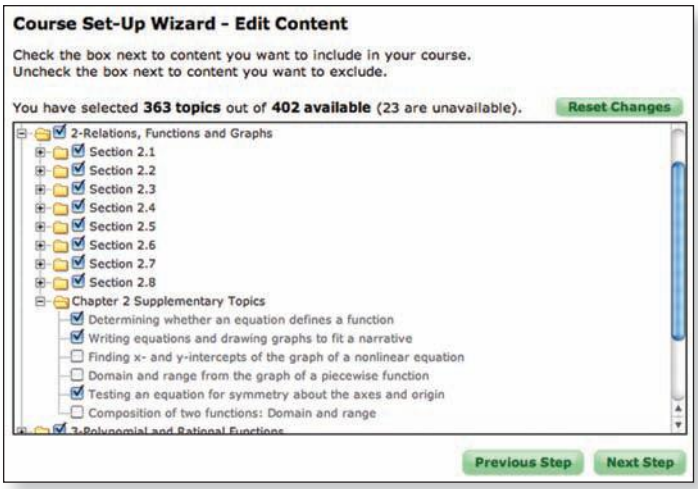


ALEKS® New Instructor Module Features for Precalculus

Help Students Achieve Success While Saving Instructor Time

ALEKS includes an **Instructor Module** with powerful, assignment-driven features and extensive content flexibility to simplify course management so instructors spend less time with administrative tasks and more time directing student learning. The ALEKS Instructor Module also includes two new features that further simplify course management and provide content flexibility: **Partial Credit on Assignments** and **Supplementary Textbook Integration Topic Coverage.**

Partial Credit On Assignments:



With the addition of many more multipart questions to ALEKS Precalculus, instructors now have the option to have ALEKS automatically assign partial credit to students' responses on multipart questions in an ALEKS Homework, Test, or Quiz. Instructors can also manually adjust scores.

Walker, Jennifer C. / Quiz 4

    - Determining whether an equation defines a function
    - Writing equations and drawing graphs to fit a narrative
    - Finding x- and y-intercepts of the graph of a nonlinear equation
    - Domain and range from the graph of a piecewise function
    - Testing an equation for symmetry about the axes and origin
    - Composition of two functions: Domain and range

Previous Step Next Step

Supplementary Textbook Integration Topic Coverage:

Instructors have access to ALL course topics in ALEKS Precalculus, and can include supplementary course topics even if they are not specifically tied to an integrated textbook's table of contents.

To learn more about how other instructors have successfully implemented ALEKS, please visit:
www.aleks.com/highered/math/implementations

"Overall, both students and I have been very pleased with ALEKS. Students like the flexibility it offers them. I like that students are working where they need to be and can spend as much time reviewing as they need. . . . Students have made such comments as 'I never liked math in high school but this is kind of fun,' or 'I never understood this in high school but now I do.'"

—Linda Flanery, Instructor, Sisseton Wahpeton College

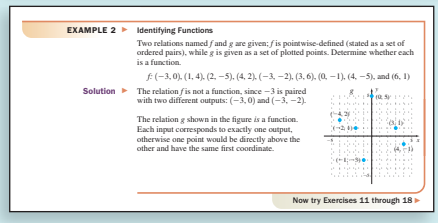
Increased Student Engagement . . .

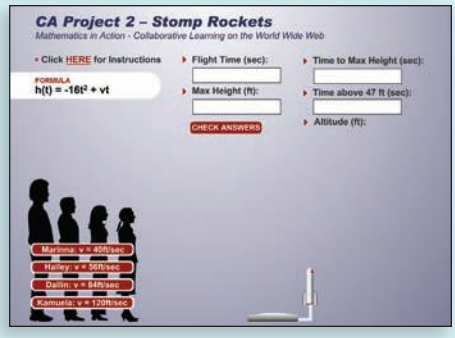
Through Meaningful Applications

Making mathematics meaningful requires that students experience a connection between the mathematics they study, and its impact on the world they live in. This text is the result of a powerful commitment to provide applications of the highest quality, and greatest interest, having close ties to the examples, and with carefully monitored levels of difficulty. We particularly made an effort to supply these in sufficient quantity to be used for in-class illustrations, included as homework assignments, and employed in the construction of quizzes and tests, without exhausting their supply prematurely. Many applications were born of our own diverse experiences, with others coming from a curious, even visionary folly that enables one to seize on the everyday events of life, and to see the mathematics in the background. These were supported by a substantial library of reference and research tools, with an eye toward history, current events, and modern trends. —The Authors



- **Chapter Openers** highlight Chapter Connections, an interesting application exercise from the chapter, and provide a list of other real-world connections to give context for students who wonder how math relates to them.

> "I think the book has very modern applications and quite a few of them. The calculator instructions are very well done."
> —*Nezam Iraniparast, Western Kentucky University*



- **Examples** throughout the text feature word problems, providing students with a starting point for how to solve these types of problems in their exercise sets.

> "The students always want to know 'When am I ever going to have to use algebra anyway?' Now it will not be hard for them to see for themselves some REAL ways." —*Sally Haas, Angelina College*

- **Application Exercises** at the end of each section are the hallmark of the Coburn series. Never contrived, always creative, and born out of the author's life and experiences, each application tells a story and appeals to a variety of teaching styles, disciplines, backgrounds, and interests. The authors have ensured that the applications reflect the most common majors of precalculus students.

> "The amount of technology is great, as are the applications. The quality of the applications is better than my current text."
> —*Daniel Russow, Arizona Western College–Yuma*

- **Math in Action Applets,** located online, enable students to work collaboratively as they manipulate applets that apply mathematical concepts in real-world contexts.

Through Timely Examples

In mathematics, it would be difficult to overstate the importance of examples that set the stage for learning. Not a few educational experiences have faltered due to an example that was too difficult, a poor fit, out of sequence, or had a distracting result. In this series, a careful and deliberate effort was made to select examples that were timely and clear, with a direct focus on the concept or skill at hand. Everywhere possible, they were further designed to link previous concepts to current ideas, and to lay the groundwork for concepts to come. As a trained educator knows, the best time to answer a question is often before it's ever asked, and a timely sequence of carefully constructed examples can go a long way in this regard, making each new idea simply the next logical, even anticipated step. When successful, the mathematical maturity of a student grows in unnoticed increments, as though it was just supposed to be that way. —The Authors

- **Side by side graphical and algebraic solutions** illustrate the difference between problem-solving methods, emphasize the connections between algebraic and graphical information, and enable students to understand why one method might be preferable to another for any given problem.
- **Titles** have been added to examples to highlight relevant learning objectives and reinforce the importance of speaking mathematically using vocabulary.
- **Annotations** located to the right of the solution sequence help the student recognize which property or procedure is being applied.
- **"Now Try"** boxes immediately following examples guide students to specific matched exercises at the end of the section, helping them identify exactly which homework problems coincide with each discussed concept.

"The authors have succeeded with numerous calculator examples with easy-to-use instructions to follow along. I truly enjoy seeing plenty of calculator examples throughout the text!!"
—*David Bosworth, Huchinson Community College*

EXAMPLE 8 ▶ **Solving a Quadratic Inequality**

Solve the inequality $-x^2 + 6x \le 9$.

Analytical Solution ▶ Begin by writing the inequality in standard form: $-x^2 + 6x - 9 \le 0$. Note this is equivalent to $g(x) \le 0$ for $g(x) = -x^2 + 6x - 9$. Since $a < 0$, the graph of g will open downward. The factored form is $g(x) = -(x - 3)^2$, showing 3 is a zero and a repeated root. Using the x-axis, we plot the point (3, 0) and visualize a parabola opening downward through this point.

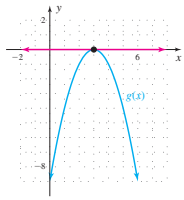
Figure 3.29 shows the graph is *below* the x-axis (outputs are negative) for *all values* of x except $x = 3$. But since this is a less than *or equal to* inequality, the solution is $x \in \mathbb{R}$.

WORTHY OF NOTE
Since $x = 3$ was a zero of multiplicity 2, the graph "bounced off" the x-axis at this point, with no change of sign for g. The graph is entirely below the x-axis, except at the vertex (3, 0).

Figure 3.29

Graphical Solution ▶ The complete graph of g shown in Figure 3.30 confirms the analytical solution (using the zeroes method). For the intervals of the domain shown in red: $(-\infty, 3) \cup (3, \infty)$, the graph of g is below the x-axis $[g(x) < 0]$. The point (3, 0) is *on* the x-axis $[g(3) = 0]$. As with the analytical solution, the solution to this "less than or equal to" inequality is all real numbers. A calculator check of the original inequality is shown in Figure 3.31.

Figure 3.30



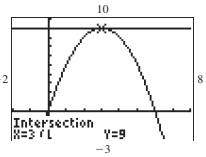


Figure 3.31

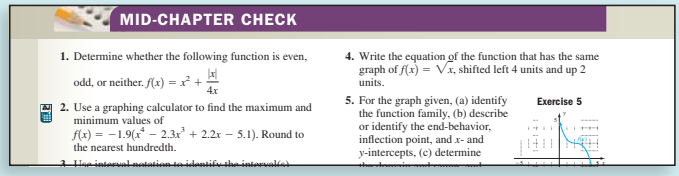
Now try Exercises 121 through 132 ▶

"The modeling and regression examples in this text are excellent, and the instructions for using the graphing calculator to investigate these types of problems are great."
—*Allison Sutton, Austin Community College*

"The examples support the exercises which is very important. The chapter is very well written and is easy to read and understand."
—*Joseph Lloyd Harris, Gulf Coast Community College*

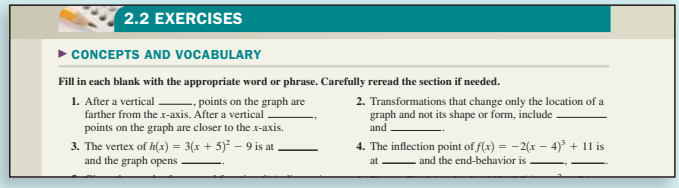
Solid Skill Development . . .



Through Exercises

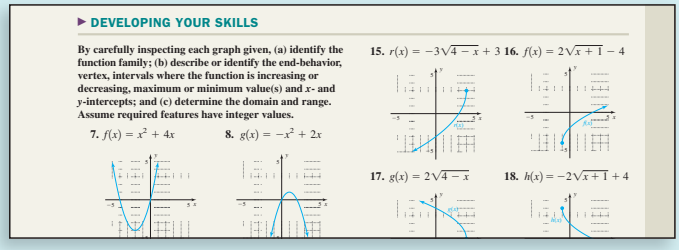
We have included a wealth of exercises in support of each section's main ideas. The exercise sets were constructed with great care, in an effort to provide support for weaker students, while challenging more advanced students to reach even further. The quantity and quality of exercises offers strong support for a teacher's efforts, and numerous opportunities to guide students through difficult calculations and to illustrate important problem solving ideas.

—The Authors



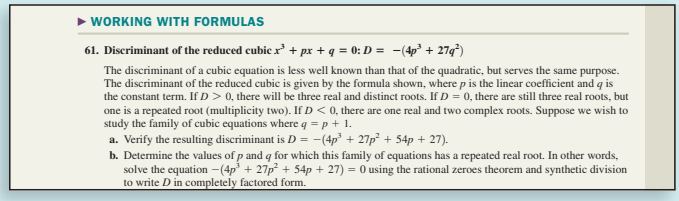
Mid-Chapter Checks

Mid-Chapter Checks provide students with a good stopping place to assess their knowledge before moving on to the second half of the chapter.

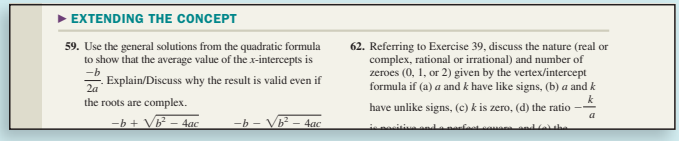


End-of-Section Exercise Sets

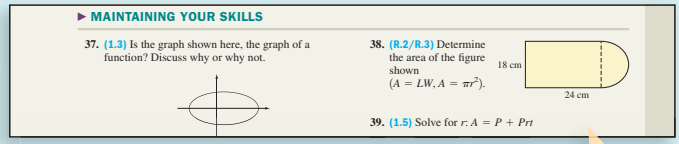
- **Concepts and Vocabulary** exercises to help students recall and retain important terms.



- **Developing Your Skills** exercises to provide practice of relevant concepts just learned with increasing levels of difficulty.



> "The sections in the assignments headed working with formulas and applications bring forward some interesting ideas and problems that are more in depth. These would help hold the students' interest in the topic."
>
> —*Sherri Rankin, Huchinson Community College*



- **Working with Formulas** exercises to demonstrate contextual applications of well-known formulas.

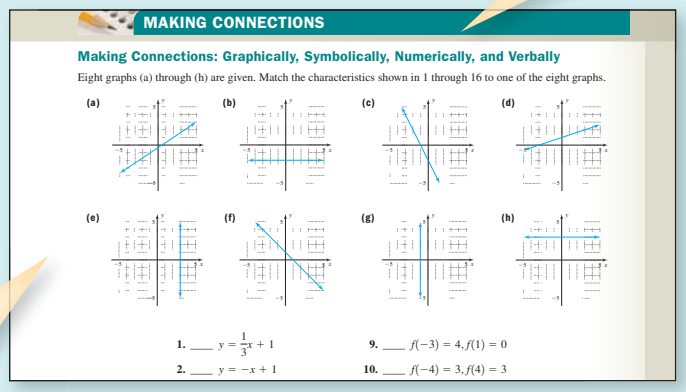
- **Extending the Concept** exercises that require communication of topics, synthesis of related concepts, and the use of higher-order thinking skills.

- **Maintaining Your Skills** exercises that address skills from previous sections to help students retain previously learning knowledge.

> "The exercise sets are plentiful. I like having many to choose from when assigning homework. When there are only one or two exercises of a particular type, it's hard for the students to get the practice they need."
>
> —*Sarah Jackson, Pratt Community College*

> "There seems to be a good selection of easy, moderate, and difficult problems in the exercises."
>
> —*Ed Gallo, Sinclair Community College*

End-of-Chapter Review Material



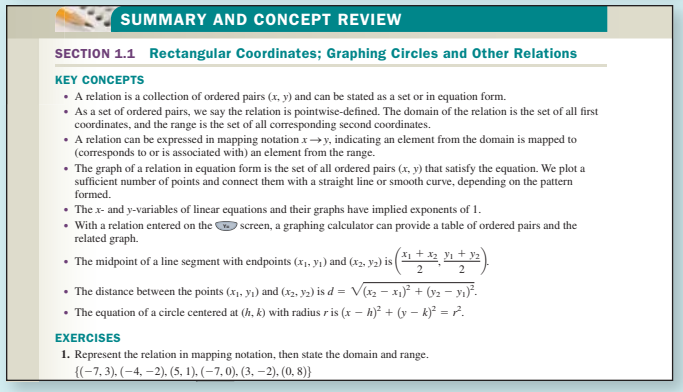
Exercises located at the end of the chapter provide students with the tools they need to prepare for a quiz or test. Each chapter features the following:

- **Making Connections** matching exercises are groups of problems where students must identify graphs based on an equation or description. This feature helps students make the connection between graphical and algebraic information while it enhances students' ability to read and interpret graphical data.
- **Chapter Summary and Concept Reviews** that present key concepts with corresponding exercises by section in a format easily used by students.

> "The problem sets are really magnificent. I deeply enjoy and appreciate the many problems that incorporate telescopes, astronomy, reflector design, nuclear cooling tower profiles, charged particle trajectories, and other such examples from science, technology, and engineering." —*Light Bryant, Arizona Western College*

- **Practice Tests** that give students the opportunity to check their knowledge and prepare for classroom quizzes, tests, and other assessments.
- **Cumulative Reviews** that are presented at the end of each chapter help students retain previously learned skills and concepts by revisiting important ideas from earlier chapters (starting with Chapter 2).
- **Graphing Calculator** icons appear next to exercises where important concepts can be supported by the use of graphing technology.

> "Not only was the algebra rigorously treated, but it was reinforced throughout the chapters with the Mid-Chapter Check and the Chapter Review and Tests." —*Mark Crawford, Waubonsee Community College*



MAKING CONNECTIONS

Making Connections: Graphically, Symbolically, Numerically, and Verbally

Eight graphs (a) through (h) are given. Match the characteristics shown in 1 through 16 to one of the eight graphs.

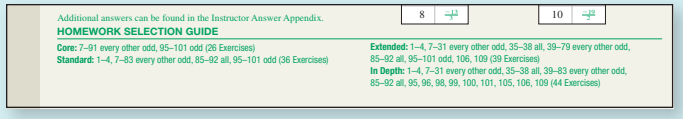
(a) (b) (c) (d) (e) (f) (g) (h)

1. ____ $y = \frac{1}{3}x + 1$
2. ____ $y = -x + 1$
9. ____ $f(-3) = 4, f(1) = 0$
10. ____ $f(-4) = 3, f(4) = 3$

SUMMARY AND CONCEPT REVIEW

SECTION 1.1 Rectangular Coordinates; Graphing Circles and Other Relations

KEY CONCEPTS



- A relation is a collection of ordered pairs (x, y) and can be stated as a set or in equation form.
- As a set of ordered pairs, we say the relation is pointwise-defined. The domain of the relation is the set of all first coordinates, and the range is the set of all corresponding second coordinates.
- A relation can be expressed in mapping notation $x \to y$, indicating an element from the domain is mapped to (corresponds to or is associated with) an element from the range.
- The graph of a relation in equation form is the set of all ordered pairs (x, y) that satisfy the equation. We plot a sufficient number of points and connect them with a straight line or smooth curve, depending on the pattern formed.
- The x- and y-variables of linear equations and their graphs have implied exponents of 1.
- With a relation entered on the $Y=$ screen, a graphing calculator can provide a table of ordered pairs and the related graph.
- The midpoint of a line segment with endpoints (x_1, y_1) and (x_2, y_2) is $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$.
- The distance between the points (x_1, y_1) and (x_2, y_2) is $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$.
- The equation of a circle centered at (h, k) with radius r is $(x - h)^2 + (y - k)^2 = r^2$.

EXERCISES

1. Represent the relation in mapping notation, then state the domain and range.
$\{(-7, 3), (-4, -2), (5, 1), (-7, 0), (3, -2), (0, 8)\}$

Homework Selection Guide

A list of suggested homework exercises has been provided for each section of the text (Annotated Instructor's Edition only). This feature may prove especially useful for departments that encourage consistency among many sections, or those having a large adjunct population. The feature was also designed as a convenience to instructors, enabling them to develop an inventory of exercises that is more in tune with the course as they like to teach it. The guide provides prescreened and preselected assignments at four different levels: *Core, Standard, Extended,* and *In Depth.*

Additional answers can be found in the Instructor Answer Appendix.

HOMEWORK SELECTION GUIDE

Core: 7–91 every other odd, 95–101 odd (26 Exercises)

Standard: 1–4, 7–83 every other odd, 85–92 all, 95–101 odd (36 Exercises)

Extended: 1–4, 7–31 every other odd, 35–38 all, 39–79 every other odd, 85–92 all, 95–101 odd, 106, 109 (39 Exercises)

In Depth: 1–4, 7–31 every other odd, 35–38 all, 39–83 every other odd, 85–92 all, 95, 96, 98, 99, 100, 101, 105, 106, 109 (44 Exercises)

- **Core:** These assignments go right to the heart of the material, offering a minimal selection of exercises that cover the primary concepts and solution strategies of the section, along with a small selection of the best applications.
- **Standard:** The assignments at this level include the *Core* exercises, while providing for additional practice without excessive drill. A wider assortment of the possible variations on a theme are included, as well as a greater variety of applications.
- **Extended:** Assignments from the *Extended* category expand on the *Standard* exercises to include more applications, as well as some conceptual or theory-based questions. Exercises may include selected items from the *Concepts and Vocabulary, Working with Formulas,* and the *Extending the Concept* categories of the exercise sets.
- **In Depth:** The *In Depth* assignments represent a more comprehensive look at the material from each section, while attempting to keep the assignment manageable for students. These include a selection of the most popular and highest-quality exercises from each category of the exercise set, with an additional emphasis on *Maintaining Your Skills.*

Strong Mathmatical Connections . . .

Through a Conversational Writing Style

While examples and applications are arguably the most prominent features of a mathematics text, it's the readability and writing style of the authors that bind them together. It may be true that some students don't read the text, and that others open the text only when looking for an example similar to the exercise they're working on. But when they do and for those students that do (read the text), it's important they have a text that "speaks to them," relating concepts in a form and at a level they understand and can relate to. We feel the writing style of this text will help draw students in and keep their interest, becoming a positive experience and bringing them back a second and third time, until it becomes habitual. At this point students might begin to see the true value of their text, as it becomes a resource for learning on equal footing with any other form of supplemental instruction. This text represents our best efforts in this direction. —The Authors

Conversational Writing Style

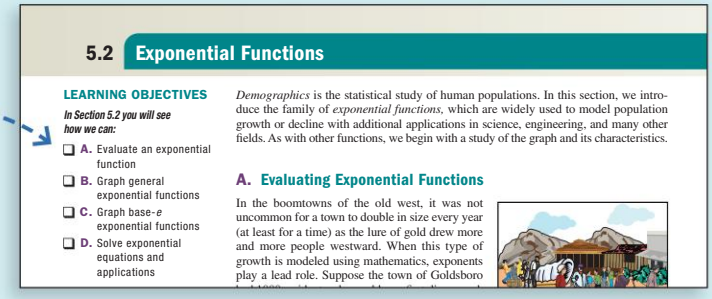
John and J.D.'s experience in the classroom and their strong connections to how students comprehend the material are evident in their writing style. They use a conversational and supportive writing style, providing the students with a tool they can depend on when the teacher is not available, when they miss a day of class, or simply when working on their own. The effort they have put into the writing is representative of John Coburn's unofficial mantra: "If you want more students to reach the top, you gotta put a few more rungs on the ladder."

"Coburn strikes a good balance between providing all of the important information necessary for a certain topic without going too deep."
—Barry Monk, Macon State College

"I think the authors have done an excellent job of interweaving the formal explanations with the 'plain talk' descriptions, illustrating with meaningful examples and applications."
—Ken Gamber, Hutchinson Community College

Through Student Involvement

How do you design a student-friendly textbook? We decided to get students involved by hosting two separate focus groups. During these sessions we asked students to advise us on how they use their books, what pedagogical elements are useful, which elements are distracting and not useful, as well as general feedback on page layout. During this process there were times when we thought, "Now why hasn't anyone ever thought of that before?" Clearly these student focus groups were invaluable. Taking direct student feedback and incorporating what is feasible and doesn't detract from instructor use of the text is the best way to design a truly student-friendly text. The next two pages will highlight what we learned from students so you can see for yourself how their feedback played an important role in the development of the Coburn/Herdlick series.



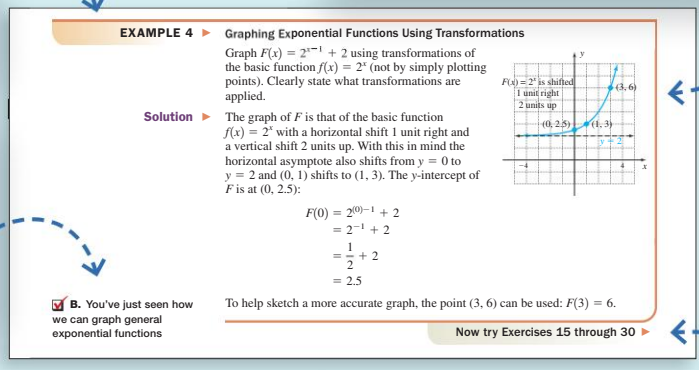
Students said that **Learning Objectives** should clearly define the goals of each section.

5.2 Exponential Functions

LEARNING OBJECTIVES

In Section 5.2 you will see how we can:

- A. Evaluate an exponential function
- B. Graph general exponential functions
- C. Graph base-e exponential functions
- D. Solve exponential equations and applications



Demographics is the statistical study of human populations. In this section, we introduce the family of *exponential functions,* which are widely used to model population growth or decline with additional applications in science, engineering, and many other fields. As with other functions, we begin with a study of the graph and its characteristics.

A. Evaluating Exponential Functions

In the boomtowns of the old west, it was not uncommon for a town to double in size every year (at least for a time) as the lure of gold drew more and more people westward. When this type of growth is modeled using mathematics, exponents play a lead role. Suppose the town of Goldsboro

Examples are "boxed" so students can clearly see where they begin and end.

Examples are called out in the margins so they are easy for students to spot.

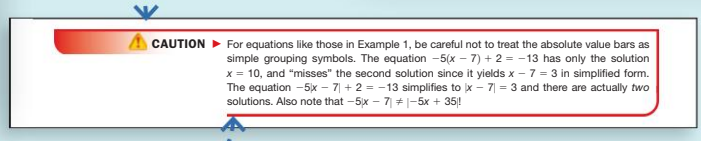
EXAMPLE 4 ▶ Graphing Exponential Functions Using Transformations

Graph $F(x) = 2^{x-1} + 2$ using transformations of the basic function $f(x) = 2^x$ (not by simply plotting points). Clearly state what transformations are applied.

Solution ▶ The graph of F is that of the basic function $f(x) = 2^x$ with a horizontal shift 1 unit right and a vertical shift 2 units up. With this in mind the horizontal asymptote also shifts from $y = 0$ to $y = 2$ and $(0, 1)$ shifts to $(1, 3)$. The y-intercept of F is at $(0, 2.5)$:

$$F(0) = 2^{(0)-1} + 2 = 2^{-1} + 2 = \frac{1}{2} + 2 = 2.5$$

To help sketch a more accurate graph, the point $(3, 6)$ can be used: $F(3) = 6$.



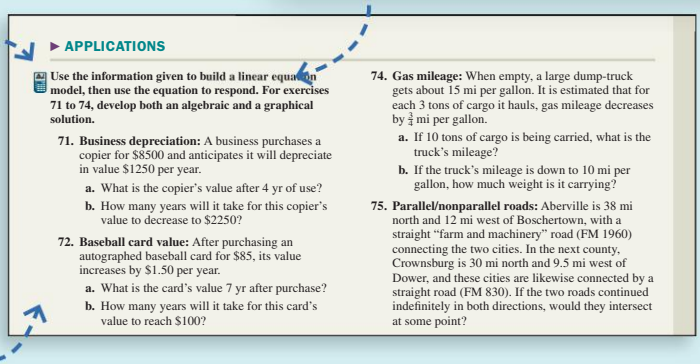
B. You've just seen how we can graph general exponential functions

Now try Exercises 15 through 30 ▶

Students asked for **Check Points** throughout each section to alert them when a specific learning objective has been covered and to reinforce the use of correct mathematical terms.

Students told us they liked when the examples were linked to the exercises.

Described by students as one of the most useful features in a math text, **Caution Boxes** signal a student to stop and take note in order to avoid mistakes in problem solving.



CAUTION ▶ For equations like those in Example 1, be careful not to treat the absolute value bars as simple grouping symbols. The equation $-5(x - 7) + 2 = -13$ has only the solution $x = 10$, and "misses" the second solution since it yields $x - 7 = 3$ in simplified form. The equation $-5|x - 7| + 2 = -13$ simplifies to $|x - 7| = 3$ and there are actually *two* solutions. Also note that $-5|x - 7| \neq |-5x + 35|$!

Students told us that the color red should only be used for things that are really important. Also, anything significant should be included in the body of the text; marginal readings imply optional.

Students told us that directions should be in bold so they are easily distinguishable from the problems.

Students said having a lot of icons was confusing. The graphing calculator is the only icon used in the exercise sets; no unnecessary icons are used.

▶ APPLICATIONS

Use the information given to build a linear equation model, then use the equation to respond. For exercises 71 to 74, develop both an algebraic and a graphical solution.

71. Business depreciation: A business purchases a copier for $8500 and anticipates it will depreciate in value $1250 per year.
- **a.** What is the copier's value after 4 yr of use?
- **b.** How many years will it take for this copier's value to decrease to $2250?

72. Baseball card value: After purchasing an autographed baseball card for $85, its value increases by $1.50 per year.
- **a.** What is the card's value 7 yr after purchase?
- **b.** How many years will it take for this card's value to reach $100?

74. Gas mileage: When empty, a large dump-truck gets about 15 mi per gallon. It is estimated that for each 3 tons of cargo it hauls, gas mileage decreases by $\frac{3}{4}$ mi per gallon.
- **a.** If 10 tons of cargo is being carried, what is the truck's mileage?
- **b.** If the truck's mileage is down to 10 mi per gallon, how much weight is it carrying?

75. Parallel/nonparallel roads: Aberville is 38 mi north and 12 mi west of Boschertown, with a straight "farm and machinery" road (FM 1960) connecting the two cities. In the next county, Crownsburg is 30 mi north and 9.5 mi west of Dower, and these cities are likewise connected by a straight road (FM 830). If the two roads continued indefinitely in both directions, would they intersect at some point?

Because students spend a lot of time in the exercise section of a text, they said that a white background is hard on their eyes…so we used a soft, off-white color for the background.

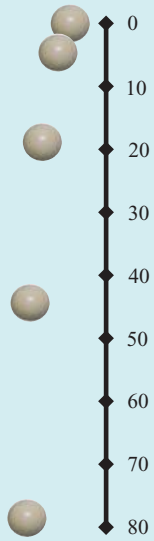
Connections to Calculus. . .

What's This Feature All About?

Calculus is often described as the study of change, motion, and accumulation. While there are two main divisions (differential calculus and integral calculus), both depend on a single, fundamental idea—the use of successive approximations of increasing accuracy to find an exact result.

Differential calculus allows us to quantify the rate of change in a quantity at a specific instant, using a tool called the *derivative*. For instance, if an object rolls off of an elevated surface (Figure 1), the equation $d = 4.9t^2$ gives the distance the object has fallen (in meters) after t seconds. Due to gravity, the velocity of the object increases the further it falls. Since velocity is computed as the distance traveled divided by the time in motion $\left(\text{or } R = \frac{D}{T}\right)$, we can easily find the *average velocity* of the object for any time interval (Figure 2). The derivative concept uses a series of time intervals that become "infinitely small," and ultimately result in a precise formula (called the *limit*) for the instantaneous velocity of the object at any time t.

Figure 1



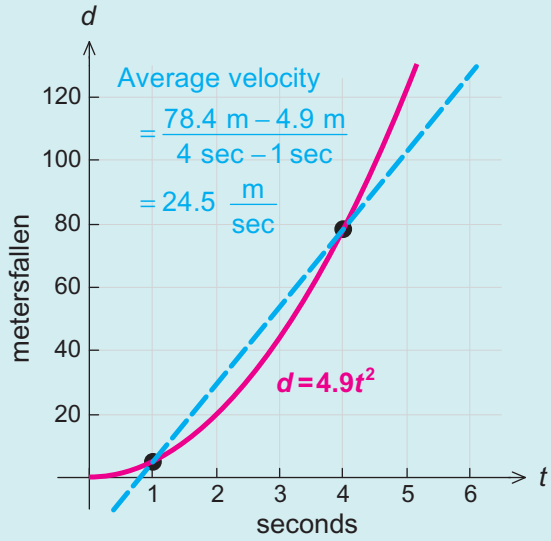


Figure 2

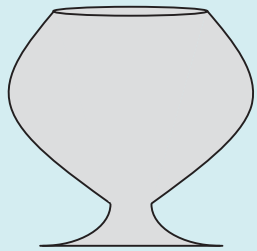
On the other hand, **integral calculus** develops a tool called the *integral*, which can find a total accumulation over an infinite number of very small intervals. For instance, we can approximate the volume of the solid shown in Figure 3 using a series of thin cylinders or disks ($V = \pi r^2 h$) that become more numerous and ever thinner, while continuing to fit snugly within the frame of the original solid (Figure 4). As the height of each disk becomes infinitely small, and the number of disks becomes infinitely large, we find these approximations tend toward a precise formula (called the *limit*) for the exact volume of the solid.

Figure 3



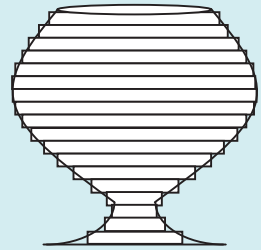


Figure 4

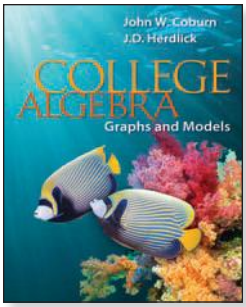
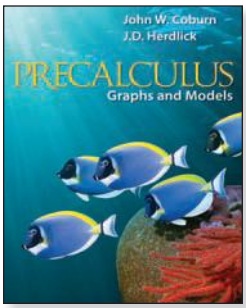


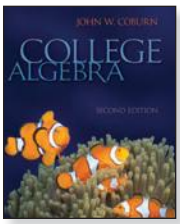
It's important to note that in each case, the tools supporting both concepts are ***algebraic in nature,*** and involve (1) algebraically rewriting an expression in a form that allows the tools of calculus to be applied, or (2) simplifying the result of such an application. This means your success will likely be measured in direct proportion to your mastery of the algebraic concepts we study in this course, many of which will form the "connections" we emphasize in this feature.

So more specifically—this feature is designed to point out connections between the algebraic concepts you're currently studying, and the calculus concepts you'll soon encounter. It's not intended as an exhaustive coverage of all connections to be found in each chapter, but simply a hint or gleaning of how the concepts you're studying now, are connected to the calculus concepts to come.



The Authors

Coburn's Precalculus Series



College Algebra: Graphs & Models, First Edition

A Review of Basic Concepts and Skills ◆ Functions and Graphs ◆ Relations; More on Functions ◆ Quadratic Functions and Operations on Functions ◆ Polynomial and Rational Functions ◆ Exponential and Logarithmic Functions ◆ Systems of Equations and Inequalities ◆ Matrices and Matrix Applications ◆ Analytic Geometry and the Conic Sections ◆ Additional Topics in Algebra

Precalculus: Graphs & Models, First Edition

Functions and Graphs ◆ Relations; More on Functions ◆ Quadratic Functions and Operations on Functions ◆ Polynomial and Rational Functions ◆ Exponential and Logarithmic Functions ◆ Introduction to Trigonometry ◆ trigonometric Identities, Inverses, and Equations ◆ Applications of Trigonometry ◆ Systems of Equations and Inequalities; Matrices ◆ Analytic Geometry; Polar and parametric Equations ◆ Sequences, Series, Counting, and Probability ◆ Bridges to Calculus—An Introduction to Limits

Making Connections . . .

Through 360° Development

McGraw-Hill's 360° Development Process is an ongoing, never-ending, market-oriented approach to building accurate and innovative print and digital products. It is dedicated to continual large-scale and incremental improvement driven by multiple customer feedback loops and checkpoints. This process is initiated during the early planning stages of our new products, intensifies during the development and production stages, and then begins again on publication, in anticipation of the next edition.

A key principle in the development of any mathematics text is its ability to adapt to teaching specifications in a universal way. The only way to do so is by contacting those universal voices—and learning from their suggestions. We are confident that our book has the most current content the industry has to offer, thus pushing our desire for accuracy to the highest standard possible. In order to accomplish this, we have moved through an arduous road to production. Extensive and open-minded advice is critical in the production of a superior text.

By investing in this extensive endeavor, McGraw-Hill delivers to you a product suite that has been created, refined, tested, and validated to be a successful tool in your course.

Student Focus Groups

Two student focus groups were held at Illinois State University and Southeastern Louisiana University to engage students in the development process and provide feedback as to how the design of a textbook impacts homework and study habits in the College Algebra, Precalculus, and Trigonometry course areas.

Developmental Editing

The manuscript has been impacted by numerous developmental reviewers who edited for clarity and consistency. Efforts resulted in cutting length from the manuscript, while retaining a conversational and casual narrative style. Editorial work also ensured the positive visual impact of art and photo placement.

Chapter Reviews and Manuscript Reviews

Teachers and academics from across the country reviewed the current edition text, the proposed table of contents, and first-draft manuscript to give feedback on reworked narrative, design changes, pedagogical enhancements, and organizational changes. This feedback was summarized by the book team and used to guide the direction of the second-draft manuscript.

Acknowledgments

We first want to express a deep appreciation for the guidance, comments, and suggestions offered by all reviewers of the manuscript. We have once again found their collegial exchange of ideas and experience very refreshing and instructive, and always helping to create a better learning tool for our students.

Vicki Krug has continued to display an uncanny ability to bring innumerable pieces from all directions into a unified whole, in addition to providing spiritual support during some extremely trying times; Patricia Steele's skill as a copy editor is as sharp as ever, and her attention to detail continues to pay great dividends; which helps pay the debt we owe Katie White, Michelle Flomenhoft, Christina Lane, and Eve Lipton for their useful suggestions, infinite patience, tireless efforts, and art-counting eyes, which helped in bringing the manuscript to completion. We must also thank John Osgood for his ready wit, creative energies, and ability to step into the flow without missing a beat; Laurie Janssen and our magnificent design team, and Dawn Bercier whose influence on this project remains strong although she has moved on, as it was her indefatigable spirit that kept the ship on course through trial and tempest, and her ski-jumper's vision that brought J.D. on board. In truth, our hats are off to all the fine people at McGraw-Hill for their continuing support and belief in this series. A final word of thanks must go to Rick Armstrong, whose depth of knowledge, experience, and mathematical connections seems endless; Anne Marie Mosher for her contributions to various features of the text, Mitch Levy for his consultation on the exercise sets, Stephen Toner for his work on the videos, Jon Booze and his team for their work on the test bank, Cindy Trimble for her invaluable ability to catch what everyone else misses; and to Rick Pescarino, Kelly Ballard, John Elliot, Jim Frost, Barb Kurt, Lillian Seese, Nate Wilson, and all of our colleagues at St. Louis Community College, whose friendship, encouragement, and love of mathematics makes going to work each day a joy.

Through Supplements

***All online supplements are available through the book's website: www.mhhe.com/coburn.**

Instructor Supplements

- **Computerized Test Bank Online:** Utilizing Brownstone Diploma® algorithm-based testing software enables users to create customized exams quickly.
- **Instructor's Solutions Manual:** Provides comprehensive, worked-out solutions to all exercises in the text.
- **Annotated Instructor's Edition:** Contains all answers to exercises in the text, which are printed in a second color, adjacent to corresponding exercises, for ease of use by the instructor.

Student Supplements

- **Student Solutions Manual** provides comprehensive, worked-out solutions to all of the odd-numbered exercises.
- **Graphing Calculator Manual** includes detailed instructions for using calculators to solve problems throughout the text. Written by the authors to accompany their text, it is designed to match and supplement the text.
- **Videos**
  - Interactive video lectures are provided for each section in the text, which explain to the students how to do key problem types, as well as highlighting common mistakes to avoid.
  - Exercise videos provide step-by-step instruction for the key exercises which students will most wish to see worked out.
  - Graphing calculator videos help students master the most essential calculator skills used in the college algebra course.
  - The videos are closed-captioned for the hearing impaired, subtitled in Spanish, and meet the Americans with Disabilities Act Standards for Accessible Design.

Connect Math™ Hosted by ALEKS®

www.connectmath.com

Connect Math Hosted by ALEKS is an exciting, new assessment and assignment platform combining the strengths of McGraw-Hill Higher Education and ALEKS Corporation. Connect Math Hosted by ALEKS is the first platform on the market to combine an artificial-intelligent, diagnostic assessment with an intuitive ehomework platform designed to meet your needs.

Connect Math Hosted by ALEKS is the culmination of a one-of-a-kind market development process involving math full-time faculty members and adjuncts at every step of the process. This process enables us to provide you with an end product that better meets your needs.

Connect Math Hosted by ALEKS is built by mathematicians educators for mathematicians educators!

ALEKS® www.aleks.com

ALEKS (**A**ssessment and **LE**arning in **K**nowledge **S**paces) is a dynamic online learning system for mathematics education, available over the Web 24/7. ALEKS assesses students, accurately determines their knowledge, and then guides them to the material that they are most ready to learn. With a variety of reports, Textbook Integration Plus, quizzes, and homework assignment capabilities, ALEKS offers flexibility and ease of use for instructors.

- ALEKS uses artificial intelligence to determine exactly what each student knows and is ready to learn. ALEKS remediates student gaps and provides highly efficient learning and improved learning outcomes
- ALEKS is a comprehensive curriculum that aligns with syllabi or specified textbooks. Used in conjunction with McGraw-Hill texts, students also receive links to text-specific videos, multimedia tutorials, and textbook pages.
- ALEKS offers a dynamic classroom management system that enables instructors to monitor and direct student progress toward mastery of course objectives.

ALEKS Prep/Remediation:

- Helps instructors meet the challenge of remediating underprepared or improperly placed students.
- Assesses students on their prerequisite knowledge needed for the course they are entering (i.e., Calculus students are tested on Precalculus knowledge) and prescribes a unique and efficient learning path specifically to address their strengths and weaknesses.
- Students can address prerequisite knowledge gaps outside of class freeing the instructor to use class time pursuing course outcomes.

Making Connections . . .

McGraw-Hill Higher Education and Blackboard® have teamed up.

Blackboard, the Web-based course-management system, has partnered with McGraw-Hill to better allow students and faculty to use online materials and activities to complement face-to-face teaching. Blackboard features exciting social learning and teaching tools that foster more logical, visually impactful and active learning opportunities for students. You'll transform your closed-door classrooms into communities where students remain connected to their educational experience 24 hours a day.

This partnership allows you and your students access to McGraw-Hill's Connect™ and Create™ right from within your Blackboard course—all with one single sign-on.

Not only do you get single sign-on with Connect and Create, you also get deep integration of McGraw-Hill content and content engines right in Blackboard. Whether you're choosing a book for your course or building Connect assignments, all the tools you need are right where you want them—inside of Blackboard.

Gradebooks are now seamless. When a student completes an integrated Connect assignment, the grade for that assignment automatically (and instantly) feeds your Blackboard grade center.

McGraw-Hill and Blackboard can now offer you easy access to industry leading technology and content, whether your campus hosts it, or we do. Be sure to ask your local McGraw-Hill representative for details.

TEGRITY—tegritycampus.mhhe.com

McGraw-Hill Tegrity Campus™ is a service that makes class time available all the time by automatically capturing every lecture in a searchable format for students to review when they study and complete assignments. With a simple one-click start and stop process, you capture all computer screens and corresponding audio. Students replay any part of any class with easy-to-use browser-based viewing on a PC or Mac.

Educators know that the more students can see, hear, and experience class resources, the better they learn. With Tegrity, students quickly recall key moments by using Tegrity's unique search feature. This search helps students efficiently find what they need, when they need it across an entire semester of class recordings. Help turn all your students' study time into learning moments immediately supported by your lecture.

To learn more about Tegrity watch a 2-minute Flash demo at **tegritycampus.mhhe.com.**

Electronic Books:

If you or your students are ready for an alternative version of the traditional textbook, McGraw-Hill eBooks offer a cheaper and eco-friendly alternative to traditional textbooks. By purchasing eBooks from McGraw-Hill, students can save as much as 50% on selected titles delivered on the most advanced eBook platform available. Contact your McGraw-Hill sales representative to discuss eBook packaging options.

Create:

Craft your teaching resources to match the way you teach! With McGraw-Hill Create, **www.mcgrawhillcreate.com,** you can easily rearrange chapters, combine material from other content sources, and quickly upload content you have written like your course syllabus or teaching notes. Find the content you need in Create by searching through thousands of leading McGraw-Hill textbooks. Arrange your book to fit your teaching style. Create even allows you to personalize your book's appearance by selecting the cover and adding your name, school, and course information. Order a Create book and you'll receive a complimentary print review copy in 3–5 business days or a complimentary electronic review copy (eComp) via email in minutes.

Go to **www.mcgrawhillcreate.com** today and register to experience how McGraw-Hill Create empowers you to teach *your* students *your* way.

Contents

Preface vi
Index of Applications xxxv

CHAPTER 1 Relations, Functions, and Graphs 1

1.1 Rectangular Coordinates; Graphing Circles and Other Relations 2
1.2 Linear Equations and Rates of Change 19
1.3 Functions, Function Notation, and the Graph of a Function 33
Mid-Chapter Check 48
Reinforcing Basic Concepts: Finding the Domain and Range of a Relation from Its Graph 48
1.4 Linear Functions, Special Forms, and More on Rates of Change 50
1.5 Solving Equations and Inequalities Graphically; Formulas and Problem Solving 64
1.6 Linear Function Models and Real Data 79
Making Connections 93
Summary and Concept Review 94
Practice Test 99
Strengthening Core Skills: The Various Forms of a Linear Equation 100
Calculator Exploration and Discovery: Evaluating Expressions and Looking for Patterns 101
Connections to Calculus: Tangent Lines 103

CHAPTER 2 More on Functions 105

2.1 Analyzing the Graph of a Function 106
2.2 The Toolbox Functions and Transformations 120
2.3 Absolute Value Functions, Equations, and Inequalities 136
Mid-Chapter Check 146
Reinforcing Basic Concepts: Using Distance to Understand Absolute Value Equations and Inequalities 147
2.4 Basic Rational Functions and Power Functions; More on the Domain 148
2.5 Piecewise-Defined Functions 163
2.6 Variation: The Toolbox Functions in Action 177
Making Connections 188
Summary and Concept Review 189
Practice Test 193
Calculator Exploration and Discovery: Studying Joint Variations 195
Strengthening Core Skills: Variation and Power Functions: $y = kx^p$ 196
Cumulative Review: Chapters 1–2 197
Connections to Calculus: Solving Various Types of Equations; Absolute Value Inequalities and Delta/Epsilon Form 199

CHAPTER 3 Quadratic Functions and Operations on Functions 203

3.1 Complex Numbers 204
3.2 Solving Quadratic Equations and Inequalities 214
3.3 Quadratic Functions and Applications 235
Mid-Chapter Check 249
Reinforcing Basic Concepts: An Alternative Method for Checking Solutions to Quadratic Equations 249
3.4 Quadratic Models; More on Rates of Change 250
3.5 The Algebra of Functions 262
3.6 The Composition of Functions and the Difference Quotient 274
Making Connections 292
Summary and Concept Review 292
Practice Test 297
Calculator Exploration and Discovery: Residuals, Correlation Coefficients, and Goodness of Fit 298
Strengthening Core Skills: Base Functions and Quadratic Graphs 300
Cumulative Review: Chapters 1–3 301
Connections to Calculus: Rates of Change and the Difference Quotient; Transformations and the Area Under a Curve 303

CHAPTER 4 Polynomial and Rational Functions 307

4.1 Synthetic Division; the Remainder and Factor Theorems 308
4.2 The Zeroes of Polynomial Functions 320
4.3 Graphing Polynomial Functions 337
Mid-Chapter Check 354
Reinforcing Basic Concepts: Approximating Real Zeroes 355
4.4 Graphing Rational Functions 356
4.5 Additional Insights into Rational Functions 371
4.6 Polynomial and Rational Inequalities 385
Making Connections 396
Summary and Concept Review 396
Practice Test 400
Calculator Exploration and Discovery: Complex Zeroes, Repeated Zeroes, and Inequalities 401
Strengthening Core Skills: Solving Inequalities Using the Push Principle 402
Cumulative Review: Chapters 1–4 403
Connections to Calculus: Graphing Techniques 405

CHAPTER 5 Exponential and Logarithmic Functions 409

5.1 One-to-One and Inverse Functions 410
5.2 Exponential Functions 422
5.3 Logarithms and Logarithmic Functions 433
5.4 Properties of Logarithms 446
Mid-Chapter Check 456
Reinforcing Basic Concepts: Understanding Properties of Logarithms 457
5.5 Solving Exponential and Logarithmic Equations 457
5.6 Applications from Business, Finance, and Science 469
5.7 Exponential, Logarithmic, and Logistic Equation Models 482
Making Connections 495
Summary and Concept Review 496
Practice Test 501
Calculator Exploration and Discovery: Investigating Logistic Equations 502
Strengthening Core Skills: The HerdBurn Scale—What's Hot and What's Not 503
Cumulative Review: Chapters 1–5 504
Connections to Calculus: Properties of Logarithms; Area Functions; Expressions Involving e^x 505

CHAPTER 6 An Introduction to Trigonometric Functions 509

6.1 Angle Measure, Special Triangles, and Special Angles 510
6.2 Unit Circles and the Trigonometry of Real Numbers 527
6.3 Graphs of the Sine and Cosine Functions 542
6.4 Graphs of the Cosecant, Secant, Tangent, and Cotangent Functions 561
Mid-Chapter Check 577
Reinforcing Basic Concepts: Trigonometry of the Real Numbers and the Wrapping Function 577
6.5 Transformations and Applications of Trigonometric Graphs 578
6.6 The Trigonometry of Right Triangles 595
6.7 Trigonometry and the Coordinate Plane 610
6.8 Trigonometric Equation Models 622
Making Connections 633
Summary and Concept Review 634
Practice Test 643
Calculator Exploration and Discovery: Variable Amplitudes and Modeling the Tides 645
Strengthening Core Skills: Standard Angles, Reference Angles, and the Trig Functions 646
Cumulative Review: Chapters 1–6 648
Connections to Calculus: Right Triangle Relationships; Converting from Rectangular Coordinates to Trigonometric (Polar) Form 650

CHAPTER 7 Trigonometric Identities, Inverses, and Equations 653

7.1 Fundamental Identities and Families of Identities 654
7.2 More on Verifying Identities 661
7.3 The Sum and Difference Identities 669
7.4 The Double-Angle, Half-Angle and Product-to-Sum Identities 680
Mid-Chapter Check 693
Reinforcing Basic Concepts: Identities—Connections and Relationships 693
7.5 The Inverse Trig Functions and Their Applications 695
7.6 Solving Basic Trig Equations 711
7.7 General Trig Equations and Applications 721
Making Connections 732
Summary and Concept Review 733
Practice Test 737
Calculator Exploration and Discovery: Seeing the Beats as the Beats Go On 739
Strengthening Core Skills: Trigonometric Equations and Inequalities 739
Cumulative Review: Chapters 1–7 741
Connections to Calculus: Simplifying Expressions Using a Trigonometric Substitution; Trigonometric Identities and Equations 743

CHAPTER 8 Applications of Trigonometry 745

8.1 Oblique Triangles and the Law of Sines 746
8.2 The Law of Cosines; the Area of a Triangle 759
8.3 Vectors and Vector Diagrams 771
Mid-Chapter Check 786
Reinforcing Basic Concepts: Scaled Drawings and the Laws of Sine and Cosine 786
8.4 Vectors Applications and the Dot Product 787
8.5 Complex Numbers in Trigonometric Form 802
8.6 De Moivre's Theorem and the Theorem on *n*th Roots 813
Making Connections 821
Summary and Concept Review 822
Practice Test 826
Calculator Exploration and Discovery: Investigating Projectile Motion 828
Strengthening Core Skills: Vectors and Static Equilibrium 828
Cumulative Review: Chapters 1–8 829
Connections to Calculus: Trigonometry and Problem Solving; Vectors in Three Dimensions 832

CHAPTER 9 Systems of Equations and Inequalities 837

9.1 Linear Systems in Two Variables with Applications 838
9.2 Linear Systems in Three Variables with Applications 853
9.3 Systems of Inequalities and Linear Programming 865
9.4 Partial Fraction Decomposition 879
Mid-Chapter Check 891
Reinforcing Basic Concepts: Window Size and Graphing Technology 892
9.5 Solving Linear Systems Using Matrices and Row Operations 893
9.6 The Algebra of Matrices 905
9.7 Solving Linear Systems Using Matrix Equations 917
9.8 Applications of Matrices and Determinants: Cramer's Rule, Geometry, and More 933
Making Connections 947
Summary and Concept Review 948
Practice Test 953
Calculator Exploration and Discovery: Cramer's Rule 954
Strengthening Core Skills: Augmented Matrices and Matrix Inverses 955
Cumulative Review: Chapters 1–9 956
Connections to Calculus: More on Partial Fraction Decomposition; The Geometry of Vectors and Determinants 958

CHAPTER 10 Analytical Geometry and the Conic Sections 961

10.1 A Brief Introduction to Analytic Geometry 962
10.2 The Circle and the Ellipse 969
10.3 The Hyperbola 984
10.4 The Analytic Parabola 997
Mid-Chapter Check 1006
Reinforcing Basic Concepts: More on Completing the Square 1006
10.5 Nonlinear Systems of Equations and Inequalities 1007
10.6 Polar Coordinates, Equations, and Graphs 1018
10.7 More on the Conic Sections: Rotation of Axes and Polar Form 1035
10.8 Parametric Equations and Graphs 1051
Making Connections 1064
Summary and Concept Review 1064
Practice Test 1069
Calculator Exploration and Discovery: Elongation and Eccentricity 1070
Strengthening Core Skills: Ellipses and Hyperbolas with Rational/Irrational Values of a and b 1071
Cumulative Review: Chapters 1–10 1072
Connections to Calculus: Polar Graphs and Instantaneous Rates of Change; Systems of Polar Equations 1073

CHAPTER 11 Additional Topics in Algebra 1077

11.1 Sequences and Series 1078
11.2 Arithmetic Sequences 1089
11.3 Geometric Sequences 1098
11.4 Mathematical Induction 1112
Mid-Chapter Check 1119
Reinforcing Basic Concepts: Applications of Summation 1119
11.5 Counting Techniques 1120
11.6 Introduction to Probability 1132
11.7 The Binomial Theorem 1145
Making Connections 1153
Summary and Concept Review 1154
Practice Test 1158
Calculator Exploration and Discovery: Infinite Series, Finite Results 1160
Strengthening Core Skills: Probability, Quick-Counting, and Card Games 1161
Cumulative Review: Chapters 1–11 1162
Connections to Calculus: Applications of Summation 1165

CHAPTER 12 Bridges to Calculus: An Introduction to Limits 1169

12.1 An Introduction to Limits Using Tables and Graphs 1170
12.2 The Properties of Limits 1180
Mid-Chapter Check 1190
12.3 Continuity and More on Limits 1191
12.4 Applications of Limits: Instantaneous Rates of Change and the Area Under a Curve 1203
Making Connections 1215
Summary and Concept Review 1216
Practice Test 1218
Calculator Exploration and Discovery: Technology and the Area Under a Curve 1219
Cumulative Review: Chapters 1–12 1220

Appendix A A Review of Basic Concepts and Skills A-1

- **A.1** Algebraic Expressions and the Properties of Real Numbers A-1
- **A.2** Exponents, Scientific Notation, and a Review of Polynomials A-10
- **A.3** Solving Linear Equations and Inequalities A-24
- **A.4** Factoring Polynomials and Solving Polynomial Equations by Factoring A-38
- **A.5** Rational Expressions and Equations A-52
- **A.6** Radicals, Rational Exponents, and Radical Equations A-64
- **Overview of Appendix A** A-80
- **Practice Test** A-82

Appendix B Proof Positive—A Selection of Proofs from Precalculus A-84

Appendix C More on Synthetic Division A-89

Appendix D Reduced Row-Echelon Form and More on Matrices A-91

Appendix E The Equation of a Conic A-93

Appendix F Families of Polar Curves A-95

Student Answer Appendix (SE only) SA-1

Instructor Answer Appendix (AIE only) IA-1

ANATOMY/PHYSIOLOGY

age of child related to circumference of head, 484
average height related to average weight, 30
distance in Plow yoga position from shoulders to toes, 643–644
height versus male shoe size, 91, 162
height versus wingspan of human body, 90
ideal weight for adult males, 46
length of radial bone when height of person is known, A–37
neck and waist measurements of human body, 92

ARCHITECTURE

area of trapezoidal window, A–32–A–33
area of walkway around fountain, A–38
distance between fountains in the Ellipse, 978–979
distances among points on mosaic zodiac floor circle, 540
elliptical fireplace with glass doors, 981
elliptical garden with fountains, 981
Gateway Arch dimensions of cross-sections, 524
height of Burj Dubai building, 607–608
height of center of elliptical bridge arches, 981
height of CNN Tower, 607
height of Eiffel Tower, 607
height of indoor waterfall, 648
height of Petronas Tower I, 607
height of St. Louis Arch, 1220
height of Stratosphere Tower in Las Vegas, 661
height of Washington Monument, 621, 786
height of window washers above ground, 603–604
heights of Eiffel Tower and Chrysler Building, 1063
heights of tallest buildings, 948
number of stairs and building height, 183
sight distance from external elevator, 1207–1208
sum of heights of Eiffel and CNN Towers, 852
surface area of Khufu's pyramid, 823
velocities of ascending and descending elevators, 609
viewing angle of Petronas Towers, 741
viewing angle of Sears Tower and its antenna, 732
volume of cement needed for circular walkway, A–38
whispering gallery height and width, 983
width of Hall of Mirrors at Versailles, A–36
window height above ground, 603–604

ART/FINE ARTS/THEATER

actors' ages, A–36
angular and linear velocities of camera cart on tracks, 643
area of border of tablecloth, 982
auction prices of three paintings, 863
auditorium seating capacity, 1095, 1097
classical music fund drive, 915–916
demand for popular songs, 290–291
distance from seat to bottom of movie screen, 669
distance from seat to top of movie screen, 668
drive-in movie theater viewing angles, 704–705
elliptical exhibit hall with stands, 981
falling/diving speeds of Star Trek characters, 99
frequencies of musical notes, 492
heights of favorite cartoon characters, 930
jewelry composed of gold alloy mixture, 844–845
Leonardo da Vinci's human body diagram, 90
logo for engineering firm, 720
movie theater revenue, 294
music store clearance sale, 946
number of tickets sold, 259, 850
original price of baseball cards, 931
playing times of Mozart's arias, 930
playing times of Rolling Stones songs, 930
purchase prices of art objects, 901
purchase prices of rare books, 904
rare books arrangement on shelves, 1159
revenue generated by movies, 1072
seating arrangement possibilities for small number of persons, 1123, 1128, 1131
sight angle of center seat in movie theater, 835
sizes of soft drinks sold at theater, 926–927
song selecting by band for contest, 1130
special effects lighting in art gallery, 834
thickness of book and number of pages, 183
ticket pricing, 245, 721
viewing angle for paintings at art show, 709
work done in moving piano across stage, 1219

BIOLOGY/ZOOLOGY

animal diets in zoo, 932
animal population maximums and minimums, 580, 591
animal territories, 1034
average birth rate of animal species, 1087
bacterial population growth, 1111
biorhythm potential cycles, 629
box turtle longevity, 1160
cell size and cell division, 500
chicken production in U.S., 491
chimpanzee's probability of spelling a word, 1144
circadian rhythm of human body temperature, 629
concentration of chemical in bloodstream of large animal, 401
crawling speed of insect, 306
crop duster's flying speed, 608
deep-sea fishing depths, 145
deer and predators, 161
deer population estimates, 1098
dimensions of fish tank, 1018
elk herd repopulation, A–63
fish and shark populations, 161
fish length to weight relationship, A–78
flight path of scavenger bird, 1030
fluctuating sizes of animal populations, 624
fruit fly population exponential growth, 475–476
gestation periods of selected mammals, 162, 863
hawk species repopulation, 1154
heights of tree and of baboons in tree, 607
human life expectancy, 31
insect infestation maximums and minimums, 406–407
lion and hyena populations, 290
motion detectors at watering holes, 756
prairie dog population growth rate, 500
predator/prey concentrations, 273, 481, 494

pricing pet care products, 852
rabbit populations, 481, 488
raccoon and mosquito populations, 290
rodent and wolf populations, 284–285, 494
sinusoidal population of mosquitoes varied by humidity, 591
sinusoidal population of porcupines varied by solar cycle, 591
species/area relationship, 162, 455
speed of racing pigeons and of wind, 851
stocking a lake, 467, 830, 956, 1088
temperature and cricket chirps, 32
temperature and insect population, 352
vector angles between flying geese and ornithologist and car, 835
volume of an egg, 186
wave motion of sharks and fish, 559
weight and age of dog, 501
weight and daily food intake of nonpasserine birds, 157–158
whale weight and length, 162
wingspan and weight of selected birds, 162
wingspan of each of three birds, 863
wolf population preservation, 1088
year when two squirrel populations were closest in size, 1221
yeast culture growth, 486

BUSINESS/ECONOMICS

advertising results, 174, 463, 467, 488
amount of crude oil imported to U.S., 174
annual profit, 1119–1120
annuities, 472–474, 479–480
automated filling of cereal boxes, 146
billboard viewing angle from highway, 709
blue-book value, 1088
break-even costs, 267–268, 272, 846, 851, 1013, 1016, 1017
business losses of a company, 48
car rental charges, 46
coffee sales fluctuating with weather, 731
coin value appreciation, 1159
commission sales, 27
committee/management composition possibilities, 1129, 1131, 1157
cost, revenue and profit, 233–234, 272
cost of undeveloped lot, 770, 830
cost to package, load, install each type of pool table, 916
credit card use, 92
decline of newspaper publishing, 174
depreciation, 31, 57–58, 62, 77, 428, 431, 467, 497, 501, 1018, 1110, 1159, 1203
e-mail address standardization, 1131
estimated price, 954
exponential growth, 431
gas mileage, 31, 46
GDP per capita in selected years, 88, 89
home selling prices within a range, 88, 90
home value growth, 456
hourly customer count in restaurant, 353
inflation rate, 432, 1088, 1111
law firm choices to attend forum, 1141
length of shipping cartons, 76
manufacturing cost, 370, 377–378, 382
market equilibrium, 847
market equilibrium point, 847, 851–852, 948, 954
marketing budgets, 445
marketing strategy and sales volume, 441, 463, 467
market share, 463–464
maximum profit, 239, 245–246, 872, 877–878, 949–950
maximum revenue, 248, 877, 891
military expenditures in U.S., 175
minimal shipping costs, 873–874, 878
minimum wage, A–9
monthly earnings of employee, 48
natural gas pricing, 175
number of books shipped per box, A–51
number of circuit boards assembled and length of time working, 29, 468, 489
number of units/services required to break even, 851
numbers of units manufactured to maximize revenue, 891, 954
online sales of pet supplies, 251
overtime wages, 175
patent applications, 90
patents issued, 91
percent of full acre being purchased, 770
plumbing service charges, 46–47
postage rates by ounce, 176
price, demand and supply, 1072
price and demand, 185
production cost, 246
production level to minimize cost, 401
profit and loss, 117
profit growth, 320
profit of new company, 301, 404
quality control tests, 145
randomly choosing corporate office location, 1140
rate of change for CD sales, 253–254
rate of growth change for Starbucks, 295
repetitive task learning curve, 468, 489
resource allocation, 930–931
retail sales revenue, 243
revenue and costs of space travel, 270
revenue generated by shirt sizes, 916
revenue growth, 431
sale price increase to return to original price, 1063
sales goals, 1097
sales of hybrid cars, 92
sales volume rate of change, 298
seasonal income, 730
seasonal sales/revenue, 730, 737, 738
selling price to maximize revenue on an item, 741
shelf size to number of cans stocked, 456
sinking funds, 474
start-up costs, 493
supply and demand, 186, 368, 847, 851–852, 948, 954, 1017
theft of precious metals in production line, 944–945
T-shirt production in each of two plants, 915
used vehicle sales, 269
vehicle tires sold by three retail outlets, 915
volumes of raw materials needed to manufacture drums, 944
volunteers arrangements to replace managers, 1129
wage increases, 1087
wages and hours worked, 183

CHEMISTRY

acid solution concentrations, 891
chlorine dissipation from swimming pool, 1110–1111
freezing time, 467
froth height of carbonated beverages, 490
household cleaner solution, 850
mixture/solution concentrations, 73–74, 77–78, 369, 844, 863
pH levels, 443, 445, 453, 455
venting landfill gases, 1111
volume of raw materials needed to manufacture combustibles, 953
water temperature mixture, 99

COMMUNICATION

cable television subscriptions, 489
cell phone charges, 176
cell phone subscribers, 234
earnings of current and previous years for video company, A–82
flagpole height, 512–513
late DVD rental returns, 1152
length of cable securing radio tower, A–78
MP3 market research, 847, 851
number of phone calls between two cities, 186
phone service calling plans, 175
profit from sales of Wi-Fi phones, 296
radar detection, 17, 753, 756
radio broadcast range, 17–18
sales of Apple iPhones, 100
signal from tall radio tower, 1006
television programming possibilities, 1131
tracking wait time for cable service installation, 1159
TV repair costs, A–9
walkie-talkie range, 826

COMPUTERS

animation on computer game, 1097
compact disk circumference, 541
consultant salary, 145
cost of repair service call, A–8
elastic rebound of animated dropping ball, 1111
encryption of messages, 941–942, 945, 953
households with Internet connections, 62
internet revenue, 295
internet selling, 186
memory card assembly rate by robot, 1162
probability of home computer ownership, 1143
randomly-generated numbers, 1142
rebate amount in incentive packages for internet service, 909–910
sales of Apple iPhones, 100
storage space on a hard drive, A–15
upgrading source of data traffic, 939
year cable installations will be greater than 30,000, 905

CONSTRUCTION/ MANUFACTURING

area of a Norman window, 943
area of circular sidewalk, 63
area of house and of lot, 379
box manufacturing, 1017
building heights measured by angles of elevation, 574, 633
cable angles to steady a radio tower, 679
cable lengths for trolley car, 482
cable winch turning angles, 541
composition of crew to complete small job, 1157
condominiums on triangular lot, 766
cost of a new home and size of the house, 29
cost of copper tubing, 186
cost of elliptical mirror and its frame, 1050
deflection of beam when force applied, 394
dimensions of cylindrical tank, 1017
dimensions of deck, 1017
drill bit efficiency, 1107
drywall sheets required, A–38
elliptical hole in roof for plumbing vent, 982
equipment aging, 1110
fencing area, 247
generator failure probability, 1140
height of vertical support to give exact degrees of incline, 641
instantaneous velocity of falling wrench, 1206–1207
largest number of shingle packs and nail buckets lifted onto roof, A–36
length of base of water tower, 1018
length of ladder leaning against building, A–75
length of roof rafters, 757
light bulb defectiveness, 1160
maximum load supported by a post, 468
measuring depth of a well, 273
number of screws to manufacture to maximize revenue, 877
parabolic flashlight reflector, 1004, 1005
power tool rental cost, A–37
profit per contract for home improvement items, 915
propeller manufacturing, 1034
ramp angle of incline, 799
rate of production for specialized part, 1214
rolling new sod over selected areas, 540–541
roof slope, 30, A–9
rotations of ceiling fan blades, 620, 621
safe weight supported by horizontal beam, 185, 187, 195
sand and cement mixtures to maximize profit, 878
sewer line slope, 30
sheep pens dimensions, 247
shopping complex distance from avenue, 603
sizes of rejected ball bearings in bin, 946
speed of a winch, 525
speed of pallet pulled by winch, 633
swimming pool dimensions, 1017
ventilation of home, 445
winch-drum radian angle turned while lifting, 636
window areas and shapes, 247
wiring an apartment by pulling wire from spool, 541

CRIMINAL JUSTICE/ LEGAL STUDIES

area taped by surveillance camera, 770
cost to seize illegal drugs, A–62
estimating time of death, 466
federal law enforcement officers employed for selected years, 89
parabolic sound receivers for private investigators, 1005
prison population increases, 62

DEMOGRAPHICS

ages of child prodigies, 891
animal population maximums and minimums, 580, 591
arrangement in photographs of multiple-birth families, 1129
basketball salaries, 492
cable television subscriptions, 489
cell phone use, 493
centenarian population increases, 483
children and AIDS cases, 494
credit card use, 92
debit card use, 491
debt-per-capita of U.S., A–21
decrease in percentage of smokers, 32, 88
family farms with milk cows, 490
federal law enforcement officers employed for selected years, 89
female physicians for selected years, 32
females/males in workforce, 91

fertility rates of women in U.S., 260
growth rates of children, 494
households with internet connections, 62
incomes over $200,000, 455
instantaneous rate of change of population, 1213
logistics and population size, 890
longest-living human, 176
low birth weight of baby and age of mother, 493
multiple births increasing, 175
number of post offices in U.S., 490
population density of urban areas, 367
population growth, 466, 1110–1111
population growth in space colony, 1110
population of coastal areas, 491
prison population increases, 62
registered podcast growth, 649
research and development expenditures, 492
sets of triplets born in U.S., 504
students joining clubs by gender and class, 916
telephone calls per capita, 490
telephone opinion poll possibilities, 1152
tourist population, 319
union workers chosen to be interviewed, 1160
veterans in civilian life, 491
volunteer enlistments in military by age, 912–913

EDUCATION/TEACHING

college loans from alumni contributions, 850
cost of college tuition and fees, 32
course schedule possibilities, 1128
exam scores needed to keep scholarship, A–37
grade point averages, 370
grade possibilities at college, 1128
guessing randomly on multiple choice test, 1152
IQ of each of three persons, 904
language retention, 369
memory retention, 445, A–63
number of children homeschooled, 297
number of credit hours taught at community college, 1156
quiz grade versus study time, 491
scholarship award possibilities, 1131
score needed on last exam to earn 80 average, A–31
sight angle for drivers approaching school, 835
students joining clubs by gender and class, 916
test averages, 370
textbook committee membership possibilities, 1127
true-false quiz probability, 1144
typing speed of student, A–63
value of doing homework, 98
vector from top of light pole to corner of playground, 834
ways for children to line up for lunch, 1130
ways to choose students to attend seminar/conference, 1130, 1136

ENGINEERING

Civil

minimum bid for boring tunnel through mountain, 768
tunnel length through mountain, 768
vector from top of light pole to corner of playground, 834

Electrical

AC circuits, 678, 811
alternating current, 560
current in circuit, 812
electrical resistance and wire dimensions, 161, 186, 878, 983, A–9
impedance, 213, 608, 809, 812, 820
parallel circuits, 812
phase angle between current and voltage, 809
temperature and resistance, 394–395
voltage in a circuit, 213, 811–812
voltage supplied to Japan, 812

Mechanical

angles between hands of clock, 621, 691
area cleaned by windshield wiper, 610
car jack and equilibrium, 678
center-pivot irrigation wheel velocities, 526
coordinates of angle in multijointed arm, 827
industrial spotlights, 1005
loss of length in pencils through use, 1221
machine gears and size, 692
position of engine piston, 630
radius and height of cylindrical vents, 1016
straight-line and angle distances of carts on circular tracks, 834
wind-powered energy, 30, 89, 134, 135, 186, 194, 353, 421
wind-power kite height, 514

ENVIRONMENTAL STUDIES

acres of each crop planted to maximize profits, 877
area of circular forest fire, 289
area of oil spill, 284
barrels of toxic waste in storage, 1119, 1163
city park dimensions, A–7
cost of removing pollutants, 155–156, 161, 368, 401, 1208–1209, A–63
deer and predators, 161
distance of forest fire to tower, 757, 826
draining of water reservoir, 1156
drinking water pollution testing, 1152
fish versus shark populations, 161
gold mining and depletion of resources, 490
hauling capacity of hazardous waste to maximize revenue, 877, 997
lawn dimensions, A–9
ounces of platinum mined over time, 501
pest control cost, A–8
recycling costs, 161, 368
sulphur dioxide emissions in U.S., 741
tomato production and watering amounts, 259–260
total area of Southeast Asia's Coral Triangle, 827
velocity of debris from strip mine explosion, 1219
venting landfill gases, 1111
volume of garbage in landfill and number of garbage trucks dumping, 29
volume of grain storage silo, A–38
waste product monthly maximums and miniumums, 742
water leaking from reservoir dam, 1214
water supply in reservoir, 352
wind-power kite height, 514

FINANCE

amount invested in bonds with different interests, 850
amounts borrowed at three interest rates, 861–862, 865
amounts invested in each interest rate, 853, 904, 931, 954
annuities, 472–474, 479–480, 830, 957
balance of payments, 352, 401

bequests to charity, 1097
checking account balance, A–37
coin denominations in collection container, 850, 931, 949
coin denominations purchased, 850
coin value appreciation, 1159
compound interest, 288, 470–472, 478–481, 500, 526, 742, 1109, 1163, 1190
credit card payments, A–31–A–32
currency conversion, 289
debt load, 319
deposits required monthly to meet final goal, 500, 501
doubling time for interest, 443, 470–471
federal investment in military over time, 270
federal surplus of U.S., 118
fixed interest, 905
government deficits, 335
guns versus butter spending, 877
interest rates, 117
international trade balance, 234
investing in coins, 62
investment growth, 479
investment tripling rate, 445
mortgage payments, 480, A–23
national debt increase, 198
opening price of stock, A–63
payday loans, 469
percentage of families owning stocks, 174
possible ways to divide monetary gift, 877
research and development dividends, 270
retirement investments, 869, 931
return on investments, 945
shares traded on New York Stock Exchange, 88
simple interest, 31, 185, 469, 478, 500
sinking funds, 474
stock prices over time, A–63
stock purchases, 1084–1085
stock value, 145
value of gold coins, 863–864
value of investment over time, 347

GEOGRAPHY/GEOLOGY

area and angle measurements of Bermuda Triangle, 827
area of center-pivot irrigated crop, 526
area of Nile River Delta, 772
area of Yukon Territory, 772
atmospheric pressure and altitude, 440, 464–465, 499
avalanche conditions, 709
contour map and length of trail up mountain, 525
depth of channel cut by river through canyon, 407–408
depth of tidal pool, 957
dimensions of a tract of land, 1017
distance across base of volcano, 762–763
distance from Four Corners USA to point on Kansas border, 643
distance north of equator of Las Vegas, 577
distance of Invercargill, NZ, from equator, 560
distance of kayak from glacier, 602
distance of viewer's house from Petronas Tower I, 607
earthquake intensity, 440, 444, 456
earthquake magnitude, 439, 498
earthquakes and elastic rebound, 630–631
fluid mechanics, 678
height of a mountain peak, 758, 827, 830, 957
height of canyon rim, 607
height of cliff, 522
height of Mount McKinley, 741
height of Mount Rushmore, 638
height of tree on mountainside, 822
highest and lowest points on each continent, A–38
land area of Tahiti and Tonga, 852, 954
length of Panama Canal, A–37
lengths of each of two rivers, 76
location of stranded boat using polar coordinates, 1018–1019
ocean depths and temperatures, 163, 493
pathways around a pond, 776
radius of Earth at latitude of Beijing, 609
rainbow height, 608
river velocities, 162
seasonal ice thickness on lake, 730
seasonal water temperature in mountain stream, 730
tide height predictions, 47
vertical and horizontal changes on contour map, 608
viewing distance changes with increasing elevations, 157, 256, 290
water depth and pressure, 197, 492
water level in lake, 31
weight of diamonds extracted from mine, 488
width of a canyon, 758
width of Africa at equator, 524
width of large rock formation, 1072
work done by arctic explorer dragging sled to haul supplies, 800, 825

HISTORY

boom town population growth, 1111
years Declaration of Independence signed and Civil War ended, 852
years each of three documents signed, 863
years each of three wars ended, 863

MATHEMATICS

angle between two vectors of box, 833–834
angle complement and supplement, 511
angle measurements of triangle, 904
angle of depression, 602, 607
angle of diagonal of parallelepiped with base, 731
angle of elevation, 607, 633, 644, 741
angle of inclination for selected materials sliding down inclines, 575
angle of rotation, 603, 607, 620, 621, 692
angles formed at each vertex of triangle on geoboard, 769
angles formed by bread sliced diagonally, 641
angles formed by radii of three tangent circles, 786
angular and linear velocities, 521
arc length, 516, 1097, 1105–1106
area of circle, 289, 421, A–21
area of circular ripple over time, 296
area of circular sector, 517
area of circular segment, 731, 737
area of circular sidewalk, 63
area of ellipse, 981
area of equilateral triangle, 184
area of first quadrant triangle, 381
area of nonright triangle, 764–765
area of parallelogram, 620, 943
area of polygon inscribed around circle, 575
area of polygon inscribed in circle, 558
area of print on page within standard border dimensions, 383
area of rectangle, 876, A–37
area of rectangle inscribed in semicircle, 834
area of right parabolic segment, 1004
area of trapezoidal window, A–32–A–33

area of triangle, 46, 738, 770, 876, A–37
area of triangle using Heron's formula, 770, 1180
area of wall illuminated by circle and by ellipse, 982
areas of small triangles within large triangle, 384
average rate of change, 254–256, 260–261
center of circle, 197
circumference of circle, 90
circumscribed triangles, 758
colored ball sequences withdrawn from bag, 1129, 1143, 1159
combination lock sequence possibilities, 1121–1122, 1128, 1157
consecutive integers, 77
coterminal angles, 515
degrees/minutes/seconds and decimal degrees conversion, 511
diagonal of cube, 609
diagonal of rectangular parallelepiped, 609
diagonal of rectangular prism, A–83
diameter of circle circumscribed around triangle, 758
dimensions of box if only volume is known, 335
dimensions of open box, 318, 1014
dimensions of rectangular solid, 863
dimensions of right triangle, 904
focal chord of hyperbola, 996
horizontal and vertical components of vector, 775
icon-choosing probability, 1160
inscribed circle area, 17
inscribed triangle area, 17
lateral surface area of cone, A–79
lateral surface area of frustum, A–79
length of apothem of hexagon, A–36
length of chord of circumscribed triangle, 758
length of diagonal of parallelepiped, 731
length of diagonals within cube, 610
length of hypotenuse of triangle, 197
length of laser pen measured by beam of light and angle of pen, 594
length of rectangle, 197
length of side of triangle, 176
letter rearrangements possibilities in words, 1129
letters/numbers written on slips of paper to be randomly drawn, 1143, 1157
line segment measuring, 541
magnitude of a diagonal, 784
maximum area included by several fenced pens, 242, 247, 336
multiple arc swings distances, 1110
nonacute angles, 620
number combination possibilities, 1128
number of sides needed for polygon inscribed in circle, 1170–1171, 1177
number of vertices of dodecahedron, A–36
original dimensions of cube after slice removed, 334
perimeter of ellipse, 981
perimeter of hexagon circumscribed by circle, 769
perimeter of legal-size paper, 954
perimeter of pentagon circumscribed by circle, 769
perimeter of polygon inscribed around circle, 575
perimeter of trapezoid, 731, 768
perimeter of triangle, 197, 198, 384
perimeter of triangle on geoboard, 769
Pick's theorem to calculate area of triangle, 46
points on a unit circle, 529, 540
possibilities for food group arrangements in table settings, 1159
probability of drawing the perfect number, 1144
Pythagorean theorem, 668
radian and degree conversion, 518
radian angle, 636
radius of circle, 197, 289
radius of circular ripple over time, 296
radius of circumscribed circle, 758
radius of sphere, 420
rearrangement possibilities of digits in numbers, 1129
remote access door opener number possibilities, 1128
rewriting an expression using negative exponents, A–23
security code PIN possibilities, 1122, 1221
simultaneous calculation of perimeter and area, 915
single digit randomly chosen from digit 10, 1140
sum of consecutive cubes, 395
sum of consecutive squares, 395
surface area of box, 382
surface area of cube, 184
surface area of cylinder, 76, 119, 233, 271, 381, A–51
surface area of cylinder when only volume is known, 383
surface area of open cylinder, 384
surface area of sphere, 184
surface area of spherical cap, 384
tangent functions, 630
thickness of paper folded several times, 1111
time of day expressed metrically, A–9
triangles formed by three rods attached at pivot points, 757, 769, 826
volume of balloon, 261
volume of composite figure, A–38
volume of cone, 421, 730, 876
volume of conical shell, A–51
volume of cube, 46
volume of cylinder, 46, 90, 119, 730, 876
volume of cylindrical shell, A–51
volume of equipoise cylinder, 417
volume of paraboloid, 504
volume of parallelepiped, 960
volume of prism, 944
volume of pyramid, 943
volume of rectangular box, A–51
volume of rolling snowball, 298
volume of sphere, 134
volume of sphere circumscribed by a cylinder, 78
volume of spherical cap, 649
volume of spherical shell, A–51
width of rectangle, 197

MEDICINE/NURSING/ NUTRITION/DIETETICS/HEALTH

absorption rate of drug, 467
age of child related to circumference of head, 484
amounts of each nut in mixture to maximum profit, 872–873
angles formed by bread sliced diagonally, 641
angles of jointed light in dentist's office, 785
animal diets in zoo, 932
average height related to average weight, 30
bacterial growth, 431, 481, 1111
calories allotted for lunch on a diet, A–36
calories of each nutrient provided daily for geriatric patient, 864

coffee blends to maximize profits, 877
concentration of medication in bloodstream, 368, A–62
connections between weather and mood, 631
cost of milk, A–8
cost of types of meat per pound, 957
costs of ordering food from selected restaurants, 916
doctors chosen randomly to visit hospitals, 1144
fertility rates of women in U.S., 260
food service supply inventories, 938
freezing time, 467
genetics and fruit fly population growths, 475–476
grams of each of three fats in soup, 864
growth weight of fetus, 260
heart rate during exercise routine, 731
hodophobics randomly chosen to receive therapy, 1144
human life expectancy, 31
ideal weight for adult males, 46
instantaneous rate of change for bacteria in human body, 1213
measures of grain in each bundle received by bakery, 945
menu items possible in restaurant, 1128
military physical conditioning regimen, 1121
milkfat mixture, 850
milligrams of painkiller in bloodstream, A–22
mixture concentrations, 77–78
pH levels, 443, 445, 453, 455
placement of kidney stone from lithotripter, 981
pounds of each coffee bean type used each week, 946
prescription drugs sales per selected years, 62
range of weights lifted to prevent heart disease, A–36
rolling pin speed, 525
sandwiches needed to maximize revenue, 877
snowcone dimensions, 709
spread of disease after outbreak, 489
tracking wait time after making doctors appointments, 1158
training diet, 932
vegetarians randomly chosen from dietetics class, 1141
ways to make hamburgers and fruit trays, 1130
ways to select recipes for competition, 1130
weight loss over time, 489
yeast culture growth, 486

METEOROLOGY

altitude and atmospheric pressure, 445, 464–465, 499
altitude and temperature, 420, 467
altitude of jet stream, 145
altitudes of fighter pilot training, 354
annual rainfall effect on number of cattle per acre, 100
atmospheric pressure and altitude, 440, 445, 464–465, 499
atmospheric pressure and vacuum strength, 1110
atmospheric temperature and altitude, 56–57, 420, 444–445
average monthly rainfall for Reno and Cheyenne, 632, 639
boiling temperature of water and altitude, 30, 89
connections between weather and mood, 631
daily water usage in arid city, 644
days in year with 10.5 hours of daylight, 1006
discharge rate of river, 316, 631, 726–727, 730
distance between sides of nuclear cooling towers, 996
earthquake intensity, 440, 444, 456
earthquake magnitude, 439, 498
earthquake range, 17
focus of parabolic radio antenna dish, 1002
gnomon shadow lengths at equator, 625–626
height of ocean floor, 331
hours of daylight by month, 124, 632
hours of daylight in selected cities, 591, 592, 594, 632
location of storm, 993
monthly temperatures for selected U.S. cities, 629, 631, 642, 644
ocean temperatures, 163, 493–494
ocean wave height, 558
parabolic sound receivers, 1005
record low temperatures for Denver, 738
seasonal precipitation in Wyoming and Washington, 627
seasonal temperatures in North Dakota, 626
sinusoidal temperature patterns at selected countries, 579, 590
speed of Caribbean Current, 850
speed of flowing water, 525
temperature and altitude, 420
temperature and atmospheric pressure, 444–445
temperature changes during daylight hours, 649
temperature drop, 261
temperature fluctuation over time, 559, 579, 1097
tidal depths of water in bay, 644
tide heights over time, 559
tsunami height and wavelength, 558
tubular fluid flow, A–51
vectors for three vessels mapping ocean floor, 782
water depth and pressure, 197, 492
wind powered energy, 30, 89, 134, 135, 186, 194, 353, 421
wind-power kite height, 514
wind velocity, 845–848

PHYSICS/ASTRONOMY/ PLANETARY STUDIES

absorption rates of fabric, 194, 493, 501
acceleration due to gravity on ball rolling down incline, 135, 720
angle made by light source and point on surface, 576
angle of illuminance, 834
angle of projection of projectile at maximum height, 1063
angular and linear velocities of Ganymede, 526
angular and linear velocities of Venus around Sun, 1162
aphelion and perihelion of Mars, 1069
area of a lune on the surface of Earth, 576
attraction between particles, A–23
average speed of UFO between two cities, 759
brightness of a star, 444
carbon-14 dating, 481
catapults and projectiles, 117, 246
Celsius to Fahrenheit temperature conversion, 46, 850
closest and farthest distances between two planets, 752–753, 756

collision of two particles moving in a medium, 1063
days required for selected planets to orbit Sun, A–79
densities of objects floating on or sinking in water, 335
distance ball rolls due to gravity, 135
distance between cities measured by radio waves on satellite, 768
distance between planets when arrived at focal chords simultaneously, 1049
distance from satellite to Earth horizon, 710
distance of Earth to Mars, 77
distance of image reflected from spherical lens, 574
distance of Mars to Sun, 195
distances traveled by bouncing rubber ball, 1145
distances traveled by swinging pendulum, 1105–1106, 1110, 1159
distance traveled by light beam over time, 588
distance traveled by planets orbiting the Sun, 541
eccentricities of planetary orbits, 1044–1045, 1049
elastic rebound of dropped balls, 1111
electrical constant between charged particles, 186
electron motion, 1062
elliptical orbit of Halley's comet, 1069
elliptical orbit of planet, 1058
fluctuating size of Mars polar ice cap, 623
focal chord for orbit of planet, 1046, 1068
force acting on object on inclined plane, 708, 790, 799, 825, 830
forces acting on a point, 772, 780
gravitational force between two objects, 160, 187
gravity and speed of falling object, 420
half-life of radioactive substances, 432, 477, 481, 499, 504
harmonic motion of float bobbing on waves, 593
harmonic motion of oscillating pendulum, 593
harmonic motion of sound waves, 585–586, 593
harmonic motion of stretched spring, 584, 592
heat flow around circumference of pipe, 708
height of bounced ball, 294
height of falling object, 259, 285
height of light source to provide maximum illumination, 202, 834
height of projectile, 233, 240, 246, 260, 294
heights and times of rocket, 228–229, 246
hydrostatics and surface tension, 558
illumination of book surface, 606
illumination of Moon surface, 631
index of refraction for selected mediums, 720
instantaneous velocity and heights of model rockets, 1213
instantaneous velocity of bowling ball dropped from building, 1213
intensity of light, 161, 187, 669, A–23
intensity of sound, 187
kinetic energy and velocity, 185
kinetic energy of planets, 559
latitudinal miles between two cities, 741
length of pendulum and its period, 299
light refraction angles, 720
linear velocity of Neptune, 526
linear velocity of turning wheel, 741
locations of blips on radar screen, 618
low-orbit space travel packages, 710
magnetic attractive force and distance, 648
magnetic field on Mars, 609
maximum range of projectile, 687, 691
minimum distance between like particles with common charge, 996
motion detectors, 524
motionless moments of particle floating in turbulence, 200, 202
noise level, 446
orbital velocity of planets, 982
orbits of an inner and an outer planet, 1062
orbits of satellites around Earth, 192
oscillation of stretched spring, 145
parabolic radio wave receivers, 1005
particle motion, 1062
path of comet, 992
perihelion, aphelion, period of comets, 1050
perihelion of asteroid Ceres, 1049
perihelions of planetary orbits, 1045, 1049
period of pendulum, 186
photochromatic sunglasses, 432
planetary orbits, 162, 493, 982
potential energy of planets, 559
pressure of gas in closed container, 181, A–9
pressure on eardrums, 678
projected image height, 184, 290, 420
projectile motion, 796, 801, 825, 828
pulling object up frictionless ramp, 997
radioactive decay, 432, 477, 481, 488, 499, 504, 577
radius and surface area of supernova, 289
radius of Jupiter, A–82
randomly choosing first speaker at space conference, 1139
range of projectile, 719, 742, 799
rate of change of projectile velocity, 255
revenue and costs of space travel, 270
ring tones on telephone, 560
rocket testing, 352–353
satellite orbiting distance north or south of Equator, 629
seasonal size of Antarctica ice sheet, 629
shadow length changes over time, 589, 594, 625
solar furnace, 1005
sound intensity, 444
spaceship velocity, 467
space-time relationship, A–51
speed of sound, 62, 691
speed of sound and temperature/altitude, 691
standing waves, 692
strokes of hand pump to create vacuum, 1110
submarine depth, 145
temperature of pizza over time, 428–429
temperatures of cool and warm drinks, 432
temperatures of Earth's atmosphere, 348
tension on rope supporting heavy object between two points, 829
thermal conductivity, 931
time for liquid stain to spread, 194, 493, 501
time for projectile/dropped object to hit ground, 134, 184, 294, 956, A–78
time required for rocket to turn around, 252
time required for satellite to reach Jupiter from Earth, A–21
touch-tone phone sounds, 687–688, 691
vectors for three forces in opposite directions, 782

velocity of a bullet, 160
velocity of falling object, 261, 271, 285–286
velocity of fluid flowing from tank, 134
velocity of particle in positive direction while floating in turbulence, 390–391
volume of bathtub draining over time, 295
wavelengths of visible light, 559
waves traveling along a string, 678
weight of astronaut on moon, 186
weight of object above surface of Earth, 185
wind powered energy, 30, 89, 134, 135, 186, 194, 353, 421
work done along distance of object being moved, 790–791, 799

POLITICS

amounts spent on defense and domestic improvements, 877
federal income tax rate and income, 853
retiree randomly chosen to be interviewed, 1144
Supreme Court justices, 30
veteran randomly chosen to be interviewed, 1141–1142
voter randomly chosen to be interviewed, 1138
women in U.S. Congress, 88

SOCIAL SCIENCES/HUMAN SERVICES

choosing soldiers for reconnaissance team, 1129
cost of picking up trash along highways, 192
daily water usage in arid city, 644
dimensions of envelopes, A–52
disarming a bomb probabilities, 1144
distances between each vertex for search-and-rescue team, 830
eating out popularity, 62
energy rationing in U.S., 174
European shoe sizes, A–37
Express Mail cost for selected years, 88
heating and cooling subsidies for low-income families, A–37
height of ladder leaning against building, 522
home location near river and golf course, 1050
home value growth, 456
international shoe sizes, 289
lawn service charge, 851
library fines on overdue materials, 496
number of customers in shopping mall, 397
number of new books published in U.S., 298
paper sizes, A–52
per capita spending on police protection, 170
phone service calling plans, 175
physical training for military recruits, 145
plumbing service charges, 46–47
postage costs, A–9
postage rate for large envelopes, 171
probability of choosing teenager from family of five children, 1133
recycling program costs, 161, 368
selecting books to read on vacation, 1130
sizes of Slushies sold at convenience store, 930
speed of lawn mower, 648
telephone area codes possibilities, 1131
time required to pick up trash along highway, 186
tracking wait time for customer service, 1142
two men pulling on mule, 782
two tractors pulling at stump, 782
watering a lawn, 524, 648
water rationing in southwestern U.S., 175
ways to dress for work, 1157
wild stallion roped by cowhands, 798
work done by mule plowing field, 799
work done to mow lawn, 800

SPORTS/LEISURE

admission charged by age at Water World, 175
amusement park attendance, 319
amusement park revenue, 838
angles between each marker in orienteering meet, 822–823
angular and linear velocities of bowling ball, 635
anxiety level of Olympic skater, 407–408
archery competition, 1061
archery target hits probabilities, 1160
area of elliptical race track, 982
areas of football and soccer fields, A–36
attendance at state park depending on weather, 731
average weight of football offensive line, A–37
awarding medals in sprinting competition, 1130
barrel races, 541
baseball card value, 31
baseball height while falling, 954
baseball hits probabilities, 1152
baseball home run angle and velocity, 1061
basketball championship final score, 904
basketball free throw possibilities, 1121, 1150–1151
basketball team formation possibilities, 1130
blanket toss competition, 246–247
bowling scores needed to obtain average, 99
bystander's possibility of being hit by flying model airplane, 822
cable lengths for trolley car, 482
card drawing probabilities, 1141
chess tournament place finishing possibilities, 1129
circus human cannonball height from ground and distance from net, 680, 801, 1057
coin flipping possibilities, 145, 1128, 1130, 1139, 1142, 1145, 1152
dartboard hits probabilities, 1143
depth of scuba diver over time, 400
descent distances of spelunkers, 76
dice rolling probabilities, 1130, 1132–1133, 1135–1136, 1139–1142, 1157
differences in speed and distance of adult and kid bicycles, 526
dimensions of flag, 1017
dimensions of sail, 1017
distance of boat to lighthouse, 644
distance of golf ball to hole, 560, 709
distance of thrown softball, A–9
distance run while training for marathon, 1211–1212, A–36
distance traveled by a seat on a Ferris wheel, 721
diving speeds, 99
domino randomly drawn from bag, 1140
elliptical billiard table, 983
exponential decay of pitcher's mound, 431
finishing a foot race possibilities, 1124
Five Card Stud probability of hands dealt, 1161–1162
football field goal kick angle and velocity, 1062
football throwing competition, 1061

game show contestants randomly chosen to start final round, 1140
game spinner angles turned through, 620
game spinners and probability, 431
golf swing arm lengths and angles, 719
height of canyon rim, 607
height of high-wire acrobat and angles of elevation, 826
height of kicked football/soccerball, 240–241, 864
height of lacrosse long pass, 827
height of thrown baseball, 801
heights of rides at amusement park, 365
high diver entry into water, 620
high jump Olympic records, 91
high-wire walking on incline, 608
horse race place finishing possibilities, 1129, 1157
hot air ballooning, 162
instantaneous velocity of carabiner dropped by rock climber, 1213
javelin throw angle of release, 799
jogging distance with increased speed, 305
jogging speed, 77
jumping frog distances jumped, 249
kiteboarding and wind speed, 146
kite height, A–78
length of boat and drag resistance, 335
linear velocity of passenger on Ferris wheel, 1111
lottery winning possibilities, 1126
magnitude and angle of tug-of-war rope, 798
maximum height of jai alai thrown ball, 956
maximum height of shot arrow and time airborne, 864
maximum number of registrants for 5-km race, 259
minimum altitude of plane flying over target, 996
minimum altitude of stunt plane, 996
motorcycle jumps, 247
number of swimmers in pool over time, A–23
number of words formed from a single word, 1157
Olympic 400-meter swimming competition, 119
origami angles, 692
parabolic sound receivers at sports events, 1005
pitcher's mound loss of height, 431
pool balls randomly chosen in game, 1141–1142
probability of bowler rolling strikes, 1158
probability of completing tandem bicycle trip, 1159
projectile components of kicked football, 785
projectile components of shot arrow, 785, 796–797
randomly choosing little league coach to speak first, 1139
remaining distance for climber to reach top of rim, 607
revenue for selected months of Water World, 297
riding a round-a-bout, 524
roller coaster design, 720
runner first to finish line, 214, 320
running times in 400-meter race, 47, 118
scores in Trumps game, 852
Scrabble game letter possibilities, 1125, 1129
shot-put angle of rotation of thrower, 644
single outcome probability of card drawn from deck, 1133, 1135–1140, 1157
size of guided tour groups and start-up times needed, 259
SkeeBall machine programming, 175
snowboarder heights, 247
soccer kick for winning goal, 1069
soccer shooting angle for goal, 710
soccer starting roster randomly chosen, 1140
soccer team starting line-up possibilities, 1131
speed of bicycle converted from rpm to mph, 521
speed of river current, 849, 850
speed of rower in still water, 849, 850
spinner outcomes possibilities, 1128, 1130, 1134, 1139, 1140, 1142, 1159
sports promotions, 445
super ball elastic rebound, 1111
swimming race and current in river, 824
target hits probability for markswoman, 1143
tennis court dimensions, 234
tension and angle of rope holding runaway steer, 827
thrown baseball reaching catcher without bouncing, 1004
throws at moving targets made by sports players, 757, 826
Tic-Tac-Toe ending board possibilities, 1132
timed swimming trials, A–37
time for thrown/dropped object to hit ground, 134, 184, 294, 956
tolerances for sport balls, 145
training diet, 932
training time for sprinter, 187
trampoline flips and belly-flops, 620
treadmill angle of incline during workout, 731
unicycle racing speed, 525
vectors for family bowling at three lanes, 782
velocity of Gravity Drum ride, 524
velocity of soccer ball kicked straight up, 1204–1206
volume of water in swimming pool, 319
waterski jump angle from lake surface, 709
ways to choose cats in pet show, 1157
ways to commit crime in Clue game, 1131
winning score in table tennis tournament, 198
work done to give wheelbarrow rides to kids, 800
work done to pull bus in tough-man contest, 800
work done to pull sled on level surface, 799

TRANSPORTATION

acceleration and velocity of car, 62
aerial distance between planes after five hours, 769
aircraft N-number possibilities, 1131
airplane speed with no wind, 845–846
airport moving walkway speed, 850
altitude of helicopter, 522
angle between plane making food drop and observation post, 836
angle of ground searchlight tracking jet plane, 835
angle of tow lines pulling barge along river bank, 827
angle of tow lines pulling yacht into port, 824
apparent height of building seen while traveling toward it, 630
bicycle sales growth, 489

biking time, 73
billboard design, 770
billboard viewing angle from highway, 709
car repair costs, A–9
celebrity fans waiting at arrival gates, A–36
coordinates of plane and of town, 1163
cost of gasoline, A–8
cost per gallon of grades of gasoline, 892
course and speed of ship in crosscurrent, 785, 957, 1051
course heading and speed of airplane flying through crosswind, 781, 785, 801, 827, 830, 1221
cruise ship speed, 850
cruising speed of airliner, A–9

CHAPTER CONNECTIONS

Viewing relations and functions in terms of an equation, a table of values, and the related graph, often brings a clearer understanding of the relationships involved. For instance, while many business are aware that Internet use is increasing with time, they are very interested in the *rate of growth*, in order to prepare and develop related goods and services.

▶ This application appears as Exercise 109 in Section 1.4.

Connections to Calculus

A solid understanding of lines and their equations is fundamental to a study of differential calculus. The *Connections to Calculus* feature for Chapter 1 reviews these essential concepts and skills, and provides an opportunity for practice in the context of a future calculus course.

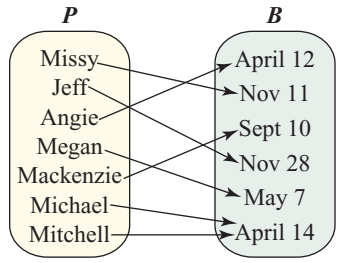
1.1 Rectangular Coordinates; Graphing Circles and Other Relations

LEARNING OBJECTIVES

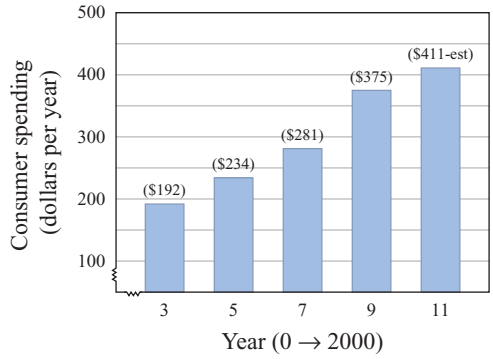
In Section 1.1 you will see how we can:

- ❑ **A.** Express a relation in mapping notation and ordered pair form
- ❑ **B.** Graph a relation
- ❑ **C.** Graph relations on a calculator
- ❑ **D.** Develop the equation and graph of a circle using the distance and midpoint formulas

In everyday life, we encounter a large variety of relationships. For instance, the time it takes us to get to work is related to our average speed; the monthly cost of heating a home is related to the average outdoor temperature; and in many cases, the amount of our charitable giving is related to changes in the cost of living. In each case we say that a relation exists between the two quantities.



A. Relations, Mapping Notation, and Ordered Pairs

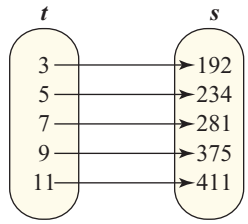


In the most general sense, a **relation** is simply a correspondence between two sets. Relations can be represented in many different ways and may even be very "unmathematical," like the one shown in Figure 1.1 between a set of people and the set of their corresponding birthdays. If P represents the set of people and B represents the set of birthdays, we say that elements of P correspond to elements of B, or the birthday relation maps elements of P to elements of B. Using what is called **mapping notation,** we might simply write $P \to B$. From a purely practical standpoint, we note that while it is possible for two different people to share the same birthday, it is quite impossible for the same person to have two different birthdays. Later, this observation will help us mark the difference between a relation and special kind of relation called a function.

Figure 1.1

The bar graph in Figure 1.2 is also an example of a relation. In the graph, each year is related to annual consumer spending per person on cable and satellite television. As an alternative to mapping or a bar graph, this relation could also be represented using ordered pairs. For example, the ordered pair (5, 234) would indicate that in 2005, spending per person on cable and satellite TV in the United States averaged $234. When a relation is represented using ordered pairs, we say the relation is **pointwise-defined.**

Figure 1.2



Source: 2009 Statistical Abstract of the United States, Table 1089 (some figures are estimates)

Over a long period of time, we could collect many ordered pairs of the form (t, s), where consumer spending s *depends* on the time t. For this reason we often call the second coordinate of an ordered pair (in this case s) the **dependent variable,** with the first coordinate designated as the **independent variable.** The set of all first coordinates is called the **domain** of the relation. The set of all second coordinates is called the **range.**

EXAMPLE 1 ▶ **Expressing a Relation as a Mapping and as a Pointwise-Defined Relation**

Represent the relation from Figure 1.2 in mapping notation and as a pointwise-defined relation, then state its domain and range.

Solution ▶ Let t represent the year and s represent consumer spending. The mapping $t \to s$ gives the diagram shown. As a pointwise-defined relation we have (3, 192), (5, 234), (7, 281), (9, 375), and (11, 411). The domain is the set {3, 5, 7, 9, 11}; the range is {192, 234, 281, 375, 411}.

Now try Exercises 7 through 12 ▶

☑ A. You've just seen how we can express a relation in mapping notation and ordered pair form

For more on this relation, **see Exercise 93.**

B. The Graph of a Relation

Table 1.1 $y = x - 1$

x	y
−4	−5
−2	−3
0	−1
2	1
4	3

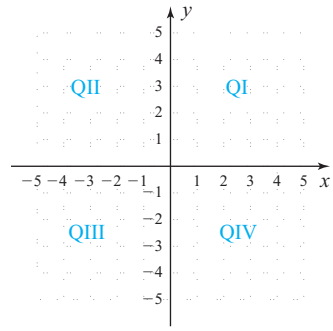
Table 1.2 $x = |y|$

x	y
2	−2
1	−1
0	0
1	1
2	2

Relations can also be stated in **equation form.** The equation $y = x - 1$ expresses a relation where each y-value is one less than the corresponding x-value (see Table 1.1). The equation $x = |y|$ expresses a relation where each x-value corresponds to the absolute value of y (see Table 1.2). In each case, the relation is the set of all ordered pairs (x, y) that create a true statement when substituted, and a few ordered pair solutions are shown in the tables for each equation.

Relations can be expressed graphically using a **rectangular coordinate system.** It consists of a horizontal number line (the x-axis) and a vertical number line (the y-axis) intersecting at their zero marks. The point of intersection is called the *origin*. The x- and y-axes create a flat, two-dimensional surface called the ***xy*-plane** and divide the plane into four regions called **quadrants.** These are labeled using a capital "Q" (for quadrant) and the Roman numerals I through IV, beginning in the upper right and moving counterclockwise (Figure 1.3). The **grid lines** shown denote the integer values on each axis and further divide the plane into a **coordinate grid,** where every point in the plane corresponds to an ordered pair. Since a point at the origin has not moved along either axis, it has coordinates (0, 0). To plot a point (x, y) means we place a dot at its location in the xy-plane. A few of the ordered pairs from $y = x - 1$ are plotted in Figure 1.4, where a noticeable pattern emerges—the points seem to lie along a straight line.

Figure 1.3



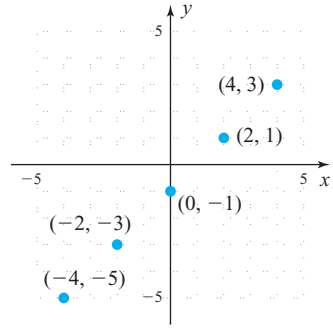


Figure 1.4

If a relation is pointwise-defined, the graph of the relation is simply the plotted points. The graph of a relation *in equation form,* such as $y = x - 1$, is the set of *all* ordered pairs (x, y) that are solutions (make the equation true).

Solutions to an Equation in Two Variables

1. If substituting $x = a$ and $y = b$ results in a true equation, the ordered pair (a, b) is a solution and on the graph of the relation.
2. If the ordered pair (a, b) is on the graph of a relation, it is a solution (substituting $x = a$ and $y = b$ will result in a true equation).

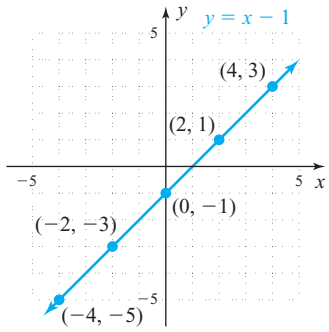
We generally use only a few select points to determine the shape of a graph, then draw a straight line or smooth curve through these points, as indicated by any patterns formed.

EXAMPLE 2 ▶ **Graphing Relations**

Graph the relations $y = x - 1$ and $x = |y|$ using the ordered pairs given in Tables 1.1 and 1.2.

Solution ▶ For $y = x - 1$, we plot the points then connect them with a straight line (Figure 1.5). For $x = |y|$, the plotted points form a V-shaped graph made up of two half lines (Figure 1.6).

Figure 1.5



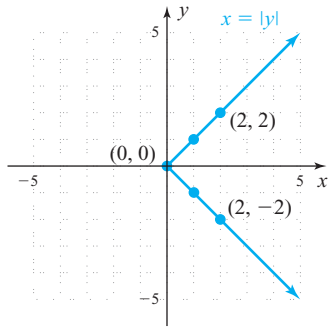


Figure 1.6

Now try Exercises 13 through 16 ▶

WORTHY OF NOTE

As the graphs in Example 2 indicate, arrowheads are used where appropriate to indicate the infinite extension of a graph.

While we used only a few points to graph the relations in Example 2, they are actually made up of an *infinite number of ordered pairs* that satisfy each equation, including those that might be rational or irrational. This understanding is an important part of reading and interpreting graphs, and is illustrated for you in Figures 1.7 through 1.10.

Figure 1.7

$y = x - 1$: selected integer values

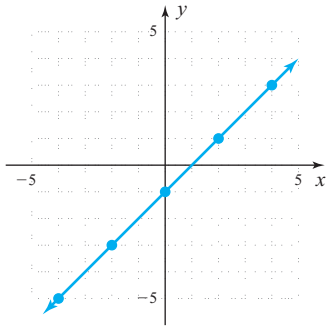

Figure 1.8

$y = x - 1$: selected rational values

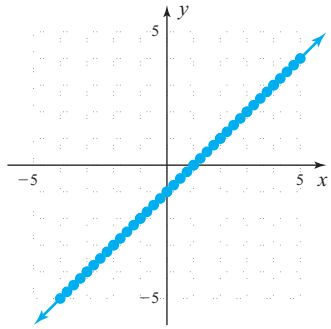

Figure 1.9

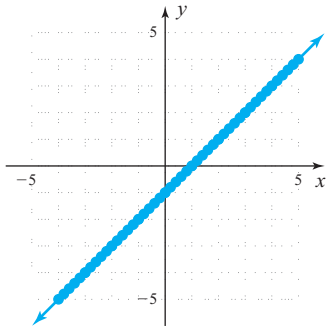
$y = x - 1$: selected real number values



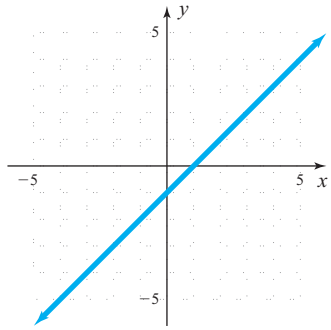


Figure 1.10

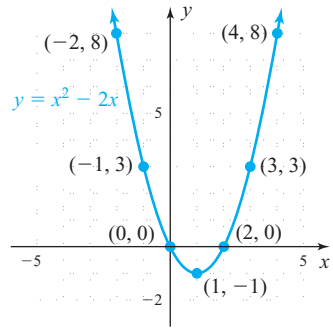
$y = x - 1$: all real number values

Since there are an infinite number of ordered pairs forming the graph of $y = x - 1$, the domain cannot be given in list form. Here we note x can be any real number and write D: $x \in \mathbb{R}$. Likewise, y can be any real number and for the range we have R: $y \in \mathbb{R}$. All of these points together make these graphs **continuous,** which for our purposes means you can draw the entire graph without lifting your pencil from the paper.

Actually, a majority of graphs cannot be drawn using only a straight line or directed line segments. In these cases, we rely on a "sufficient number" of points to outline the basic shape of the graph, then connect the points with a smooth curve. As your experience with graphing increases, this "sufficient number of points" tends to get smaller as you learn to anticipate what the graph of a given relation should look like. In particular, for the linear graph in Figure 1.5 we notice that both the x- and y-variables have an *implied exponent of 1*. This is in fact a characteristic of linear equations and graphs. In Example 3 we'll notice that if the exponent on one of the variables is 2 (either x or y is *squared*) while the other exponent is 1, the result is a graph called a **parabola.** If the x-term is squared (Example 3a) the parabola is oriented vertically, as in Figure 1.11, and its highest or lowest point is called the **vertex.** If the y-term is squared (Example 3c), the parabola is oriented horizontally, as in Figure 1.13, and the leftmost or rightmost point is the vertex. The graphs and equations of other relations likewise have certain identifying characteristics. **See Exercises 85 through 92.**

EXAMPLE 3 ▶ Graphing Relations

Graph the following relations by completing the tables given. Then use the graph to state the domain and range of the relation.



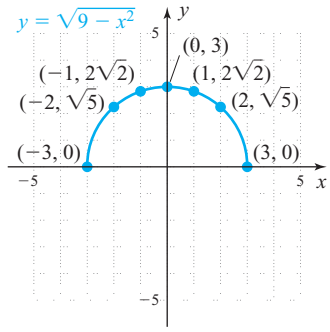
a. $y = x^2 - 2x$ **b.** $y = \sqrt{9 - x^2}$ **c.** $x = y^2$

Solution ▶ For each relation, we use each x-input in turn to determine the related y-output(s), if they exist. Results can be entered in a table and the ordered pairs used to assist in drawing a complete graph.

a. $y = x^2 - 2x$

x	y	(x, y) Ordered Pairs
−4	24	(−4, 24)
−3	15	(−3, 15)
−2	8	(−2, 8)
−1	3	(−1, 3)
0	0	(0, 0)
1	−1	(1, −1)
2	0	(2, 0)
3	3	(3, 3)
4	8	(4, 8)

Figure 1.11

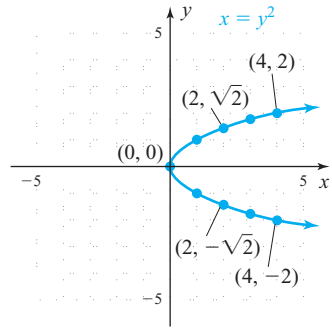


The resulting **vertical parabola** is shown in Figure 1.11. Although (−4, 24) and (−3, 15) cannot be plotted here, the arrowheads indicate an infinite extension of the graph, which will include these points. This "infinite extension" in the *upward* direction shows there is no largest y-value (the graph becomes infinitely "tall"). Since the smallest possible y-value is -1 [from the vertex $(1, -1)$], the range is $y \geq -1$. However, this extension also continues forever in the *outward* direction as well (the graph gets wider and wider). This means the x-value of all possible ordered pairs could vary from negative to positive infinity, and the domain is all real numbers. We then have D: $x \in \mathbb{R}$ and R: $y \geq -1$.

b. $y = \sqrt{9 - x^2}$

x	y	(x, y) Ordered Pairs
-4	not real	—
-3	0	$(-3, 0)$
-2	$\sqrt{5}$	$(-2, \sqrt{5})$
-1	$2\sqrt{2}$	$(-1, 2\sqrt{2})$
0	3	$(0, 3)$
1	$2\sqrt{2}$	$(1, 2\sqrt{2})$
2	$\sqrt{5}$	$(2, \sqrt{5})$
3	0	$(3, 0)$
4	not real	—

Figure 1.12



The result is the graph of a **semicircle** (Figure 1.12). The points with irrational coordinates were graphed by estimating their location. Note that when $x < -3$ or $x > 3$, the relation $y = \sqrt{9 - x^2}$ does not represent a real number and no points can be graphed. Also note that no arrowheads are used since the graph terminates at $(-3, 0)$ and $(3, 0)$. These observations and the graph itself show that for this relation, D: $-3 \le x \le 3$, and R: $0 \le x \le 3$.

c. Similar to $x = |y|$, the relation $x = y^2$ is defined only for $x \ge 0$ since y^2 is always nonnegative ($-1 = y^2$ has no real solutions). In addition, we reason that each positive x-value will correspond to two y-values. For example, given $x = 4$, $(4, -2)$ and $(4, 2)$ are both solutions to $x = y^2$.

$x = y^2$

x	y	(x, y) Ordered Pairs
-2	not real	—
-1	not real	—
0	0	$(0, 0)$
1	$-1, 1$	$(1, -1)$ and $(1, 1)$
2	$-\sqrt{2}, \sqrt{2}$	$(2, -\sqrt{2})$ and $(2, \sqrt{2})$
3	$-\sqrt{3}, \sqrt{3}$	$(3, -\sqrt{3})$ and $(3, \sqrt{3})$
4	$-2, 2$	$(4, -2)$ and $(4, 2)$

Figure 1.13

This relation is a horizontal parabola, with a vertex at $(0, 0)$ (Figure 1.13). The graph begins at $x = 0$ and extends infinitely to the right, showing the domain is $x \ge 0$. Similar to Example 3a, this "infinite extension" also extends in both the *upward* and *downward* directions and the *y-value* of all possible ordered pairs could vary from negative to positive infinity. We then have D: $x \ge 0$ and R: $y \in \mathbb{R}$.

☑ B. You've just seen how we can graph relations

Now try Exercises 17 through 24 ▶

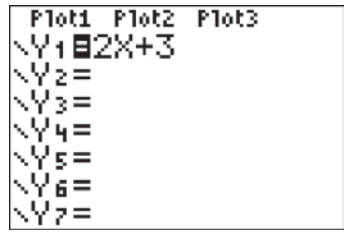
C. Graphing Relations on a Calculator

For relations given in equation form, the **TABLE** feature of a graphing calculator can be used to compute ordered pairs, and the GRAPH feature to draw the related graph. To use these features, we first solve the equation for the variable y (write y in terms of x), then enter the right-hand expression on the calculator's Y= (equation editor) screen.

We can then select either the GRAPH feature, or set-up, create, and use the **TABLE** feature. We'll illustrate here using the relation $-2x + y = 3$.

1. Solve for y in terms of x.
   $-2x + y = 3$ given equation
   $y = 2x + 3$ add $2x$ to each side
2. Enter the equation.
   Press the Y= key to access the equation editor, then enter $2x + 3$ as Y_1 (see Figure 1.14). The calculator automatically highlights the equal sign, showing that equation Y_1 is now active. If there are other equations on the screen, you can either CLEAR them or deactivate them by moving the cursor to overlay the equal sign and pressing ENTER.
3. Use the **TABLE** or GRAPH.
   To set up the table, we use the keystrokes 2nd WINDOW **(TBLSET).** For this exercise, we'll put the table in the **"Indpnt: Auto Ask"** mode, which will have the calculator automatically generate the input and output values. In this mode, we can tell the calculator where to start the inputs (we chose **TblStart = −3**), and have the calculator produce the input values using any increment desired (we choose **ΔTbl = 1**). See Figure 1.15A. Access the table using 2nd GRAPH **(TABLE),** and the table resulting from this setup is shown in Figure 1.15B. Notice that all ordered pairs satisfy the equation $y = 2x + 3$, or "y is twice x increased by 3."

Figure 1.14



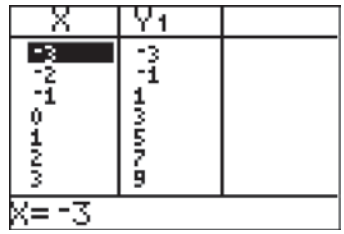


Figure 1.15A

Figure 1.15B

Since much of our graphical work is centered at (0, 0) on the coordinate grid, the calculator's default settings for the standard viewing WINDOW are $[-10, 10]$ for both x and y (Figure 1.16). The **Xscl** and **Yscl** values give the scale used on each axis, and indicate here that each "tick mark" will be 1 unit apart. To graph the line in this window, we can use the ZOOM key and select **6:ZStandard** (Figure 1.17), which resets the window to these default settings and automatically graphs the line (Figure 1.18).

Figure 1.16

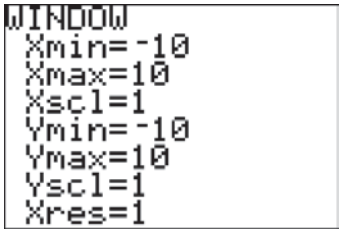

Figure 1.17

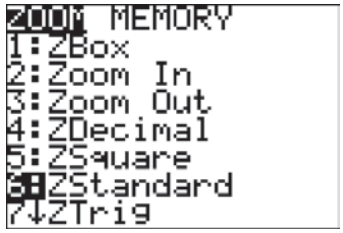

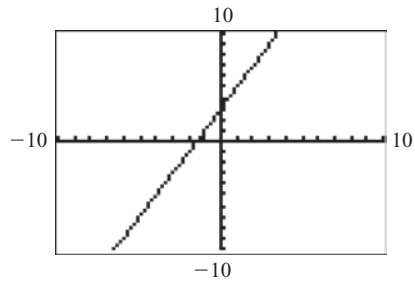

Figure 1.18

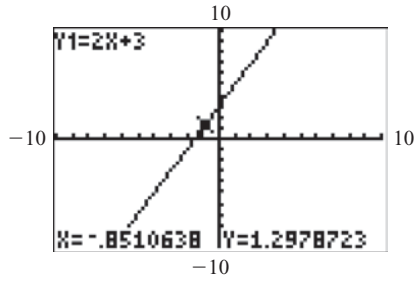
In addition to using the calculator's **TABLE** feature to find ordered pairs for a given graph, we can also use the calculator's TRACE feature. As the name implies, this feature allows us to "trace" along the graph by moving a cursor to the left ◄ and right ► using the arrow keys. The calculator displays the coordinates of the cursor's location each time it moves. After pressing the TRACE key, the marker appears automatically and as you move it to the left or right, the current coordinates are shown at the bottom

of the screen (Figure 1.19). While not very "pretty," (−0.8510638, 1.2978723) is a point on this line (rounded to seven decimal places) and satisfies its equation. The calculator is displaying these decimal values because the viewing screen is exactly 95 pixels wide, 47 pixels to the left of the y-axis, and 47 pixels to the right. This means that each time you press the left or right arrow, the x-value changes by 1/47th—which is not a nice round number. To have the calculator TRACE through "friendlier" values, we can use the ZOOM **4:ZDecimal** feature, which sets **Xmin** $= -4.7$ and **Xmax** $= 4.7$, or ZOOM **8:ZInteger,** which sets **Xmin** $= -47$ and **Xmax** $= 47$. Let's use the ZOOM **4:ZDecimal** option here, noting the calculator automatically regraphs the line. Pressing the TRACE key once again and moving the marker shows that more "friendly" ordered pair solutions are displayed (Figure 1.20). Other methods for finding a friendly window are discussed later in this section.

Figure 1.19



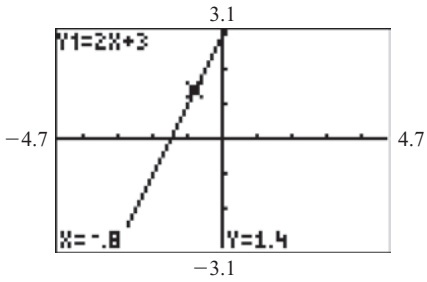


Figure 1.20

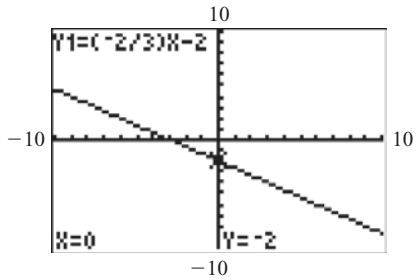
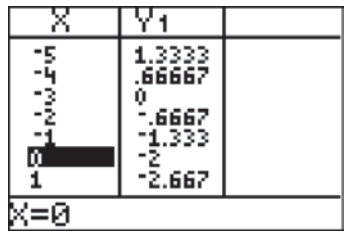


EXAMPLE 4 ▶ **Graphing a Relation Using Technology**



Use a calculator to graph $2x + 3y = -6$. Then use the **TABLE** feature to determine the value of y when $x = 0$, and the value of x when $y = 0$. Write each result in ordered pair form.

Solution ▶ We begin by solving the equation for y, so we can enter it on the Y= screen.

$$2x + 3y = -6 \qquad \text{given equation}$$
$$3y = -2x - 6 \qquad \text{subtract } 2x \text{ (isolate the } y\text{-term)}$$
$$y = \frac{-2}{3}x - 2 \qquad \text{divide by 3}$$

Entering $y = \frac{-2}{3}x - 2$ on the Y= screen and using ZOOM **6:ZStandard** produces the graph shown. Using the **TABLE** and scrolling as needed, shows that when $x = 0$, $y = -2$, and when $y = 0$, $x = -3$. As ordered pairs we have $(0, -2)$ and $(-3, 0)$.

☑ **C.** You've just seen how we can graph a relation using a calculator

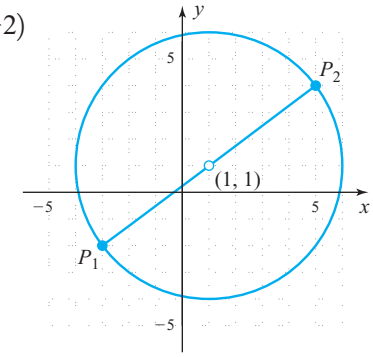
Now try Exercises 25 through 28 ▶

D. The Equation and Graph of a Circle

Using the midpoint and distance formulas, we can develop the equation of another important relation, that of a circle. As the name suggests, the **midpoint of a line segment** is located halfway between the endpoints. On a standard number line, the midpoint of the line segment with endpoints 1 and 5 is 3, but more important, note that 3 is the

average distance (from zero) of 1 unit and 5 units: $\frac{1+5}{2} = \frac{6}{2} = 3$. This observation can be extended to find the midpoint between any two points (x_1, y_1) and (x_2, y_2) in the xy-plane. We simply find the average distance between the x-coordinates and the average distance between the y-coordinates.

The Midpoint Formula



Given any line segment with endpoints $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$, the midpoint M is given by

$$M: \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$$

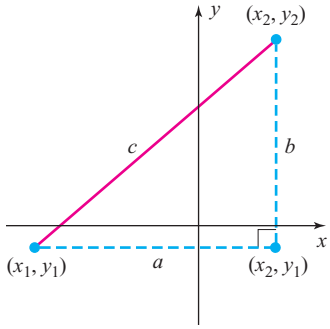
The midpoint formula can be used in many different ways. Here we'll use it to find the coordinates of the center of a circle.

EXAMPLE 5 ▶ **Using the Midpoint Formula**

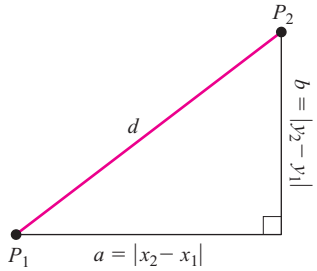
The diameter of a circle has endpoints at $P_1 = (-3, -2)$ and $P_2 = (5, 4)$. Use the midpoint formula to find the coordinates of the center, then plot this point.

Solution ▶

$$\text{Midpoint: } \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$$



$$M: \left(\frac{-3 + 5}{2}, \frac{-2 + 4}{2}\right)$$



$$M: \left(\frac{2}{2}, \frac{2}{2}\right) = (1, 1)$$

The center is at (1, 1), which we graph directly on the diameter as shown.

Now try Exercises 29 through 38 ▶

Figure 1.21

The Distance Formula

In addition to a line segment's midpoint, we are often interested in the *length* of the segment. For any two points (x_1, y_1) and (x_2, y_2) not lying on a horizontal or vertical line, a right triangle can be formed as in Figure 1.21. Regardless of the triangle's orientation, the length of side a (the horizontal segment or base of the triangle) will have length $|x_2 - x_1|$ units, with side b (the vertical segment or height) having length $|y_2 - y_1|$ units. From the Pythagorean theorem (Appendix A.6), we see that $c^2 = a^2 + b^2$ corresponds to $c^2 = (|x_2 - x_1|)^2 + (|y_2 - y_1|)^2$. By taking the square root of both sides we obtain the length of the hypotenuse, *which is identical to the distance between these two points*: $c = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$. The result is called the **distance formula,** although it's most often written using d for distance, rather than c. Note the absolute value bars are dropped from the formula, since the square of any quantity is always nonnegative. This also means that *either* point can be used as the initial point in the computation.

The Distance Formula

Given any two points $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$, the straight line distance d between them is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

EXAMPLE 6 ▶ **Using the Distance Formula**

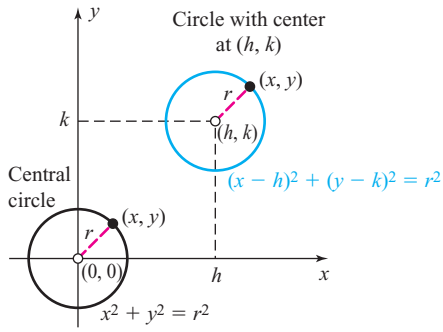
Use the distance formula to find the diameter of the circle from Example 5.

Solution ▶ For $(x_1, y_1) = (-3, -2)$ and $(x_2, y_2) = (5, 4)$, the distance formula gives

$$\begin{aligned} d &= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} \\ &= \sqrt{[5 - (-3)]^2 + [4 - (-2)]^2} \\ &= \sqrt{8^2 + 6^2} \\ &= \sqrt{100} = 10 \end{aligned}$$

The diameter of the circle is 10 units long.

Now try Exercises 39 through 48 ▶



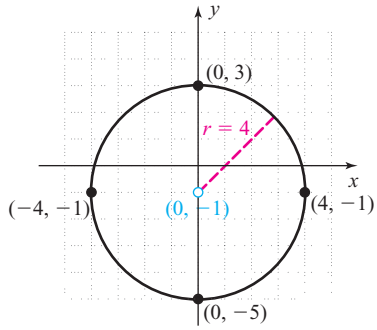
A circle can be defined as the set of all points in a plane that are a *fixed distance* called the **radius,** from a *fixed point* called the **center.** Since the definition involves *distance,* we can construct the general equation of a circle using the distance formula. Assume the center has coordinates (h, k), and let (x, y) represent any point on the graph. The distance between these points is equal to the radius r, and the distance formula yields: $\sqrt{(x - h)^2 + (y - k)^2} = r$. Squaring both sides gives the equation of a circle in **standard form:** $(x - h)^2 + (y - k)^2 = r^2$.

The Equation of a Circle

A circle of radius r with center at (h, k) has the equation

$$(x - h)^2 + (y - k)^2 = r^2$$

If $h = 0$ and $k = 0$, the circle is centered at $(0, 0)$ and the graph is a **central circle** with equation $x^2 + y^2 = r^2$. At other values for h or k, the center is at (h, k) with no change in the radius. Note that an open dot is used for the center, as it's actually a point of reference and not a part of the graph.



EXAMPLE 7 ▶ **Finding the Equation of a Circle in Standard Form**

Find the equation of a circle with center $(0, -1)$ and radius 4.

Solution ▶ Since the center is at $(0, -1)$ we have $h = 0$, $k = -1$, and $r = 4$. Using the standard form $(x - h)^2 + (y - k)^2 = r^2$ we obtain

$$(x - 0)^2 + [y - (-1)]^2 = 4^2 \quad \text{substitute 0 for } h, -1 \text{ for } k, \text{ and 4 for } r$$
$$x^2 + (y + 1)^2 = 16 \quad \text{simplify}$$

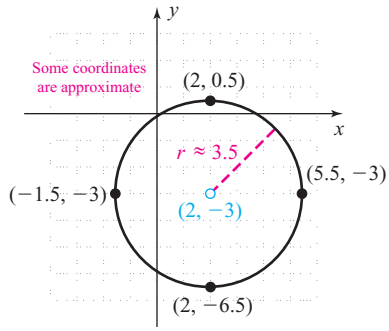
The graph of $x^2 + (y + 1)^2 = 16$ is shown in the figure.

Circle

Center: $(0, -1)$
Radius: $r = 4$
Diameter: $2r = 8$

Now try Exercises 49 through 66 ▶

The graph of a circle can be obtained by first identifying the coordinates of the center and the length of the radius from the equation in standard form. After plotting the center point, we count a distance of r units left and right of center in the horizontal direction, and up and down from center in the vertical direction, obtaining four points on the circle. Neatly graph a circle containing these four points.



EXAMPLE 8 ▶ **Graphing a Circle**

Graph the circle represented by $(x - 2)^2 + (y + 3)^2 = 12$. Clearly label the center and radius.

Solution ▶ Comparing the given equation with the standard form, we find the center is at $(2, -3)$ and the radius is $r = 2\sqrt{3} \approx 3.5$.

$$(x - h)^2 + (y - k)^2 = r^2 \qquad \text{standard form}$$
$$\downarrow \quad \downarrow \quad \downarrow$$
$$(x - 2)^2 + (y + 3)^2 = 12 \qquad \text{given equation}$$
$$-h = -2 \qquad -k = 3 \qquad r^2 = 12$$
$$h = 2 \qquad k = -3 \qquad r = \sqrt{12} = 2\sqrt{3} \approx 3.5 \qquad \text{radius must be positive}$$

Plot the center $(2, -3)$ and count approximately 3.5 units in the horizontal and vertical directions. Complete the circle by freehand drawing or using a compass. The graph shown is obtained.

Circle

Center: $(2, -3)$
Radius: $r = 2\sqrt{3}$

Endpoints of horizontal diameter
$(2 - 2\sqrt{3}, -3)$ and $(2 + 2\sqrt{3}, -3)$

Endpoints of vertical diameter
$(2, -3 + 2\sqrt{3})$ and $(2, -3 - 2\sqrt{3})$

Now try Exercises 67 through 72 ▶

WORTHY OF NOTE

After writing the equation in standard form, it is possible to end up with a constant that is zero or negative. In the first case, the graph is a single point. In the second case, no graph is possible since roots of the equation will be complex numbers. These are called *degenerate cases*. **See Exercise 105.**

In Example 8, note the equation is composed of binomial squares in both x and y. By expanding the binomials and collecting like terms, we can write the equation of the circle in **general form:**

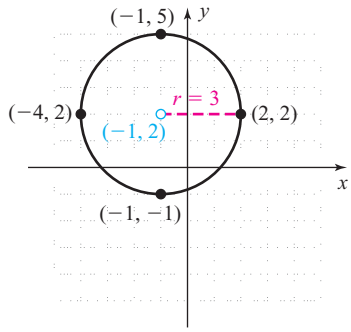
$$(x-2)^2+(y+3)^2=12 \quad \text{standard form}$$
$$x^2-4x+4+y^2+6y+9=12 \quad \text{expand binomials}$$
$$x^2+y^2-4x+6y+1=0 \quad \text{combine like terms—general form}$$

For future reference, observe the general form contains a *sum* of second-degree terms in x and y, and that *both terms have the same coefficient* (in this case, "1").

Since this form of the equation was derived by squaring binomials, it seems reasonable to assume we can go back to the standard form by creating binomial squares in x and y. This is accomplished by *completing the square*.

EXAMPLE 9 ▶ Finding the Center and Radius of a Circle

Find the center and radius of the circle with equation $x^2+y^2+2x-4y-4=0$. Then sketch its graph and label the center and radius.



Solution ▶ To find the center and radius, we complete the square in both x and y.

$$x^2+y^2+2x-4y-4=0 \quad \text{given equation}$$
$$(x^2+2x+__)+(y^2-4y+__)=4 \quad \text{group } x\text{-terms and } y\text{-terms; add 4}$$
$$(x^2+2x+1)+(y^2-4y+4)=4+1+4 \quad \text{complete each binomial square}$$

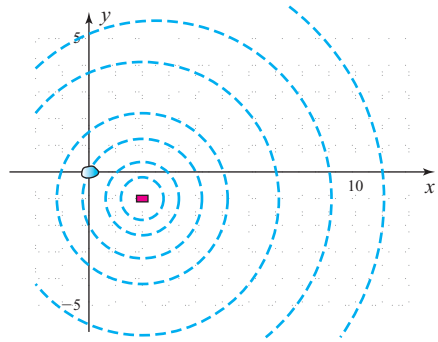
adds 1 to left side; adds 4 to left side; add 1 + 4 to right side

$$(x+1)^2+(y-2)^2=9 \quad \text{factor and simplify}$$

The center is at $(-1, 2)$ and the radius is $r=\sqrt{9}=3$.

Circle

Center: $(-1, 2)$
Radius: $r=3$



Now try Exercises 73 through 84 ▶

EXAMPLE 10 ▶ Applying the Equation of a Circle

To aid in a study of nocturnal animals, some naturalists install a motion detector near a popular watering hole. The device has a range of 10 m in any direction. Assume the water hole has coordinates $(0, 0)$ and the device is placed at $(2, -1)$.

a. Write the equation of the circle that models the maximum effective range of the device.

b. Use the distance formula to determine if the device will detect a badger that is approaching the water and is now at coordinates $(11, -5)$.

Solution ▶

a. Since the device is at $(2, -1)$ and the radius (or reach) of detection is 10 m, any movement in the interior of the circle defined by $(x - 2)^2 + (y + 1)^2 = 10^2$ will be detected.

b. Using the points $(2, -1)$ and $(11, -5)$ in the distance formula yields:

$$\begin{aligned} d &= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} && \text{distance formula} \\ &= \sqrt{(11 - 2)^2 + [-5 - (-1)]^2} && \text{substitute given values} \\ &= \sqrt{9^2 + (-4)^2} && \text{simplify} \\ &= \sqrt{81 + 16} && \text{compute squares} \\ &= \sqrt{97} \approx 9.85 && \text{result} \end{aligned}$$

Since $9.85 < 10$, the badger is within range of the device and will be detected.

Now try Exercises 95 through 100 ▶

When using a graphing calculator to study circles, it's important to note that most standard viewing windows have the x- and y-values preset at $[-10, 10]$ even though the calculator screen is not square. This tends to compress the y-values and give a skewed image of the graph. If the circle appears oval in shape, use ZOOM **5:ZSquare** to obtain the correct perspective. Graphing calculators can produce the graph of a circle in various ways, and the choice of method simply depends on what you'd like to accomplish. To simply view the graph or compare two circular graphs, the **DRAW** command is used. From the home screen press: 2nd PRGM **(DRAW) 9:Circle(.** This generates the **"Circle("** command, with the left parentheses indicating we need to supply three inputs, separated by commas. These inputs are the x-coordinate of the center, the y-coordinate of the center, and the radius of the circle. For the circle defined by the equation $(x - 3)^2 + (y + 2)^2 = 49$, we know the center is at $(3, -2)$ and the radius is 7 units. The resulting command and graph are shown in Figures 1.22 and 1.23.

While the **DRAW** command will graph any circle, we are unable to use the TRACE or **CALC** commands to interact with the graph. To make these features available, we must first solve for x in terms of y, as we did previously (the **1:ClrDraw** command is used to clear the graph). Consider the *relation* $x^2 + y^2 = 25$, which we know is the equation of a circle centered at $(0, 0)$ with radius $r = 5$.

$$\begin{aligned} x^2 + y^2 &= 25 && \text{original equation} \\ y^2 &= 25 - x^2 && \text{isolate } y^2 \\ y &= \pm\sqrt{25 - x^2} && \text{solve for } y \end{aligned}$$

Note that we can separate this result into two parts, enabling the calculator to graph $Y_1 = \sqrt{25 - x^2}$ (giving the "upper half" of the circle), and $Y_2 = -\sqrt{25 - x^2}$ (giving the "lower half"). Enter these on the Y= screen (note that $Y_2 = -Y_1$ can be used instead of reentering the entire expression: VARS ▸ ENTER). If we graph Y_1 and Y_2 on the standard screen, the result appears more oval than circular (Figure 1.24). Using the ZOOM **5:ZSquare** option, the tick marks become equally spaced on both axes (Figure 1.25).

Figure 1.22, 1.23

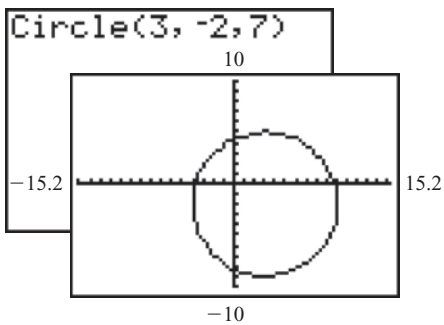


Figure 1.24

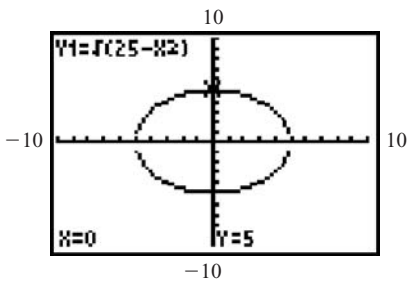

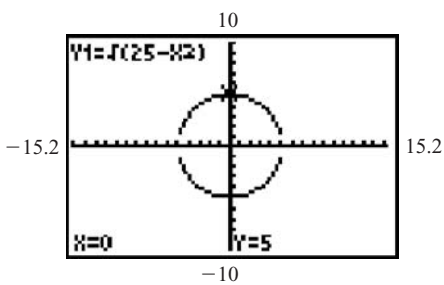

Figure 1.25

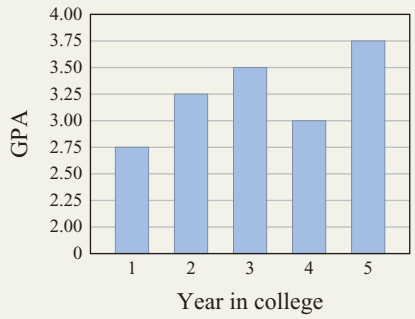
D. You've just seen how we can develop the equation and graph of a circle using the distance and midpoint formulas

Although it is a much improved graph, the circle does not appear "closed" as the calculator lacks sufficient pixels to show the proper curvature. A second alternative is to manually set a "friendly" window. Using Xmin $= -9.4$, Xmax $= 9.4$, Ymin $= -6.2$, and Ymax $= 6.2$ will generate a better graph due to the number of pixels available. Note that we can jump between the upper and lower halves of the circle using the up or down arrows. **See Exercises 101 and 102.**

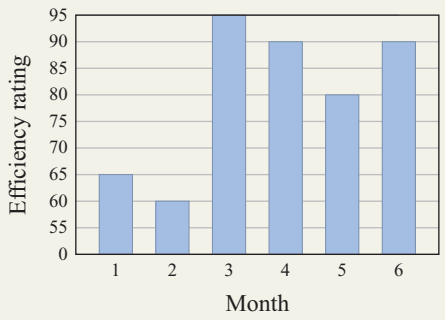
1.1 EXERCISES

CONCEPTS AND VOCABULARY



Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. If a relation is defined by a set of ordered pairs, the domain is the set of all _____ components, the range is the set of all _____ components.
2. For the equation $y = x + 5$ and the ordered pair (x, y), x is referred to as the input or _____ variable, while y is called the _____ or dependent variable.
3. A circle is defined as the set of all points that are an equal distance, called the _____, from a given point, called the _____.
4. For $x^2 + y^2 = 25$, the center of the circle is at _____ and the length of the radius is _____ units. The graph is called a _____ circle.
5. Discuss/Explain how to find the center and radius of the circle defined by the equation $x^2 + y^2 - 6x = 7$. How would this circle differ from the one defined by $x^2 + y^2 - 6y = 7$?
6. In Example 3(b) we graphed the semicircle defined by $y = \sqrt{9 - x^2}$. Discuss how you would obtain the equation of the full circle from this equation, and how the two equations are related.



DEVELOPING YOUR SKILLS

Represent each relation in mapping notation, then state the domain and range.

7.

8.

State the domain and range of each pointwise-defined relation.

9. $\{(1, 2), (3, 4), (5, 6), (7, 8), (9, 10)\}$
10. $\{(-2, 4), (-3, -5), (-1, 3), (4, -5), (2, -3)\}$
11. $\{(4, 0), (-1, 5), (2, 4), (4, 2), (-3, 3)\}$
12. $\{(-1, 1), (0, 4), (2, -5), (-3, 4), (2, 3)\}$

Complete each table using the given equation. For Exercises 15, 16, 21, and 22, each input may correspond to two outputs (be sure to find both if they exist). Use these points to graph the relation. For Exercises 17 through 24, also state the domain and range.

13. $y = -\frac{2}{3}x + 1$

Use a graphing calculator to graph the following relations. Then use the TABLE feature to determine the value of y when $x = 0$, and the value(s) of x when $y = 0$, and write the results in ordered pair form.

25. $-2x + 5y = 10$

26. $x + 2y = 6$

27. $y = x^2 - 4x$

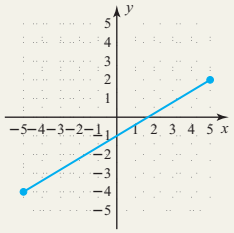
28. $y + x^2 = 2x + 3$

Find the midpoint of each segment with the given endpoints.

29. (1, 8), (5, −6)

30. (5, 6), (6, −8)

31. (−4.5, 9.2), (3.1, −9.8)



32. (5.2, 7.1), (6.3, −7.1)

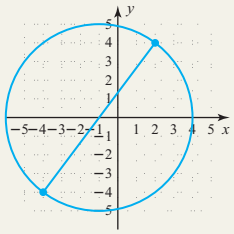
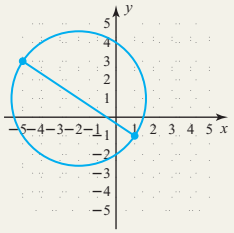
34. $\left(-\frac{3}{4}, -\frac{1}{3}\right), \left(\frac{3}{8}, \frac{5}{6}\right)$

Find the midpoint of each segment.

35.



36.



Find the center of each circle with the diameter shown.

37.

38.

39. Use the distance formula to find the length of the line segment in Exercise 35.

40. Use the distance formula to find the length of the line segment in Exercise 36.

41. Use the distance formula to find the length of the diameter of the circle in Exercise 37.

42. Use the distance formula to find the length of the diameter of the circle in Exercise 38.

In Exercises 43 to 48, three points that form the vertices of a triangle are given. Use the distance formula to determine if any of the triangles are right triangles (the three sides satisfy the Pythagorean Theorem $a^2 + b^2 = c^2$).

43. $(-3, 7), (2, 2), (5, 5)$

44. $(7, 0), (-1, 0), (7, 4)$

45. $(-4, 3), (-7, -1), (3, -2)$

46. $(5, 2), (0, -3), (4, -4)$

47. $(-3, 2), (-1, 5), (-6, 4)$

48. $(0, 0), (-5, 2), (2, -5)$

Find the equation of a circle satisfying the conditions given, then sketch its graph.

49. center $(0, 0)$, radius 3

50. center $(0, 0)$, radius 6

51. center $(5, 0)$, radius $\sqrt{3}$

52. center $(0, 4)$, radius $\sqrt{5}$

53. center $(4, -3)$, radius 2

54. center $(3, -8)$, radius 9

55. center $(-7, -4)$, radius $\sqrt{7}$

56. center $(-2, -5)$, radius $\sqrt{6}$

57. center $(1, -2)$, diameter 6

58. center $(-2, 3)$, diameter 10

59. center $(4, 5)$, diameter $4\sqrt{3}$

60. center $(5, 1)$, diameter $4\sqrt{5}$

61. center at $(7, 1)$, graph contains the point $(1, -7)$

62. center at $(-8, 3)$, graph contains the point $(-3, 15)$

63. center at $(3, 4)$, graph contains the point $(7, 9)$

64. center at $(-5, 2)$, graph contains the point $(-1, 3)$

65. diameter has endpoints $(5, 1)$ and $(5, 7)$

66. diameter has endpoints $(2, 3)$ and $(8, 3)$

Identify the center and radius of each circle, then graph. Also state the domain and range of the relation.

67. $(x - 2)^2 + (y - 3)^2 = 4$

68. $(x - 5)^2 + (y - 1)^2 = 9$

69. $(x + 1)^2 + (y - 2)^2 = 12$

70. $(x - 7)^2 + (y + 4)^2 = 20$

71. $(x + 4)^2 + y^2 = 81$

72. $x^2 + (y - 3)^2 = 49$

Write each equation in standard form to find the center and radius of the circle. Then sketch the graph.

73. $x^2 + y^2 - 10x - 12y + 4 = 0$

74. $x^2 + y^2 + 6x - 8y - 6 = 0$

75. $x^2 + y^2 - 10x + 4y + 4 = 0$

76. $x^2 + y^2 + 6x + 4y + 12 = 0$

77. $x^2 + y^2 + 6y - 5 = 0$

78. $x^2 + y^2 - 8x + 12 = 0$

79. $x^2 + y^2 + 4x + 10y + 18 = 0$

80. $x^2 + y^2 - 8x - 14y - 47 = 0$

81. $x^2 + y^2 + 14x + 12 = 0$

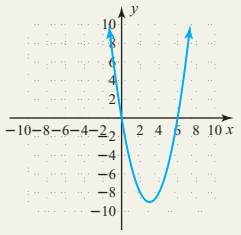
82. $x^2 + y^2 - 22y - 5 = 0$

83. $2x^2 + 2y^2 - 12x + 20y + 4 = 0$

84. $3x^2 + 3y^2 - 24x + 18y + 3 = 0$

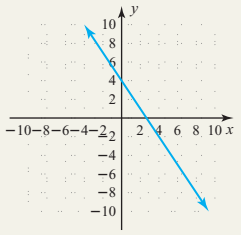
In this section we looked at characteristics of equations that generated linear graphs, and graphs of parabolas and circles. Use this information and ordered pairs of your choosing to match the eight graphs given with their corresponding equation (two of the equations given have no matching graph).

a. $y = x^2 - 6x$ **b.** $x^2 + (y - 3)^2 = 36$



c. $x^2 + y = 9$ **d.** $3x - 4y = 12$

e. $y = \frac{-3}{2}x + 4$ **f.** $(x - 1)^2 + (y + 2)^2 = 49$



g. $(x - 3)^2 + y^2 = 16$ **h.** $(x - 1)^2 + (y + 2)^2 = 9$

i. $4x - 3y = 12$ **j.** $6x + y = x^2 + 9$

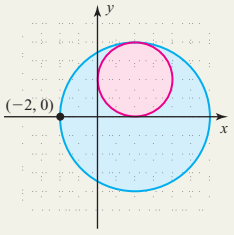
▶ WORKING WITH FORMULAS

93. Spending on Cable and Satellite TV: $s = 29t + 96$

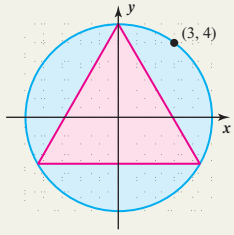
The data from Example 1 is closely modeled by the formula shown, where t represents the year ($t = 0$ corresponds to the year 2000) and s represents the average amount spent per person, per year in the United States. (a) List five ordered pairs for this relation using $t = 3, 5, 7, 9, 11$. Does the model give a good approximation of the actual data? (b) According to the model, what will be the average amount spent on cable and satellite TV in the year 2013? (c) According to the model, in what year will annual spending surpass $500? (d) Use the table to graph this relation by hand.

94. Radius of a circumscribed circle: $r = \sqrt{\frac{A}{2}}$

The radius r of a circle circumscribed around a square is found by using the formula given, where A is the area of the square. Solve the formula for A and use the result to find the area of the square shown.



▶ APPLICATIONS



95. Radar detection: A luxury liner is located at map coordinates (5, 12) and has a radar system with a range of 25 nautical miles in any direction. (a) Write the equation of the circle that models the range of the ship's radar, and (b) use the distance formula to determine if the radar can pick up the liner's sister ship located at coordinates (15, 36).

96. Earthquake range: The epicenter (point of origin) of a large earthquake was located at map coordinates (3, 7), with the quake being felt up to 12 mi away. (a) Write the equation of the circle that models the range of the earthquake's effect. (b) Use the distance formula to determine if a person living at coordinates (13, 1) would have felt the quake.

97. Inscribed circle: Find the equation for both the red and blue circles, then find the area of the region shaded in blue.

98. Inscribed triangle: The area of an equilateral triangle inscribed in a circle is given by the formula $A = \frac{3\sqrt{3}}{4}r^2$, where r is the radius of the circle. Find the area of the equilateral triangle shown.

99. Radio broadcast range: Two radio stations may not use the same frequency if their broadcast areas *overlap.* Suppose station KXRQ has a broadcast area bounded by $x^2 + y^2 + 8x - 6y = 0$ and WLRT has a broadcast area bounded by $x^2 + y^2 - 10x + 4y = 0$. Graph the circle representing each broadcast area on the same grid to determine if both stations may broadcast on the same frequency.

100. Radio broadcast range: The emergency radio broadcast system is designed to alert the population by relaying an emergency signal to all points of the country. A signal is sent from a station whose broadcast area is bounded by $x^2 + y^2 = 2500$ (x and y in miles) and the signal is picked up and relayed by a transmitter with range $(x - 20)^2 + (y - 30)^2 = 900$. Graph the circle representing each broadcast area on the same grid to determine the greatest distance from the original station that this signal can be received. Be sure to scale the axes appropriately.

101. Graph the circle defined by $x^2 + y^2 = 36$ using a friendly window, then use the TRACE feature to find the value of y when $x = 3.6$. Now find the value of y when $x = 4.8$. Explain why the values seem "interchangeable."

102. Graph the circle defined by $(x - 3)^2 + y^2 = 16$ using a friendly window, then use the TRACE feature to find the value of the y-intercepts. Show you get the same intercept by computation.

▶ EXTENDING THE CONCEPT

103. Although we use the word "domain" extensively in mathematics, it is also commonly seen in literature and heard in everyday conversation. Using a college-level dictionary, look up and write out the various meanings of the word, noting how closely the definitions given are related to its mathematical use.

104. Consider the following statement, then determine whether it is true or false and discuss why. *A graph will exhibit some form of symmetry if, given a point that is h units from the x-axis, k units from the y-axis, and d units from the origin, there is a second point on the graph that is a like distance from the origin and each axis.*

105. When completing the square to find the center and radius of a circle, we sometimes encounter a value for r^2 that is negative or zero. These are called **degenerate cases.** If $r^2 < 0$, no circle is possible, while if $r^2 = 0$, the "graph" of the circle is simply the point (h, k). Find the center and radius of the following circles (if possible).

a. $x^2 + y^2 - 12x + 4y + 40 = 0$

b. $x^2 + y^2 - 2x - 8y - 8 = 0$

c. $x^2 + y^2 - 6x - 10y + 35 = 0$

▶ MAINTAINING YOUR SKILLS

106. (Appendix A.2) Evaluate/Simplify the following expressions.

a. $\dfrac{x^2x^5}{x^3}$

b. $3^3 + 3^2 + 3^1 + 3^0 + 3^{-1}$

c. $125^{-\frac{1}{3}}$

d. $27^{\frac{2}{3}}$

e. $(2m^3n)^2$

f. $(5x)^0 + 5x^0$

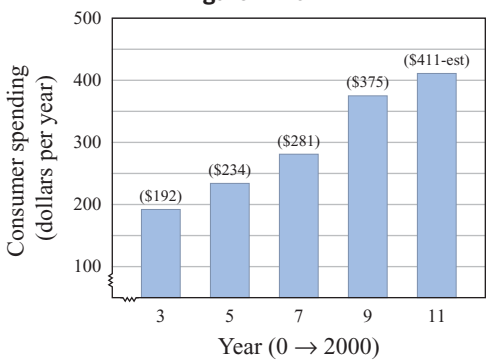
107. (Appendix A.3) Solve the following equation.

$$\frac{x}{3} + \frac{1}{4} = \frac{5}{6}$$

108. (Appendix A.4) Solve $x^2 - 27 = 6x$ by factoring.

109. (Appendix A.6) Solve $1 - \sqrt{n + 3} = -n$ and check solutions by substitution. If a solution is extraneous, so state.

1.2 Linear Equations and Rates of Change



LEARNING OBJECTIVES

In Section 1.2 you will see how we can:

- ❑ **A.** Graph linear equations using the intercept method
- ❑ **B.** Find the slope of a line and interpret it as a rate of change
- ❑ **C.** Graph horizontal and vertical lines
- ❑ **D.** Identify parallel and perpendicular lines
- ❑ **E.** Apply linear equations in context

In preparation for sketching graphs of other equations, we'll first look more closely at the characteristics of linear graphs. While linear graphs are fairly simple models, they have many substantive and meaningful applications. For instance, most of us are aware that satellite and cable TV have been increasing in popularity since they were first introduced. A close look at Figure 1.2 from Section 1.1 reveals that spending on these forms of entertainment increased from $192 per person per year in 2003 to $281 in 2007 (Figure 1.26). From an investor's or a producer's point of view, there is a very high interest in the questions, "How fast are sales increasing? Can this relationship be modeled mathematically to help predict sales in future years?" Answers to these and other questions are precisely what our study in this section is all about.

Figure 1.26

Source: 2009 Statistical Abstract of the United States, Table 1089 (some figures are estimates)

A. The Graph of a Linear Equation

A linear equation can be identified using these three tests:

1. the exponent on any variable is one,
2. no variable occurs in a denominator, and
3. no two variables are multiplied together.

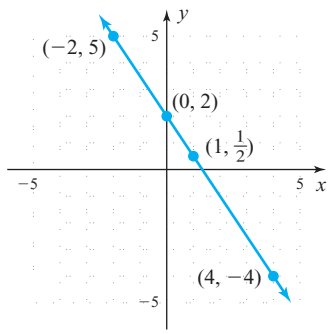
The equation $3y = 9$ is a linear equation in one variable, while $2x + 3y = 12$ and $y = -\frac{2}{3}x + 4$ are linear equations in two variables. In general, we have the following definition:

Linear Equations

A linear equation is one that can be written in the form

$$ax + by = c$$

where a, b, and c are real numbers, with a and b not simultaneously equal to zero.



As in Section 1.1, the most basic method for graphing a line is to simply plot a few points, then draw a straight line through the points.

EXAMPLE 1 ▶ **Graphing a Linear Equation in Two Variables**

Graph the equation $3x + 2y = 4$ by plotting points.

Solution ▶ Selecting $x = -2$, $x = 0$, $x = 1$, and $x = 4$ as inputs, we compute the related outputs and enter the ordered pairs in a table. The result is

x input	y output	(x, y) ordered pairs
-2	5	$(-2, 5)$
0	2	$(0, 2)$
1	$\frac{1}{2}$	$(1, \frac{1}{2})$
4	-4	$(4, -4)$

WORTHY OF NOTE

If you cannot draw a straight line through the plotted points, a computational error has been made. All points satisfying a linear equation *lie on a straight line.*

Now try Exercises 7 through 12 ▶

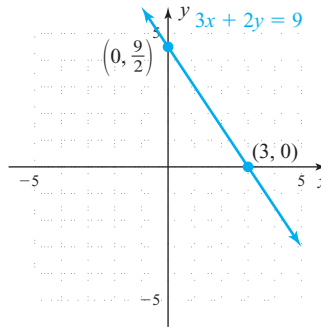
Notice that the line in Example 1 crosses the y-axis at $(0, 2)$, and this point is called the ***y*-intercept** of the line. In general, y-intercepts have the form $(0, y)$. Although difficult to see graphically, substituting 0 for y and solving for x shows this line crosses the x-axis at $(\frac{4}{3}, 0)$ and this point is called the ***x*-intercept.** In general, x-intercepts have the form $(x, 0)$. The x- and y-intercepts are usually easier to calculate than other points (since $y = 0$ or $x = 0$, respectively) and we often graph linear equations using only these two points. This is called the **intercept method** for graphing linear equations.

The Intercept Method

1. Substitute 0 for x and solve for y. This will give the y-intercept $(0, y)$.
2. Substitute 0 for y and solve for x. This will give the x-intercept $(x, 0)$.
3. Plot the intercepts and use them to graph a straight line.

EXAMPLE 2 ▶ Graphing Lines Using the Intercept Method

Graph $3x + 2y = 9$ using the intercept method.



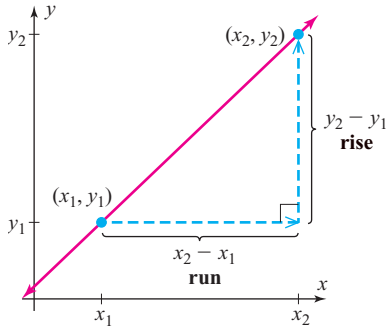
Solution ▶

Substitute 0 for x (y-intercept)

$$3(0) + 2y = 9$$
$$2y = 9$$
$$y = \frac{9}{2}$$
$$\left(0, \frac{9}{2}\right)$$

Substitute 0 for y (x-intercept)

$$3x + 2(0) = 9$$
$$3x = 9$$
$$x = 3$$
$$(3, 0)$$



Now try Exercises 13 through 32 ▶

A. You've just seen how we can graph linear equations using the intercept method

B. The Slope of a Line and Rates of Change

After the x- and y-intercepts, we next consider the **slope of a line.** We see applications of this concept in many diverse areas, including the *grade* of a highway (trucking), the *pitch* of a roof (carpentry), the *climb* of an airplane (flying), the *drainage* of a field (landscaping), and the *slope* of a mountain (parks and recreation). While the general concept is an intuitive one, we seek to quantify the concept (assign it a numeric value) for purposes of comparison and decision making. In each of the preceding examples (grade, pitch, climb, etc.), slope is a measure of "steepness," as defined by the ratio $\frac{\text{vertical change}}{\text{horizontal change}}$. Using a line segment through arbitrary points $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$, we can create the right triangle shown in Figure 1.27 to help us quantify this relationship. The figure illustrates that the **vertical change** or the

Figure 1.27

change in *y* (also called the **rise**) is simply the difference in y-coordinates: $y_2 - y_1$. The **horizontal change** or **change in *x*** (also called the **run**) is the difference in x-coordinates: $x_2 - x_1$. In algebra, we typically use the letter "m" to represent slope, giving $m = \frac{y_2 - y_1}{x_2 - x_1}$ as the $\frac{\text{change in } y}{\text{change in } x}$. The result is called the **slope formula.**

WORTHY OF NOTE

While the original reason that "m" was chosen for slope is uncertain, some have speculated that it was because in French, the verb for "to climb" is *m*onter. Others say it could be due to the "*m*odulus of slope," the word *modulus* meaning a numeric measure of a given property, in this case the inclination of a line.

The Slope Formula

Given two points $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$, the slope of the nonvertical line through P_1 and P_2 is

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

where $x_2 \neq x_1$.

Actually, the slope value does much more than quantify the slope of a line, it expresses a **rate of change** between the quantities measured along each axis. In applications of slope, the ratio $\frac{\text{change in } y}{\text{change in } x}$ is symbolized as $\frac{\Delta y}{\Delta x}$. The symbol Δ is the Greek letter **delta** and has come to represent a change in some quantity, and the notation $m = \frac{\Delta y}{\Delta x}$ is read, "slope is equal to the *change in y* over the *change in x*." Interpreting slope as a rate of change has many significant applications in college algebra and beyond.

EXAMPLE 3 ▶ **Using the Slope Formula**

Find the slope of the line through the given points, then use $m = \frac{\Delta y}{\Delta x}$ to find an additional point on the line.

a. (2, 1) and (8, 4) **b.** (−2, 6) and (4, 2)

Solution ▶

a. For $P_1 = (2, 1)$ and $P_2 = (8, 4)$,

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{4 - 1}{8 - 2} = \frac{3}{6} = \frac{1}{2}$$

The slope of this line is $\frac{1}{2}$.

Using $\frac{\Delta y}{\Delta x} = \frac{1}{2}$, we note that y increases 1 unit (the y-value is positive), as x increases 2 units. Since (8, 4) is known to be on the line, the point $(8 + 2, 4 + 1) = (10, 5)$ must also be on the line.

b. For $P_1 = (-2, 6)$ and $P_2 = (4, 2)$,

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{2 - 6}{4 - (-2)} = \frac{-4}{6} = \frac{-2}{3}$$

The slope of this line is $\frac{-2}{3}$.

Using $\frac{\Delta y}{\Delta x} = \frac{-2}{3}$, we note that y decreases 2 units (the y-value is negative), as x increases 3 units. Since (4, 2) is known to be on the line, the point $(4 + 3, 2 - 2) = (7, 0)$ must also be on the line.

Now try Exercises 33 through 40 ▶

CAUTION ▶ When using the slope formula, try to avoid these common errors.

1. The order that the x- and y-coordinates are subtracted must be consistent, since $\frac{y_2 - y_1}{x_2 - x_1} \neq \frac{y_2 - y_1}{x_1 - x_2}$.
2. The vertical change (involving the y-values) always occurs in the numerator: $\frac{y_2 - y_1}{x_2 - x_1} \neq \frac{x_2 - x_1}{y_2 - y_1}$.
3. When x_1 or y_1 is negative, use parentheses when substituting into the formula to prevent confusing the negative sign with the subtraction operation.

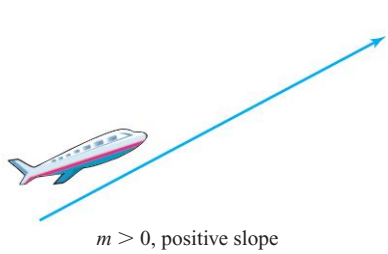
EXAMPLE 4 ▶ **Interpreting the Slope Formula as a Rate of Change**

Jimmy works on the assembly line for an auto parts remanufacturing company. By 9:00 A.M. his group has assembled 29 carburetors. By 12:00 noon, they have completed 87 carburetors. Assuming the relationship is linear, find the slope of the line and discuss its meaning in this context.

Solution ▶ First write the information as ordered pairs using c to represent the carburetors assembled and t to represent time. This gives $(t_1, c_1) = (9, 29)$ and $(t_2, c_2) = (12, 87)$. The slope formula then gives:

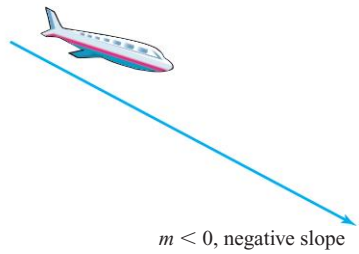
$$\frac{\Delta c}{\Delta t} = \frac{c_2 - c_1}{t_2 - t_1} = \frac{87 - 29}{12 - 9} = \frac{58}{3} \text{ or } 19.\overline{3}$$

Here the slope ratio measures $\frac{\text{carburetors assembled}}{\text{hours}}$, and we see that Jimmy's group can assemble 58 carburetors every 3 hr, or about $19\frac{1}{3}$ carburetors per hour.



WORTHY OF NOTE

Actually, the assignment of (t_1, c_1) to (9, 29) and (t_2, c_2) to (12, 87) was arbitrary. The slope ratio will be the same *as long as the order of subtraction is the same.* In other words, if we reverse this assignment and use $(t_1, c_1) = (12, 87)$ and $(t_2, c_2) = (9, 29)$, we have $m = \frac{29 - 87}{9 - 12} = \frac{-58}{-3} = \frac{58}{3}$.



Now try Exercises 41 through 44 ▶

Positive and Negative Slope

If you've ever traveled by air, you've likely heard the announcement, "Ladies and gentlemen, please return to your seats and fasten your seat belts as we begin our descent." For a time, the descent of the airplane follows a linear path, but the *slope of the line is negative* since the altitude of the plane is decreasing. Positive and negative slopes, as well as the rate of change they represent, are important characteristics of linear graphs. In Example 3(a), the slope was a positive number ($m > 0$) and the line will slope upward from left to right since the y-values are increasing. If $m < 0$ as in Example 3(b), the slope of the line is negative and the line slopes downward as you move left to right since y-values are decreasing.

$m > 0$, positive slope
y-values *increase* from left to right

$m < 0$, negative slope
y-values *decrease* from left to right

EXAMPLE 5 ▶ **Applying Slope as a Rate of Change in Altitude**

At a horizontal distance of 10 mi after take-off, an airline pilot receives instructions to decrease altitude from their current level of 20,000 ft. A short time later, they are 17.5 mi from the airport at an altitude of 10,000 ft. Find the slope ratio for the descent of the plane and discuss its meaning in this context. Recall that 1 mi = 5280 ft.

Solution ▶ Let a represent the altitude of the plane and d its horizontal distance from the airport. Converting all measures to feet, we have $(d_1, a_1) = (52{,}800, 20{,}000)$ and $(d_2, a_2) = (92{,}400, 10{,}000)$, giving

$$\frac{\Delta a}{\Delta d} = \frac{a_2 - a_1}{d_2 - d_1} = \frac{10{,}000 - 20{,}000}{92{,}400 - 52{,}800} = \frac{-10{,}000}{39{,}600} = \frac{-25}{99}$$

Since this slope ratio measures $\frac{\Delta \text{altitude}}{\Delta \text{distance}}$, we note the plane is decreasing 25 ft in altitude for every 99 ft it travels horizontally.

Now try Exercises 45 through 48 ▶

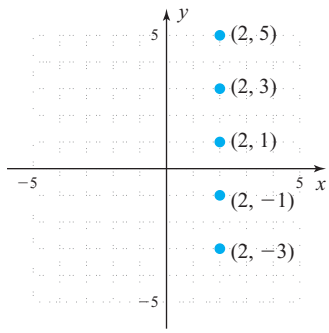
☑ **B.** You've just seen how we can find the slope of a line and interpret it as a rate of change

C. Horizontal Lines and Vertical Lines

Horizontal and vertical lines have a number of important applications, from finding the boundaries of a given graph (the domain and range), to performing certain tests on nonlinear graphs. To better understand them, consider that in *one dimension,* the graph of $x = 2$ is a single point (Figure 1.28), indicating a location on the number line 2 units from zero in the positive direction. In *two dimensions,* the equation $x = 2$ represents **all points** with an x-coordinate of 2. A few of these are graphed in Figure 1.29, but since there are an infinite number, we end up with a solid *vertical line* whose equation is $x = 2$ (Figure 1.30).

Figure 1.28

Figure 1.29



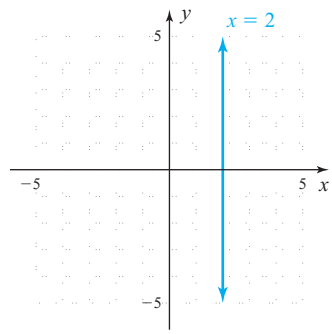


Figure 1.30

WORTHY OF NOTE

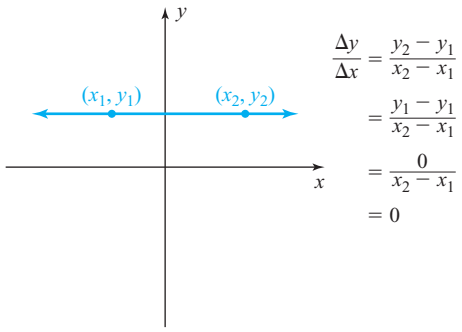
If we write the equation $x = 2$ in the form $ax + by = c$, the equation becomes $x + 0y = 2$, since the original equation has no y-variable. Notice that regardless of the value chosen for y, x will always be 2 and we end up with the set of ordered pairs $(2, y)$, which gives us a vertical line.

The same idea can be applied to horizontal lines. In *two dimensions,* the equation $y = 4$ represents *all points* with a y-coordinate of positive 4, and there are an infinite number of these as well. The result is a solid horizontal line whose equation is $y = 4$. **See Exercises 49 through 54.**

Horizontal Lines	Vertical Lines
The equation of a horizontal line is $y = k$ where $(0, k)$ is the y-intercept.	The equation of a vertical line is $x = h$ where $(h, 0)$ is the x-intercept.

So far, the slope formula has only been applied to lines that were nonhorizontal or nonvertical. So what *is* the slope of a horizontal line? On an intuitive level, we expect that a perfectly level highway would have an incline or slope of zero. In general, for any two points on a horizontal line, $y_2 = y_1$ and $y_2 - y_1 = 0$, giving a slope of $m = \frac{0}{x_2 - x_1} = 0$. For any two points on a vertical line, $x_2 = x_1$ and $x_2 - x_1 = 0$, making the slope ratio undefined: $m = \frac{y_2 - y_1}{0}$ (see Figures 1.31 and 1.32).

Figure 1.31
For any horizontal line, $y_2 = y_1$



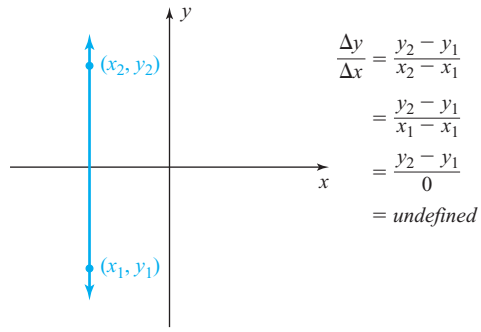


Figure 1.32
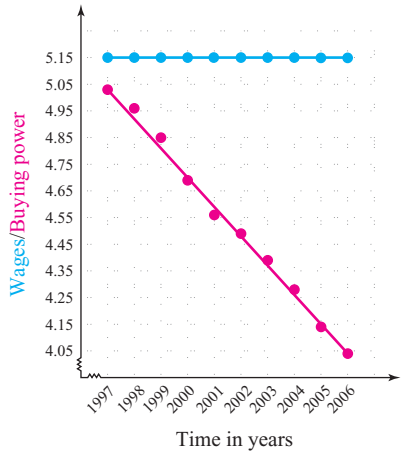
For any vertical line, $x_2 = x_1$

The Slope of a Horizontal Line	The Slope of a Vertical Line
The slope of any horizontal line is zero.	The slope of any vertical line is undefined.

EXAMPLE 6 ▶ Calculating Slopes



The federal minimum wage remained constant from 1997 through 2006. However, the buying power (in 1996 dollars) of these wage earners fell each year due to inflation (see Table 1.3). This decrease in buying power is approximated by the red line shown.

a. Using the data or graph, find the slope of the line segment representing the minimum wage.

b. Select two points on the line representing buying power to approximate the slope of the line segment, and explain what it means in this context.

Table 1.3

Time t (years)	Minimum wage w	Buying power p
1997	5.15	5.03
1998	5.15	4.96
1999	5.15	4.85
2000	5.15	4.69
2001	5.15	4.56
2002	5.15	4.49
2003	5.15	4.39
2004	5.15	4.28
2005	5.15	4.14
2006	5.15	4.04

Solution ▶

a. Since the minimum wage did not increase or decrease from 1997 to 2006, the line segment has slope $m = 0$.

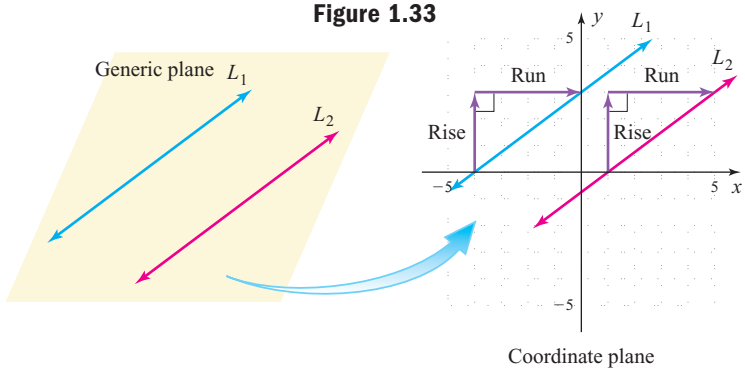
b. The points (1997, 5.03) and (2006, 4.04) from the table appear to be on or close to the line drawn. For buying power p and time t, the slope formula yields:

$$\frac{\Delta p}{\Delta t} = \frac{p_2 - p_1}{t_2 - t_1} = \frac{4.04 - 5.03}{2006 - 1997} = \frac{-0.99}{9} = \frac{-0.11}{1}$$

The buying power of a minimum wage worker decreased by 11¢ per year during this time period.

WORTHY OF NOTE

In the context of lines, try to avoid saying that a horizontal line has "no slope," since it's unclear whether a slope of zero or an undefined slope is intended.



Now try Exercises 55 and 56 ▶

☑ **C.** You've just seen how we can graph horizontal and vertical lines

D. Parallel and Perpendicular Lines

Two lines in the same plane that never intersect are called **parallel lines.** When we place these lines on the coordinate grid, we find that "never intersect" is equivalent to saying "the lines have equal slopes but different y-intercepts." In Figure 1.33, notice the rise and run of each line is identical, and that by counting $\frac{\Delta y}{\Delta x}$ both lines have slope $m = \frac{3}{4}$.

Figure 1.33

Parallel Lines

Given L_1 and L_2 are distinct, nonvertical lines with slopes of m_1 and m_2, respectively.

1. If $m_1 = m_2$, then L_1 is parallel to L_2.
2. If L_1 is parallel to L_2, then $m_1 = m_2$.

In symbols, we write $L_1 \| L_2$.

Any two vertical lines (undefined slope) are parallel.

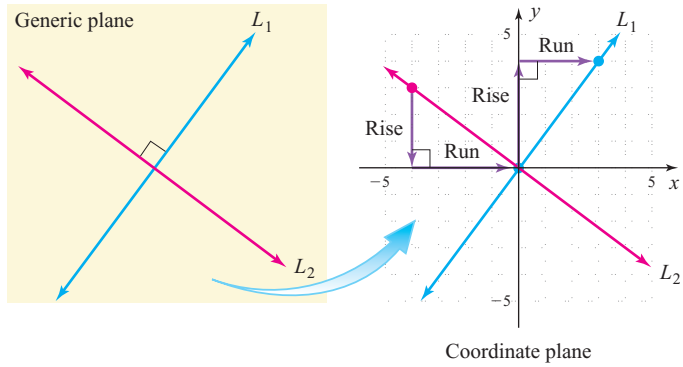
EXAMPLE 7A ▶ Determining Whether Two Lines Are Parallel

Teladango Park has been mapped out on a rectangular coordinate system, with a ranger station at (0, 0). Brendan and Kapi are at coordinates (−24, −18) and have set a direct course for the pond at (11, 10). Caden and Kymani are at (−27, 1) and are heading straight to the lookout tower at (−2, 21). Are they hiking on parallel or nonparallel courses?

Solution ▶ To respond, we compute the slope of each trek across the park.

For Brendan and Kapi:

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{10 - (-18)}{11 - (-24)} = \frac{28}{35} = \frac{4}{5}$$



For Caden and Kymani:

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{21 - 1}{-2 - (-27)} = \frac{20}{25} = \frac{4}{5}$$

Since the slopes are equal, the two groups are hiking on parallel courses.

Two lines in the same plane that intersect at right angles are called **perpendicular lines.** Using the coordinate grid, we note that *intersect at right angles* suggests that *their slopes are negative reciprocals*. While certainly not a proof, notice in Figure 1.34, the ratio $\frac{\text{rise}}{\text{run}}$ for L_1 is $\frac{4}{3}$ and the ratio $\frac{\text{rise}}{\text{run}}$ for L_2 is $\frac{-3}{4}$. Alternatively, we can say their **slopes have a product of −1,** since $m_1 \cdot m_2 = -1$ implies $m_1 = -\frac{1}{m_2}$.

Figure 1.34

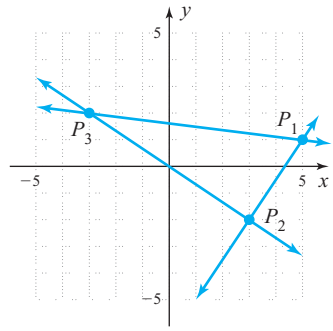
Perpendicular Lines

Given L_1 and L_2 are distinct, nonvertical lines with slopes of m_1 and m_2, respectively.

1. If $m_1 \cdot m_2 = -1$, then L_1 is perpendicular to L_2.
2. If L_1 is perpendicular to L_2, then $m_1 \cdot m_2 = -1$.

In symbols we write $L_1 \perp L_2$.

Any vertical line (undefined slope) is perpendicular to any horizontal line (slope $m = 0$).



We can easily find the slope of a line perpendicular to a second line whose slope is known or can be found—just find the reciprocal and make it negative. For a line with slope $m_1 = -\frac{3}{7}$, any line perpendicular to it will have a slope of $m_2 = \frac{7}{3}$. For $m_1 = -5$, the slope of any line perpendicular would be $m_2 = \frac{1}{5}$.

EXAMPLE 7B ▶ **Determining Whether Two Lines Are Perpendicular**

The three points $P_1 = (5, 1)$, $P_2 = (3, -2)$, and $P_3 = (-3, 2)$ form the vertices of a triangle. Use these points to draw the triangle, then use the slope formula to determine if they form a *right* triangle.

Solution ▶ For a right triangle to be formed, two of the lines through these points must be perpendicular (forming a right angle). From Figure 1.35, it *appears* a right triangle is formed, but we must *verify* that two of the sides are actually perpendicular. Using the slope formula, we have:

Figure 1.35

For P_1 and P_2

$$m_1 = \frac{-2 - 1}{3 - 5} = \frac{-3}{-2} = \frac{3}{2}$$

For P_1 and P_3

$$m_2 = \frac{2 - 1}{-3 - 5} = \frac{1}{-8}$$

For P_2 and P_3

$$m_3 = \frac{2 - (-2)}{-3 - 3} = \frac{4}{-6} = \frac{2}{-3}$$

Since $m_1 \cdot m_3 = -1$, the triangle has a right angle and must be a right triangle.

D. You've just seen how we can identify parallel and perpendicular lines

Now try Exercises 57 through 68 ▶

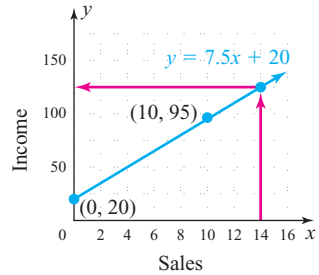
E. Applications of Linear Equations

The graph of a linear equation can be used to help solve many applied problems. If the numbers you're working with are either very small or very large, **scale the axes** appropriately. This can be done by letting each tic mark represent a smaller or larger unit so the data points given will fit on the grid. Also, many applications use only nonnegative values and although points with negative coordinates may be used to graph a line, only ordered pairs in QI can be meaningfully interpreted.

EXAMPLE 8 ▶ **Applying a Linear Equation Model—Commission Sales**

Use the information given to create a linear equation model in two variables, then graph the line and answer the question posed:

A salesperson gets a daily $20 meal allowance plus $7.50 for every item she sells. How many sales are needed for a daily income of $125?



Verify your answer by graphing the line on a calculator and using the TRACE feature.

Algebraic Solution ▶ Let x represent sales and y represent income. This gives

verbal model: Daily income (y) equals \$7.5 per sale (x) + \$20 for meals

equation model: $y = 7.5x + 20$

Using $x = 0$ and $x = 10$, we find (0, 20) and (10, 95) are points on this line and these are used to sketch the graph. From the graph, it appears that 14 sales are needed to generate a daily income of \$125.00.

Since daily income is given as \$125, we substitute 125 for y and solve for x.

$$125 = 7.5x + 20 \quad \text{substitute 125 for } y$$
$$105 = 7.5x \quad \text{subtract 20}$$
$$14 = x \quad \text{divide by 7.5}$$

Graphical Solution ▶ Begin by entering the equation $y = 7.5x + 20$ on the Y= screen, recognizing that in this context, both the input and output values must be positive. Reasoning the 10 sales will net \$95 (less than \$125) and 20 sales will net \$170 (more than \$125), we set the viewing WINDOW as shown in Figure 1.36. We can then GRAPH the equation and use the TRACE feature to estimate the number of sales needed. The result shows that income is close to \$125 when x is close to 14 (Figure 1.37). In addition to letting us trace along a graph, the TRACE option enables us to evaluate the equation at specific points. Simply entering the number "14" causes the calculator to accept 14 as the desired input (Figure 1.38), and after pressing ENTER, it verifies that (14, 125) is indeed a point on the graph (Figure 1.39).

Now try Exercises 71 through 80 ▶

1.2 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. To find the x-intercept of a line, substitute _____ for y and solve for x. To find the y-intercept, substitute _____ for x and solve for y.
2. The slope formula is $m =$ _____ $=$ _____, and indicates a rate of change between the x- and y-variables.
3. If $m < 0$, the slope of the line is _____ and the line slopes _____ from left to right.
4. The slope of a horizontal line is _____, the slope of a vertical line is _____, and the slopes of two parallel lines are _____.
5. Discuss/Explain If $m_1 = 2.1$ and $m_2 = 2.01$, will the lines intersect? If $m_1 = \frac{2}{3}$ and $m_2 = -\frac{2}{3}$, are the lines perpendicular?
6. Discuss/Explain the relationship between the slope formula, the Pythagorean theorem, and the distance formula. Include several illustrations.

▶ DEVELOPING YOUR SKILLS

Create a table of values for each equation and sketch the graph.

7. $2x + 3y = 6$

x	y

8. $-3x + 5y = 10$

x	y

9. $y = \frac{3}{2}x + 4$

x	y

10. $y = \frac{5}{3}x - 3$

x	y

11. If you completed Exercise 9, verify that $(-3, -0.5)$ and $(\frac{1}{2}, \frac{19}{4})$ also satisfy the equation given. Do these points appear to be on the graph you sketched?

12. If you completed Exercise 10, verify that $(-1.5, -5.5)$ and $(\frac{11}{2}, \frac{37}{6})$ also satisfy the equation given. Do these points appear to be on the graph you sketched?

Graph the following equations using the intercept method. Plot a third point as a check.

13. $3x + y = 6$

14. $-2x + y = 12$

15. $5y - x = 5$

16. $-4y + x = 8$

17. $-5x + 2y = 6$

18. $3y + 4x = 9$

19. $2x - 5y = 4$

20. $-6x + 4y = 8$

21. $2x + 3y = -12$

22. $-3x - 2y = 6$

23. $y = -\frac{1}{2}x$

24. $y = \frac{2}{3}x$

25. $y - 25 = 50x$

26. $y + 30 = 60x$

27. $y = -\frac{2}{5}x - 2$

28. $y = \frac{3}{4}x + 2$

29. $2y - 3x = 0$

30. $y + 3x = 0$

31. $3y + 4x = 12$

32. $-2x + 5y = 8$

Compute the slope of the line through the given points, then graph the line and use $m = \frac{\Delta y}{\Delta x}$ to find two additional points on the line. Answers may vary.

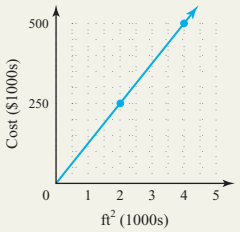
33. $(3, 5), (4, 6)$

34. $(-2, 3), (5, 8)$

35. $(10, 3), (4, -5)$

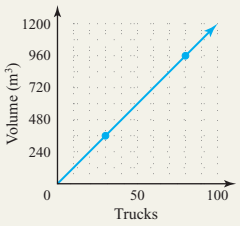
36. $(-3, -1), (0, 7)$

37. $(1, -8), (-3, 7)$



38. $(-5, 5), (0, -5)$

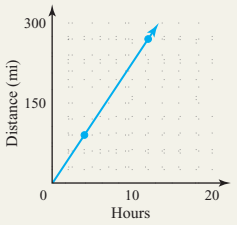
39. $(-3, 6), (4, 2)$



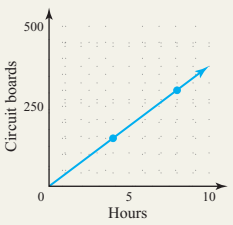
40. $(-2, -4), (-3, -1)$

41. The graph shown models the relationship between the cost of a new home and the size of the home in square feet. (a) Determine the slope of the line and interpret what the slope ratio means in this context and (b) estimate the cost of a 3000 ft^2 home.

Exercise 41



Exercise 42



42. The graph shown models the relationship between the volume of garbage that is dumped in a landfill and the number of commercial garbage trucks that enter the site. (a) Determine the slope of the line and interpret what the slope ratio means in this context and (b) estimate the number of trucks entering the site daily if 1000 m^3 of garbage is dumped per day.

43. The graph shown models the relationship between the distance of an aircraft carrier from its home port and the number of hours since departure. (a) Determine the slope of the line and interpret what the slope ratio means in this context and (b) estimate the distance from port after 8.25 hours.

Exercise 43

Exercise 44

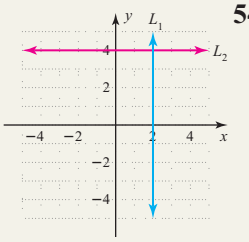
44. The graph shown models the relationship between the number of circuit boards that have been assembled at a factory and the number of hours since starting time. (a) Determine the slope of the line and interpret what the slope ratio means in this context and (b) estimate how many hours the factory has been running if 225 circuit boards have been assembled.

45. Height and weight: While there are many exceptions, numerous studies have shown a close relationship between an average height and average weight. Suppose a person 70 in. tall weighs 165 lb, while a person 64 in. tall weighs 142 lb. Assuming the relationship is linear, (a) find the slope of the line and discuss its meaning in this context and (b) determine how many pounds are added for each inch of height.

46. Rate of climb: Shortly after takeoff, a plane increases altitude at a constant (linear) rate. In 5 min the altitude is 10,000 ft. Fifteen minutes after takeoff, the plane has reached its cruising altitude of 32,000 ft. (a) Find the slope of the line and discuss its meaning in this context and (b) determine how long it takes the plane to climb from 12,200 ft to 25,400 ft.

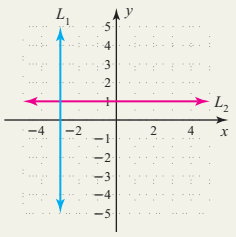
47. Sewer line slope: Fascinated at how quickly the plumber was working, Ryan watched with great interest as the new sewer line was laid from the house to the main line, a distance of 48 ft. At the edge of the house, the sewer line was 6 in. under ground. If the plumber tied in to the main line at a depth of 18 in., what is the slope of the (sewer) line? What does this slope indicate?

48. Slope (pitch) of a roof: A contractor goes to a lumber yard to purchase some trusses (the triangular frames) for the roof of a house. Many sizes are available, so the contractor takes some measurements to ensure the roof will have the desired slope. In one case, the height of the truss (base to ridge) was 4 ft, with a width of 24 ft (eave to eave). Find the slope of the roof if these trusses are used. What does this slope indicate?



Graph each line using two or three ordered pairs that satisfy the equation.

49. $x = -3$ **50.** $y = 4$



51. $x = 2$ **52.** $y = -2$

Write the equation for each line L_1 and L_2 shown. Specifically state their point of intersection.

53.

54.

55. Supreme Court justices: The table given shows the total number of justices j sitting on the Supreme Court of the United States for selected time periods t (in decades), along with the number of nonmale, nonwhite justices n for the same years. (a) Use the data to graph the linear relationship between t and j, then determine the slope of the line and discuss its meaning in this context. (b) Use the data to graph the linear relationship between t and n, then determine the slope of the line and discuss its meaning.

Exercise 55

Time t ($1960 \rightarrow 0$)	Justices j	Nonwhite, nonmale n
0	9	0
10	9	1
20	9	2
30	9	3
40	9	4
50	9	5

56. Boiling temperature: The table shown gives the boiling temperature t of water as related to the altitude h. Use the data to graph the linear relationship between h and t, then determine the slope of the line and discuss its meaning in this context.

Exercise 56

Altitude h (ft)	Boiling Temperature t (°F)
0	212.0
1000	210.2
2000	208.4
3000	206.6
4000	204.8
5000	203.0
6000	201.2

Two points on L_1 and two points on L_2 are given. Use the slope formula to determine if lines L_1 and L_2 are parallel, perpendicular, or neither.

57. L_1: $(-2, 0)$ and $(0, 6)$
L_2: $(1, 8)$ and $(0, 5)$

58. L_1: $(1, 10)$ and $(-1, 7)$
L_2: $(0, 3)$ and $(1, 5)$

59. L_1: $(-3, -4)$ and $(0, 1)$
L_2: $(0, 0)$ and $(-4, 4)$

60. L_1: $(6, 2)$ and $(8, -2)$
L_2: $(5, 1)$ and $(3, 0)$

61. L_1: $(6, 3)$ and $(8, 7)$
L_2: $(7, 2)$ and $(6, 0)$

62. L_1: $(-5, -1)$ and $(4, 4)$
L_2: $(4, -7)$ and $(8, 10)$

In Exercises 63 to 68, three points that form the vertices of a triangle are given. Use the points to draw the triangle, then use the slope formula to determine if any of the triangles are right triangles. Also see Exercises 43–48 in Section 1.1.

66. $(5, 2), (0, -3), (4, -4)$

67. $(-3, 2), (-1, 5), (-6, 4)$

68. $(0, 0), (-5, 2), (2, -5)$

▶ WORKING WITH FORMULAS

69. Human life expectancy: $L = 0.15T + 73.7$

In the United States, the average life expectancy has been steadily increasing over the years due to better living conditions and improved medical care. This relationship is modeled by the formula shown, where L is the average life expectancy and T is number of years since 1980. (a) What was the life expectancy in the year 2010? (b) In what year will average life expectancy reach 79 yr?

70. Interest earnings: $100I = 35{,}000T$

If \$5000 dollars is invested in an account paying 7% simple interest, the amount of interest earned is given by the formula shown, where I is the interest and T is the time in years. Begin by solving the formula for I. (a) How much interest is earned in 5 yr? (b) How much is earned in 10 yr? (c) Use the two points (5 yr, interest) and (10 yr, interest) to calculate the slope of this line. What do you notice?

▶ APPLICATIONS

Use the information given to build a linear equation model, then use the equation to respond. For exercises 71 to 74, develop both an algebraic and a graphical solution.

71. Business depreciation: A business purchases a copier for \$8500 and anticipates it will depreciate in value \$1250 per year.

a. What is the copier's value after 4 yr of use?

b. How many years will it take for this copier's value to decrease to \$2250?

72. Baseball card value: After purchasing an autographed baseball card for \$85, its value increases by \$1.50 per year.

a. What is the card's value 7 yr after purchase?

b. How many years will it take for this card's value to reach \$100?

73. Water level: During a long drought, the water level in a local lake decreased at a rate of 3 in. per month. The water level before the drought was 300 in.

a. What was the water level after 9 months of drought?

b. How many months will it take for the water level to decrease to 20 ft?

74. Gas mileage: When empty, a large dump-truck gets about 15 mi per gallon. It is estimated that for each 3 tons of cargo it hauls, gas mileage decreases by $\frac{3}{4}$ mi per gallon.

a. If 10 tons of cargo is being carried, what is the truck's mileage?

b. If the truck's mileage is down to 10 mi per gallon, how much weight is it carrying?

75. Parallel/nonparallel roads: Aberville is 38 mi north and 12 mi west of Boschertown, with a straight "farm and machinery" road (FM 1960) connecting the two cities. In the next county, Crownsburg is 30 mi north and 9.5 mi west of Dower, and these cities are likewise connected by a straight road (FM 830). If the two roads continued indefinitely in both directions, would they intersect at some point?

76. Perpendicular/nonperpendicular course headings: Two shrimp trawlers depart Charleston Harbor at the same time. One heads for the shrimping grounds located 12 mi north and 3 mi east of the harbor. The other heads for a point 2 mi south and 8 mi east of the harbor. Assuming the harbor is at (0, 0), are the routes of the trawlers perpendicular? If so, how far apart are the boats when they reach their destinations (to the nearest one-tenth mi)?

77. Cost of college: For the years 2000 to 2008, the cost of tuition and fees per semester (in constant dollars) at a public 4-yr college can be approximated by the equation $y = 386x + 3500$, where y represents the cost in dollars and $x = 0$ represents the year 2000. Use the equation to find: (a) the cost of tuition and fees in 2010 and (b) the year this cost will exceed \$9000.

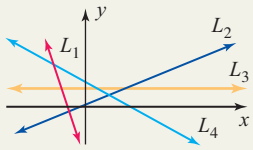
Source: The College Board

78. Female physicians: In 1960 only about 7% of physicians were female. Soon after, this percentage began to grow dramatically. For the years 1990 to 2000, the percentage of physicians that were female can be approximated by the equation $y = 0.6x + 18.1$, where y represents the percentage (as a whole number) and $x = 0$ represents the year 1990. Use the equation to find: (a) the percentage of physicians that were female in 2000 and (b) the projected year this percentage would have exceeded 30%.

Source: American Journal of Public Health

79. Decrease in smokers: For the years 1990 to 2000, the percentage of the U.S. adult population who were smokers can be approximated by the equation $y = \frac{-13}{25}x + 28.7$, where y represents the percentage of smokers (as a whole number) and $x = 0$ represents 1990. Use the equation to find: (a) the percentage of adults who smoked in the year 2005 and (b) the year the percentage of smokers is projected to fall below 15%.

Source: WebMD



80. Temperature and cricket chirps: Biologists have found a strong relationship between temperature and the number of times a cricket chirps. This is modeled by the equation $T = \frac{1}{4}N + 40$, where N is the number of times the cricket chirps per minute and T is the temperature in Fahrenheit. Use the equation to find: (a) the outdoor temperature if the cricket is chirping 48 times per minute and (b) the number of times a cricket chirps if the temperature is 70°.

▶ EXTENDING THE CONCEPT

81. If the lines $4y + 2x = -5$ and $3y + ax = -2$ are perpendicular, what is the value of a?

82. Let m_1, m_2, m_3, and m_4 be the slopes of lines L_1, L_2, L_3, and L_4, respectively. Which of the following statements is true?

a. $m_4 < m_1 < m_3 < m_2$
b. $m_3 < m_2 < m_4 < m_1$
c. $m_3 < m_4 < m_2 < m_1$
d. $m_1 < m_3 < m_4 < m_2$
e. $m_1 < m_4 < m_3 < m_2$

83. An *arithmetic sequence* is a sequence of numbers where each successive term is found by adding a fixed constant, called the common difference d, to the preceding term. For instance 3, 7, 11, 15, . . . is an arithmetic sequence with $d = 4$. The formula for the "nth term" t_n of an arithmetic sequence is a linear equation of the form $t_n = t_1 + (n - 1)d$, where d is the common difference and t_1 is the first term of the sequence. Use the equation to find the term specified for each sequence.

a. 2, 9, 16, 23, 30, . . . ; 21st term
b. 7, 4, 1, −2, −5, . . . ; 31st term
c. 5.10, 5.25, 5.40, 5.55, . . . ; 27th term
d. $\frac{3}{2}, \frac{9}{4}, 3, \frac{15}{4}, \frac{9}{2}, \ldots$; 17th term

▶ MAINTAINING YOUR SKILLS

84. **(1.1)** Name the center and radius of the circle defined by $(x - 3)^2 + (y + 4)^2 = 169$

85. **(Appendix A.6)** Compute the sum and product indicated:

a. $\sqrt{20} + 3\sqrt{45} - \sqrt{5}$
b. $(3 + \sqrt{5})(3 - \sqrt{5})$

86. **(Appendix A.4)** Solve the equation by factoring, then check the result(s) using substitution:
$12x^2 - 44x - 45 = 0$

87. **(Appendix A.5)** Factor the following polynomials completely:

a. $x^3 - 3x^2 - 4x + 12$
b. $x^2 - 23x - 24$
c. $x^3 - 125$

1.3 Functions, Function Notation, and the Graph of a Function

LEARNING OBJECTIVES

In Section 1.3 you will see how we can:

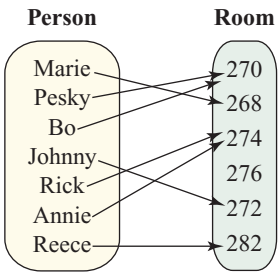
- ❑ **A.** Distinguish the graph of a function from that of a relation
- ❑ **B.** Determine the domain and range of a function
- ❑ **C.** Use function notation and evaluate functions
- ❑ **D.** Read and interpret information given graphically

In this section we introduce one of the most central ideas in mathematics—the concept of a function. Functions can model the cause-and-effect relationship that is so important to using mathematics as a decision-making tool. In addition, the study will help to unify and expand on many ideas that are already familiar.

A. Functions and Relations

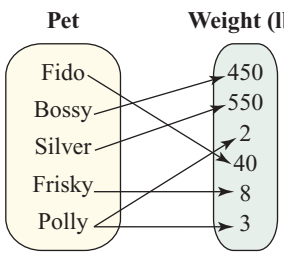
There is a special type of relation that merits further attention. A **function** is a relation where each element of the domain corresponds to exactly one element of the range. In other words, for each first coordinate or input value, there is only one possible second coordinate or output.

Functions



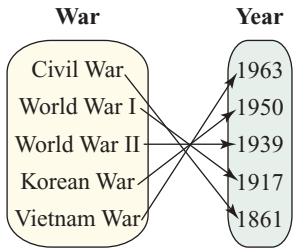
A *function* is a relation that pairs each element from the *domain* with exactly one element from the *range*.

If the relation is defined by a mapping, we need only check that each element of the domain is mapped to exactly one element of the range. This is indeed the case for the mapping $P \rightarrow B$ from Figure 1.1 (page 2), where we saw that each person corresponded to only one birthday, and that it was impossible for one person to be born on two different days. For the relation $x = |y|$ shown in Figure 1.6 (page 4), each element of the domain except zero is paired with *more than one* element of the range. The relation $x = |y|$ is *not* a function.



EXAMPLE 1 ▶ Determining Whether a Relation is a Function

Three different relations are given in mapping notation below. Determine whether each relation is a function.



a.

b.

c.

Solution ▶

Relation (a) is a function, since each person corresponds to exactly one room. This relation pairs math professors with their respective office numbers. Notice that while two people can be in one office, it is impossible for one person to physically be in two different offices.

Relation (b) is not a function, since we cannot tell whether Polly the Parrot weighs 2 lb or 3 lb (one element of the domain is mapped to two elements of the range).

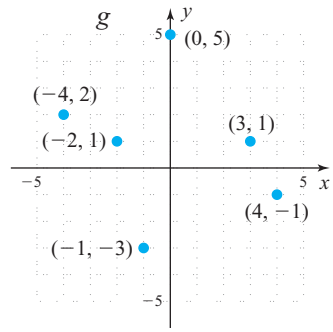
Relation (c) is a function, where each major war is paired with the year it began.

Now try Exercises 7 through 10 ▶

If the relation is pointwise-defined or given as a set of individual and distinct plotted points, we need only check that no two points have the same first coordinate with a different second coordinate. This gives rise to an alternative definition for a function.

Functions (Alternate Definition)

A function is a set of ordered pairs (x, y), in which each first component is paired with only one second component.



EXAMPLE 2 ▶ **Identifying Functions**

Two relations named f and g are given; f is pointwise-defined (stated as a set of ordered pairs), while g is given as a set of plotted points. Determine whether each is a function.

f: $(-3, 0)$, $(1, 4)$, $(2, -5)$, $(4, 2)$, $(-3, -2)$, $(3, 6)$, $(0, -1)$, $(4, -5)$, and $(6, 1)$

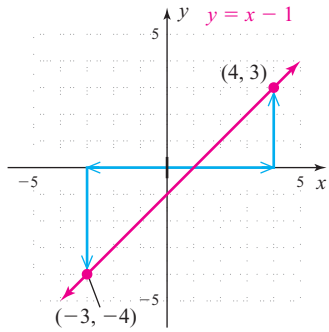
Solution ▶ The relation f is not a function, since -3 is paired with two different outputs: $(-3, 0)$ and $(-3, -2)$.

The relation g shown in the figure *is* a function. Each input corresponds to exactly one output, otherwise one point would be directly above the other and have the same first coordinate.

Now try Exercises 11 through 18 ▶

The graphs of $y = x - 1$ and $x = |y|$ from Section 1.1 offer additional insight into the definition of a function. Figure 1.40 shows the line $y = x - 1$ with emphasis on the plotted points $(4, 3)$ and $(-3, -4)$. The vertical movement shown from the x-axis to a point on the graph illustrates *the pairing of a given x-value with one related y-value*. Note the vertical line shows *only one related y-value* ($x = 4$ is paired with only $y = 3$). Figure 1.41 gives the graph of $x = |y|$, highlighting the points $(4, 4)$ and $(4, -4)$. The vertical movement shown here branches in two directions, associating one x-value with more than one y-value. This shows the relation $y = x - 1$ is also a function, while the relation $x = |y|$ is not.

Figure 1.40



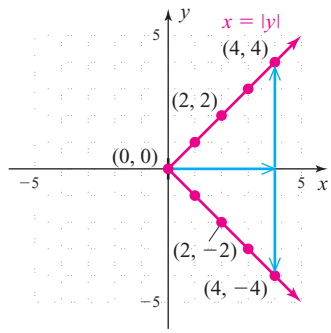


Figure 1.41

This "vertical connection" of a location on the x-axis to a point on the graph can be generalized into a **vertical line test** for functions.

Vertical Line Test

A given graph is the graph of a function, if and only if every vertical line intersects the graph in at most one point.

Applying the test to the graph in Figure 1.40 helps to illustrate that the graph of any nonvertical line must be the graph of a function, as is the graph of any pointwise-defined relation where no x-coordinate is repeated. Compare the relations f and g from Example 2.

EXAMPLE 3 ▶ **Using the Vertical Line Test**

Use the vertical line test to determine if any of the relations shown (from Section 1.1) are functions.

Solution ▶ Visualize a vertical line on each coordinate grid (shown in solid blue), then mentally shift the line to the left and right as shown in Figures 1.42, 1.43, and 1.44 (dashed lines). In Figures 1.42 and 1.43, every vertical line intersects the graph only once, indicating both $y = x^2 - 2x$ and $y = \sqrt{9 - x^2}$ are functions. In Figure 1.44, a vertical line intersects the graph twice for any $x > 0$ [for instance, both (4, 2) and (4, −2) are on the graph]. The relation $x = y^2$ is not a function.

Figure 1.42

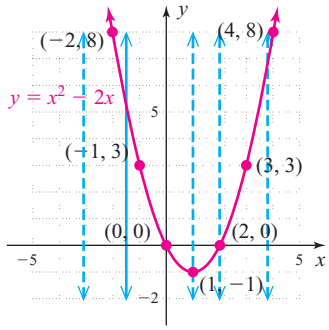

Figure 1.43

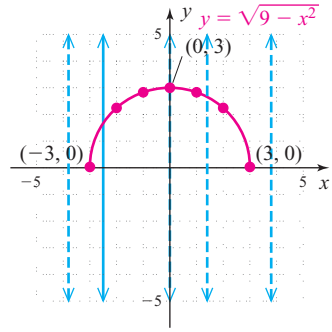

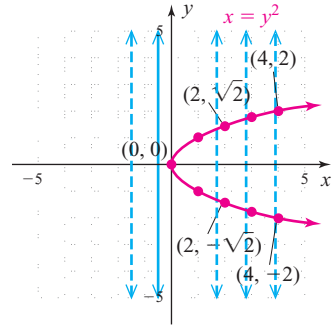

Figure 1.44

Now try Exercises 19 through 30 ▶

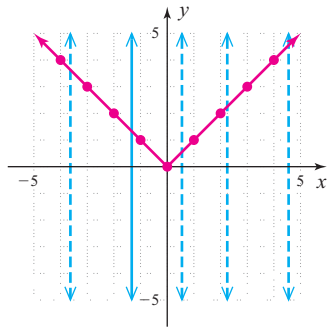
EXAMPLE 4 ▶ **Using the Vertical Line Test**

Use a table of values to graph the relations defined by

a. $y = |x|$ **b.** $y = \sqrt{x}$,

then use the vertical line test to determine whether each relation is a function.

Solution ▶ **a.** For $y = |x|$, using input values from $x = -4$ to $x = 4$ produces the following table and graph (Figure 1.45). Note the result is a V-shaped graph that "opens upward." The point (0, 0) of this absolute value graph is called the **vertex.** Since any vertical line will intersect the graph in at most one point, this is the graph of a function.



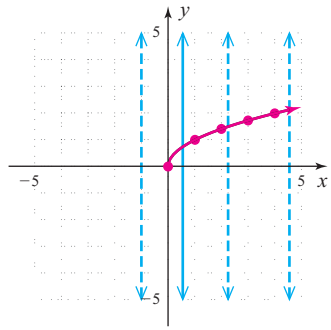
WORTHY OF NOTE

For relations and functions, a good way to view the distinction is to consider a mail carrier. It is possible for the carrier to put more than one letter into the same mailbox (more than one x going to the same y), but quite impossible for the carrier to place the same letter in two different boxes (one x going to two y's).

$y = |x|$

x	$y = \lvert x \rvert$
−4	4
−3	3
−2	2
−1	1
0	0
1	1
2	2
3	3
4	4

Figure 1.45



b. For $y = \sqrt{x}$, values less than zero do not produce a real number, so our graph actually begins at (0, 0) (see Figure 1.46). Completing the table for nonnegative values produces the graph shown, which appears to rise to the right and remains in the first quadrant. Since any vertical line will intersect this graph in at most one place, $y = \sqrt{x}$ is also a function.

$y = \sqrt{x}$

x	$y = \sqrt{x}$
0	0
1	1
2	$\sqrt{2} \approx 1.4$
3	$\sqrt{3} \approx 1.7$
4	2

Figure 1.46

A. You've just seen how we can distinguish the graph of a function from that of a relation

Now try Exercises 31 through 34 ▶

B. The Domain and Range of a Function

Vertical Boundary Lines and the Domain

In addition to its use as a graphical test for functions, a vertical line can help determine the domain of a function from its graph. For the graph of $y = \sqrt{x}$ (Figure 1.46), a vertical line will not intersect the graph until $x = 0$, and then will intersect the graph for all values $x \geq 0$ (showing the function is defined for these values). These **vertical boundary lines** indicate the domain is $x \geq 0$.

Instead of using a simple inequality to write the domain and range, we will often use (1) a form of **set notation,** (2) a **number line** graph, or (3) **interval notation.** Interval notation is a symbolic way of indicating a selected interval of the real numbers. When a number acts as the **boundary point** for an interval (also called an **endpoint**), we use a left bracket "[" or a right bracket "]" to indicate **inclusion** of the endpoint. If the boundary point is **not included,** we use a left parenthesis "(" or right parenthesis ")."

WORTHY OF NOTE

On a number line, some texts will use an open dot "○" to mark the location of an endpoint that is not included, and a closed dot "•" for an included endpoint.

EXAMPLE 5 ▶ **Using Notation to State the Domain and Range**

Model the given phrase using the correct inequality symbol. Then state the result in set notation, graphically, and in interval notation: "The set of real numbers greater than or equal to 1."

Solution ▶ Let n represent the number: $n \geq 1$.

- Set notation: $\{n \mid n \geq 1\}$
- Graph: 

- Interval notation: $n \in [1, \infty)$

WORTHY OF NOTE

Since infinity is really a *concept* and not a number, it is *never included* (using a bracket) as an endpoint for an interval.

Now try Exercises 35 through 50 ▶

The "$\in$" symbol says the number n is *an element of the set or interval* given. The "∞" symbol represents positive infinity and indicates the interval continues forever to the right. Note that the endpoints of an interval must occur in the same order as on the number line *(smaller value on the left; larger value on the right)*.

A short summary of other possibilities is given here for any real number x. Many variations are possible.

Conditions ($a < b$)	Set Notation	Number Line	Interval Notation
x is greater than k	$\{x \mid x > k\}$		$x \in (k, \infty)$
x is less than or equal to k	$\{x \mid x \leq k\}$		$x \in (-\infty, k]$
x is less than b and greater than a	$\{x \mid a < x < b\}$		$x \in (a, b)$
x is less than b and greater than or equal to a	$\{x \mid a \leq x < b\}$		$x \in [a, b)$
x is less than a or x is greater than b	$\{x \mid x < a$ or $x > b\}$		$x \in (-\infty, a) \cup (b, \infty)$

For the graph of $y = |x|$ (Figure 1.45), a vertical line will intersect the graph (or its infinite extension) for *all values* of x, and the domain is $x \in (-\infty, \infty)$. Using vertical lines in this way also affirms the domain of $y = x - 1$ (Section 1.1, Figure 1.5) is $x \in (-\infty, \infty)$ while the domain of the relation $x = |y|$ (Section 1.1, Figure 1.6) is $x \in [0, \infty)$.

Range and Horizontal Boundary Lines

The range of a relation can be found using a **horizontal "boundary line,"** since it will associate a value on the y-axis with a point on the graph (if it exists). Simply visualize a horizontal line and move the line up or down until you determine the graph will always intersect the line, or will no longer intersect the line. This will give you the boundaries of the range. Mentally applying this idea to the graph of $y = \sqrt{x}$ (Figure 1.46) shows the range is $y \in [0, \infty)$. Although shaped very differently, a horizontal boundary line shows the range of $y = |x|$ (Figure 1.45) is also $y \in [0, \infty)$.

EXAMPLE 6 ▶ **Determining the Domain and Range of a Function**

Use a table of values to graph the functions defined by

a. $y = x^2$ **b.** $y = \sqrt[3]{x}$

Then use boundary lines to determine the domain and range of each.

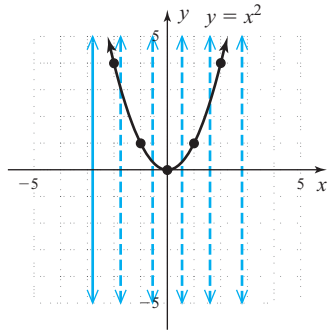
Solution ▶

a. For $y = x^2$, it seems convenient to use inputs from $x = -3$ to $x = 3$, producing the following table and graph. Note the result is a basic parabola that "opens upward" (both ends point in the positive y direction), with a vertex at $(0, 0)$. Figure 1.47 shows a vertical line will intersect the graph or its extension anywhere it is placed. The domain is $x \in (-\infty, \infty)$. Figure 1.48 shows a horizontal line will intersect the graph only for values of y that are greater than or equal to 0. The range is $y \in [0, \infty)$.

Squaring Function

x	$y = x^2$
-3	9
-2	4
-1	1
0	0
1	1
2	4
3	9

Figure 1.47



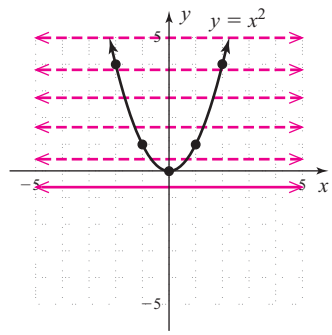


Figure 1.48

b. For $y = \sqrt[3]{x}$, we select points that are perfect cubes where possible, then a few others to round out the graph. The resulting table and graph are shown. Notice there is a "pivot point" at $(0, 0)$ called a **point of inflection,** and the ends of the graph point in opposite directions. Figure 1.49 shows a vertical line will intersect the graph or its extension anywhere it is placed. Figure 1.50 shows a horizontal line will likewise always intersect the graph. The domain is $x \in (-\infty, \infty)$, and the range is $y \in (-\infty, \infty)$.

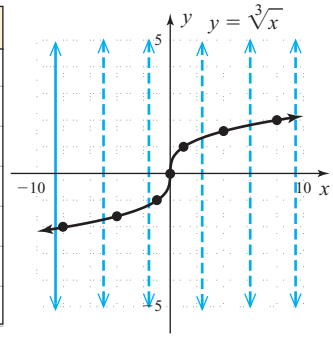

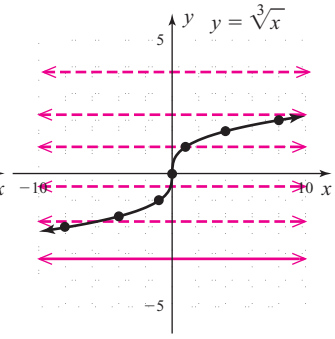

Figure 1.50

Now try Exercises 51 through 62 ▶

Implied Domains

When stated in equation form, the domain of a function is implicitly given by the expression used to define it, since the expression will dictate what input values are allowed. The **implied domain** is the set of all real numbers for which the function represents a real number. If the function involves a rational expression, the domain will exclude any input that causes a denominator of zero, since division by zero is undefined. If the function involves a square root expression, the domain will exclude inputs that create a negative radicand, since $\sqrt{A}$ represents a real number only when $A \geq 0$.

EXAMPLE 7 ▶ **Determining Implied Domains**

State the domain of each function using interval notation.

a. $y = \dfrac{3}{x+2}$ **b.** $y = \sqrt{2x+3}$

c. $y = \dfrac{x-1}{x^2-9}$ **d.** $y = x^2 - 5x + 7$

Solution ▶

a. By inspection, we note an x-value of -2 results in a zero denominator and must be excluded. The domain is $x \in (-\infty, -2) \cup (-2, \infty)$.

b. Since the radicand must be nonnegative, we solve the inequality $2x + 3 \geq 0$, giving $x \geq \frac{-3}{2}$. The domain is $x \in [\frac{-3}{2}, \infty)$.

c. To prevent division by zero, inputs of -3 and 3 must be excluded (set $x^2 - 9 = 0$ and solve by factoring). The domain is $x \in (-\infty, -3) \cup (-3, 3) \cup (3, \infty)$. Note that $x = 1$ *is in the domain* since $\frac{0}{-8} = 0$ is defined. See Figure 1.51, where $Y_1 = \dfrac{X-1}{X^2-9}$.

d. Since squaring a number and multiplying a number by a constant are defined for all real numbers, the domain is $x \in (-\infty, \infty)$.

Figure 1.51

Now try Exercises 63 through 80 ▶

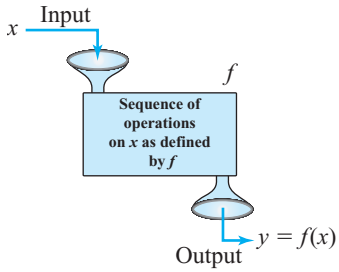
EXAMPLE 8 ▶ **Determining Implied Domains**

Determine the domain of each function:

a. $y = \sqrt{\dfrac{7}{x+3}}$ **b.** $y = \dfrac{2x}{\sqrt{4x+5}}$

Solution ▶

a. For $y = \sqrt{\dfrac{7}{x+3}}$, we must have $\dfrac{7}{x+3} \geq 0$ (for the radicand) **and** $x + 3 \neq 0$ (for the denominator). Since the numerator is *always* positive, we need $x + 3 > 0$, which gives $x > -3$. The domain is $x \in (-3, \infty)$.



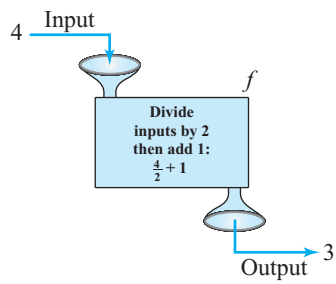
b. For $y = \dfrac{2x}{\sqrt{4x+5}}$, we must have $4x + 5 \geq 0$ **and** $\sqrt{4x+5} \neq 0$. This shows we need $4x + 5 > 0$, so $x > \frac{-5}{4}$. The domain is $x \in (\frac{-5}{4}, \infty)$.

Now try Exercises 81 through 96 ▶

☑ **B.** You've just seen how we can determine the domain and range of a function

C. Function Notation

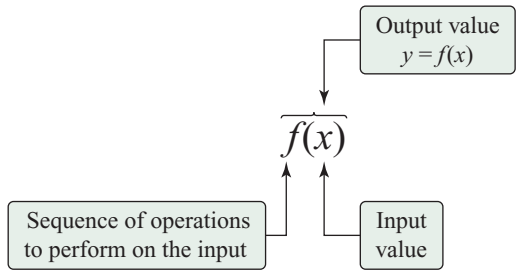
Figure 1.52



In our study of functions, you've likely noticed that the relationship between input and output values is an important one. To highlight this fact, think of a function as a simple machine, which can *process inputs* using a stated sequence of operations, then deliver a single output. The inputs are x-values, a program we'll name f performs the operations on x, and y is the resulting output (see Figure 1.52). Once again we see that "the value of y depends on the value of x," or simply "y is a function of x." Notationally, we write "y is a function of x" as $y = f(x)$ using **function notation.** You are already familiar with letting a variable represent a number. Here we do something quite different, as the letter f is used to represent *a sequence of operations to be performed on* x. Consider the function $y = \dfrac{x}{2} + 1$, which we'll now write as $f(x) = \dfrac{x}{2} + 1$ [since $y = f(x)$].

In words the function says, "divide inputs by 2, then add 1." To evaluate the function at $x = 4$ (Figure 1.53) we have:

input 4 input 4



$$f(x) = \frac{x}{2} + 1$$
$$f(4) = \frac{4}{2} + 1$$
$$= 2 + 1$$
$$= 3$$

Figure 1.53

Function notation enables us to summarize the three most important aspects of a function using a single expression, as shown in Figure 1.54.

Figure 1.54

Instead of saying, ". . . when $x = 4$, the value of the function is 3," we simply say "f of 4 is 3," or write $f(4) = 3$. Note that the ordered pair $(4, 3)$ is equivalent to $(4, f(4))$.

CAUTION ▶ Although $f(x)$ is the favored notation for a "function of x," other letters can also be used. For example, $g(x)$ and $h(x)$ also denote functions of x, where g and h represent different sequences of operations on the x-inputs. It is also important to remember that these represent *function values* and not the product of two variables: $f(x) \neq f \cdot (x)$.

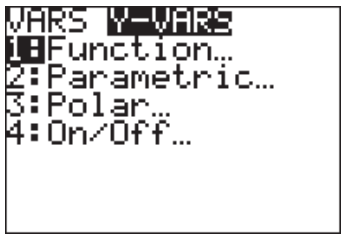
EXAMPLE 9 ▶ **Evaluating a Function**

Given $f(x) = -2x^2 + 4x$, find

a. $f(-2)$ **b.** $f\left(\frac{7}{2}\right)$ **c.** $f(2a)$ **d.** $f(a + 1)$

Solution ▶

a.
$$f(x) = -2x^2 + 4x$$
$$f(-2) = -2(-2)^2 + 4(-2)$$
$$= -8 + (-8) = -16$$



b.
$$f(x) = -2x^2 + 4x$$
$$f\left(\frac{7}{2}\right) = -2\left(\frac{7}{2}\right)^2 + 4\left(\frac{7}{2}\right)$$
$$= \frac{-49}{2} + 14 = \frac{-21}{2} \text{ or } -10.5$$

c.
$$f(x) = -2x^2 + 4x$$
$$f(2a) = -2(2a)^2 + 4(2a)$$
$$= -2(4a^2) + 8a$$
$$= -8a^2 + 8a$$

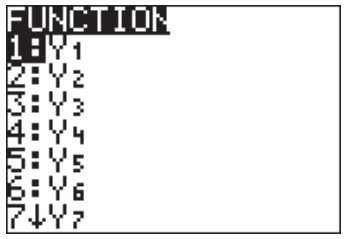
d.
$$f(x) = -2x^2 + 4x$$
$$f(a + 1) = -2(a + 1)^2 + 4(a + 1)$$
$$= -2(a^2 + 2a + 1) + 4a + 4$$
$$= -2a^2 - 4a - 2 + 4a + 4$$
$$= -2a^2 + 2$$

Now try Exercises 87 through 102 ▶

Figure 1.55

A graphing calculator can evaluate the function $Y_1 = -2X^2 + 4X$ using the **TABLE** feature, the TRACE feature, or function notation (on the home screen). The first two have been illustrated previously. To use function notation, we access the function names using the VARS key and right arrow to select **Y-VARS** (Figure 1.55). The **1:Function** option is the default, so pressing ENTER will enable us to make our choice (Figure 1.56). In this case, we selected **1:Y_1**, which the calculator then places on the home screen, enabling us to enclose the desired input value in parentheses (function notation). Pressing ENTER completes the evaluation (Figure 1.57), which verifies the result from Example 9(b).

Figure 1.56



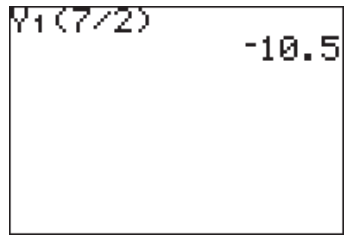


Figure 1.57

☑ **C.** You've just seen how we can use function notation and evaluate functions

D. Reading and Interpreting Information Given Graphically

Graphs are an important part of studying functions, and learning to read and interpret them correctly is a high priority. A graph highlights and emphasizes the all-important input/output relationship that defines a function. In this study, we hope to firmly establish that the following statements are synonymous:

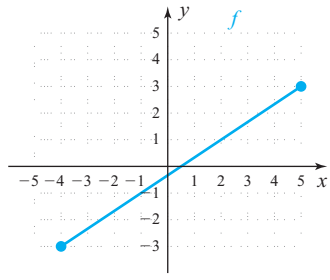
1. $f(-2) = 5$
2. $(-2, f(-2)) = (-2, 5)$
3. $(-2, 5)$ is on the graph of f, and
4. when $x = -2, f(x) = 5$

EXAMPLE 10A ▶ Reading a Graph

For the functions f and g whose graphs are shown in Figures 1.58 and 1.59

a. State the domain of the function.
b. Evaluate the function at $x = 2$.
c. Determine the value(s) of x for which $y = 3$.
d. State the range of the function.

Figure 1.58



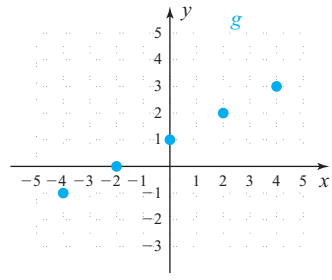


Figure 1.59

Solution ▶ For f,

a. The graph is a continuous line segment with endpoints at $(-4, -3)$ and $(5, 3)$, so we state the domain in interval notation. Using a vertical boundary line we note the smallest input is -4 and the largest is 5. The domain is $x \in [-4, 5]$.

b. The graph shows an input of $x = 2$ corresponds to $y = 1$: $f(2) = 1$ since $(2, 1)$ is a point on the graph.

c. For $f(x) = 3$ (or $y = 3$) the input value must be $x = 5$ since $(5, 3)$ is the point on the graph.

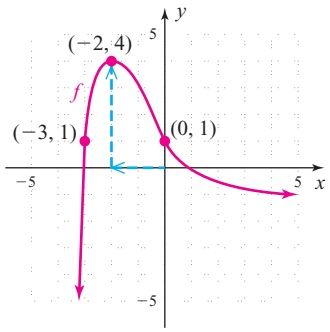
d. Using a horizontal boundary line, the smallest output value is -3 and the largest is 3. The range is $y \in [-3, 3]$.

For g,

a. Since g is given as a set of plotted points, we state the domain as the set of first coordinates: D: $\{-4, -2, 0, 2, 4\}$.

b. An input of $x = 2$ corresponds to $y = 2$: $g(2) = 2$ since $(2, 2)$ is on the graph.

c. For $g(x) = 3$ (or $y = 3$) the input value must be $x = 4$, since $(4, 3)$ is a point on the graph.



d. The range is the set of all second coordinates: R: $\{-1, 0, 1, 2, 3\}$.

EXAMPLE 10B ▶ Reading a Graph

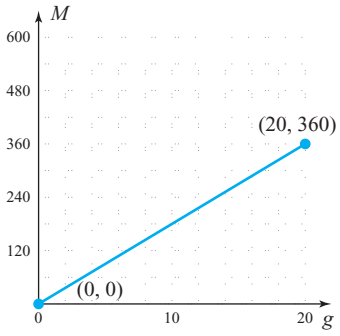
Use the graph of $f(x)$ given to answer the following questions:

a. What is the value of $f(-2)$?

b. What value(s) of x satisfy $f(x) = 1$?

Solution ▶

a. The notation $f(-2)$ says to find the value of the function f when $x = -2$. Expressed graphically, we go to $x = -2$ and locate the corresponding point on the graph (blue arrows). Here we find that $f(-2) = 4$.



b. For $f(x) = 1$, we're looking for x-inputs that result in an output of $y = 1$ [since $y = f(x)$]. From the graph, we note there are two points with a y-coordinate of 1, namely, $(-3, 1)$ and $(0, 1)$. This shows $f(-3) = 1, f(0) = 1$, and the required x-values are $x = -3$ and $x = 0$.

Now try Exercises 103 through 108 ▶

In many applications involving functions, the domain and range can be determined by the context or situation given.

EXAMPLE 11 ▶ Determining the Domain and Range from the Context

Paul's 2009 Voyager has a 20-gal tank and gets 18 mpg. The number of miles he can drive (his range) depends on how much gas is in the tank. As a function we have $M(g) = 18g$, where $M(g)$ represents the total distance in miles and g represents the gallons of gas in the tank (see graph). Find the domain and range.

Solution ▶

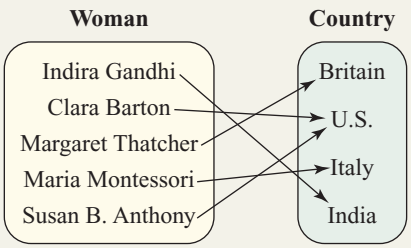
Begin evaluating at $x = 0$, since the tank cannot hold less than zero gallons. With an empty tank, the (minimum) range is $M(0) = 18(0)$ or 0 miles. On a full tank, the maximum range is $M(20) = 18(20)$ or 360 miles. As shown in the graph, the domain is $g \in [0, 20]$ and the corresponding range is $M(g) \in [0, 360]$.

D. You've just seen how we can read and interpret information given graphically

Now try Exercises 112 through 119 ▶

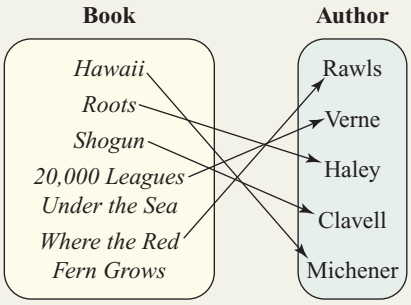
1.3 EXERCISES

▶ CONCEPTS AND VOCABULARY



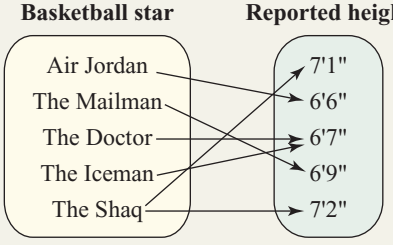
Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. If a relation is given in ordered pair form, we state the domain by listing all of the _____ coordinates in a set.
2. A relation is a function if each element of the _____ is paired with _____ _____ element of the range.
3. The set of output values for a function is called the _____ of the function.
4. Write using function notation: The function f evaluated at 3 is negative 5: _____
5. Discuss/Explain why the relation $y = x^2$ is a function, while the relation $x = y^2$ is not. Justify your response using graphs, ordered pairs, and so on.
6. Discuss/Explain the process of finding the domain and range of a function given its graph, using vertical and horizontal boundary lines. Include a few illustrative examples.

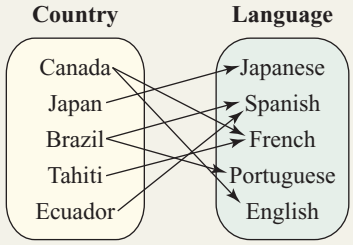


▶ DEVELOPING YOUR SKILLS

Determine whether the mappings shown represent functions or nonfunctions. If a nonfunction, explain how the definition of a function is violated.

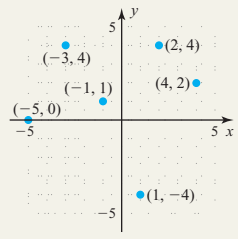


7.

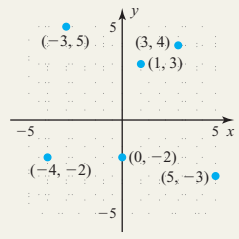


8.

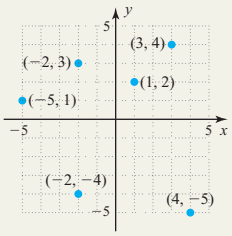
9.



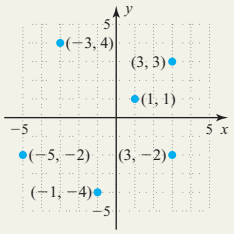
10.



Determine whether the relations indicated represent functions or nonfunctions. If the relation is a nonfunction, explain how the definition of a function is violated.

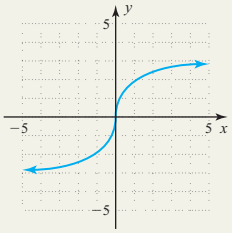


11. $(-3, 0)$, $(1, 4)$, $(2, -5)$, $(4, 2)$, $(-5, 6)$, $(3, 6)$, $(0, -1)$, $(4, -5)$, and $(6, 1)$
12. $(-7, -5)$, $(-5, 3)$, $(4, 0)$, $(-3, -5)$, $(1, -6)$, $(0, 9)$, $(2, -8)$, $(3, -2)$, and $(-5, 7)$
13. $(9, -10)$, $(-7, 6)$, $(6, -10)$, $(4, -1)$, $(2, -2)$, $(1, 8)$, $(0, -2)$, $(-2, -7)$, and $(-6, 4)$
14. $(1, -81)$, $(-2, 64)$, $(-3, 49)$, $(5, -36)$, $(-8, 25)$, $(13, -16)$, $(-21, 9)$, $(34, -4)$, and $(-55, 1)$
15.

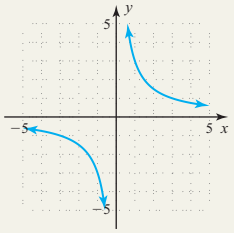


16.

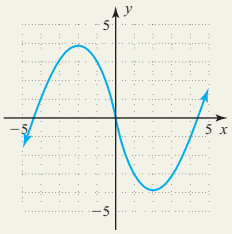
17.



18.



Determine whether or not the relations given represent a function. If not, explain how the definition of a function is violated.



19.

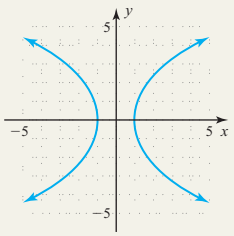
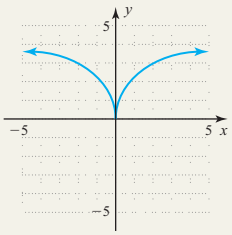
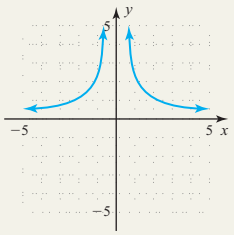
21.



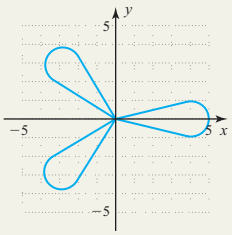
22.



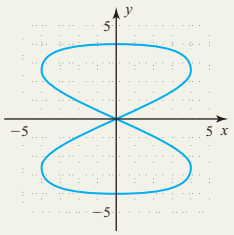
23.



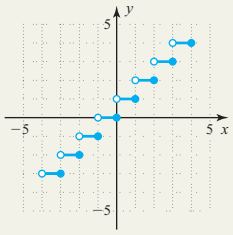
24.



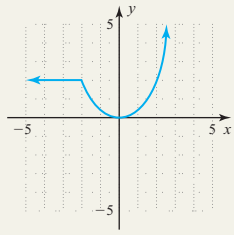
25.



26.



27.



28.

29.

30.

Graph each relation using a table, then use the vertical line test to determine if the relation is a function.

31. $y = x$

32. $y = \sqrt[3]{x}$

33. $y = (x + 2)^2$

34. $x = |y - 2|$

Use an inequality to write a mathematical model for each statement, then write the relation in interval notation.

35. To qualify for a secretarial position, a person must type at least 45 words per minute.

36. The balance in a checking account must remain above $1000 or a fee is charged.

37. To bake properly, a turkey must be kept between the temperatures of 250° and 450°.

38. To fly effectively, the airliner must cruise at or between altitudes of 30,000 and 35,000 ft.

Graph each inequality on a number line, then write the relation in interval notation.

39. $p < 3$

40. $x > -2$

41. $m \leq 5$

42. $n \geq -4$

43. $x \neq 1$

44. $x \neq -3$

45. $5 > x > 2$

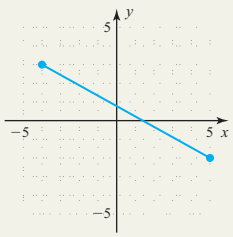
46. $-3 < p \leq 4$

Write the domain illustrated on each graph in set notation and interval notation.

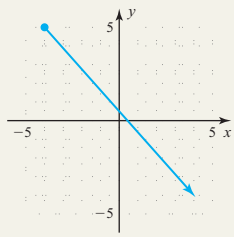
47.

48.

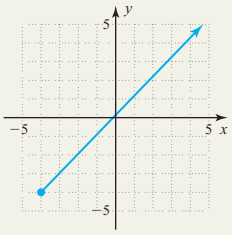
49.



50.



Determine whether or not the relations indicated represent functions, then determine the domain and range of each.



51.

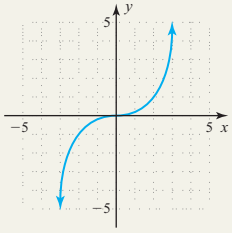
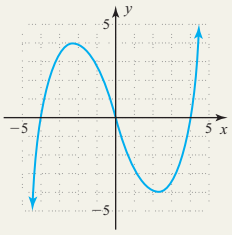
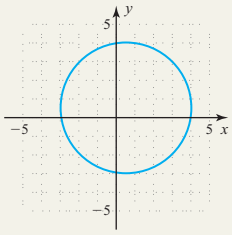
53.



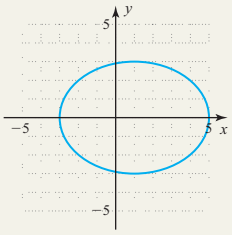
54.



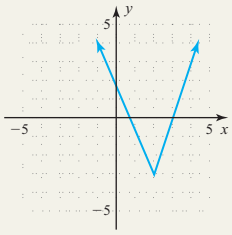
55.



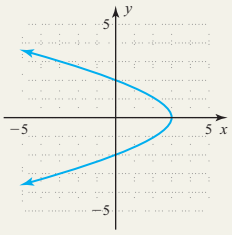
56.



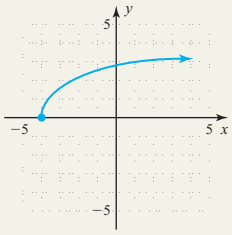
57.



58.



59.



60.

61.

62.

Determine the domain of the following functions, and write your response in interval notation.

63. $f(x) = \dfrac{3}{x - 5}$

64. $g(x) = \dfrac{-2}{3 + x}$

65. $h(a) = \sqrt{3a + 5}$

66. $p(a) = \sqrt{5a - 2}$

67. $v(x) = \dfrac{x + 2}{x^2 - 25}$

68. $w(x) = \dfrac{x - 4}{x^2 - 49}$

69. $u = \dfrac{v - 5}{v^2 - 18}$

70. $p = \dfrac{q + 7}{q^2 - 12}$

71. $y = \dfrac{17}{25}x + 123$

72. $y = \dfrac{11}{19}x - 89$

73. $m = n^2 - 3n - 10$

74. $s = t^2 - 3t - 10$

75. $y = 2|x| + 1$

76. $y = |x - 2| + 3$

77. $y_1 = \dfrac{x}{x^2 - 3x - 10}$

78. $y_2 = \dfrac{x - 4}{x^2 + 2x - 15}$

79. $y = \dfrac{\sqrt{x - 2}}{2x - 5}$

80. $y = \dfrac{\sqrt{x + 1}}{3x + 2}$

81. $h(x) = \dfrac{-2}{\sqrt{x + 4}}$

82. $f(x) = \sqrt{\dfrac{5}{x - 2}}$

83. $g(x) = \sqrt{\dfrac{-4}{3 - x}}$

84. $p(x) = \dfrac{-7}{\sqrt{5 - x}}$

85. $r(x) = \dfrac{2x - 1}{\sqrt{3x - 7}}$

86. $s(x) = \dfrac{x^2 - 4}{\sqrt{11 - 2x}}$

For Exercises 87 through 102, determine the value of $f(-6)$, $f(\frac{3}{2})$, $f(2c)$, and $f(c + 1)$, then simplify. Verify results using a graphing calculator where possible.

87. $f(x) = \dfrac{1}{2}x + 3$

88. $f(x) = \dfrac{2}{3}x - 5$

89. $f(x) = 3x^2 - 4x$

90. $f(x) = 2x^2 + 3x$

Determine the value of $h(3)$, $h(-\frac{2}{3})$, $h(3a)$, and $h(a - 2)$, then simplify.

91. $h(x) = \dfrac{3}{x}$

92. $h(x) = \dfrac{2}{x^2}$

93. $h(x) = \dfrac{5|x|}{x}$

94. $h(x) = \dfrac{4|x|}{x}$

Determine the value of $g(4)$, $g(\frac{3}{2})$, $g(2c)$, and $g(c + 3)$, then simplify.

95. $g(r) = 2\pi r$

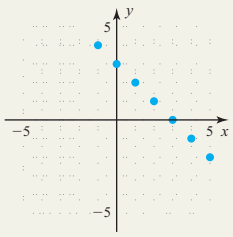
96. $g(r) = 2\pi rh$

97. $g(r) = \pi r^2$

98. $g(r) = \pi r^2 h$

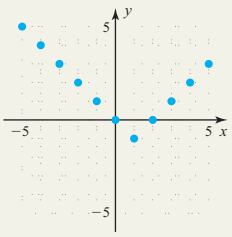
Determine the value of $p(5)$, $p(\frac{3}{2})$, $p(3a)$, and $p(a - 1)$, then simplify.

99. $p(x) = \sqrt{2x + 3}$



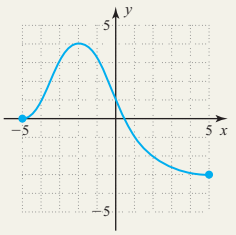
100. $p(x) = \sqrt{4x - 1}$

101. $p(x) = \dfrac{3x^2 - 5}{x^2}$

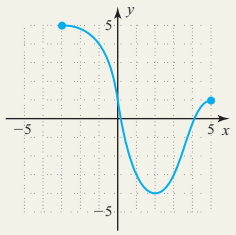


102. $p(x) = \dfrac{2x^2 + 3}{x^2}$

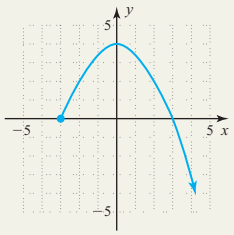
Use the graph of each function given to (a) state the domain, (b) state the range, (c) evaluate $f(2)$, and (d) find the value(s) x for which $f(x) = k$ (k a constant). Assume all results are integer-valued.



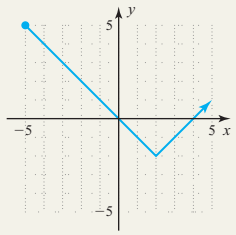
103. $k = 4$



104. $k = 3$



105. $k = 1$



106. $k = -3$

107. $k = 2$

108. $k = -1$

▶ WORKING WITH FORMULAS

109. Ideal weight for males: $W(H) = \frac{9}{2}H - 151$

The ideal weight for an adult male can be modeled by the function shown, where W is his weight in pounds and H is his height in inches. (a) Find the ideal weight for a male who is 75 in. tall. (b) If I am 72 in. tall and weigh 210 lb, how much weight should I lose?

110. Celsius to Fahrenheit conversions: $C = \frac{5}{9}(F - 32)$

The relationship between Fahrenheit degrees and degrees Celsius is modeled by the function shown. (a) What is the Celsius temperature if °F $= 41$? (b) Use the formula to solve for F in terms of C, then substitute the result from part (a). What do you notice?

111. Pick's theorem: $A = \frac{1}{2}B + I - 1$

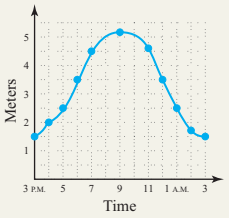
Pick's theorem is an interesting yet little known formula for computing the area of a polygon drawn in the Cartesian coordinate system. The formula can be applied as long as the vertices of the polygon are lattice points (both x and y are integers). If B represents the number of lattice points lying directly on the boundary of the polygon (including the vertices), and I represents the number of points in the interior, the area of the polygon is given by the formula shown. Use some graph paper to carefully draw a triangle with vertices at $(-3, 1)$, $(3, 9)$, and $(7, 6)$, then use Pick's theorem to compute the triangle's area.

▶ APPLICATIONS

112. Gas mileage: John's old '87 LeBaron has a 15-gal gas tank and gets 23 mpg. The number of miles he can drive is a function of how much gas is in the tank. (a) Write this relationship in equation form and (b) determine the domain and range of the function in this context.

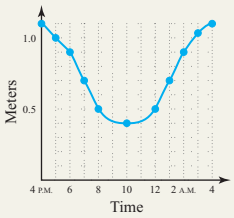
113. Gas mileage: Jackie has a gas-powered model boat with a 5-oz gas tank. The boat will run for 2.5 min on each ounce. The number of minutes she can operate the boat is a function of how much gas is in the tank. (a) Write this relationship in equation form and (b) determine the domain and range of the function in this context.

114. Volume of a cube: The volume of a cube depends on the length of the sides. In other words, volume is a function of the sides: $V(s) = s^3$. (a) In practical terms, what is the domain of this function? (b) Evaluate $V(6.25)$ and (c) evaluate the function for $s = 2x^2$.



115. Volume of a cylinder: For a fixed radius of 10 cm, the volume of a cylinder depends on its height. In other words, volume is a function of height: $V(h) = 100\pi h$. (a) In practical terms, what is the domain of this function? (b) Evaluate $V(7.5)$ and (c) evaluate the function for $h = \frac{8}{\pi}$.

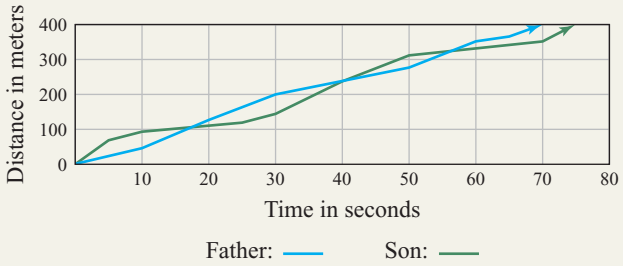
116. Rental charges: Temporary Transportation Inc. rents cars (local rentals only) for a flat fee of $19.50 and an hourly charge of $12.50. This means that cost is a function of the hours the car is rented plus the flat fee. (a) Write this relationship in equation form; (b) find the cost if the car is rented for 3.5 hr; (c) determine how long the car was rented if the bill came to $119.75; and (d) determine the domain and range of the function in this context, if your budget limits you to paying a maximum of $150 for the rental.



117. Cost of a service call: Paul's Plumbing charges a flat fee of $50 per service call plus an hourly rate of $42.50. This means that cost is a function of the hours the job takes to complete plus the flat fee. (a) Write this relationship in equation form; (b) find the cost of a service call that takes $2\frac{1}{2}$ hr; (c) find the number of hours the job took if the charge came to $262.50; and (d) determine the

domain and range of the function in this context, if your insurance company has agreed to pay for all charges over $500 for the service call.

118. Predicting tides: The graph shown approximates the height of the tides at Fair Haven, New Brunswick, for a 12-hr period. (a) Is this the graph of a function? Why? (b) Approximately what time did high tide occur? (c) How high is the tide at 6 P.M.? (d) What time(s) will the tide be 2.5 m?



119. Predicting tides: The graph shown approximates the height of the tides at Apia, Western Samoa, for a 12-hr period. (a) Is this the graph of a function? Why? (b) Approximately what time did low tide occur? (c) How high is the tide at 2 A.M.? (d) What time(s) will the tide be 0.7 m?

▶ EXTENDING THE CONCEPT

120. A father challenges his son to a 400-m race, depicted in the graph shown here.

a. Who won and what was the approximate winning time?

b. Approximately how many meters behind was the second place finisher?

c. Estimate the number of seconds the father was in the lead in this race.

d. How many times during the race were the father and son tied?

121. Sketch the graph of $f(x) = x$, then discuss how you could use this graph to obtain the graph of $F(x) = |x|$ without computing additional points. What would the graph of $g(x) = \dfrac{|x|}{x}$ look like?

122. Sketch the graph of $f(x) = x^2 - 4$, then discuss how you could use this graph to obtain the graph of $F(x) = |x^2 - 4|$ without computing additional points. Determine what the graph of $g(x) = \dfrac{|x^2 - 4|}{x^2 - 4}$ would look like.

123. If the equation of a function is given, the domain is implicitly defined by input values that generate real-valued outputs. But unless the graph is given or can be easily sketched, we must attempt to find the range analytically *by solving for x in terms of y*. We should note that sometimes this is an easy task, while at other times it is virtually impossible and we must rely on other methods. For the following functions, determine the implicit domain and find the range by solving for x in terms of y.

a. $y = \frac{x-3}{x+2}$ **b.** $y = x^2 - 3$

▶ MAINTAINING YOUR SKILLS

124. **(1.1)** Find the equation of a circle whose center is $(4, -1)$ with a radius of 5. Then graph the circle.

125. **(Appendix A.6)** Compute the sum and product indicated:

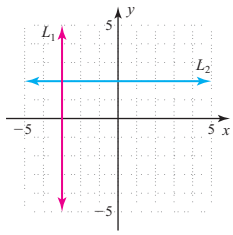
a. $\sqrt{24} + 6\sqrt{54} - \sqrt{6}$

b. $(2 + \sqrt{3})(2 - \sqrt{3})$

126. **(Appendix A.4)** Solve the equation by factoring, then check the result(s) using substitution: $3x^2 - 4x = 7$.

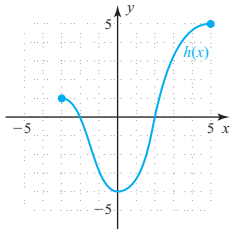
127. **(Appendix A.4)** Factor the following polynomials completely:

a. $x^3 - 3x^2 - 25x + 75$



b. $2x^2 - 13x - 24$

c. $8x^3 - 125$

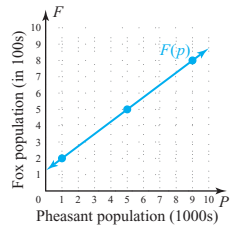


MID-CHAPTER CHECK

1. Sketch the graph of the line $4x - 3y = 12$. Plot and label at least three points.
2. Find the slope of the line passing through the given points: $(-3, 8)$ and $(4, -10)$.
3. In 2009, Data.com lost \$2 million. In 2010, they lost \$0.5 million. Will the slope of the line through these points be positive or negative? Why? Calculate the slope. Were you correct? Write the slope as a unit rate and explain what it means in this context.

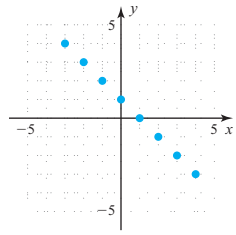
Exercises 5 and 6

Exercises 7 and 8



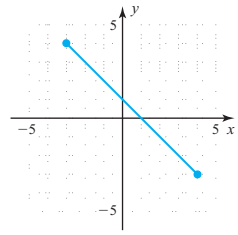
4. To earn some spending money, Sahara takes a job in a ski shop working primarily with her specialty—snowboards. She is paid a monthly salary of \$950 plus a commission of \$7.50 for each snowboard she sells. (a) Write a function that models her monthly earnings E. (b) Use a graphing calculator to determine her income if she sells 20, 30, or 40 snowboards in one month. (c) Use the results of parts a and b to set an appropriate viewing window and graph the line. (d) Use the TRACE feature to determine the number of snowboards that must be sold for Sahara's monthly income to top \$1300.

5. Write the equation for line L_1 shown. Is this the graph of a function? Discuss why or why not.
6. Write the equation for line L_2 shown. Is this the graph of a function? Discuss why or why not.
7. For the graph of function $h(x)$ shown, (a) determine the value of $h(2)$; (b) state the domain; (c) determine the value(s) of x for which $h(x) = -3$; and (d) state the range.
8. Judging from the appearance of the graph alone, compare the rate of change (slope) from $x = 1$ to $x = 2$ to the rate of change from $x = 4$ to $x = 5$. Which rate of change is larger? How is that demonstrated graphically?

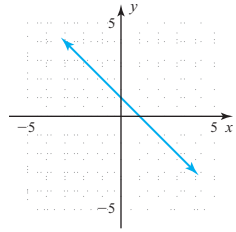


Exercise 9

9. Compute the slope of the line shown, and explain what it means as a rate of change in this context. Then use the slope to predict the fox population when the pheasant population is 13,000.



10. State the domain and range for each function below.



a.

b.

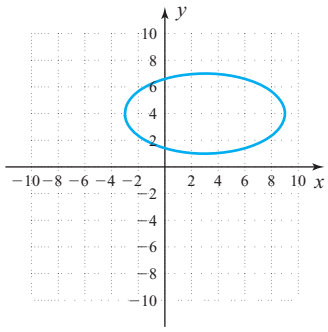
c.

REINFORCING BASIC CONCEPTS

Finding the Domain and Range of a Relation from Its Graph

The concepts of domain and range are an important and fundamental part of working with relations and functions. In this chapter, we learned to determine the domain of any relation from its graph using a "vertical boundary line," and the range by using a "horizontal boundary line." These approaches to finding the domain and range can be combined into a single step by envisioning a rectangle drawn around or about the graph. If the entire graph can be "bounded" within the rectangle, the domain and range can be based on the rectangle's related length and width. If it's impossible to bound the graph in a particular direction, the related x- or y-values continue infinitely. Consider the graph in Figure 1.60. This is the graph of an ellipse (Section 8.2), and a rectangle that bounds the graph in all directions is shown in Figure 1.61.

Figure 1.60



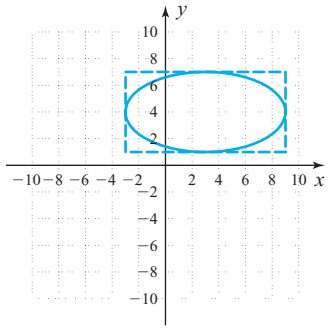


Figure 1.61

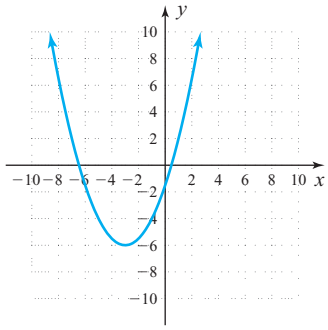
The rectangle extends from $x = -3$ to $x = 9$ in the horizontal direction, and from $y = 1$ to $y = 7$ in the vertical direction. The domain of this relation is $x \in [-3, 9]$ and the range is $y \in [1, 7]$.

The graph in Figure 1.62 is a parabola, and no matter how large we draw the rectangle, an infinite extension of the graph will extend beyond its boundaries in the left and right directions, and in the upward direction (Figure 1.63).

Figure 1.62



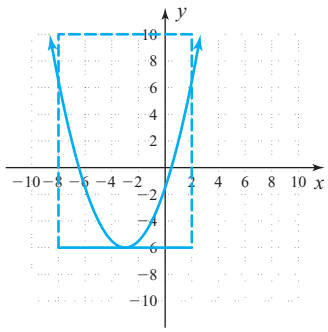


Figure 1.63

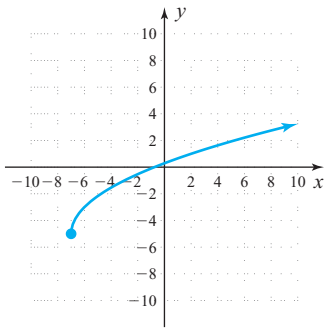
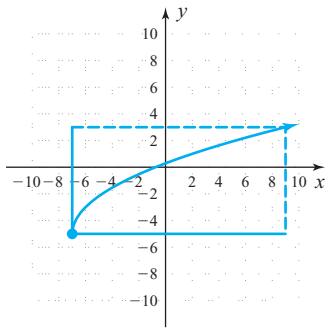
The domain of this relation is $x \in (-\infty, \infty)$ and the range is $y \in [-6, \infty)$.

Finally, the graph in Figure 1.64 is the graph of a square root function, and a rectangle can be drawn that bounds the graph below and to the left, but not above or to the right (Figure 1.65).

Figure 1.64





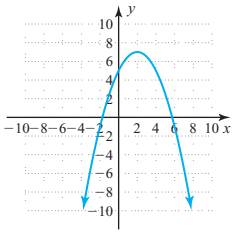


Figure 1.65

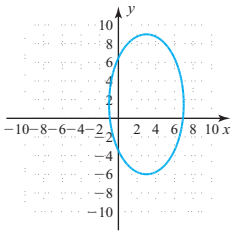

The domain of this relation is $x \in [-7, \infty)$ and the range is $y \in [-5, \infty)$.

Use this approach to find the domain and range of the following relations and functions.

Exercise 2:

Exercise 3:

Exercise 4:

1.4 Linear Functions, Special Forms, and More on Rates of Change

LEARNING OBJECTIVES

In Section 1.4 you will see how we can:

- ❑ **A.** Write a linear equation in slope-intercept form and function form
- ❑ **B.** Use slope-intercept form to graph linear equations
- ❑ **C.** Write a linear equation in point-slope form
- ❑ **D.** Apply the slope-intercept form and point-slope form in context

The concept of slope is an important part of mathematics, because it gives us a way to measure and compare change. The value of an automobile changes with time, the circumference of a circle increases as the radius increases, and the tension in a spring grows the more it is stretched. The real world is filled with examples of how one change affects another, and slope helps us understand how these changes are related.

A. Linear Equations, Slope-Intercept Form and Function Form

In Section 1.2, we learned that a linear equation is one that can be written in the form $ax + by = c$. Solving for y in a linear equation offers distinct advantages to understanding linear graphs and their applications.

EXAMPLE 1 ▶ **Solving for y in a Linear Equation**

Solve $2y - 6x = 4$ for y, then evaluate at $x = 4$, $x = 0$, and $x = -\frac{1}{3}$.

Solution ▶

$$\begin{aligned} 2y - 6x &= 4 && \text{given equation} \\ 2y &= 6x + 4 && \text{add } 6x \\ y &= 3x + 2 && \text{divide by } 2 \end{aligned}$$

Since the coefficients are integers, evaluate the function mentally. Inputs are multiplied by 3, then increased by 2, yielding the ordered pairs (4, 14), (0, 2), and $(-\frac{1}{3}, 1)$.

Now try Exercises 7 through 12 ▶

This form of the equation (where y has been written in terms of x) enables us to quickly identify what operations are performed on x in order to obtain y. Once again, for $y = 3x + 2$: *multiply inputs by 3, then add 2*.

EXAMPLE 2 ▶ **Solving for y in a Linear Equation**

Solve the linear equation $3y - 2x = 6$ for y, then identify the new coefficient of x and the constant term.

Solution ▶

$$\begin{aligned} 3y - 2x &= 6 && \text{given equation} \\ 3y &= 2x + 6 && \text{add } 2x \\ y &= \frac{2}{3}x + 2 && \text{divide by } 3 \end{aligned}$$

The coefficient of x is $\frac{2}{3}$ and the constant term is 2.

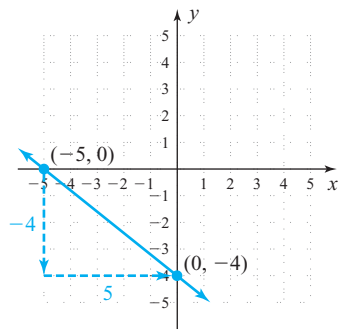
Now try Exercises 13 through 18 ▶

WORTHY OF NOTE

In Example 2, the final form can be written $y = \frac{2}{3}x + 2$ as shown (inputs are multiplied by two-thirds, then increased by 2), or written as $y = \frac{2x}{3} + 2$ (inputs are multiplied by two, the result divided by 3 and this amount increased by 2). The two forms are equivalent.

When the coefficient of x is rational, it's helpful to select inputs that are multiples of the denominator if the context or application requires us to evaluate the equation. This enables us to perform most operations mentally. For $y = \frac{2}{3}x + 2$, possible inputs might be $x = -9, -6, 0, 3, 6$, and so on. **See Exercises 19 through 24.**

In Section 1.2, linear equations were graphed using the intercept method. When the equation is written with y in terms of x, we notice a powerful connection between the graph and its equation—one that highlights the primary characteristics of a linear graph.



EXAMPLE 3 ▶ **Noting Relationships between an Equation and Its Graph**

Find the intercepts of $4x + 5y = -20$ and use them to graph the line. Then,

a. Use the intercepts to calculate the slope of the line, then identify the y-intercept.

b. Write the equation with y in terms of x and compare the calculated slope and y-intercept to the equation in this form. Comment on what you notice.

Solution ▶ Substituting 0 for x in $4x + 5y = -20$, we find the y-intercept is $(0, -4)$. Substituting 0 for y gives an x-intercept of $(-5, 0)$. The graph is displayed here.

a. The y-intercept is $(0, -4)$ and by calculation or counting $\frac{\Delta y}{\Delta x}$, the slope is $m = \frac{-4}{5}$ [from the intercept $(-5, 0)$ we count down 4, giving $\Delta y = -4$, and right 5, giving $\Delta x = 5$, to arrive at the intercept $(0, -4)$].

b. Solving for y:

$$\begin{aligned} 4x + 5y &= -20 && \text{given equation} \\ 5y &= -4x - 20 && \text{subtract } 4x \\ y &= \frac{-4}{5}x - 4 && \text{divide by } 5 \end{aligned}$$

The slope value seems to be the coefficient of x, while the y-intercept is the constant term.

Now try Exercises 25 through 30 ▶

After solving a linear equation for y, an input of $x = 0$ causes the "x-term" to become zero, so the y-intercept automatically involves the constant term. As Example 3 illustrates, we can also identify the slope of the line—it is the coefficient of x. In general, a linear equation of the form $y = mx + b$ is said to be in **slope-intercept form,** since the slope of the line is m and the y-intercept is $(0, b)$.

Slope-Intercept Form

For a nonvertical line whose equation is $y = \boldsymbol{m}x + \boldsymbol{b}$, the slope of the line is $\boldsymbol{m}$ and the y-intercept is $(0, \boldsymbol{b})$.

Solving a linear equation for y in terms of x is sometimes called writing the equation in **function form,** as this form clearly highlights what operations are performed on the input value in order to obtain the output (see Example 1). In other words, this form plainly shows that "y depends on x," or "y is a function of x," and that the equations $y = mx + b$ and $f(x) = mx + b$ are equivalent.

Linear Functions

A linear function is one of the form

$$f(x) = mx + b,$$

where m and b are real numbers.

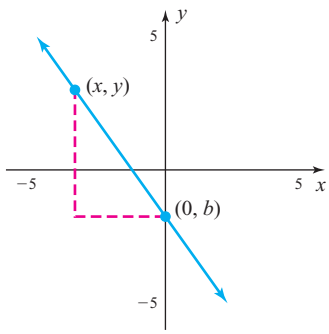
Note that if $m = 0$, the result is a **constant function** $f(x) = b$. If $m = 1$ and $b = 0$, the result is $f(x) = x$, called the **identity function.**

EXAMPLE 4 ▶ **Finding the Function Form of a Linear Equation**

Write each equation in both slope-intercept form and function form. Then identify the slope and y-intercept of the line.

a. $3x - 2y = 9$ **b.** $y + x = 5$ **c.** $2y = x$

Solution ▶



a. $3x - 2y = 9$	**b.** $y + x = 5$	**c.** $2y = x$
$-2y = -3x + 9$	$y = -x + 5$	$y = \frac{x}{2}$
$y = \frac{3}{2}x - \frac{9}{2}$	$y = -1x + 5$	$y = \frac{1}{2}x$
$f(x) = \frac{3}{2}x - \frac{9}{2}$	$f(x) = -1x + 5$	$f(x) = \frac{1}{2}x$
$m = \frac{3}{2}, b = -\frac{9}{2}$	$m = -1, b = 5$	$m = \frac{1}{2}, b = 0$
y-intercept $\left(0, -\frac{9}{2}\right)$	y-intercept $(0, 5)$	y-intercept $(0, 0)$

Now try Exercises 31 through 38 ▶

A. You've just seen how we can write a linear equation in slope-intercept form and function form

Note that we can analytically develop the slope-intercept form of a line using the slope formula. Figure 1.66 shows the graph of a general line through the point (x, y) with a y-intercept of $(0, b)$. Using these points in the slope formula, we have

Figure 1.66

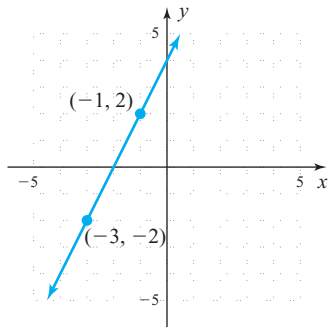
$$\frac{y_2 - y_1}{x_2 - x_1} = m \qquad \text{slope formula}$$

$$\frac{y - b}{x - 0} = m \qquad \text{substitute: } (0, b) \text{ for } (x_1, y_1),\ (x, y) \text{ for } (x_2, y_2)$$

$$\frac{y - b}{x} = m \qquad \text{simplify}$$

$$y - b = mx \qquad \text{multiply by } x$$

$$y = mx + b \qquad \text{add } b \text{ to both sides}$$



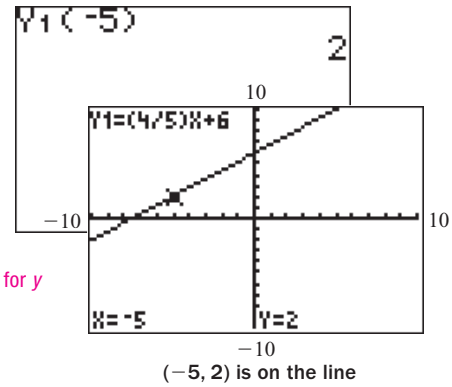
This approach confirms the relationship between the graphical characteristics of a line and its slope-intercept form. Specifically, for any linear equation written in the form $y = mx + b$, the slope must be m and the y-intercept is $(0, b)$.

B. Slope-Intercept Form and the Graph of a Line

If the slope and y-intercept of a linear equation are known or can be found, we can construct its equation by substituting these values directly into the slope-intercept form $y = mx + b$.

EXAMPLE 5 ▶ **Finding the Equation of a Line from Its Graph**

Find the slope-intercept equation of the line shown.



Solution ▶ Using $(-3, -2)$ and $(-1, 2)$ in the slope formula, or by simply counting $\frac{\Delta y}{\Delta x}$, the slope is $m = \frac{4}{2}$ or $\frac{2}{1}$. By inspection we see the y-intercept is $(0, 4)$. Substituting $\frac{2}{1}$ for m and 4 for b in the slope-intercept form we obtain the equation $y = 2x + 4$.

Now try Exercises 39 through 44 ▶

Actually, if the slope is known and we have *any* point (x, y) on the line, we can still construct the equation since the given point *must satisfy the equation of the line*. In this case, we're treating $y = mx + b$ as a simple formula, solving for b after substituting known values for m, x, and y.

EXAMPLE 6 ▶ **Using $y = mx + b$ as a Formula**

Find the slope-intercept equation of a line that has slope $m = \frac{4}{5}$ and contains $(-5, 2)$. Verify results on a graphing calculator.

(−5, 2) is on the line

Solution ▶ Use $y = mx + b$ as a "formula," with $m = \frac{4}{5}$, $x = -5$, and $y = 2$.

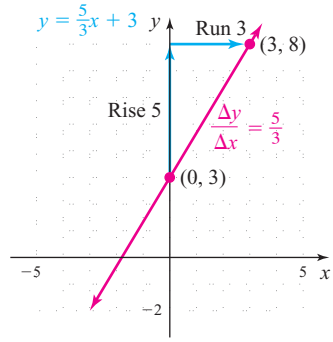
$y = mx + b$	slope-intercept form
$2 = \frac{4}{5}(-5) + b$	substitute $\frac{4}{5}$ for m, -5 for x, and 2 for y
$2 = -4 + b$	simplify
$6 = b$	solve for b

The equation of the line is $y = \frac{4}{5}x + 6$. After entering the equation on the Y= screen of a graphing calculator, we can evaluate $x = -5$ on the home screen, or use the TRACE feature. See the figures provided.

Now try Exercises 45 through 50 ▶

Writing a linear equation in slope-intercept form enables us to draw its graph with a minimum of effort, since we can easily locate the y-intercept and a second point using the rate of change $\frac{\Delta y}{\Delta x}$. For instance, $\frac{\Delta y}{\Delta x} = \frac{-2}{3}$ indicates that counting down 2 and right 3 from a known point will locate another point on this line.

EXAMPLE 7 ▶ **Graphing a Line Using Slope-Intercept Form and the Rate of Change**



Write $3y - 5x = 9$ in slope-intercept form, then graph the line using the y-intercept and the rate of change (slope).

Solution ▶

$3y - 5x = 9$	given equation
$3y = 5x + 9$	isolate y term
$y = \frac{5}{3}x + 3$	divide by 3

The slope is $m = \frac{5}{3}$ and the y-intercept is $(0, 3)$.

Plot the y-intercept, then use $\frac{\Delta y}{\Delta x} = \frac{5}{3}$ (up 5 and right 3—shown in blue) to find another point on the line (shown in red). Finish by drawing a line through these points.

WORTHY OF NOTE

Noting the fraction $\frac{5}{3}$ is equal to $\frac{-5}{-3}$, we could also begin at (0, 3) and count $\frac{\Delta y}{\Delta x} = \frac{-5}{-3}$ (down 5 and left 3) to find an additional point on the line: $(-3, -2)$. Also, for any negative slope $\frac{\Delta y}{\Delta x} = -\frac{a}{b}$, note $-\frac{a}{b} = \frac{-a}{b} = \frac{a}{-b}$.

Now try Exercises 51 through 62 ▶

For a discussion of what graphing method might be most efficient for a given linear equation, **see Exercises 103 and 114.**

Parallel and Perpendicular Lines

From Section 1.2 we know parallel lines have equal slopes: $m_1 = m_2$, and perpendicular lines have slopes with a product of -1: $m_1 \cdot m_2 = -1$ or $m_1 = -\frac{1}{m_2}$. In some applications, we need to find the equation of a second line parallel or perpendicular to a given line, through a given point. Using the slope-intercept form makes this a simple four-step process.

Finding the Equation of a Line Parallel or Perpendicular to a Given Line

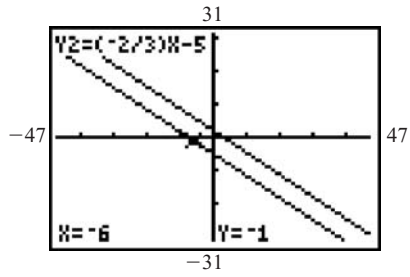
1. Identify the slope m_1 of the given line.
2. Find the slope m_2 of the new line using the parallel or perpendicular relationship.
3. Use m_2 with the point (x, y) in the "formula" $y = mx + b$ and solve for b.
4. The desired equation will be $y = m_2x + b$.

EXAMPLE 8 ▶ **Finding the Equation of a Parallel Line**

Find the slope-intercept equation of a line that goes through $(-6, -1)$ and is parallel to $2x + 3y = 6$.

Solution ▶ Begin by writing the equation in slope-intercept form to identify the slope.

$$\begin{aligned} 2x + 3y &= 6 && \text{given line} \\ 3y &= -2x + 6 && \text{isolate } y\text{-term} \\ y &= \tfrac{-2}{3}x + 2 && \text{result} \end{aligned}$$



The original line has slope $m_1 = \frac{-2}{3}$ and this will also be the slope of any line parallel to it. Using $m_2 = \frac{-2}{3}$ with $(x, y) \rightarrow (-6, -1)$ we have

$$\begin{aligned} y &= mx + b && \text{slope-intercept form} \\ -1 &= \frac{-2}{3}(-6) + b && \text{substitute } \tfrac{-2}{3} \text{ for } m, \\ & && -6 \text{ for } x, \text{ and } -1 \text{ for } y \\ -1 &= 4 + b && \text{simplify} \\ -5 &= b && \text{solve for } b \end{aligned}$$

The equation of the new line is $y = \frac{-2}{3}x - 5$.

Now try Exercises 63 through 76 ▶

Graphing the lines from Example 8 as Y_1 and Y_2 on a graphing calculator, we note the lines do appear to be parallel (they actually *must* be since they have identical slopes). Using the ZOOM **8:ZInteger** feature of the calculator, we can quickly verify that Y_2 indeed contains the point $(-6, -1)$.

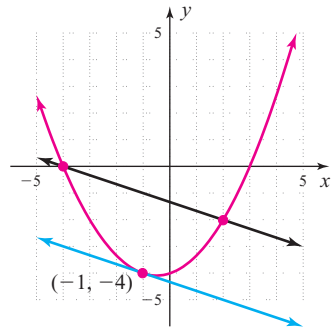
For any nonlinear graph, a straight line drawn through two points on the graph is called a **secant line.** The slope of a secant line, and lines parallel and perpendicular to this line, play fundamental roles in the further development of the rate-of-change concept.

EXAMPLE 9 ▶ **Finding Equations for Parallel and Perpendicular Lines**

A secant line is drawn using the points $(-4, 0)$ and $(2, -2)$ on the graph of the function shown. Find the equation of a line that is

a. parallel to the secant line through $(-1, -4)$.

b. perpendicular to the secant line through $(-1, -4)$.



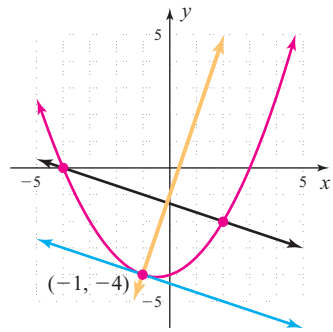
Solution ▶ Either by using the slope formula or counting $\frac{\Delta y}{\Delta x}$, we find the secant line has slope $m = \frac{-2}{6} = \frac{-1}{3}$.

WORTHY OF NOTE

The word "secant" comes from the Latin word *secare,* meaning "to cut." Hence a secant line is one that cuts through a graph, as opposed to a tangent line, which touches the graph at only one point.

a. For the parallel line through $(-1, -4)$, $m_2 = \dfrac{-1}{3}$.

$$y = mx + b \qquad \text{slope-intercept form}$$
$$-4 = \frac{-1}{3}(-1) + b \qquad \text{substitute } \tfrac{-1}{3} \text{ for } m, -1 \text{ for } x, \text{ and } -4 \text{ for } y$$
$$-\frac{12}{3} = \frac{1}{3} + b \qquad \text{simplify } (-4 = -\tfrac{12}{3})$$
$$-\frac{13}{3} = b \qquad \text{result}$$



The equation of the parallel line (in blue) is $y = \dfrac{-1}{3}x - \dfrac{13}{3}$.

b. For the perpendicular line through $(-1, -4)$, $m_2 = 3$.

$$y = mx + b \qquad \text{slope-intercept form}$$
$$-4 = 3(-1) + b \qquad \text{substitute 3 for } m, -1 \text{ for } x, \text{ and } -4 \text{ for } y$$
$$-4 = -3 + b \qquad \text{simplify}$$
$$-1 = b \qquad \text{result}$$

The equation of the perpendicular line (in yellow) is $y = 3x - 1$.

B. You've just seen how we can use the slope-intercept form to graph linear equations

Now try Exercises 77 through 82 ▶

C. Linear Equations in Point-Slope Form

As an alternative to using $y = mx + b$, we can find the equation of the line using the slope formula $\dfrac{y_2 - y_1}{x_2 - x_1} = m$, and the fact that *the slope of a line is constant*. For a given slope m, we can let (x_1, y_1) represent a *given* point on the line and (x, y) represent *any other point* on the line, and the formula becomes $\dfrac{y - y_1}{x - x_1} = m$. Isolating the "$y$" terms on one side gives a new form for the equation of a line, called the **point-slope form:**

$$\frac{y - y_1}{x - x_1} = m \qquad \text{slope formula}$$
$$\frac{(x - x_1)}{1}\left(\frac{y - y_1}{x - x_1}\right) = m(x - x_1) \qquad \text{multiply both sides by } (x - x_1)$$
$$y - y_1 = m(x - x_1) \qquad \text{simplify} \rightarrow \text{point-slope form}$$

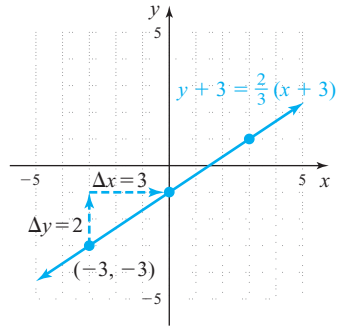
The Point-Slope Form of a Linear Equation

For a nonvertical line whose equation is $y - y_1 = m(x - x_1)$, the slope of the line is m and (x_1, y_1) is a point on the line.

While using $y = mx + b$ (as in Example 6) may appear to be easier, both the slope-intercept form and point-slope form have their own advantages and it will help to be familiar with both.

EXAMPLE 10 ▶ **Using $y - y_1 = m(x - x_1)$ as a Formula**

Find the equation of the line in point-slope form, if $m = \frac{2}{3}$ and $(-3, -3)$ is on the line. Then graph the line.



Solution ▶

$$y - y_1 = m(x - x_1) \quad \text{point-slope form}$$

$$y - (-3) = \frac{2}{3}[x - (-3)] \quad \text{substitute } \tfrac{2}{3} \text{ for } m\text{; } (-3, -3) \text{ for } (x_1, y_1)$$

$$y + 3 = \frac{2}{3}(x + 3) \quad \text{simplify, point-slope form}$$

To graph the line, plot $(-3, -3)$ and use $\frac{\Delta y}{\Delta x} = \frac{2}{3}$ to find additional points on the line.

☑ **C.** You've just seen how we can write a linear equation in point-slope form

Now try Exercises 83 through 94 ▶

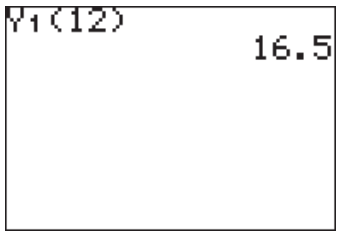
D. Applications of Linear Equations

As a mathematical tool, linear equations rank among the most common, powerful, and versatile. In all cases, it's important to remember that slope represents a *rate of change*. The notation $m = \frac{\Delta y}{\Delta x}$ literally means the quantity measured along the y-axis, is changing with respect to changes in the quantity measured along the x-axis.

EXAMPLE 11 ▶ **Relating Temperature to Altitude**

In meteorological studies, atmospheric temperature depends on the altitude according to the formula $T(h) = -3.5h + 58.5$, where $T(h)$ represents the approximate Fahrenheit temperature at height h (in thousands of feet, $0 \le h \le 36$).

a. Interpret the meaning of the slope in this context.
b. Determine the temperature at an altitude of 12,000 ft.
c. If the temperature is -8°F what is the approximate altitude?



Algebraic Solution ▶

a. Notice that h is the input variable and T is the output. This shows $\frac{\Delta T}{\Delta h} = \frac{-3.5}{1}$, meaning the temperature drops 3.5°F for every 1000-ft increase in altitude.

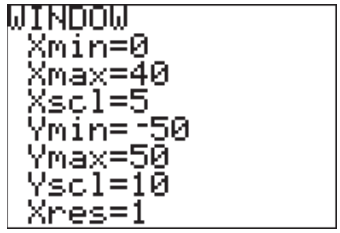
b. Since height is in thousands, use $h = 12$.

$$T(h) = -3.5h + 58.5 \quad \text{original formula}$$
$$T(12) = -3.5(12) + 58.5 \quad \text{substitute 12 for } h$$
$$= 16.5 \quad \text{result}$$

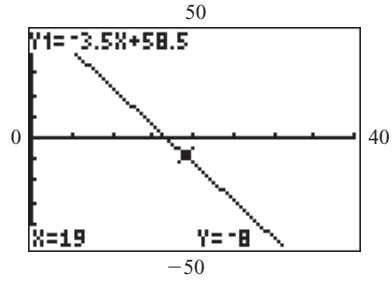
Technology Solution ▶

At a height of 12,000 ft, the temperature is about 16.5°.

c. Replacing $T(h)$ with -8 and solving gives



Algebraic Solution ▶



$$\begin{aligned} T(h) &= -3.5h + 58.5 && \text{original formula} \\ -8 &= -3.5h + 58.5 && \text{substitute } -8 \text{ for } T(h) \\ -66.5 &= -3.5h && \text{subtract } 58.5 \\ 19 &= h && \text{divide by } -3.5 \end{aligned}$$

The temperature is about $-8°$F at a height of $19 \times 1000 = 19{,}000$ ft.

Graphical Solution ▶

Since we're given $0 \le h \le 36$, we can set Xmin $= 0$ and Xmax $= 40$. At ground level ($x = 0$), the formula gives a temperature of 58.5°, while at $h = 36$, we have $T(36) = -67.5$. This shows appropriate settings for the range would be Ymin $= -50$ and Ymax $= 50$ (see figure). After setting $Y_1 = -3.5X + 58.5$, we press TRACE and move the cursor until we find an output value near -8, which occurs when X is near 19. To check, we input 19 for x and the calculator displays an output of -8, which corresponds with the algebraic result (at 19,000 ft, the temperature is $-8°$F).

Now try Exercises 105 and 106 ▶

In many applications, outputs that are integer or rational values are rare, making it difficult to use the TRACE feature alone to find an exact solution. In the Section 1.5, we'll develop additional ways that graphs and technology can be used to solve equations.

In some applications, the relationship is known to be linear but only a few points on the line are given. In this case, we can use two of the known data points to calculate the slope, then the point-slope form to find an equation model. One such application is *linear depreciation,* as when a government allows businesses to depreciate vehicles and equipment over time (the less a piece of equipment is worth, the less you pay in taxes).

EXAMPLE 12A ▶ **Using Point-Slope Form to Find a Function Model**

Five years after purchase, the auditor of a newspaper company estimates the value of their printing press is $60,000. Eight years after its purchase, the value of the press had depreciated to $42,000. Find a linear equation that models this depreciation and discuss the slope and y-intercept in context.

Solution ▶

Since the value of the press depends on time, the ordered pairs have the form (time, value) or (t, v) where *time* is the input, and *value* is the output. This means the ordered pairs are (5, 60,000) and (8, 42,000).

$$\begin{aligned} m &= \frac{v_2 - v_1}{t_2 - t_1} && \text{slope formula} \\ &= \frac{42{,}000 - 60{,}000}{8 - 5} && (t_1, v_1) = (5, 60{,}000);\ (t_2, v_2) = (8, 42{,}000) \\ &= \frac{-18{,}000}{3} = \frac{-6000}{1} && \text{simplify and reduce} \end{aligned}$$

WORTHY OF NOTE

Actually, it doesn't matter which of the two points are used in Example 12A. Once the point (5, 60,000) is plotted, a constant slope of $m = -6000$ will "drive" the line through (8, 42,000). If we first graph (8, 42,000), the same slope would "drive" the line through (5, 60,000). Convince yourself by reworking the problem using the other point.

The slope of the line is $\frac{\Delta \text{value}}{\Delta \text{time}} = \frac{-6000}{1}$, indicating the printing press loses \$6000 in value with each passing year.

$$\begin{aligned} v - v_1 &= m(t - t_1) && \text{point-slope form} \\ v - 60{,}000 &= -6000(t - 5) && \text{substitute } -6000 \text{ for } m\text{; } (5, 60{,}000) \text{ for } (t_1, v_1) \\ v - 60{,}000 &= -6000t + 30{,}000 && \text{simplify} \\ v &= -6000t + 90{,}000 && \text{solve for } v \end{aligned}$$

The depreciation equation is $v(t) = -6000t + 90{,}000$. The v-intercept (0, 90,000) indicates the original value (cost) of the equipment was \$90,000.

Once the depreciation equation is found, it represents the (time, value) relationship for all future (and intermediate) ages of the press. In other words, we can now predict the value of the press for any given year. However, note that some equation models are valid for only a set period of time, and each model should be used with care.

EXAMPLE 12B ▶ Using a Function Model to Gather Information

From Example 12A,

a. How much will the press be worth after 11 yr?

b. How many years until the value of the equipment is \$9000?

c. Is this function model valid for $t = 18$ yr (why or why not)?

Solution ▶

a. Find the value v when $t = 11$:

$$\begin{aligned} v(t) &= -6000t + 90{,}000 && \text{equation model} \\ v(11) &= -6000(11) + 90{,}000 && \text{substitute 11 for } t \\ &= 24{,}000 && \text{result (11, 24,000)} \end{aligned}$$

After 11 yr, the printing press will only be worth \$24,000.

b. ". . . value is \$9000" means $v(t) = 9000$:

$$\begin{aligned} v(t) &= 9000 && \text{value at time } t \\ -6000t + 90{,}000 &= 9000 && \text{substitute } -6000t + 90{,}000 \text{ for } v(t) \\ -6000t &= -81{,}000 && \text{subtract } 90{,}000 \\ t &= 13.5 && \text{divide by } -6000 \end{aligned}$$

After 13.5 yr, the printing press will be worth \$9000.

c. Since substituting 18 for t gives a negative quantity, the function model is not valid for $t = 18$. In the current context, the model is only valid while $v \geq 0$ and solving $-6000t + 90{,}000 \geq 0$ shows the domain of the function in this context is $t \in [0, 15]$.

D. You've just seen how we can apply the slope-intercept form and point-slope form in context

Now try Exercises 107 through 112 ▶

1.4 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. For the equation $y = \frac{-7}{4}x + 3$, the slope is _____ and the y-intercept is _____.
2. The notation $\frac{\Delta \text{cost}}{\Delta \text{time}}$ indicates the _____ is changing in response to changes in _____.
3. Line 1 has a slope of -0.4. The slope of any line perpendicular to line 1 is _____.
4. The equation $y - y_1 = m(x - x_1)$ is called the _____ form of a line.
5. Discuss/Explain how to graph a line using only the slope and a point on the line (no equations).
6. Given $m = -\frac{3}{5}$ and $(-5, 6)$ is on the line. Compare and contrast finding the equation of the line using $y = mx + b$ versus $y - y_1 = m(x - x_1)$.

▶ DEVELOPING YOUR SKILLS

Solve each equation for y and evaluate the result using $x = -5, x = -2, x = 0, x = 1$, and $x = 3$.

7. $4x + 5y = 10$
8. $3y - 2x = 9$
9. $-0.4x + 0.2y = 1.4$
10. $-0.2x + 0.7y = -2.1$
11. $\frac{1}{3}x + \frac{1}{5}y = -1$
12. $\frac{1}{7}y - \frac{1}{3}x = 2$

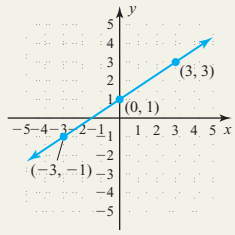
For each equation, solve for y and identify the new coefficient of x and new constant term.

13. $6x - 3y = 9$
14. $9y - 4x = 18$
15. $-0.5x - 0.3y = 2.1$
16. $-0.7x + 0.6y = -2.4$
17. $\frac{5}{6}x + \frac{1}{7}y = -\frac{4}{7}$
18. $\frac{7}{12}y - \frac{4}{15}x = \frac{7}{6}$

Evaluate each equation by selecting three inputs that will result in integer values. Then graph each line.

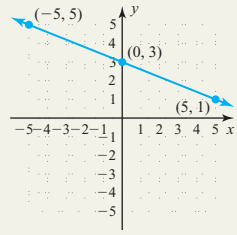
19. $y = -\frac{4}{3}x + 5$
20. $y = \frac{5}{4}x + 1$
21. $y = -\frac{3}{2}x - 2$
22. $y = \frac{2}{5}x - 3$
23. $y = -\frac{1}{6}x + 4$
24. $y = -\frac{1}{3}x + 3$

Find the x- and y-intercepts for each line, then (a) use these two points to calculate the slope of the line, (b) write the equation with y in terms of x (solve for y) and (c) compare the calculated slope and y-intercept to the equation from part (b). Comment on what you notice.



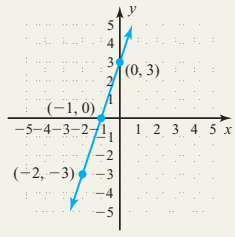
25. $3x + 4y = 12$
26. $3y - 2x = -6$
27. $2x - 5y = 10$
28. $2x + 3y = 9$
29. $4x - 5y = -15$
30. $5y + 6x = -25$

Write each equation in slope-intercept form (solve for y) and function form, then identify the slope and y-intercept.



31. $2x + 3y = 6$
32. $4y - 3x = 12$
33. $5x + 4y = 20$
34. $y + 2x = 4$
35. $x = 3y$
36. $2x = -5y$
37. $3x + 4y - 12 = 0$
38. $5y - 3x + 20 = 0$

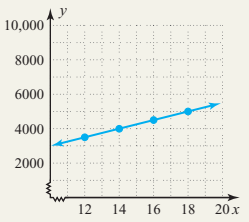
For Exercises 39 to 50, use the slope-intercept form to state the equation of each line. Verify your solutions to Exercises 45 to 47 using a graphing calculator.



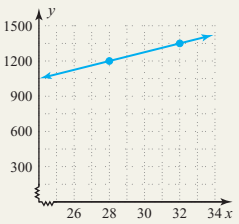
39.

40.

41.

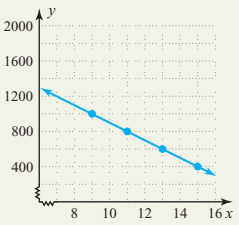


42. $m = -2$; y-intercept $(0, -3)$
43. $m = 3$; y-intercept $(0, 2)$
44. $m = \frac{-3}{2}$; y-intercept $(0, -4)$
45. $m = -4$; $(-3, 2)$ is on the line



46. $m = 2$; $(5, -3)$ is on the line

47. $m = \frac{-3}{2}$; $(-4, 7)$ is on the line



48.

49.

50.

Write each equation in slope-intercept form, then use the rate of change (slope) and *y*-intercept to graph the line.

51. $3x + 5y = 20$

52. $2y - x = 4$

53. $2x - 3y = 15$

54. $-3x + 2y = 4$

Graph each linear equation using the *y*-intercept and rate of change (slope) determined from each equation.

55. $y = \frac{2}{3}x + 3$

56. $y = \frac{5}{2}x - 1$

57. $y = \frac{-1}{3}x + 2$

58. $y = \frac{-4}{5}x + 2$

59. $y = 2x - 5$

60. $y = -3x + 4$

61. $y = \frac{1}{2}x - 3$

62. $y = \frac{-3}{2}x + 2$

Find the equation of the line using the information given. Write answers in slope-intercept form.

63. parallel to $2x - 5y = 10$, through the point $(-5, 2)$

64. parallel to $6x + 9y = 27$, through the point $(-3, -5)$

65. perpendicular to $5y - 3x = 9$, through the point $(6, -3)$

66. perpendicular to $x - 4y = 7$, through the point $(-5, 3)$

67. parallel to $12x + 5y = 65$, through the point $(-2, -1)$

68. parallel to $15y - 8x = 50$, through the point $(3, -4)$

69. parallel to $y = -3$, through the point $(2, 5)$

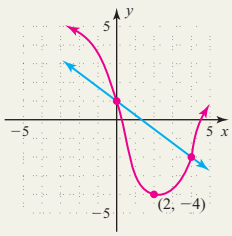
70. perpendicular to $y = -3$ through the point $(2, 5)$

Write the equations in slope-intercept form and state whether the lines are parallel, perpendicular, or neither.

71. $4y - 5x = 8$
$5y + 4x = -15$

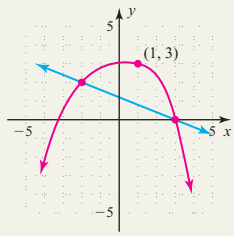
72. $3y - 2x = 6$
$2x + 3y = 6$

73. $2x - 5y = 20$
$4x - 3y = 18$



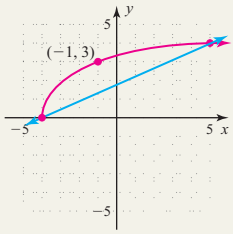
74. $-4x + 6y = 12$
$2x + 3y = 6$

75. $3x + 4y = 12$
$6x + 8y = 2$



76. $5y = 11x + 135$
$11y + 5x = -77$

A *secant line* is one that intersects a graph at two or more points. For each graph given, find an equation of the line (a) parallel and (b) perpendicular to the secant line, through the point indicated.



77.

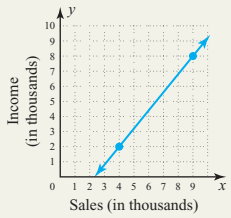
Find the equation of the line in point-slope form, then graph the line.

83. $m = 2$; $P_1 = (2, -5)$

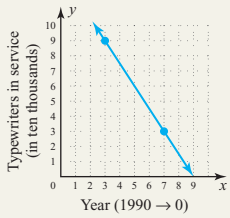
84. $m = -1$; $P_1 = (2, -3)$

85. $P_1 = (3, -4)$, $P_2 = (11, -1)$



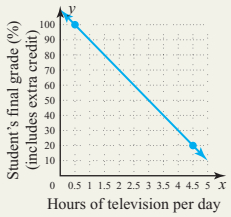
86. $P_1 = (-1, 6)$, $P_2 = (5, 1)$

87. $m = 0.5$; $P_1 = (1.8, -3.1)$

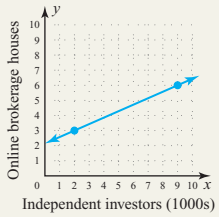


88. $m = 1.5$; $P_1 = (-0.75, -0.125)$

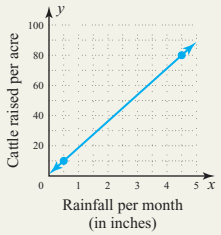
Find the equation of the line in point-slope form, and state the meaning of the slope in context—what information is the slope giving us?



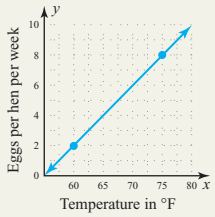
89.



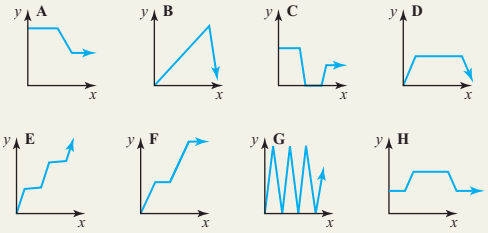
90.



91.



92.



93.

94.

Using the concept of slope, match each description with the graph that best illustrates it. Assume time is scaled on the horizontal axes, and height, speed, or distance from the origin (as the case may be) is scaled on the vertical axis.

95. While driving today, I got stopped by a state trooper. After she warned me to slow down, I continued on my way.

96. After hitting the ball, I began trotting around the bases shouting, "Ooh, ooh, ooh!" When I saw it wasn't a home run, I began sprinting.

97. At first I ran at a steady pace, then I got tired and walked the rest of the way.

98. While on my daily walk, I had to run for a while when I was chased by a stray dog.

99. I climbed up a tree, then I jumped out.

100. I steadily swam laps at the pool yesterday.

101. I walked toward the candy machine, stared at it for a while then changed my mind and walked back.

102. For practice, the girls' track team did a series of 25-m sprints, with a brief rest in between.

▶ WORKING WITH FORMULAS

103. General linear equation: $ax + by = c$

The general equation of a line is shown here, where a, b, and c are real numbers, with a and b not simultaneously zero. Solve the equation for y and note the slope (coefficient of x) and y-intercept (constant term). Use these to find the slope and y-intercept of the following lines, without solving for y or computing points.

a. $3x + 4y = 8$ **b.** $2x + 5y = -15$

c. $5x - 6y = -12$ **d.** $3y - 5x = 9$

104. Intercept-Intercept form of a linear equation: $\frac{x}{h} + \frac{y}{k} = 1$

The x- and y-intercepts of a line can also be found by writing the equation in the form shown (with the equation set equal to 1). The x-intercept will be $(h, 0)$ and the y-intercept will be $(0, k)$. Find the x- and y-intercepts of the following lines using this method. How is the slope of each line related to the values of h and k?

a. $2x + 5y = 10$ **b.** $3x - 4y = -12$

c. $5x + 4y = 8$

▶ APPLICATIONS

105. Speed of sound: The speed of sound as it travels through the air depends on the temperature of the air according to the function $V = \frac{3}{5}T + 331$, where V represents the velocity of the sound waves in meters per second (m/s), at a temperature of $T°$ Celsius. (a) Interpret the meaning of the slope and y-intercept in this context. (b) Determine the speed of sound at a temperature of 20°C. (c) If the speed of sound is measured at 361 m/s, what is the temperature of the air?

106. Acceleration: A driver going down a straight highway is traveling 60 ft/sec (about 41 mph) on cruise control, when he begins accelerating at a rate of 5.2 ft/sec^2. The final velocity of the car is given by $V = \frac{26}{5}t + 60$, where V is the velocity at time t. (a) Interpret the meaning of the slope and y-intercept in this context. (b) Determine the velocity of the car after 9.4 seconds. (c) If the car is traveling at 100 ft/sec, for how long did it accelerate?

107. Investing in coins: The purchase of a "collector's item" is often made in hopes the item will increase in value. In 1998, Mark purchased a 1909-S VDB Lincoln Cent (in fair condition) for $150. By the year 2004, its value had grown to $190. (a) Use the relation (time since purchase, value) with $t = 0$ corresponding to 1998 to find a linear equation modeling the value of the coin. (b) Discuss what the slope and y-intercept indicate in this context. (c) How much was the penny worth in 2009? (d) How many years after purchase will the penny's value exceed $250? (e) If the penny is now worth $170, how many years has Mark owned the penny?

108. Depreciation: Once a piece of equipment is put into service, its value begins to depreciate. A business purchases some computer equipment for $18,500. At the end of a 2-yr period, the value of the equipment has decreased to $11,500. (a) Use the relation (time since purchase, value) to find a linear equation modeling the value of the equipment. (b) Discuss what the slope and y-intercept indicate in this context. (c) What is the equipment's value after 4 yr? (d) How many years after purchase will the value decrease to $6000? (e) Generally, companies will sell used equipment while it still has value and use the funds to purchase new equipment. According to the function, how many years will it take this equipment to depreciate in value to $1000?

109. Internet connections: The number of households that are hooked up to the Internet (homes that are online) has been increasing steadily in recent years. In 1995, approximately 9 million homes were online. By 2001 this figure had climbed to about 51 million. (a) Use the relation (year, homes online) with $t = 0$ corresponding to 1995 to find an equation model for the number of homes online. (b) Discuss what the slope indicates in this context. (c) According to this model, in what year did the first homes begin to come online? (d) If the rate of change stays constant, how many households were on the Internet in 2006? (e) How many years after 1995 will there be over 100 million households connected? (f) If there are 115 million households connected, what year is it?

Source: 2004 Statistical Abstract of the United States, Table 965

110. Prescription drugs: Retail sales of prescription drugs have been increasing steadily in recent years. In 1995, retail sales hit $72 billion. By the year 2000, sales had grown to about $146 billion. (a) Use the relation (year, retail sales of prescription drugs) with $t = 0$ corresponding to 1995 to find a linear equation modeling the growth of retail sales. (b) Discuss what the slope indicates in this context. (c) According to this model, in what year will sales reach $250 billion? (d) According to the model, what was the value of retail prescription drug sales in 2005? (e) How many years after 1995 will retail sales exceed $279 billion? (f) If yearly sales totaled $294 billion, what year is it?

Source: 2004 Statistical Abstract of the United States, Table 122

111. Prison population: In 1990, the number of persons sentenced and serving time in state and federal institutions was approximately 740,000. By the year 2000, this figure had grown to nearly 1,320,000. (a) Find a linear function with $t = 0$ corresponding to 1990 that models this data, (b) discuss the slope ratio in context, and (c) use the equation to estimate the prison population in 2010 if this trend continues.

Source: Bureau of Justice Statistics at www.ojp.usdoj.gov/bjs

112. Eating out: In 1990, Americans bought an average of 143 meals per year at restaurants. This phenomenon continued to grow in popularity and in the year 2000, the average reached 170 meals per year. (a) Find a linear function with $t = 0$ corresponding to 1990 that models this growth, (b) discuss the slope ratio in context, and (c) use the equation to estimate the average number of times an American will eat at a restaurant in 2010 if the trend continues.

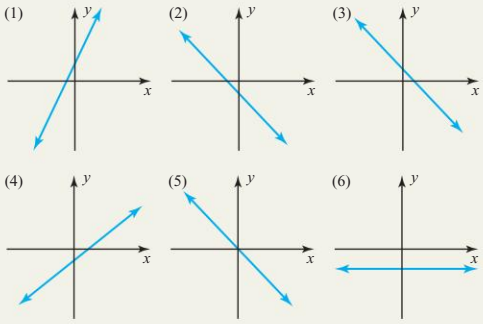
▶ EXTENDING THE CONCEPT

113. Locate and read the following article. Then turn in a one-page summary. "Linear Function Saves Carpenter's Time," Richard Crouse, *Mathematics Teacher,* Volume 83, Number 5, May 1990: pp. 400–401.

114. The general form of a linear equation is $ax + by = c$, where a and b are not simultaneously zero. (a) Find the x- and y-intercepts using the general form (substitute 0 for x, then 0 for y). Based on what you see, when does the intercept method work most efficiently? (b) Find the slope and y-intercept using the general form (solve for y). Based on what you see, when does the slope-intercept method work most efficiently?



115. Match the correct graph to the conditions stated for m and b. There are more choices than graphs.

a. $m < 0, b < 0$ **b.** $m > 0, b < 0$

c. $m < 0, b > 0$ **d.** $m > 0, b > 0$

e. $m = 0, b > 0$ **f.** $m < 0, b = 0$

g. $m > 0, b = 0$ **h.** $m = 0, b < 0$

▶ MAINTAINING YOUR SKILLS

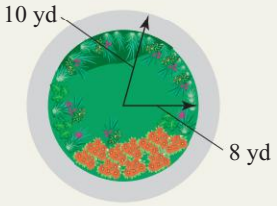
116. **(1.3)** Determine the domain:

a. $y = \sqrt{2x - 5}$

b. $y = \dfrac{5}{2x - 5}$

117. **(Appendix A.6)** Simply without the use of a calculator.

a. $27^{\frac{2}{3}}$ **b.** $\sqrt{81x^2}$



118. **(Appendix A.3)** Three equations follow. One is an identity, another is a contradiction, and a third has a solution. State which is which.

$2(x - 5) + 13 - 1 = 9 - 7 + 2x$

$2(x - 4) + 13 - 1 = 9 + 7 - 2x$

$2(x - 5) + 13 - 1 = 9 + 7 + 2x$

119. **(Appendix A.2)** Compute the area of the circular sidewalk shown here ($A = \pi r^2$). Use your calculator's value of π and round the answer (only) to hundredths.

1.5 Solving Equations and Inequalities Graphically; Formulas and Problem Solving

LEARNING OBJECTIVES

In Section 1.5 you will see how we can:

- ❑ **A.** Solve equations graphically using the *intersection-of-graphs* method
- ❑ **B.** Solve equations graphically using the *x*-intercept/*zeroes* method
- ❑ **C.** Solve linear inequalities graphically
- ❑ **D.** Solve for a specified variable in a formula or literal equation
- ❑ **E.** Use a problem-solving guide to solve various problem types

In this section, we'll build on many of the ideas developed in Appendix A.3 (Solving Linear Equations and Inequalities), as we learn to manipulate formulas and employ certain problem-solving strategies. We will also extend our understanding of graphical solutions to a point where they can be applied to virtually any family of functions.

A. Solving Equations Graphically Using the *Intersect Method*

For some background on why a graphical solution is effective, consider the equation $2x - 9 = -3(x - 1) - 2$. By definition, an **equation** is a statement that two expressions are equal for some value of the variable (Appendix A.3). To highlight this fact, the expressions $2x - 9$ and $-3(x - 1) - 2$ are evaluated independently for selected integers in Tables 1.4 and 1.5.

Table 1.4

x	$2x - 9$
-3	-15
-2	-13
-1	-11
0	-9
1	-7
2	-5
3	-3

Table 1.5

x	$-3(x - 1) - 2$
-3	10
-2	7
-1	4
0	1
1	-2
2	-5
3	-8

Note the two expressions are equal (the equation is true) only when the input is $x = 2$. Solving equations graphically is a simple extension of this observation. By treating the expression on the left as the independent function Y_1, we have $Y_1 = 2X - 9$ and the related linear graph will contain *all ordered pairs shown* in Table 1.4 (see Figure 1.67). Doing the same for the right-hand expression yields $Y_2 = -3(X - 1) - 2$, and its related graph will likewise contain all ordered pairs shown in the Table 1.5 (see Figure 1.68).

$$\underbrace{2x - 9}_{Y_1} = \underbrace{-3(x - 1) - 2}_{Y_2}$$

The solution is then found where $Y_1 = Y_2$, or in other words, at the point where these two lines intersect (if it exists). See Figure 1.69.

Most graphing calculators have an **intersect** feature that can quickly find the point(s) where two graphs intersect. On many calculators, we access this ability using the sequence 2nd TRACE **(CALC)** and selecting option **5:intersect** (Figure 1.70).

Figure 1.67

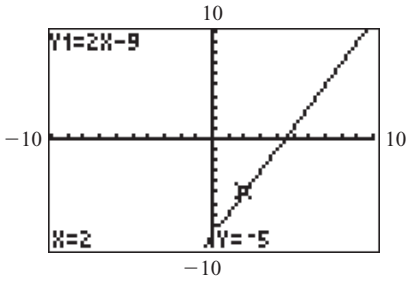


Figure 1.68

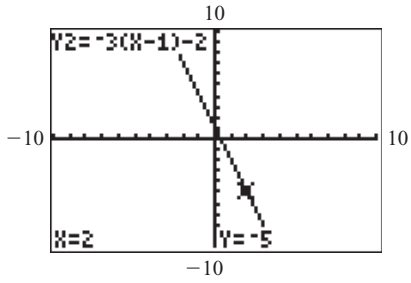

Figure 1.69

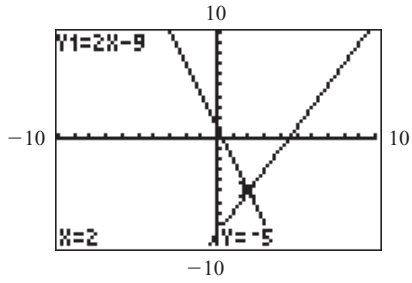

Figure 1.70

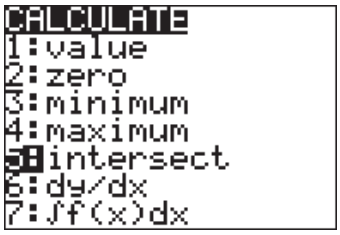

Figure 1.71

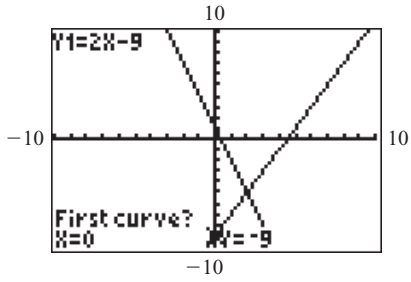

Figure 1.72

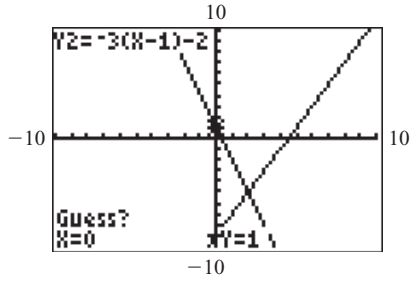

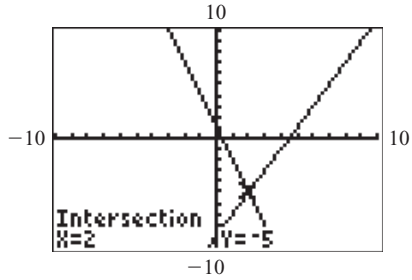

Figure 1.73

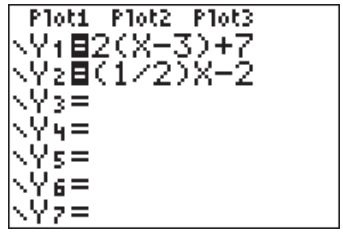
Because the calculator can work with up to 10 expressions at once, it will ask you to identify each graph you want to work with—even when there are only two. A marker is displayed on each graph in turn, and named in the upper left corner of the window (Figure 1.71). You can select a graph by pressing ENTER, or bypass a graph by pressing one of the arrow keys. For situations involving multiple graphs or multiple solutions, the calculator offers a **"GUESS?"** option that enables you to specify the approximate location of the solution you're interested in (Figure 1.72). For now, we'll simply press ENTER two times in succession to identify each graph, and a third time to bypass the **"GUESS?"** option. The calculator then finds and displays the point of intersection (Figure 1.73). Be sure to check the settings on your viewing window before you begin, and if the point of intersection is not visible, try ZOOM **3:Zoom Out** or other window-resizing features to help locate it.

EXAMPLE 1A ▶ Solving an Equation Graphically

Solve the equation $2(x - 3) + 7 = \frac{1}{2}x - 2$ using a graphing calculator.

Solution ▶ Begin by entering the left-hand expression as Y_1 and the right-hand expression as Y_2 (Figure 1.74). To find points of intersection, press 2nd TRACE **(CALC)** and select option **5:intersect,** which automatically places you on the graphing window, and asks you to identify the **"First curve?."** As discussed, pressing ENTER three times in succession will identify each graph, bypass the "**Guess**?" option, then find and display the point of intersection (Figure 1.75). Here the point of intersection is $(-2, -3)$, showing the solution to this equation is $x = -2$ (for which both expressions equal -3). This can be verified by direct substitution or by using the **TABLE** feature.

Figure 1.74



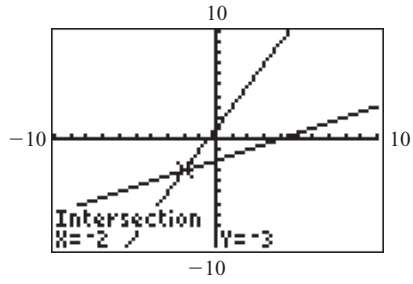


Figure 1.75

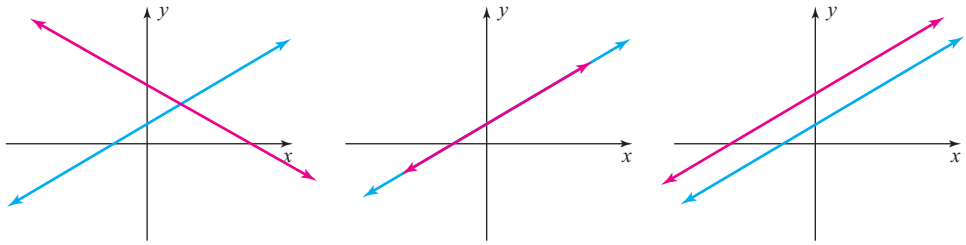
This method of solving equations is called the **Intersection-of-Graphs** method, and can be applied to many different equation types.



Intersection-of-Graphs Method for Solving Equations

For any equation of the form $f(x) = g(x)$,

1. Assign $f(x)$ as Y_1 and $g(x)$ as Y_2.
2. Graph both function and identify any point(s) of intersection, if they exist. The x-coordinate of all such points is a solution to the equation.

Recall that in the solution of linear equations, we sometimes encounter equations that are identities (infinitely many solutions) or contradictions (no solutions). These possibilities also have graphical representations, and appear as coincident lines and parallel lines respectively. These possibilities are illustrated in Figure 1.76.

Figure 1.76

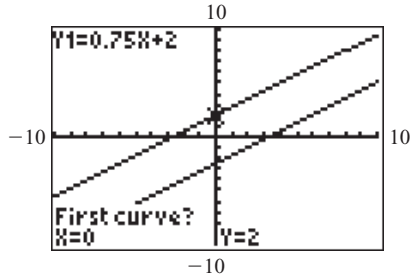
One point of intersection (unique solution) | Infinitely many points of intersection (identity) | No point of intersection (contradiction)

EXAMPLE 1B ▶ **Solving an Equation Graphically**

Solve $0.75x + 2 = 0.5(1 + 1.5x) - 3$ using a graphing calculator.

Solution ▶ With $0.75X + 2$ as Y_1 and $0.5(1 + 1.5X) - 3$ as Y_2, we use the 2nd TRACE **(CALC)** option and select **5:intersect.** The graphs appear to be parallel lines (Figure 1.77), and after pressing ENTER three times we obtain the error message shown (Figure 1.78), confirming there are no solutions.

Figure 1.77



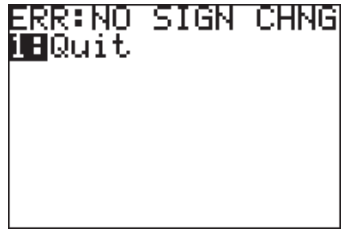


Figure 1.78

A. You've just seen how we can solve equations using the Intersection-of-Graphs method

Now try Exercises 7 through 16 ▶

B. Solving Equations Graphically Using the *x*-Intercept/Zeroes Method

The intersection-of-graphs method works extremely well when the graphs of $f(x)$ and $g(x)$ (Y_1 and Y_2) are simple and "well-behaved." Later in this course, we encounter a number of graphs that are more complex, and it will help to develop alternative methods for solving graphically. Recall that two equations are equivalent if they have the same solution set. For instance, the equations $2x = 6$ and $2x - 6 = 0$ are equivalent (since $x = 3$ is a solution to both), as are $3x - 1 = x + 5$ and $2x - 6 = 0$ (since

$x = 3$ is a solution to both). Applying the intersection-of-graphs method to the last two equivalent equations, gives

$$\underbrace{3x - 1}_{Y_1} = \underbrace{x + 5}_{Y_2} \quad \text{and} \quad \underbrace{2x - 6}_{Y_1} = \underbrace{0}_{Y_2}$$

WORTHY OF NOTE

The *intersection-of-graphs method* focuses on a point of intersection (a, b), and names $x = a$ as the solution. The *zeroes method* focuses on the input $x = r$, for which the output is 0 $[Y_1(r) = 0]$. All such values r are called the **zeroes** of the function. Much more will be said about functions and their zeroes in later chapters.

The intersection method will work equally well in both cases, but the equation on the right has *only one variable expression,* and will produce a single (visible) graph (since $Y_2 = 0$ is simply the x-axis). Note that here we seek an input value that will result in an output of 0. In other words, all solutions will have the form $(x, 0)$, *which is the x-intercept* of the graph. For this reason, the method is alternatively called the **zeroes method** or the ***x*-intercept method.** The method employs the approach shown above, in which the equation $f(x) = g(x)$ is rewritten as $f(x) - g(x) = 0$, with $f(x) - g(x)$ assigned as Y_1.

Zeroes/*x*-Intercept Method for Solving Equations

For any equation of the form $f(x) = g(x)$,

1. Rewrite the equation as $f(x) - g(x) = 0$.
2. Assign $f(x) - g(x)$ as Y_1.
3. Graph the resulting function and identify any x-intercepts, if they exist.

Any x-intercept(s) of the graph will be a solution to the equation.

To locate the zero (x-intercept) for $2x - 6 = 0$ on a graphing calculator, enter $2X - 6$ for Y_1 and use the **2:zero** option found on the same menu as the **5:intercept** option (Figure 1.79). Since some equations have more than one zero, the **2:zero** option will ask you to "narrow down" the interval it should search, even though there is only one zero here. It does this by asking for a **"Left Bound?",** a **"Right Bound?",** and a **"GUESS?"** (the **Guess?** option can once again be bypassed). You can enter these bounds by tracing along the graph or by inputting a chosen value, then pressing ENTER (note how the calculator posts a marker at each bound). Figure 1.80 shows we entered $x = 0$ as the left bound and $x = 4$ as the right, and the calculator will search for the x-intercept in this interval (note that in general, the cursor will be either above or below the x-axis for the left bound, but must be on *the opposite side* of the x-axis for the right bound). Pressing ENTER once more bypasses the **Guess?** option and locates the x-intercept at (3, 0). The solution is $x = 3$ (Figure 1.81).

Figure 1.79

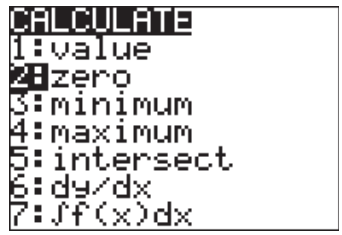

Figure 1.80

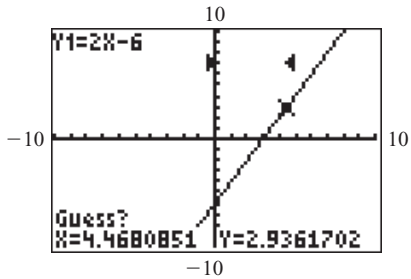

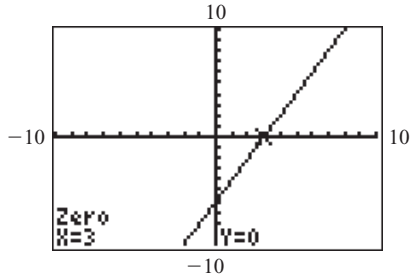

Figure 1.81

EXAMPLE 2 ▶ **Solving an Equation Using the Zeroes Method**

Solve the equation $-4(x + 3) - 6 = 2x + 3$ using the zeroes method.

Solution ▶ As given, we have $f(x) = -4(x + 3) - 6$ and $g(x) = 2x + 3$. Rewriting the equation as $f(x) - g(x) = 0$ gives $-4(x + 3) - 6 - (2x + 3) = 0$, where the expression for $g(x)$ is parenthesized to ensure the equations remain equivalent. Entering $-4(X + 3) - 6 - (2X + 3)$ as Y_1 and pressing 2nd TRACE **(CALC) 2:zero** produces the screen shown in Figure 1.82, with the calculator requesting a left bound. We can input any x-value that is obviously to the left of the x-intercept, or move the cursor to any position left of the x-intercept and press ENTER (we input $x = -4$, see Figure 1.83). The calculator then asks for a right bound and as before we can input any x-value obviously to the right, or simply move the cursor to any location on the *opposite side* of the x-axis and press ENTER (we chose $x = -2$, see Figure 1.84). After bypassing the **Guess?** option (press ENTER once again), the calculator locates the x-intercept at $(-3.5, 0)$, and the solution to the original equation is $x = -3.5$ (Figure 1.85).

Figure 1.82

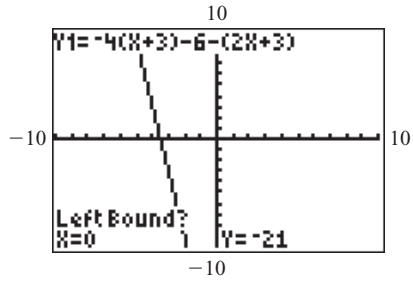

Figure 1.83

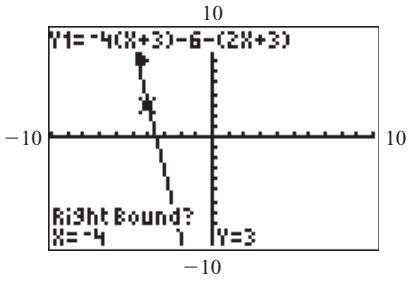

Figure 1.84

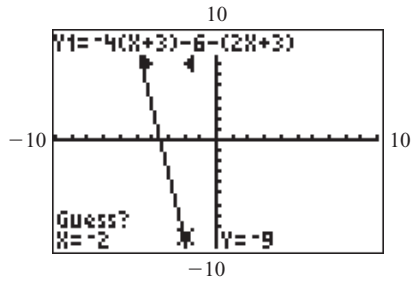

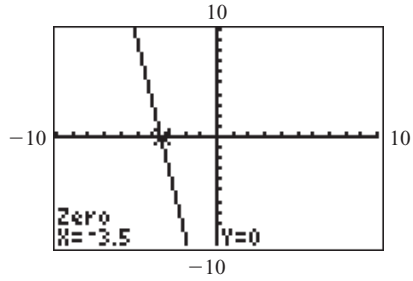

Figure 1.85

B. You've just seen how we can solve equations using the *x*-intercept/zeroes method

Now try Exercises 17 through 26 ▶

C. Solving Linear Inequalities Graphically

The intersection-of-graphs method can also be applied to solve linear inequalities. The point of intersection simply becomes one of the boundary points for the solution interval, and is included or excluded depending on the inequality given. For the inequality $f(x) > g(x)$ written as $Y_1 > Y_2$, it becomes clear the inequality is true for all inputs x where the outputs for Y_1 are greater than the outputs for Y_2, meaning *the graph of f(x) is above the graph of g(x)*. A similar statement can be made for $f(x) < g(x)$ written as $Y_1 < Y_2$.

Intersection-of-Graphs Method for Solving Inequalities

For any inequality of the form $f(x) > g(x)$,

1. Assign $f(x)$ as Y_1 and $g(x)$ as Y_2.
2. Graph both functions and identify any point(s) of intersection, if they exist.

The solution set is all real numbers x for which the graph of Y_1 is *above* the graph of Y_2.

For strict inequalities, the boundary of the solution interval is not included. A similar process is used for the inequalities $f(x) \geq g(x)$, $f(x) < g(x)$, and $f(x) \leq g(x)$. Note that we can actually draw the graphs of Y_1 and Y_2 differently (one more bold than the

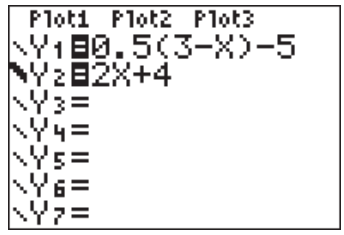
other) to clearly tell them apart in the viewing window. This is done on the Y= screen, by moving the cursor to the far left of the current function and pressing ENTER until a bold line appears. From the default setting, pressing ENTER one time produces this result.

EXAMPLE 3 ▶ **Solving an Inequality Using the Intersection-of-Graphs Method**

Solve $0.5(3 - x) - 5 \le 2x + 4$ using the intersection-of-graphs method.

Solution ▶ To assist with the clarity of the solution, we set the calculator to graph Y_2 using a bolder line than Y_1 (Figure 1.86). With $0.5(3 - X) - 5$ as Y_1 and $2X + 4$ as Y_2, we use the 2nd TRACE **(CALC)** option and select **5:intersect.** Pressing ENTER three times serves to identify both graphs, bypass the **"Guess?"** option, and display the point of intersection $(-3, -2)$ (Figure 1.87). Since the graph of Y_1 is *below* the graph of Y_2 $(Y_1 \le Y_2)$ for all values of x to the right of $(-3, -2)$, $x = -3$ is the left boundary, with the interval extending to positive infinity. Due to the less than *or equal to* inequality, we *include* $x = -3$ and the solution interval is $x \in [-3, \infty)$.

Figure 1.86



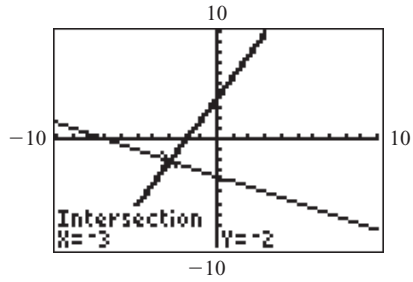


Figure 1.87

C. You've just seen how we can solve linear inequalities graphically

Now try Exercises 27 through 36 ▶

D. Solving for a Specified Variable in Literal Equations

A **formula** is an equation that models a known relationship between two or more quantities. A **literal equation** is simply one that has two or more variables. Formulas are a type of literal equation, but not every literal equation is a formula. For example, the formula $A = P + PRT$ models the growth of money in an account earning simple interest, where A represents the total amount accumulated, P is the initial deposit, R is the annual interest rate, and T is the number of years the money is left on deposit. To *describe* $A = P + PRT$, we might say the formula has been "solved for A" or that "A is written in terms of P, R, and T." In some cases, before using a formula it may be convenient to solve for one of the other variables, say P. In this case, P is called the **object variable.**

EXAMPLE 4 ▶ **Solving for Specified Variable**

Given $A = P + PRT$, write P in terms of A, R, and T (solve for P).

Solution ▶ Since the object variable occurs in more than one term, we first apply the distributive property.

$$A = \boldsymbol{P} + \boldsymbol{P}RT \qquad \text{focus on } \boldsymbol{P}\text{—the object variable}$$

$$A = \boldsymbol{P}(1 + RT) \qquad \text{factor out } \boldsymbol{P}$$

$$\frac{A}{1 + RT} = \frac{\boldsymbol{P}(1 + RT)}{(1 + RT)} \qquad \text{solve for } \boldsymbol{P} \text{ [divide by } (1 + RT)\text{]}$$

$$\frac{A}{1 + RT} = \boldsymbol{P} \qquad \text{result}$$

Now try Exercises 37 through 48 ▶

We solve literal equations for a specified variable using the same methods we used for other equations and formulas. Remember that it's good practice to *focus on the object variable* to help guide you through the solution process, as again shown in Example 5.

EXAMPLE 5 ▶ **Solving for a Specified Variable**

Given $2x + 3y = 15$, write y in terms of x (solve for y).

Solution ▶

$$\begin{aligned} 2x + 3y &= 15 && \text{focus on the object variable} \\ 3y &= -2x + 15 && \text{subtract } 2x \text{ (isolate } y\text{-term)} \\ \tfrac{1}{3}(3y) &= \tfrac{1}{3}(-2x + 15) && \text{multiply by } \tfrac{1}{3} \text{ (solve for } y) \\ y &= \tfrac{-2}{3}x + 5 && \text{simplify and distribute} \end{aligned}$$

WORTHY OF NOTE

In Example 5, notice that in the second step we wrote the subtraction of $2x$ as $-2x + 15$ instead of $15 - 2x$. For reasons that will become clearer as we continue our study, we generally write variable terms before constant terms.

Now try Exercises 49 through 54 ▶

Literal Equations and General Solutions

Solving literal equations for a specified variable can help us develop the general solution for an entire family of equations. This is demonstrated here for the family of linear equations written in the form $ax + b = c$. A side-by-side comparison with a specific linear equation demonstrates that identical ideas are used.

Specific Equation		Literal Equation
$2x + 3 = 15$	focus on object variable	$ax + b = c$
$2x = 15 - 3$	subtract constant	$ax = c - b$
$x = \dfrac{15 - 3}{2}$	divide by coefficient	$x = \dfrac{c - b}{a}$

Of course the solution on the left would be written as $x = 6$ and checked in the original equation. On the right we now have a general formula for all equations of the form $ax + b = c$.

EXAMPLE 6 ▶ **Solving Equations of the Form $ax + b = c$ Using a General Formula**

Solve $6x - 1 = -25$ using the formula just developed, and check your solution in the original equation.

Solution ▶ For this equation, $a = 6$, $b = -1$, and $c = -25$, giving

$$\begin{aligned} x &= \frac{c - b}{a} \\ &= \frac{-25 - (-1)}{6} \\ &= \frac{-24}{6} \\ &= -4 \end{aligned}$$

Check:

$$\begin{aligned} 6x - 1 &= -25 \\ 6(-4) - 1 &= -25 \\ -24 - 1 &= -25 \\ -25 &= -25 \checkmark \end{aligned}$$

Now try Exercises 55 through 60 ▶

D. You've just seen how we can solve for a specified variable in a formula or literal equation

Developing a general solution for the linear equation $ax + b = c$ seems to have little practical use. But in Section 3.2 we'll use this idea to develop a general solution for *quadratic equations,* a result with much greater significance.

E. Using a Problem-Solving Guide

Becoming a good problem solver is an evolutionary process. Over time and with continued effort, your problem-solving skills grow, as will your ability to solve a wider range of applications. Most good problem solvers develop the following characteristics:

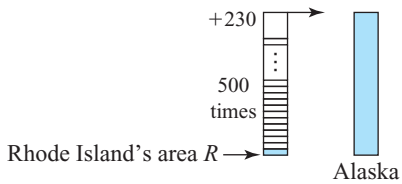
- A positive attitude
- A mastery of basic facts
- Strong mental arithmetic skills
- Good mental-visual skills
- Good estimation skills
- A willingness to persevere

These characteristics form a solid basis for applying what we call the **Problem-Solving Guide,** which simply organizes the basic elements of good problem solving. Using this guide will help save you from two common stumbling blocks—indecision and not knowing where to start.

Problem-Solving Guide

- **Gather and organize information.**
  Read the problem several times, forming a mental picture as you read. *Highlight key phrases.* List given information, including any related formulas. *Clearly identify what you are asked to find.*
- **Make the problem visual.**
  Draw and label a diagram or create a table of values, as appropriate. This will help you see how different parts of the problem fit together.
- **Develop an equation model.**
  Assign a variable to represent what you are asked to find and build any related expressions referred to in the problem. Write an equation model based on the relationships given in the problem. *Carefully reread the problem to double-check your equation model.*
- **Use the model and given information to solve the problem.**
  Substitute given values, then simplify and solve. State the answer in sentence form, and check that the answer is reasonable. Include any units of measure indicated.

General Modeling Exercises



Translating word phrases into symbols is an important part of building equations from information given in paragraph form. Sometimes the variable *occurs more than once* in the equation, because two different items in the same exercise are related. If the relationship involves a comparison of size, we often use line segments or bar graphs to model the relative sizes.

EXAMPLE 7 ▶ Solving an Application Using the Problem-Solving Guide

The largest state in the United States is Alaska (AK), which covers an area that is 230 square miles (mi^2) more than 500 times that of the smallest state, Rhode Island (RI). If they have a combined area of 616,460 mi^2, how many square miles does each cover?

Solution ▶ Combined area is 616,460 mi^2, AK covers 230 more than 500 times the area of RI.

gather and organize information
highlight any key phrases

make the problem visual

Let R represent the area of Rhode Island. — assign a variable
Then $500R + 230$ represents Alaska's area. — build related expressions

Rhode Island's area + Alaska's area = Total

$R + (500R + 230) = 616{,}460$ — write the equation model

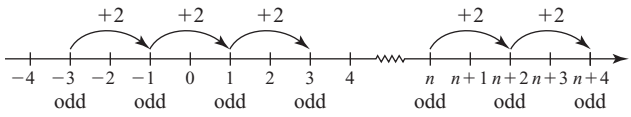
$501R = 616{,}230$ — combine like terms, subtract 230

$R = 1230$ — divide by 501

Rhode Island covers an area of 1230 mi^2, while Alaska covers an area of $500(1230) + 230 = 615{,}230$ mi^2.

Now try Exercises 63 through 68 ▶

Consecutive Integer Exercises



Exercises involving **consecutive integers** offer excellent practice in assigning variables to unknown quantities, building related expressions, and the problem-solving process in general. We sometimes work with consecutive **odd** integers or consecutive **even** integers as well.

EXAMPLE 8 ▶ Solving a Problem Involving Consecutive Odd Integers

The sum of three consecutive *odd* integers is 69. What are the integers?

Solution ▶

The sum of three consecutive odd integers . . . — gather/organize information; highlight any key phrases

make the problem visual

WORTHY OF NOTE

The number line illustration in Example 8 shows that consecutive odd integers are *two units* apart and the related expressions were built accordingly: n, $n + 2$, $n + 4$, and so on. In particular, *we cannot use* n, $n + 1$, $n + 3$, . . . because n and $n + 1$ are *not two units apart*. If we know the exercise involves *even* integers instead, the same model is used, since even integers are also two units apart. For *consecutive* integers, the labels are n, $n + 1$, $n + 2$, and so on.

Let n represent the smallest consecutive odd integer, — assign a variable
then $n + 2$ represents the second odd integer and — build related expressions
$(n + 2) + 2 = n + 4$ represents the third.

In words: first + second + third odd integer = 69 — write the equation model

$n + (n + 2) + (n + 4) = 69$ — equation model

$3n + 6 = 69$ — combine like terms

$3n = 63$ — subtract 6

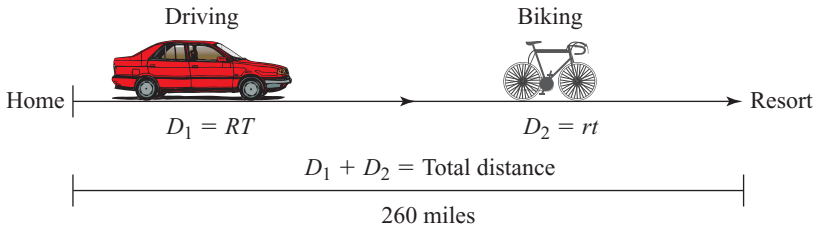
$n = 21$ — divide by 3

The odd integers are $n = 21$, $n + 2 = 23$, and $n + 4 = 25$.
$21 + 23 + 25 = 69$ ✓

Now try Exercises 69 through 72 ▶

Uniform Motion (Distance, Rate, Time) Exercises

Uniform motion problems have many variations, and it's important to draw a good diagram when you get started. Recall that if speed is constant, the distance traveled is equal to the rate of speed multiplied by the time in motion: $D = RT$.



EXAMPLE 9 ▶ **Solving a Problem Involving Uniform Motion**

I live 260 mi from a popular mountain retreat. On my way there to do some mountain biking, my car had engine trouble—forcing me to bike the rest of the way. If I drove 2 hr longer than I biked and averaged 60 miles per hour driving and 10 miles per hour biking, how many hours did I spend pedaling to the resort?

Solution ▶

The sum of the two distances must be 260 mi. — gather/organize information

The **rates** are given, and the driving time is *2 hr more than biking* time. — highlight any key phrases; make the problem visual

Let t represent the biking time, then $T = t + 2$ represents time spent driving. — assign a variable; build related expressions

$D_1 + D_2 = 260$	write the equation model
$RT + rt = 260$	$RT = D_1$, $rt = D_2$
$60(t + 2) + 10t = 260$	substitute $t + 2$ for T, 60 for R, 10 for r
$70t + 120 = 260$	distribute and combine like terms
$70t = 140$	subtract 120
$t = 2$	divide by 70

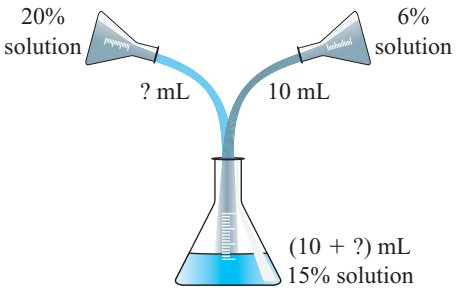
I rode my bike for $t = 2$ hr, after driving $t + 2 = 4$ hr.

Now try Exercises 73 through 76 ▶

Exercises Involving Mixtures

Mixture problems offer another opportunity to refine our problem-solving skills while using many elements from the problem-solving guide. They also lend themselves to a very useful mental-visual image and have many practical applications.

EXAMPLE 10 ▶ **Solving an Application Involving Mixtures**



As a nasal decongestant, doctors sometimes prescribe saline solutions with a concentration between 6% and 20%. In "the old days," pharmacists had to create different mixtures, but only needed to stock these concentrations, since any percentage in between could be obtained using a mixture. An order comes in for a 15% solution. How many milliliters (mL) of the 20% solution must be mixed with 10 mL of the 6% solution to obtain the desired 15% solution? Provide both an algebraic solution and a graphical solution.

Algebraic Solution ▶

Only 6% and 20% concentrations are available; mix some 20% solution with 10 mL of the 6% solution. (See Figure 1.88.)

gather/organize information
highlight any key phrases

Figure 1.88

make the problem visual

Let x represent the amount of 20% solution, then $10 + x$ represents the total amount of 15% solution.

assign a variable
build related expressions

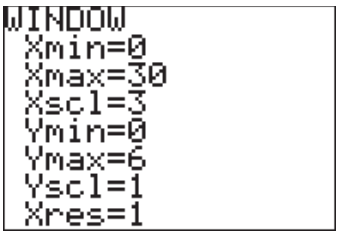
1st quantity times its concentration		2nd quantity times its concentration		1st+2nd quantity times desired concentration	
$10(0.06)$	$+$	$x(0.2)$	$=$	$(10 + x)(0.15)$	write equation model
0.6	$+$	$0.2x$	$=$	$1.5 + 0.15x$	distribute/simplify
		$0.2x$	$=$	$0.9 + 0.15x$	subtract 0.6
		$0.05x$	$=$	0.9	subtract $0.15x$
		x	$=$	18	divide by 0.05

To obtain a 15% solution, 18 mL of the 20% solution must be mixed with 10 mL of the 6% solution.

Graphical Solution ▶

Although both methods work equally well, here we elect to use the intersection-of-graphs method and enter $10(0.06) + X(0.2)$ as Y_1 and $(10 + X)(0.15)$ as Y_2. Virtually all graphical solutions require a careful study of the context to set the viewing window prior to graphing. If 10 mL of liquid were used from each concentration, we would have 20 mL of a 13% solution (see *Worthy of Note*), so more of the stronger solution is needed. This shows that an appropriate Xmax might be close to 30. If all 30 mL were used, the output would be $30(0.15) = 4.5$, so an appropriate Ymax might be around 6 (see Figure 1.89). Using 2nd TRACE **(CALC) 5:Intersect** and pressing ENTER three times gives (18, 4.2) as the point of intersection, showing $x = 18$ mL of the stronger solution must be used (Figure 1.90).

Figure 1.89



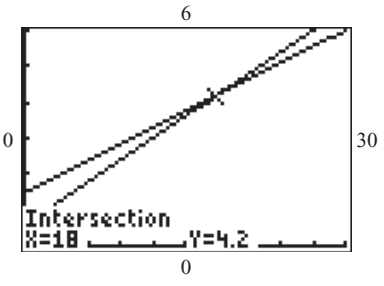


Figure 1.90

WORTHY OF NOTE

For mixture exercises, an estimate assuming equal amounts of each liquid can be helpful. For example, assume we use 10 mL of the 6% solution and 10 mL of the 20% solution. The final concentration would be halfway in between, $\frac{6 + 20}{2} = 13\%$. This is too low a concentration (we need a 15% solution), so we know that more than 10 mL of the stronger (20%) solution must be used.

☑ **E.** You've just seen how we can use the problem-solving guide to solve various problem types

Now try Exercises 77 through 84 ▶

1.5 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section, if necessary.

1. When using the _____ method, one side of an equation is entered as ___ and the other side as ___ on a graphing calculator. The _____ of the point of _____ is the solution of the equation.
2. To solve a linear inequality using the intersection-of-graphs method, first find the point of _____. The _____ of this point is a boundary value of the solution interval and if the inequality is not strict, this value is _____ in the solution.
3. A(n) ____ equation is an equation having ____or more unknowns.
4. For the equation $S = 2\pi r^2 + 2\pi rh$, we can say that S is written in terms of ___ and ___.
5. Discuss/Explain the similarities and differences between the intersection and zeroes methods for solving equations. How can the zeroes method be applied to solving linear inequalities? Give examples in your discussion.
6. Discuss/Explain each of the four basic parts of the *problem-solving guide*. Include a solved example in your discussion.

▶ DEVELOPING YOUR SKILLS

Solve the following equations using a graphing calculator and the intersection-of-graphs method. For Exercises 7 and 8, carefully sketch the graphs you designate as Y_1 and Y_2 by hand before using your calculator.

7. $3x - 7 = -2(x + 1) + 10$
8. $-2x + 1 = 2(x - 3) - 1$
9. $0.8x + 0.4 = 0.25(2 - 0.4x) - 2.8$
10. $0.5x + 2.5 = 0.75(3 - 0.2x) - 0.4$
11. $x - (3x + 1) = -0.5(4x + 6) + 2$
12. $3x - (4 + x) = 0.2(6 + 10x) - 5.2$
13. $\frac{1}{3}x = \frac{-2}{3}x - 9$
14. $\frac{-4}{5}x + 8 = \frac{6}{5}x$
15. $\frac{1}{2}(x - 4) + 10 = x - (2 + \frac{1}{2}x)$
16. $\frac{-1}{3}(x + 6) + 5 = -x - (6 - \frac{2}{3}x)$

Solve the following equations using a graphing calculator and the *x*-intercept/zeroes method. Compare your results for Exercises 17 and 18 to those of Exercises 7 and 8.

17. $3x - 7 = -2(x + 1) + 10$
18. $-2x + 1 = 2(x - 3) - 1$
19. $2(3 - 2x) - 5 = -3x + 3$
20. $-3(-3 - x) + 4 = 2x + 5$
21. $-1.5(x + 4) + 2.5 = 3x - 3.5$
22. $0.8(3x - 1) + 0.2 = -2x + 3.8$
23. $2(x + 2) + 1 = x + (1 + x)$
24. $3(2x - 1) - 1 = 2x - (1 - 4x)$
25. $3x - (0.7x - 1.2) = 2(1.1x + 0.6) + 0.1x$
26. $3x + 2(0.2x - 1.4) = 4(0.8x - 0.7) + 0.2x$

Solve the following inequalities using a graphing calculator and the intersection-of-graphs method. Compare your results for Exercises 27 and 28 to those of Exercises 7 and 8.

27. $3x - 7 > -2(x + 1) + 10$
28. $-2x + 1 > 2(x - 3) - 1$
29. $2x - (3 + x) \geq -2(5 - 2x) + 7$
30. $4(3x - 5) + 2 \geq 3(2 - 4x) + 24$
31. $-0.3(x + 2) + 1.1 < 0.2x + 3$
32. $0.25(4 - x) + 1 < 1 - 0.5x$
33. $-3(x - 1) + 1 \leq x - 4(x - 1)$
34. $1.1(2 - x) + 0.2 > 5(0.1 - 0.2x) - 0.1x$
35. $2(1.5x - 1.1) + 0.1x \geq 4x - 0.3(3x - 4)$
36. $4(x - 1) - 2x + 7 < 2(x + 1.5)$

Solve for the specified variable in each formula or literal equation.

37. $P = C + CM$ for C (retail)

38. $S = P - PD$ for P (retail)

39. $C = 2\pi r$ for r (geometry)

40. $V = LWH$ for W (geometry)

41. $\dfrac{P_1V_1}{T_1} = \dfrac{P_2V_2}{T_2}$ for T_2 (science)

42. $\dfrac{C}{P_2} = \dfrac{P_1}{d^2}$ for P_2 (communication)

43. $V = \frac{4}{3}\pi r^2 h$ for h (geometry)

44. $V = \frac{1}{3}\pi r^2 h$ for h (geometry)

45. $S_n = n\left(\dfrac{a_1 + a_n}{2}\right)$ for n (sequences)

46. $A = \dfrac{h(b_1 + b_2)}{2}$ for h (geometry)

47. $S = B + \frac{1}{2}PS$ for P (geometry)

48. $s = \frac{1}{2}gt^2 + vt$ for g (physics)

49. $Ax + By = C$ for y

50. $2x + 3y = 6$ for y

51. $\frac{5}{6}x + \frac{3}{8}y = 2$ for y

52. $\frac{2}{3}x - \frac{7}{9}y = 12$ for y

53. $y - 3 = \frac{-4}{5}(x + 10)$ for y

54. $y + 4 = \frac{-2}{15}(x + 10)$ for y

The following equations are given in $ax + b = c$ form. Solve by identifying the value of a, b, and c, then using the formula $x = \dfrac{c - b}{a}$.

55. $3x + 2 = -19$

56. $7x + 5 = 47$

57. $-6x + 1 = 33$

58. $-4x + 9 = 43$

59. $7x - 13 = -27$

60. $3x - 4 = -25$

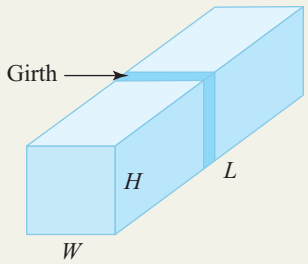
▶ WORKING WITH FORMULAS

61. Surface area of a cylinder: $SA = 2\pi r^2 + 2\pi rh$

The surface area of a cylinder is given by the formula shown, where h is the height of the cylinder and r is the radius of the base. Find the height of a cylinder that has a radius of 8 cm and a surface area of 1256 cm^2. Use $\pi \approx 3.14$.

62. Using the equation-solving process for Exercise 61 as a model, solve the formula $SA = 2\pi r^2 + 2\pi rh$ for h.

▶ APPLICATIONS



Solve by building an equation model and using the problem-solving guidelines as needed. Check all answers using a graphing calculator.

General Modeling Exercises

63. Two spelunkers (cave explorers) were exploring different branches of an underground cavern. The first was able to descend 198 ft farther than twice the second. If the first spelunker descended 1218 ft, how far was the second spelunker able to descend?

64. The area near the joining of the Tigris and Euphrates Rivers (in modern Iraq) has often been called the *Cradle of Civilization,* since the area has evidence of many ancient cultures. The length of the Euphrates River exceeds that of the Tigris by 620 mi. If they have a combined length of 2880 mi, how long is each river?

65. U.S. postal regulations require that a package can have a maximum combined length and girth (distance around) of 108 in. A shipping carton is constructed so that it has a width of 14 in., a height of 12 in., and can be cut or folded to various lengths. What is the maximum length that can be used?

Source: www.USPS.com

66. Hi-Tech Home Improvements buys a fleet of identical trucks that cost $32,750 each. The company is allowed to depreciate the value of their trucks for tax purposes by $5250 per year. If company policies dictate that older trucks must be sold once their value declines to $6500, approximately how many years will they keep these trucks?

67. The longest suspension bridge in the world is the Akashi Kaikyo (Japan) with a length of 6532 feet. Japan is also home to the Shimotsui Straight bridge. The Akashi Kaikyo bridge is 364 ft more than twice the length of the Shimotsui bridge. How long is the Shimotsui bridge?

Source: www.guinnessworldrecords.com

68. The Mars rover *Spirit* landed on January 3, 2004. Just over 1 yr later, on January 14, 2005, the *Huygens* probe landed on Titan (one of Saturn's moons). At their closest approach, the distance from the Earth to Saturn is 29 million mi more than 21 times the distance from the Earth to Mars. If the distance to Saturn is 743 million mi, what is the distance to Mars?

Consecutive Integer Exercises

69. Find two consecutive even integers such that the sum of twice the smaller integer plus the larger integer is one hundred forty-six.

70. When the smaller of two consecutive integers is added to three times the larger, the result is fifty-one. Find the smaller integer.

71. Seven times the first of two consecutive odd integers is equal to five times the second. Find each integer.

72. Find three consecutive even integers where the sum of triple the first and twice the second is eight more than four times the third.

Uniform Motion Exercises

73. At 9:00 A.M., Linda leaves work on a business trip, gets on the interstate, and sets her cruise control at 60 mph. At 9:30 A.M., Bruce notices she's left her briefcase and cell phone, and immediately starts after her driving 75 mph. At what time will Bruce catch up with Linda?

74. A plane flying at 300 mph has a 3-hr head start on a "chase plane," which has a speed of 800 mph. How far from the airport will the chase plane overtake the first plane?

75. Jeff had a job interview in a nearby city 72 mi away. On the first leg of the trip he drove an average of 30 mph through a long construction zone, but was able to drive 60 mph after passing through this zone. If driving time for the trip was $1\frac{1}{2}$ hr, how long was he driving in the construction zone?

76. At a high-school cross-country meet, Jared jogged 8 mph for the first part of the race, then increased his speed to 12 mph for the second part. If the race was 21 mi long and Jared finished in 2 hr, how far did he jog at the faster pace?

Mixture Exercises

Give the total amount of the mix that results and the percent concentration or worth of the mix.

77. Two quarts of 100% orange juice are mixed with 2 quarts of water (0% juice).

78. Ten pints of a 40% acid are combined with 10 pints of an 80% acid.

79. Eight pounds of premium coffee beans worth $2.50 per pound are mixed with 8 lb of standard beans worth $1.10 per pound.

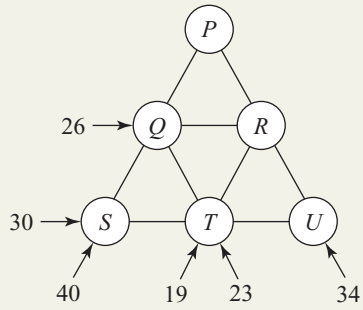
80. A rancher mixes 50 lb of a custom feed blend costing $1.80 per pound, with 50 lb of cheap cottonseed worth $0.60 per pound.

Solve each application of the mixture concept.

81. To help sell more of a lower grade meat, a butcher mixes some premium ground beef worth $3.10/lb, with 8 lb of lower grade ground beef worth $2.05/lb. If the result was an intermediate grade of ground beef worth $2.68/lb, how much premium ground beef was used?

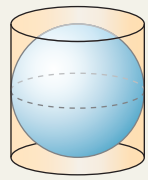
82. Knowing that the camping/hiking season has arrived, a nutrition outlet is mixing GORP (Good Old Raisins and Peanuts) for the anticipated customers. How many pounds of peanuts worth \$1.29/lb, should be mixed with 20 lb of deluxe raisins worth \$1.89/lb, to obtain a mix that will sell for \$1.49/lb?

83. How many pounds of walnuts at 84¢/lb should be mixed with 20 lb of pecans at \$1.20/lb to give a mixture worth \$1.04/lb?



84. How many pounds of cheese worth 81¢/lb must be mixed with 10 lb cheese worth \$1.29/lb to make a mixture worth \$1.11/lb?

▶ EXTENDING THE CONCEPT



85. Look up and read the following article. Then turn in a one page summary. "Don't Give Up!," William H. Kraus, *Mathematics Teacher,* Volume 86, Number 2, February 1993: pages 110–112.

86. A chemist has four solutions of a very rare and expensive chemical that are 15% acid (cost \$120 per ounce), 20% acid (cost \$180 per ounce), 35% acid (cost \$280 per ounce) and 45% acid (cost \$359 per ounce). She requires 200 oz of a 29% acid solution. Find the combination of any two of these concentrations that will minimize the total cost of the mix.

87. P, Q, R, S, T, and U represent numbers. The arrows in the figure show the sum of the two or three numbers added in the indicated direction (Example: $Q + T = 23$). Find $P + Q + R + S + T + U$.

88. Given a sphere circumscribed by a cylinder, verify the volume of the sphere is $\frac{2}{3}$ that of the cylinder.

▶ MAINTAINING YOUR SKILLS

89. **(Appendix A.5)** Solve for x: $\dfrac{1}{x+2} - \dfrac{2}{x} = \dfrac{3}{x^2+2x}$

90. **(1.4)** Solve for y, then state the slope and y-intercept of the line: $-6x + 7y = 42$

91. **(Appendix A.4)** Factor each expression:

a. $4x^2 - 9$

b. $x^3 - 27$

92. **(1.3)** Given $g(x) = x^2 - 3x - 10$, evaluate $g(\frac{1}{3})$, $g(-2)$, and $g(5)$

1.6 Linear Function Models and Real Data

LEARNING OBJECTIVES

In Section 1.6 you will see how we can:

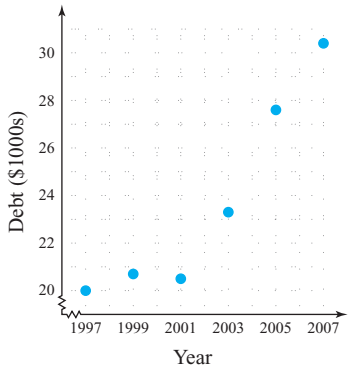
- ❑ **A.** Draw a scatterplot and identify positive and negative associations
- ❑ **B.** Use a scatterplot to identify linear and nonlinear associations
- ❑ **C.** Use a scatterplot to identify strong and weak correlations
- ❑ **D.** Find a linear function that models the relationships observed in a set of data
- ❑ **E.** Use linear regression to find the line of best fit

Collecting and analyzing data is a tremendously important mathematical endeavor, having applications throughout business, industry, science, and government. The link between classroom mathematics and real-world mathematics is called a **regression,** in which we attempt to find an equation that will act as a model for the raw data. In this section, we focus on situations where the data is best modeled by a linear function.

A. Scatterplots and Positive/Negative Associations

In this section, we continue our study of ordered pairs and functions, but this time using data collected from various sources or from observed real-world relationships. You can hardly pick up a newspaper or magazine without noticing it contains a large volume of data presented in graphs, charts, and tables. In addition, there are many simple experiments or activities that enable you to collect your own data. We begin analyzing the collected data using a **scatterplot,** which is simply a graph of all of the ordered pairs in a data set. Often, real data (sometimes called **raw data**) is not very "well behaved" and the points may be somewhat scattered—the reason for the name.

Positive and Negative Associations



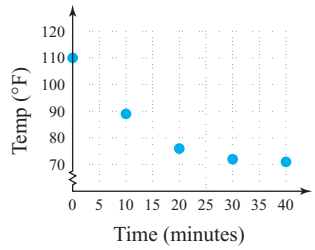
Earlier we noted that lines with positive slope rise from left to right, while lines with negative slope fall from left to right. We can extend this idea to the data from a scatterplot. The data points in Example 1A seem to *rise* as you move from left to right, with larger input values generally resulting in larger outputs. In this case, we say there is a **positive association** between the variables. If the data seems to decrease or fall as you move left to right, we say there is a **negative association.**

EXAMPLE 1A ▶ **Drawing a Scatterplot and Observing Associations**

The ratio of the federal debt to the total population is known as the *per capita debt*. The per capita debt of the United States is shown in the table for the odd-numbered years from 1997 to 2007. Draw a scatterplot of the data and state whether the association is positive, negative, or cannot be determined.

Source: Data from the Bureau of Public Debt at www.publicdebt.treas.gov

Year	Per Capita Debt ($1000s)
1997	20.0
1999	20.7
2001	20.5
2003	23.3
2005	27.6
2007	30.4



Solution ▶ Since the amount of debt depends on the year, *year* is the input x and *per capita debt* is the output y. Scale the x-axis from 1997 to 2007 and the y-axis from 20 to 30 to comfortably fit the data (the "squiggly lines," near the 20 and 1997 in the graph are used to show that some initial values have been skipped). The graph indicates a positive association between the variables, meaning the debt is generally *increasing* as time goes on.

EXAMPLE 1B ▶ **Drawing a Scatterplot and Observing Associations**

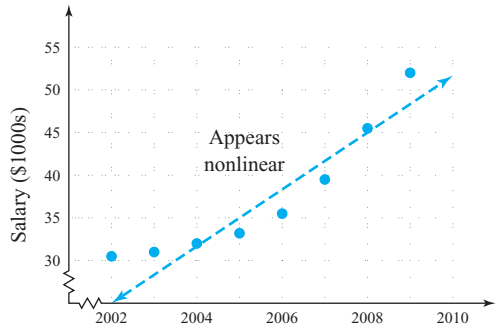
A cup of coffee is placed on a table and allowed to cool. The temperature of the coffee is measured every 10 min and the data are shown in the table. Draw the scatterplot and state whether the association is positive, negative, or cannot be determined.

Elapsed Time (minutes)	Temperature (°F)
0	110
10	89
20	76
30	72
40	71

Solution ▶ Since temperature depends on cooling time, *time* is the input x and *temperature* is the output y. Scale the x-axis from 0 to 40 and the y-axis from 70 to 110 to comfortably fit the data. As you see in the figure, there is a negative association between the variables, meaning the temperature *decreases* over time.

Now try Exercises 7 and 8 ▶

☑ **A.** You've just seen how we can draw a scatterplot and identify positive and negative associations



B. Scatterplots and Linear/Nonlinear Associations

The data in Example 1A had a positive association, while the association in Example 1B was negative. But the data from these examples differ in another important way. In Example 1A, the data seem to cluster about an imaginary line. This indicates a linear equation model might be a good approximation for the data, and we say there is a **linear association** between the variables. The data in Example 1B could not accurately be modeled using a straight line, and we say the variables *time* and *cooling temperature* exhibit a **nonlinear association.**

EXAMPLE 2 ▶ **Drawing a Scatterplot and Observing Associations**

A college professor tracked her annual salary for 2002 to 2009 and the data are shown in the table. Draw the scatterplot and determine if there is a linear or nonlinear association between the variables. Also state whether the association is positive, negative, or cannot be determined.

Year	Salary ($1000s)
2002	30.5
2003	31
2004	32
2005	33.2
2006	35.5
2007	39.5
2008	45.5
2009	52

Solution ▶ Since salary earned depends on a given year, *year* is the input x and *salary* is the output y. Scale the x-axis from 2002 to 2010, and the y-axis from 30 to 55 to comfortably fit the data. A line doesn't seem to model the data very well, and the association appears to be nonlinear. The data rises from left to right, indicating a positive association between the variables. This makes good sense, since we expect our salaries to increase over time.

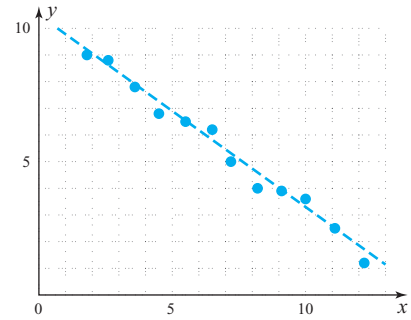
Now try Exercises 9 and 10 ▶

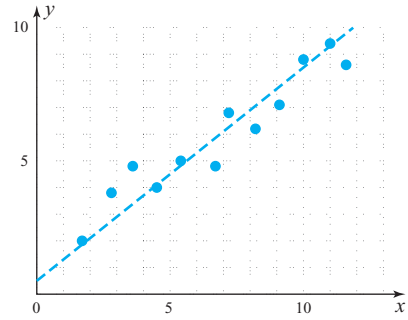
B. You've just seen how we can use a scatterplot to identify linear and nonlinear associations

C. Identifying Strong and Weak Correlations

Using Figures 1.91 and 1.92 shown, we can make one additional observation regarding the data in a scatterplot. While both associations shown appear linear, the data in Figure 1.91 seems to cluster more tightly about an imaginary straight line than the data in Figure 1.92.

Figure 1.91





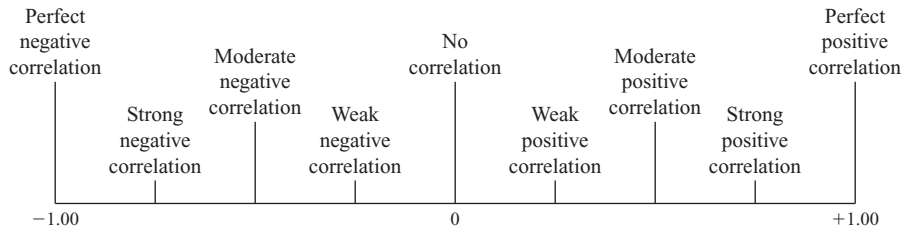


Figure 1.92

We refer to this "clustering" as the "goodness of fit," or in statistical terms, the strength of the correlation. To quantify this fit we use a measure called the correlation coefficient r, which tells whether the association is positive or negative: $r > 0$ or $r < 0$, and quantifies the strength of the association: $|r| \leq 100\%$. Actually, the coefficient is given in decimal form, making $|r| \leq 1$. If the data points form a perfectly straight line, we say the strength of the correlation is either -1 or 1, depending on the association. If the data points appear clustered about the line, but are scattered on either side of it, the strength of the correlation falls somewhere between -1 and 1, depending on how tightly/loosely they're scattered. This is summarized in Figure 1.93.

Figure 1.93

The following scatterplots help to further illustrate this idea. Figure 1.94 shows a linear and negative association between the value of a car and the age of a car, with a strong correlation. Figure 1.95 shows there is no apparent association between family income and the number of children, and Figure 1.96 appears to show a linear and positive association between a man's height and weight, with a weak correlation.

Figure 1.94

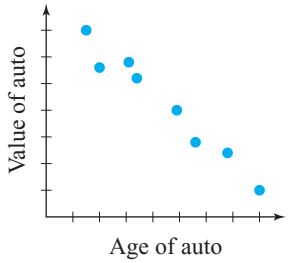

Figure 1.95

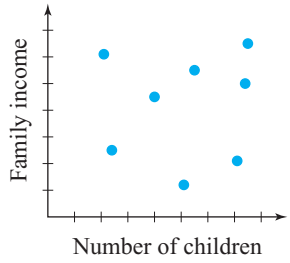

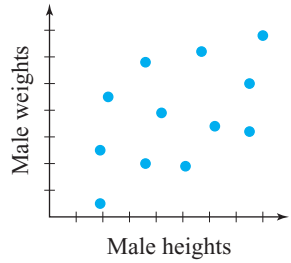

Figure 1.96

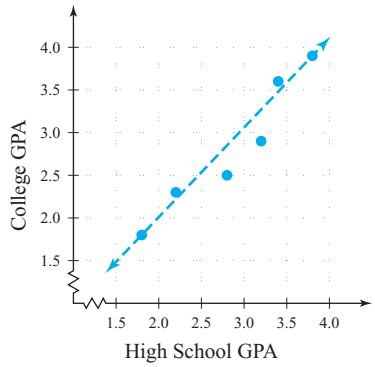
Until we develop a more accurate method of calculating a numerical value for this correlation, the best we can do are these broad generalizations: weak correlation, strong correlation, or no correlation.

EXAMPLE 3A ▶ High School and College GPAs

Many colleges use a student's high school GPA as a possible indication of their future college GPA. Use the data from Table 1.6 (high school/college GPA) to draw a scatterplot. Then



a. Sketch a line that seems to approximate the data, meaning it has the same general direction while passing through the observed "center" of the data.

b. State whether the association is positive, negative, or cannot be determined.

c. Decide whether the correlation is weak or strong.

Table 1.6

High School GPA	College GPA
1.8	1.8
2.2	2.3
2.8	2.5
3.2	2.9
3.4	3.6
3.8	3.9

Solution ▶

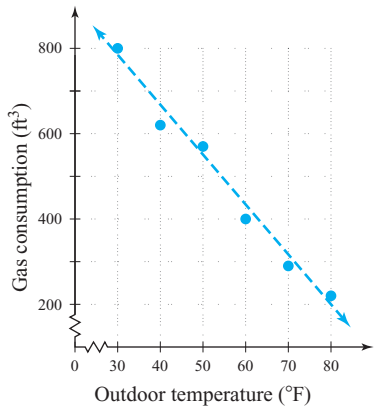
a. A line approximating the data set as a whole is shown in the figure.

b. Since the line has positive slope, there is a positive association between a student's high school GPA and their GPA in college.

c. The correlation appears strong.

EXAMPLE 3B ▶ Natural Gas Consumption

The amount of natural gas consumed by homes and offices varies with the season, with the highest consumption occurring in the winter months. Use the data from Table 1.7 (outdoor temperature/gas consumed) to draw a scatterplot. Then



a. Sketch an estimated line of best fit.

b. State whether the association is positive, negative, or cannot be determined.

c. Decide whether the correlation is weak or strong.

Table 1.7

Outdoor Temperature (°F)	Gas Consumed (cubic feet)
30	800
40	620
50	570
60	400
70	290
80	220

Solution ▶

a. We again use appropriate scales and sketch a line that seems to model the data (see figure).

b. There is a negative association between temperature and the amount of natural gas consumed.

c. The correlation appears to be strong.

Now try Exercises 11 and 12 ▶

☑ **C.** You've just seen how we can use a scatterplot to identify strong and weak correlations

D. Linear Functions That Model Relationships Observed in a Set of Data

Finding a **linear function model** for a set of data involves visually estimating and sketching a line that appears to best "fit" the data. This means answers will vary slightly, but a good, usable model can often be obtained. To find the function, we select two points on this imaginary line and use either the slope-intercept form or the point-slope formula to construct the function. Points on this estimated line but not actually in the data set *can still be used* to help determine the function.

EXAMPLE 4 ▶ **Finding a Linear Function to Model the Relationship Between GPAs**

Use the scatterplot from Example 3A to find a function model for the line a college might use to project an incoming student's future GPA.

Solution ▶ Any two points on or near the estimated best-fit line can be used to help determine the linear function (see the figure in Example 3A). For the slope, it's best to pick two points that are some distance apart, as this tends to improve the accuracy of the model. It appears (1.8, 1.8) and (3.8, 3.9) are both on the line, giving

$$\begin{aligned} m &= \frac{y_2 - y_1}{x_2 - x_1} && \text{slope formula} \\ &= \frac{3.9 - 1.8}{3.8 - 1.8} && \text{substitute } (x_2, y_2) \text{ for } \rightarrow (3.8, 3.9), (x_1, y_1) \text{ for } \rightarrow (1.8, 1.8) \\ &= 1.05 && \text{slope} \\ y - y_1 &= m(x - x_1) && \text{point-slope form} \\ y - 1.8 &= 1.05(x - 1.8) && \text{substitute 1.05 for } m, (1.8, 1.8) \text{ for } (x_1, y_1) \\ y - 1.8 &= 1.05x - 1.89 && \text{distribute} \\ y &= 1.05x - 0.09 && \text{add 1.8 (solve for } y) \end{aligned}$$

One possible function model for this data is $f(x) = 1.05x - 0.09$. Slightly different functions may be obtained, depending on the points chosen.

Now try Exercises 13 through 22 ▶

WORTHY OF NOTE

Sometimes it helps to draw a straight line on an overhead transparency, then lay it over the scatterplot. By shifting the transparency up and down, and rotating it left and right, the line can more accurately be placed so that it's centered among and through the data.

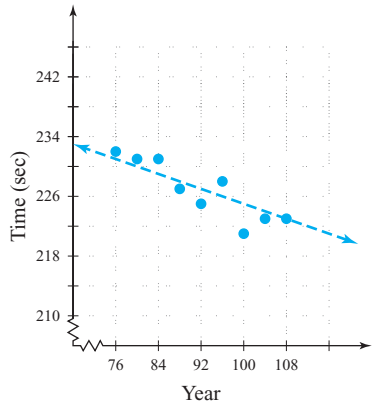
The function from Example 4 predicts that a student with a high school GPA of 3.2 will have a college GPA of almost 3.3: $f(3.2) = 1.05(3.2) - 0.09 \approx 3.3$, yet the data gives an actual value of only 2.9. When working with data and function models, we should expect some variation when the two are compared, especially if the correlation is weak.

Applications of data analysis can be found in virtually all fields of study. In Example 5 we apply these ideas to an Olympic swimming event.

EXAMPLE 5 ▶ Finding a Linear Function to Model the Relationship (Year, Gold Medal Times)

The men's 400-m freestyle times (gold medal times—to the nearest second) for the 1976 through 2008 Olympics are given in Table 1.8 (1900→0). Let the year be the input x, and winning race time be the output y. Based on the data, draw a scatterplot and answer the following questions.

a. Does the association appear linear or nonlinear?



b. Is the association positive or negative?

c. Classify the correlation as weak or strong.

d. Find a function model that approximates the data, then use it to predict the winning time for the 2012 Olympics.

Table 1.8

Year (x) (1900→0)	Time (y) (sec)
76	232
80	231
84	231
88	227
92	225
96	228
100	221
104	223
108	223

Solution ▶

Begin by choosing appropriate scales for the axes. The x-axis (year) could be scaled from 76 to 112, and the y-axis (swim time) from 210 to 246. This will allow for a "frame" around the data. After plotting the points, we obtain the scatterplot shown in the figure.

a. The association appears to be linear.

b. The association is negative, showing that finishing times tend to decrease over time.

c. There is a moderate to strong correlation.

d. The points (76, 232) and (104, 223) appear to be on a line approximating the data, and we select these to develop our equation model.

$$m = \frac{y_2 - y_1}{x_2 - x_1} \quad \text{slope formula}$$

$$= \frac{223 - 232}{104 - 76} \quad (x_1, y_1) \to (76, 232),\ (x_2, y_2) \to (104, 223)$$

$$\approx -0.32 \quad \text{slope (rounded to tenths)}$$

$$y - 232 = -0.32(x - 76) \quad \text{point-slope form}$$

$$y - 232 = -0.32x + 24.32 \quad \text{distribute}$$

$$y = -0.32x + 256.32 \quad \text{add 232 (solve for } y\text{)}$$

One model for this data is $y = -0.32x + 256.32$. Based on this model, the predicted time for the 2012 Olympics would be

$$\begin{aligned} f(x) &= -0.32x + 256.32 && \text{function model} \\ f(112) &= -0.32(112) + 256.32 && \text{substitute 112 for } x \text{ (2012)} \\ &= 220.48 && \text{result} \end{aligned}$$

In 2012 the winning time is projected to be about 220.5 sec.

Now try Exercises 23 and 24 ▶

D. You've just seen how we can find a linear function that models relationships observed in a set of data

As a reminder, great care should be taken when using equation models obtained from real data. It would be foolish to assume that in the year 2700, swim times for the 400-m freestyle would be near 0 sec—even though that's what the model predicts for $x = 800$. Most function models are limited by numerous constraining factors, and data collected over a much longer period of time might even be better approximated using a nonlinear model.

E. Linear Regression and the Line of Best Fit

There is actually a sophisticated method for calculating the equation of a line that best fits a data set, called the **regression line.** The method minimizes the vertical distance between all data points and the line itself, making it the unique **line of best fit.** Most graphing calculators have the ability to perform this calculation quickly. The process involves these steps: (1) clearing old data, (2) entering new data, (3) displaying the data, (4) calculating the regression line, and (5) displaying and using the regression line. We'll illustrate by finding the regression line for the data shown in Table 1.8 in Example 5, which gives the men's 400-m freestyle gold medal times (in seconds) for the 1976 through the 2008 Olympics, with 1900→0.

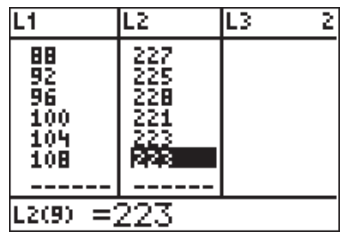
Step 1: Clear Old Data

To prepare for the new data, we first clear out any old data. Press the STAT key and select option **4:ClrList.** This places the **ClrList** command on the home screen. We tell the calculator which lists to clear by pressing 2nd 1 to indicate List1 (L1), then enter a comma using the , key, and continue entering other lists we want to clear: 2nd 2 , 2nd 3 ENTER will clear List1 (L1), List2 (L2), and List3 (L3).

Step 2: Enter New Data

Press the STAT key and select option **1:Edit.** Move the cursor to the first position of List1, and simply enter the data from the first column of Table 1.8 in order: 76 ENTER 80 ENTER 84 ENTER, and so on. Then use the right arrow › to navigate to List2, and enter the data from the second column: 232 ENTER 231 ENTER 231 ENTER, and so on. When finished, you should obtain the screen shown in Figure 1.97.

Figure 1.97



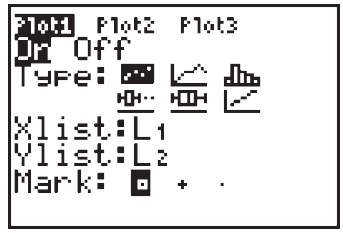


Figure 1.98

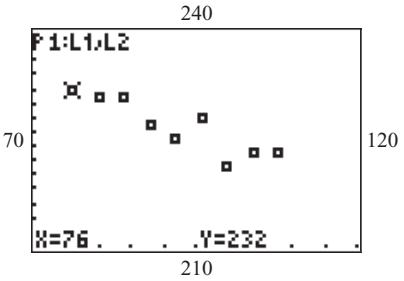
Step 3: Display the Data



With the data held in these lists, we can now display the related ordered pairs on the coordinate grid. First press the Y= key and CLEAR any existing equations. Then press 2nd Y= to access the "**STATPLOTS**" screen. With the cursor on **1:Plot1,** press ENTER and be sure the options shown in Figure 1.98 are highlighted. If you need to make any changes, navigate the cursor to

WORTHY OF NOTE

As a rule of thumb, the tick marks for Xscl can be set by mentally estimating $\frac{|\text{Xmax}| + |\text{Xmin}|}{10}$ and using a convenient number in the neighborhood of the result (the same goes for Yscl). As an alternative to manually setting the window, the ZOOM **9:ZoomStat** feature can be used.

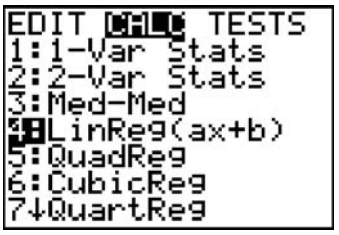
the desired option and press ENTER. Note the data in L1 ranges from 76 to 108, while the data in L2 ranges from 221 to 232. This means an appropriate viewing window might be [70, 120] for the x-values, and [210, 240] for the y-values. Press the WINDOW key and set up the window accordingly. After you're finished, pressing the GRAPH key should produce the graph shown in Figure 1.99.

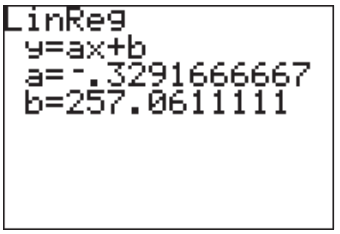
Figure 1.99

Step 4: Calculate the Regression Equation

To have the calculator compute the regression equation, press the STAT and ▸ keys to move the cursor over to the **CALC** options (see Figure 1.100). Since it appears the data is best modeled by a linear equation, we choose option **4:LinReg(ax + b).** Pressing the number 4 places this option on the home screen, and pressing ENTER computes the values of a and b (the calculator automatically uses the values in L1 and L2 unless instructed otherwise). Rounded to hundredths, the linear regression model is $y = -0.33x + 257.06$ (Figure 1.101).

Figure 1.100





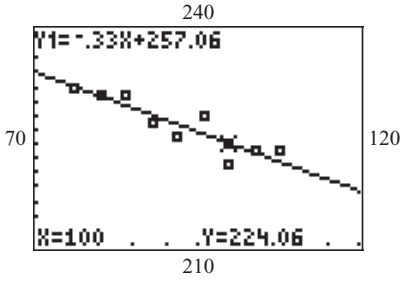


Figure 1.101

Step 5: Display and Use the Results

Although graphing calculators have the ability to paste the regression equation directly into Y_1 on the Y= screen, for now we'll enter $Y_1 = -0.33x + 257.06$ by hand. Afterward, pressing the GRAPH key will plot the data points (if Plot1 is still active) and graph the line. Your display screen should now look like the one in Figure 1.102. The regression line is the best estimator for the set of data as a whole, but there will still be some difference between the values it generates and the values from the set of raw data (the output in Figure 1.102 shows the estimated time for the 2000 Olympics was about 224 sec, when actually it was the year Ian Thorpe of Australia set a world record of 221 sec).

Figure 1.102

EXAMPLE 6 ▸ Using Regression to Model Employee Performance

Riverside Electronics reviews employee performance semiannually, and awards increases in their hourly rate of pay based on the review. The table shows Thomas' hourly wage for the last 4 yr (eight reviews). Find the regression equation for the data and use it to project his hourly wage for the year 2011, after his fourteenth review.

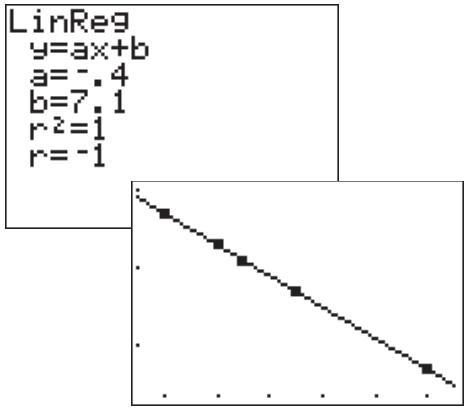
Review (x)	Wage (y)
(2004) 1	$9.58
2	$9.75
(2005) 3	$10.54
4	$11.41
(2006) 5	$11.60
6	$11.91
(2007) 7	$12.11
8	$13.02

Solution ▸ Following the prescribed sequence produces the equation $y = 0.48x + 9.09$. For $x = 14$ we obtain $y = 0.48(14) + 9.09$ or a wage of $15.81. According to this model, Thomas will be earning $15.81 per hour in 2011.

Now try Exercises 27 through 34 ▸

With each linear regression, the calculator can be set to compute a correlation coefficient that is a measure of how well the equation fits the data (see Subsection C). To display this "r-value" use 2nd 0 **(CATALOG)** and activate **DiagnosticOn.** Figure 1.103 shows a scatterplot with perfect negative correlation ($r = -1$) and notice all data points are *on* the line. Figure 1.104 shows a strong positive correlation ($r \approx 0.98$) of the data from Example 6. **See Exercise 35.**

Figure 1.103



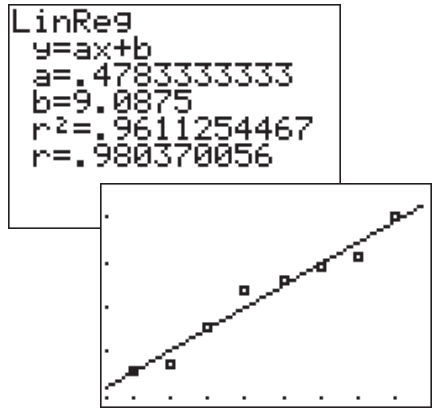


Figure 1.104

☑ **E.** You've just seen how we can use a linear regression to find the line of best fit

1.6 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. When the ordered pairs from a set of data are plotted on a coordinate grid, the result is called a _____.

2. If the data points seem to form a curved pattern or if no pattern is apparent, the data is said to have a _____ association.

3. If the data points seems to cluster along an imaginary line, the data is said to have a _____ association.

4. If the pattern of data points seems to increase as they are viewed left to right, the data is said to have a _____ association.

5. Compare/Contrast: One scatterplot is linear, with a weak and positive association. Another is linear, with a strong and negative association. Give a written description of each scatterplot.

6. Discuss/Explain how this is possible: Working from the same scatterplot, Demetrius obtained the equation $y = -0.64x + 44$ for his equation model, while Jessie got the equation $y = -0.59x + 42$.

▶ DEVELOPING YOUR SKILLS

7. For mail with a high priority, "Express Mail" offers next day delivery by 12:00 noon to most destinations, 365 days of the year. The service was first offered by the U.S. Postal Service in the early 1980s and has been growing in use ever since. The cost of the service (in cents) for selected years is shown in the table. (a) Draw a scatterplot of the data, then (b) decide if the association is positive, negative, or cannot be determined.

4000	204.7
5000	202.9
6000	201.0
7000	199.2
8000	197.4

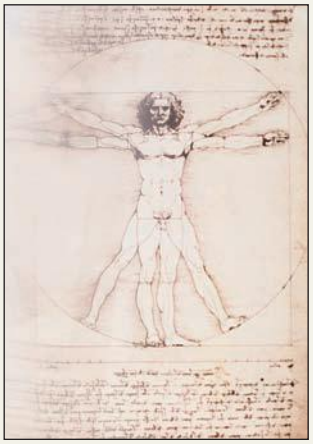
(a) Draw a scatterplot using scales that appropriately fit the data and sketch an estimated line of best fit, (b) decide if the association is positive or negative. (c) Choose two points on or near the estimated line of best fit, and use them to find a function model and predict the boiling point of water on the summit of Mt. Hood in Washington State (11,239 ft height), and along the shore of the Dead Sea (approximately 1312 ft below sea level). Answers may vary.

23. For the data given in Exercise 11 (Gross Domestic Product per Capita), choose two points on or near the line you sketched and use them to find a function model for the data. Based on this model, what is the projected GDP per capita for the year 2010?

24. For the data given in Exercise 12 (Sales by Real Estate Brokers), choose two points on or near the line you sketched and use them to find a function model for the data. Based on this model, how many sales can be expected for homes costing $275,000? $300,000?

▶ WORKING WITH FORMULAS

25. Circumference of a Circle: $C = 2\pi r$: The formula for the circumference of a circle can be written as a function of C in terms of r: $C(r) = 2\pi r$. (a) Set up a table of values for $r = 1$ through 6 and draw a scatterplot of the data. (b) Is the association positive or negative? Why? (c) What can you say about the strength of the correlation? (d) Sketch a line that "approximates" the data. What can you say about the slope of this line?



26. Volume of a Cylinder: $V = \pi r^2 h$: As part of a project, students cut a long piece of PVC pipe with a diameter of 10 cm into sections that are 5, 10, 15, 20, and 25 cm long. The bottom of each is then made watertight and each section is filled to the brim with water. The volume is then measured using a flask marked in cm^3 and the results collected into the table shown. (a) Draw a scatterplot of the data. (b) Is the association positive or negative? Why? (c) What can you say about the strength of the correlation? (d) Would the correlation here be stronger or weaker than the correlation in Exercise 25? Why? (e) Run a linear regression to verify your response.

Height (cm)	Volume (cm^3)
5	380
10	800
15	1190
20	1550
25	1955

▶ APPLICATIONS

Use the regression capabilities of a graphing calculator to complete Exercises 27 through 34.

27. Height versus wingspan: Leonardo da Vinci's famous diagram is an illustration of how the human body comes in predictable proportions. One such comparison is a person's height to their wingspan (the maximum distance from the outstretched tip of one middle finger to the other). Careful measurements were taken on eight students and the set of data is shown here. Using the data, (a) draw the scatterplot; (b) determine whether the association is linear or nonlinear; (c) determine whether the association is positive or negative; and (d) find the regression equation and use it to predict the wingspan of a student with a height of 65 in.

Height (x)	Wingspan (y)
61	60.5
61.5	62.5
54.5	54.5
73	71.5
67.5	66
51	50.75
57.5	54
52	51.5

28. Patent applications: Every year the U.S. Patent and Trademark Office (USPTO) receives thousands of applications from scientists and inventors. The table given shows the number of applications received for the odd years from 1993 to 2003 (1990→0). Use the data to (a) draw the scatterplot; (b) determine whether the association is linear or nonlinear; (c) determine whether the association is positive or negative; and (d) find the regression equation and use it to predict the number of applications that will be received in 2011.

Source: United States Patent and Trademark Office at www.uspto.gov/web

Year (1990→0)	Applications (1000s)
3	188.0
5	236.7
7	237.0
9	278.3
11	344.7
13	355.4

29. Patents issued: An increase in the number of patent applications (see Exercise 28), typically brings an increase in the number of patents issued, though many applications are denied due to improper filing, lack of scientific support, and other reasons. The table given shows the number of patents issued for the odd years from 1993 to 2003 (1999 → 0). Use the data to (a) draw the scatterplot; (b) determine whether the association is linear or nonlinear; (c) determine whether the association is positive or negative; and (d) find the regression equation and use it to predict the number of applications that will be approved in 2011. Which is increasing faster, the number of patent applications or the number of patents issued? How can you tell for sure?

Year (1990→0)	Patents (1000s)
3	107.3
5	114.2

30. High jump records: In the sport of track and field, the high jumper is an unusual athlete. They seem to defy gravity as they launch their bodies over the high bar. The winning height at the summer Olympics (to the nearest unit) has steadily increased over time, as shown in the table for selected years. Using the data, (a) draw the scatterplot, (b) determine whether the association is linear or nonlinear, (c) determine whether the association is positive or negative, and (d) find the regression equation using $t = 0$ corresponding to 1900 and predict the winning height for the 2004 and 2008 Olympics. How close did the model come to the actual heights?

31. Females/males in the workforce: Over the last 4 decades, the percentage of the female population in the workforce has been increasing at a fairly steady rate. At the same time, the percentage of the male population in the workforce has been declining. The set of data is shown in the tables. Using the data, (a) draw scatterplots for both data sets, (b) determine whether the associations are linear or nonlinear, (c) determine whether the associations are positive or negative, and (d) determine if the percentage of females in the workforce is increasing faster than the percentage of males is decreasing. Discuss/Explain how you can tell for sure.

32. Height versus male shoe size: While it seems reasonable that taller people should have larger feet, there is actually a wide variation in the relationship between height and shoe size. The data in the table show the height (in inches) compared to the shoe size worn for a random sample of 12 male chemistry students. Using the data, (a) draw the scatterplot, (b) determine whether the association is linear or nonlinear, (c) determine whether the association is positive or negative, and (d) find the regression equation and use it to predict the shoe size of a man 80 in. tall and another that is 60 in. tall. Note that the heights of these two men fall outside of the range of our data set (see comment after Example 5 on page 85).

34. Sales of hybrid cars: Since their mass introduction near the turn of the century, the sales of hybrid cars in the United States grew steadily until late 2007, when the price of gasoline began showing signs of weakening and eventually dipped below $3.00/gal. Estimates for the annual sales of hybrid cars are given in the table for the years 2002 through 2009 (2000→0). (a) Use a graphing calculator to draw a scatterplot of the data and decide if the association is linear or nonlinear. (b) If linear, calculate a regression model for the data and display the scatterplot and data on the same screen. (c) Assuming that sales of hybrid cars recover, how many hybrids does the model project will be sold in the year 2012?

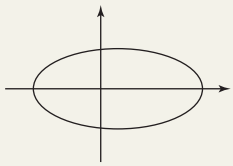
▶ EXTENDING THE CONCEPT



35. It can be very misleading to rely on the correlation coefficient alone when selecting a regression model. To illustrate, (a) run a linear regression on the data set given (without doing a scatterplot), and note the strength of the correlation (the correlation coefficient). (b) Now run a quadratic regression **(STAT CALC 5:QuadReg)** and note the strength of the correlation. (c) What do you notice? What factors other than the correlation coefficient must be taken into account when choosing a form of regression?

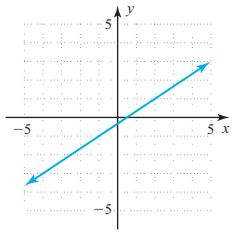
36. In his book *Gulliver's Travels,* Jonathan Swift describes how the Lilliputians were able to measure Gulliver for new clothes, even though he was a giant compared to them. According to the text, "Then they measured my right thumb, and desired no more . . . for by mathematical computation, once around the thumb is twice around the wrist, and so on to the neck and waist." Is it true that once around the neck is twice around the waist? Find at least 10 willing subjects and take measurements of their necks and waists in millimeters. Arrange the data in ordered pair form (circumference of neck, circumference of waist). Draw the scatterplot for this data. Does the association appear to be linear? Find the equation of the best fit line for this set of data. What is the slope of this line? Is the slope near $m = 2$?

▶ MAINTAINING YOUR SKILLS

37. **(1.3)** Is the graph shown here, the graph of a function? Discuss why or why not.

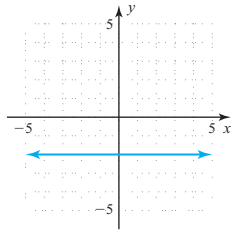
38. **(Appendix A.2/A.3)** Determine the area of the figure shown ($A = LW, A = \pi r^2$).

39. **(1.5)** Solve for r: $A = P + Prt$



40. **(Appendix A.3)** Solve for w (if possible): $-2(6w^2 + 5) - 1 = 7w - 4(3w^2 + 1)$

MAKING CONNECTIONS



Making Connections: Graphically, Symbolically, Numerically, and Verbally

Eight graphs (a) through (h) are given. Match the characteristics shown in 1 through 16 to one of the eight graphs.

5. ____ $y = -2$

6. ____ $m < 0, b < 0$

7. ____ $m = -2$

8. ____ $m = \frac{2}{3}$

9. ____ $f(-3) = 4, f(1) = 0$

10. ____ $f(-4) = 3, f(4) = 3$

11. ____ $f(x) \geq 0$ for $x \in [-3, \infty)$

12. ____ $x = 3$

13. ____ $f(x) \leq 0$ for $x \in [1, \infty)$

14. ____ m is zero

15. ____ function is increasing, y-intercept is negative

16. ____ function is decreasing, y-intercept is negative

SUMMARY AND CONCEPT REVIEW

SECTION 1.1 Rectangular Coordinates; Graphing Circles and Other Relations

KEY CONCEPTS

- A relation is a collection of ordered pairs (x, y) and can be stated as a set or in equation form.
- As a set of ordered pairs, we say the relation is pointwise-defined. The domain of the relation is the set of all first coordinates, and the range is the set of all corresponding second coordinates.
- A relation can be expressed in mapping notation $x \to y$, indicating an element from the domain is mapped to (corresponds to or is associated with) an element from the range.
- The graph of a relation in equation form is the set of all ordered pairs (x, y) that satisfy the equation. We plot a sufficient number of points and connect them with a straight line or smooth curve, depending on the pattern formed.
- The x- and y-variables of linear equations and their graphs have implied exponents of 1.
- With a relation entered on the Y= screen, a graphing calculator can provide a table of ordered pairs and the related graph.
- The midpoint of a line segment with endpoints (x_1, y_1) and (x_2, y_2) is $\left(\dfrac{x_1 + x_2}{2}, \dfrac{y_1 + y_2}{2}\right)$.
- The distance between the points (x_1, y_1) and (x_2, y_2) is $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$.
- The equation of a circle centered at (h, k) with radius r is $(x - h)^2 + (y - k)^2 = r^2$.

EXERCISES

1. Represent the relation in mapping notation, then state the domain and range.

$\{(-7, 3), (-4, -2), (5, 1), (-7, 0), (3, -2), (0, 8)\}$

2. Graph the relation $y = \sqrt{25 - x^2}$ by completing the table, then state the domain and range of the relation.

x	y
-5	
-4	
-2	
0	
2	
4	
5	

3. Use a graphing calculator to graph the relation $5x + 3y = -15$. Then use the **TABLE** feature to determine the value of y when $x = 0$, and the value(s) of x when $y = 0$, and write the results in ordered pair form.

Mr. Northeast and Mr. Southwest live in Coordinate County and are good friends. Mr. Northeast lives at *19 East and 25 North* or (19, 25), while Mr. Southwest lives at *14 West and 31 South* or $(-14, -31)$. If the streets in Coordinate County are laid out in one mile squares,

4. Use the distance formula to find how far apart they live.

5. If they agree to meet halfway between their homes, what are the coordinates of their meeting place?

6. Sketch the graph of $x^2 + y^2 = 16$.

7. Sketch the graph of $x^2 + y^2 + 6x + 4y + 9 = 0$.

8. Find an equation of the circle whose diameter has the endpoints $(-3, 0)$ and $(0, 4)$.

SECTION 1.2 Linear Equations and Rates of Change

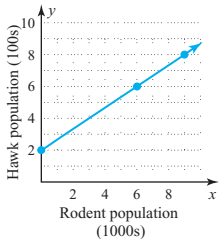
KEY CONCEPTS

- A linear equation can be written in the form $ax + by = c$, where a and b are not simultaneously equal to 0.
- The slope of the line through (x_1, y_1) and (x_2, y_2) is $m = \dfrac{y_2 - y_1}{x_2 - x_1}$, where $x_1 \neq x_2$.
- Other designations for slope are $m = \dfrac{\text{rise}}{\text{run}} = \dfrac{\text{change in } y}{\text{change in } x} = \dfrac{\Delta y}{\Delta x} = \dfrac{\text{vertical change}}{\text{horizontal change}}$.
- Lines with positive slope ($m > 0$) rise from left to right; lines with negative slope ($m < 0$) fall from left to right.
- The equation of a horizontal line is $y = k$; the slope is $m = 0$.
- The equation of a vertical line is $x = h$; the slope is undefined.
- Lines can be graphed using the intercept method. First determine $(x, 0)$ (substitute 0 for y and solve for x), then $(0, y)$ (substitute 0 for x and solve for y). Then draw a straight line through these points.
- Parallel lines have equal slopes ($m_1 = m_2$); perpendicular lines have slopes that are negative reciprocals ($m_1 = -\dfrac{1}{m_2}$ or $m_1 \cdot m_2 = -1$).

EXERCISES

9. Plot the points and determine the slope, then use the ratio $\dfrac{\Delta y}{\Delta x} = \dfrac{\text{rise}}{\text{run}}$ to find an additional point on the line:
a. $(-4, 3)$ and $(5, -2)$ and **b.** $(3, 4)$ and $(-6, 1)$.

10. Use the slope formula to determine if lines L_1 and L_2 are parallel, perpendicular, or neither:
a. L_1: $(-2, 0)$ and $(0, 6)$; L_2: $(1, 8)$ and $(0, 5)$
b. L_1: $(1, 10)$ and $(-1, 7)$: L_2: $(-2, -1)$ and $(1, -3)$



11. Graph each equation by plotting points: (a) $y = 3x - 2$ (b) $y = -\frac{3}{2}x + 1$.

12. Find the intercepts for each line and sketch the graph: (a) $2x + 3y = 6$ (b) $y = \frac{4}{3}x - 2$.

13. Identify each line as either horizontal, vertical, or neither, and graph each line.
a. $x = 5$ **b.** $y = -4$ **c.** $2y + x = 5$

14. Determine if the triangle with the vertices given is a right triangle: $(-5, -4)$, $(7, 2)$, $(0, 16)$.

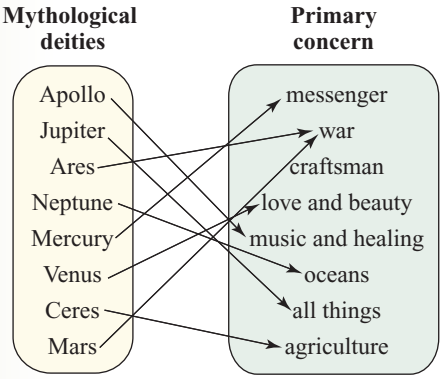
15. Find the slope and y-intercept of the line shown and discuss the slope ratio in this context.

SECTION 1.3 Functions, Function Notation, and the Graph of a Function

KEY CONCEPTS

- A function is a relation, rule, or equation that pairs each element from the domain with exactly one element of the range.
- The vertical line test says that if every vertical line crosses the graph of a relation in at most one point, the relation is a function.
- The domain and range can be stated using set notation, graphed on a number line, or expressed using interval notation.

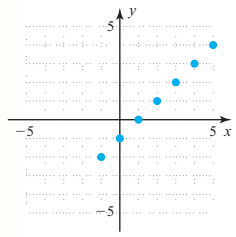
- On a graph, vertical boundary lines can be used to identify the domain, or the set of "allowable inputs" for a function.
- On a graph, horizontal boundary lines can be used to identify the range, or the set of y-values (outputs) generated by the function.
- When a function is stated as an equation, the implied domain is the set of x-values that yield real number outputs.
- x-values that cause a denominator of zero or that cause the radicand of a square root expression to be negative must be excluded from the domain.
- *The phrase "*y is a function of x," is written as $y = f(x)$. This notation enables us to summarize the three most important aspects of a function with a single expression (input, sequence of operations, output).



EXERCISES

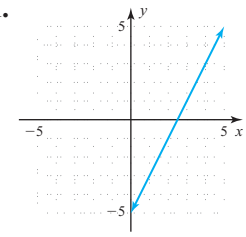
16. State the implied domain of each function:

a. $f(x) = \sqrt{4x + 5}$ **b.** $g(x) = \dfrac{x - 4}{x^2 - x - 6}$

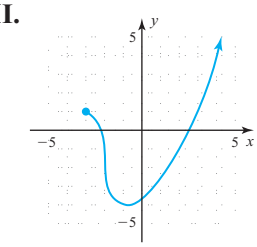


17. Determine $h(-2)$, $h(-\frac{2}{3})$, and $h(3a)$ for $h(x) = 2x^2 - 3x$.

18. Determine if the mapping given represents a function. If not, explain how the definition of a function is violated.



19. For the graph of each function shown, (a) state the domain and range, (b) find the value of $f(2)$, and (c) determine the value(s) of x for which $f(x) = 1$.



I.

II.

III.

SECTION 1.4 Linear Functions, Special Forms, and More on Rates of Change

KEY CONCEPTS

- The equation of a nonvertical line in slope-intercept form is $y = mx + b$ or $f(x) = mx + b$. The slope of the line is m and the y-intercept is $(0, b)$.
- To graph a line given its equation in slope-intercept form, plot the y-intercept, then use the slope ratio $m = \dfrac{\Delta y}{\Delta x}$ to find a second point, and draw a line through these points.
- If the slope m and a point (x_1, y_1) on the line are known, the equation of the line can be written in point-slope form: $y - y_1 = m(x - x_1)$.

- A secant line is the straight line drawn through two points on a nonlinear graph.
- The notation $m = \dfrac{\Delta y}{\Delta x}$ literally means the quantity measured along the y-axis is changing with respect to changes in the quantity measured along the x-axis.

EXERCISES

20. Write each equation in slope-intercept form, then identify the slope and y-intercept.

a. $4x + 3y - 12 = 0$ **b.** $5x - 3y = 15$

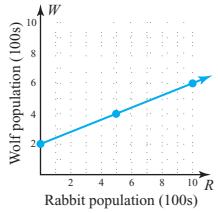
21. Graph each equation using the slope and y-intercept.

a. $f(x) = -\frac{2}{3}x + 1$ **b.** $h(x) = \frac{5}{2}x - 3$

22. Graph the line with the given slope through the given point.

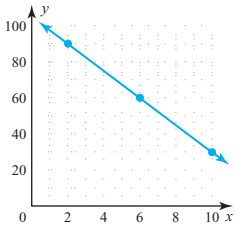
a. $m = \frac{2}{3}$; $(1, 4)$ **b.** $m = -\frac{1}{2}$; $(-2, 3)$

23. What are the equations of the horizontal line and the vertical line passing through $(-2, 5)$? Which line is the point $(7, 5)$ on?



24. Find the equation of the line passing through $(1, 2)$ and $(-3, 5)$. Write your final answer in slope-intercept form.

25. Find the equation for the line that is parallel to $4x - 3y = 12$ and passes through the point $(3, 4)$. Write your final answer in slope-intercept form.



26. Determine the slope and y-intercept of the line shown. Then write the equation of the line in slope-intercept form and interpret the slope ratio $m = \dfrac{\Delta W}{\Delta R}$ in the context of this exercise.

27. For the graph given, (a) find the equation of the line in point-slope form, (b) use the equation to predict the x- and y-intercepts, (c) write the equation in slope-intercept form, and (d) find y when $x = 20$, and the value of x for which $y = 15$.

Exercise 26

Exercise 27

SECTION 1.5 Solving Equations and Inequalities Graphically; Formulas and Problem Solving

KEY CONCEPTS

- To use the intersection-of-graphs method for solving equations, assign the left-hand expression as Y_1 and the right-hand as Y_2. The solution(s) of the original equation are the x-coordinate(s) of the point(s) of intersection of the graphs of Y_1 and Y_2.
- When an equation is written in the form $h(x) = 0$, the solutions can be found using the x-Intercept/Zeroes method. Assign $h(x)$ as Y_1, and find the x-intercepts of its graph.
- Linear inequalities can be solved by first applying the intersection-of-graphs method to identify the boundary value of the solution interval. Next, the solution is determined by a careful observation of the relative positions of the graphs (is Y_1 above or below Y_2) and the given inequality.
- To solve formulas for a specified variable, focus on the object variable and apply properties of equality to write this variable in terms of all others.
- The basic elements of good problem solving include:
  1. Gathering and organizing information
  2. Making the problem visual
  3. Developing an equation model
  4. Using the model to solve the application

For a complete review, see the problem-solving guide on page 71.

EXERCISES

28. Solve the following equation using the intersection-of-graphs method.

$3(x - 2) + 10 = 16 - 2(3 - 2x)$

29. Solve the following equation using the x-intercept/zeroes method.

$2(x - 1) + \frac{3}{2} = 5(\frac{2}{5}x + \frac{1}{5}) - \frac{3}{2}$

30. Solve the following inequality using the intersection-of-graphs method.

$3(x + 2) - 2.2 < -2 + 4(0.2 - 0.5x)$

Solve for the specified variable in each formula or literal equation.

31. $V = \pi r^2 h$ for h

32. $P = 2L + 2W$ for L

33. $ax + b = c$ for x

34. $2x - 3y = 6$ for y

Use the problem-solving guidelines (page 71) to solve the following applications.

35. At a large family reunion, two kegs of lemonade are available. One is 2% sugar (too sour) and the second is 7% sugar (too sweet). How many gallons of the 2% keg, must be mixed with 12 gallons of the 7% keg to get a 5% mix?

36. A rectangular window with a width of 3 ft and a height of 4 ft is topped by a semi-circular window. Find the total area of the window.

37. Two cyclists start from the same location and ride in opposite directions, one riding at 15 mph and the other at 18 mph. If their radio phones have a range of 22 mi, how many minutes will they be able to communicate?

SECTION 1.6 Linear Function Models and Real Data

KEY CONCEPTS

- A scatterplot is the graph of all the ordered pairs in a real data set.
- When drawing a scatterplot, be sure to scale the axes to comfortably fit the data.
- If larger inputs tend to produce larger output values, we say there is a positive association.
- If larger inputs tend to produce smaller output values, we say there is a negative association.
- If the data seem to cluster around an imaginary line, we say there is a linear association between the variables.
- If the data clearly cannot be approximated by a straight line, we say the variables exhibit a nonlinear association (or sometimes no association).
- The correlation coefficient r measures how tightly a set of data points cluster about an imaginary curve. The strength of the correlation is given as a value between -1 and 1. Measures close to -1 or 1 indicate a very strong correlation. Measures close to 0 indicate a very weak correlation.
- We can attempt to model linear data sets using an estimated line of best fit.
- A regression line minimizes the vertical distance between all data points and the graph itself, making it the unique line of best fit.

EXERCISES

38. To determine the value of doing homework, a student in college algebra collects data on the time spent by classmates on their homework in preparation for a quiz. Her data is entered in the table shown. (a) Use a graphing calculator to draw a scatterplot of the data. (b) Does the association appear linear or nonlinear? (c) Is the association positive or negative?

39. If the association in Exercise 38 is linear, (a) use a graphing calculator to find a linear function that models the relation (study time, grade), then (b) graph the data and the line on the same screen. (c) Does the correlation appear weak or strong?

40. According to the function model from Exercise 39, what grade can I expect if I study for 120 minutes?

Exercise 38

x (min study)	y (quiz score)
45	70
30	63
10	59
20	67
60	73
70	85
90	82
75	90

PRACTICE TEST

1. Solve each equation.

a. $-\frac{2}{3}x - 5 = 7 - (x + 3)$

b. $-5.7 + 3.1x = 14.5 - 4(x + 1.5)$

c. $P = C + kC$; for C

d. $P = 2L + 2W$; for W

2. How much water that is 102°F must be mixed with 25 gal of water at 91°F, so that the resulting temperature of the water will be 97°F.

3. To make the bowling team, Jacques needs a three-game average of 160. If he bowled 141 and 162 for the first two games, what score S must be obtained in the third game so that his average is at least 160?

4. In the 2009 movie *Star Trek* (Chris Pine, Zachary Quinto, Zoy Zaldana, Eric Bana), Sulu falls off of the drill platform without a parachute, and Kirk dives off the platform to save him. To slow his fall, Sulu uses a spread-eagle tactic, while Kirk keeps his body straight and arms at his side, to maximize his falling speed. If Sulu is falling at a rate of 180 ft/sec, while Kirk is falling at 250 ft/sec, how long would it take Kirk to reach Sulu, if it took Kirk a full 2 sec to react and dive after Sulu?

5. Two relations here are functions and two are not. Identify the nonfunctions (justify your response).

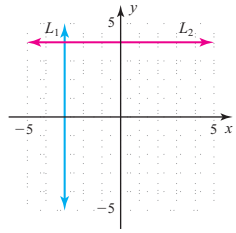
a. $x = y^2 + 2y$ **b.** $y = \sqrt{5 - 2x}$

c. $|y| + 1 = x$ **d.** $y = x^2 + 2x$

6. Determine whether the lines are parallel, perpendicular, or neither:

L_1: $2x + 5y = -15$ and L_2: $y = \frac{2}{5}x + 7$.

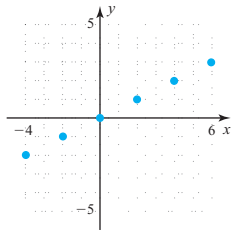
7. Graph the line using the slope and y-intercept: $x + 4y = 8$



8. Find the center and radius of the circle defined by $x^2 + y^2 - 4x + 6y - 3 = 0$, then sketch its graph.

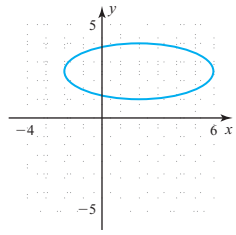
9. After 2 sec, a car is traveling 20 mph. After 5 sec, its speed is 40 mph. Assuming the relationship is linear, find the velocity equation and use it to determine the speed of the car after 9 sec.

10. Find the equation of the line parallel to $6x + 5y = 3$, containing the point $(2, -2)$. Answer in slope-intercept form.

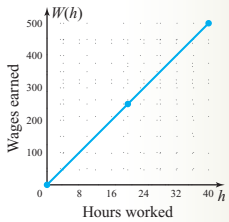


11. My partner and I are at coordinates $(-20, 15)$ on a map. If our destination is at coordinates $(35, -12)$, (a) what are the coordinates of the rest station located halfway to our destination? (b) How far away is our destination? Assume that each unit is 1 mi.

12. Write the equations for lines L_1 and L_2 shown.



13. State the domain and range for the relations shown on graphs 13(a) and 13(b).



Exercise 13(a)

Exercise 13(b)

14. For the linear function shown,

a. Determine the value of $W(24)$ from the graph.

b. What input h will give an output of $W(h) = 375$?

c. Find a linear function for the graph.

d. What does the slope indicate in this context?

e. State the domain and range of h.

15. Given $f(x) = \dfrac{2 - x^2}{x^2}$, evaluate and simplify:

a. $f(\frac{2}{3})$ **b.** $f(a + 3)$

16. In 2007, there were 3.3 million Apple iPhones sold worldwide. By 2009, this figure had jumped to approximately 30.3 million [*Source*: http://brainstormtech.blogs.fortune.cnn.com/2009/03/12/]. Assume that for a time, this growth could be modeled by a linear function. (a) Determine the rate of change $\frac{\Delta \text{sales}}{\Delta \text{time}}$, and (b) interpret it in this context. Then use the rate of change to (c) approximate the number of sales in 2008, and what the projected sales would be for 2010 and 2011.

Exercise 16

17. Solve the following equations using the x-intercept/zeroes method.

a. $2x + \left(4 - \frac{1}{3}x\right) = -(20 + x)$

b. $2(0.7x - 1.3) + 2.6 = 2x - 3(0.2x - 2)$

18. Solve the following inequalities using the intersection-of-graphs method.

a. $3x - (5 - x) \geq 2(5 - x) + 3$

b. $2(0.75x - 1) < 0.7 + 0.5(3x - 1)$

19. To study how annual rainfall affects the ability to attain certain levels of livestock production, a local university collects data on the average annual rainfall for a particular area and compares this to the average number of free-ranging cattle per acre for ranchers in that area. The data collected are shown in the table. (a) Use a graphing calculator to draw a scatterplot of the data. (b) Does the association appear linear or nonlinear? (c) Is the association positive or negative?

Exercise 19

Rainfall (in.)	Cattle per Acre
12	2
16	3
19	7
23	9
28	11
32	22
37	23
40	26

20. If the association in Exercise 19 is linear, (a) use a graphing calculator to find a linear function that models the relation (rainfall, cattle per acre), (b) use the function to find the number of cattle per acre that might be possible for an area receiving 50 in. of rainfall per year, and (c) state whether the correlation is weak or strong.

STRENGTHENING CORE SKILLS

The Various Forms of a Linear Equation

Learning mathematics is very much like the construction of a skyscraper. The final height of the skyscraper ultimately depends on the strength of the foundation and quality of the frame supporting each new floor as it is built. Our previous work with linear functions and their graphs, while having a number of useful applications, is actually the foundation on which much of our future work is built. For this reason, it's important you gain a certain fluency with linear functions and relationships—even to a point where things come to you effortlessly and automatically. As noted mathematician Henri Lebesque once said, "An idea reaches its maximum level of usefulness only when you understand it so well that it seems like you have always known it. You then become incapable of seeing the idea as anything but a trivial and immediate result." These formulas and concepts, while simple, have an endless number of significant and substantial applications.

Forms and Formulas

slope formula	point-slope form	slope-intercept form	standard form
$m = \frac{y_2 - y_1}{x_2 - x_1}$	$y - y_1 = m(x - x_1)$	$y = mx + b$	$Ax + By = C$
given any two points on the line	given slope m and any point (x_1, y_1)	given slope m and y-intercept $(0, b)$	A, B, and C are integers (used in linear systems)

Characteristics of Lines

y-intercept	x-intercept	increasing	decreasing
$(0, y)$	$(x, 0)$	$m > 0$	$m < 0$
let $x = 0$, solve for y	let $y = 0$, solve for x	line slants upward from left to right	line slants downward form left to right

Relationships between Lines

intersecting	parallel	perpendicular	dependent
$m_1 \neq m_2$	$m_1 = m_2$, $b_1 \neq b_2$	$m_1 m_2 = -1$	$m_1 = m_2$, $b_1 = b_2$
lines intersect at one point	lines do not intersect	lines intersect at right angles	lines intersect at all points

Special Lines

horizontal	vertical	identity
$y = k$	$x = h$	$y = x$
horizontal line through k	vertical line through h	the input value *identifies* the output

Use the formulas and concepts reviewed here to complete the following exercises.

For the two points given: (a) compute the slope of the line through the points and state whether the line is increasing or decreasing, (b) find the equation of the line in point-slope form, then write the equation in slope-intercept form, and (c) find the x- and y-intercepts and graph the line.

Exercise 1: $P_1(0, 5)$ $P_2(6, 7)$

Exercise 2: $P_1(3, 2)$ $P_2(0, 9)$

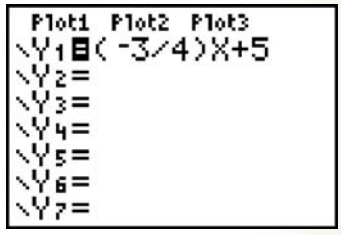
Exercise 3: $P_1(3, 2)$ $P_2(9, 5)$

Exercise 4: $P_1(-5, -4)$ $P_2(3, 2)$

Exercise 5: $P_1(-2, 5)$ $P_2(6, -1)$

Exercise 6: $P_1(2, -7)$ $P_2(-8, -2)$

CALCULATOR EXPLORATION AND DISCOVERY



Evaluating Expressions and Looking for Patterns

These "explorations" are designed to explore the full potential of a graphing calculator, as well as to use this potential to investigate patterns and discover connections that might otherwise be overlooked. In this *exploration and discovery,* we point out the various ways an expression can be evaluated on a graphing calculator. Some ways seem easier, faster, and/or better than others, but each has advantages and disadvantages depending on the task at hand, and it will help to be aware of them all for future use.

One way to evaluate an expression is to use the **TABLE** feature of a graphing calculator, with the expression entered as Y_1 on the Y= screen. If you want the calculator to generate inputs, use the 2nd WINDOW (**TBLSET**) screen to indicate a starting value (**TblStart=**) and an increment value (**ΔTbl =**), and set the calculator in **Indpnt:** AUTO ASK mode (to input specific values, the calculator should be in **Indpnt: AUTO** ASK mode). After pressing 2nd GRAPH (**TABLE**), the calculator shows the corresponding input and output values.

Expressions can also be evaluated on the home screen for a single value or a series of values. Enter the expression $-\frac{3}{4}x + 5$ on the Y= screen (see Figure 1.105) and use 2nd MODE (**QUIT**) to get back to the home screen. To evaluate this expression, access Y_1 using VARS ▸ (**Y-VARS**), and use the first option **1:Function** ENTER. This brings us to a submenu where any of the equations Y_1 through Y_0 (actually Y_{10}) can be accessed. Since the default setting is the one we need (**1:Y1**), simply press ENTER and Y_1 appears on the home screen. To evaluate a single input, simply enclose it in

Figure 1.105

parentheses. To evaluate more than one input, enter the numbers as a set of values with the set enclosed in parentheses. In Figure 1.106, Y_1 has been evaluated for $x = -4$, then simultaneously for $x = -4, -2, 0$, and 2.

A third way to evaluate expressions is using a list, with the desired inputs entered in List 1 (L1), then List 2 (L2) defined in terms of L1. For example, $L2 = -\frac{3}{4}L1 + 5$ will return the same values for inputs of $-4, -2, 0$, and 2 seen previously on the home screen (remember to clear the lists first). Lists are accessed by pressing STAT **1:Edit.** Enter the numbers $-4, -2, 0$, and 2 in L1, then use the right arrow ▶ to move to L2. It is important to note that you *next press the up arrow key* ▲ so that the cursor overlies L2. The bottom of the screen now reads "L2 = " and the calculator is waiting for us to define L2. After entering $L2 = -\frac{3}{4}L1 + 5$ (see Figure 1.107) and pressing ENTER we obtain the same outputs as before (see Figure 1.108). The advantage of using the "list" method is that we can *further explore or experiment with the output values* in a search for patterns.

Exercise 1: Evaluate the expression $0.2L1 + 3$ on the list screen, using consecutive integer inputs from -6 to 6 inclusive. What do you notice about the outputs?

Exercise 2: Evaluate the expression $\sqrt{2}L1 - \sqrt{9.1}$ on the list screen, using consecutive integer inputs from -6 to 6 inclusive. We suspect there is a pattern to the output values, but this time the pattern is very difficult to see. On the home screen, compute the difference between a few successive outputs from L2 [for example, L2(1) − L2(2)]. What do you notice?

Figure 1.106

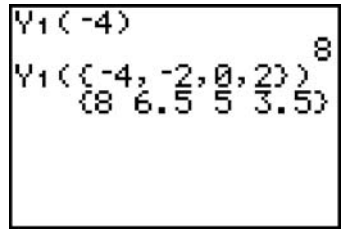


Figure 1.107

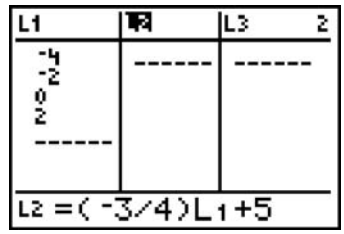

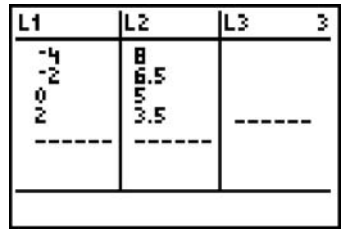

Figure 1.108

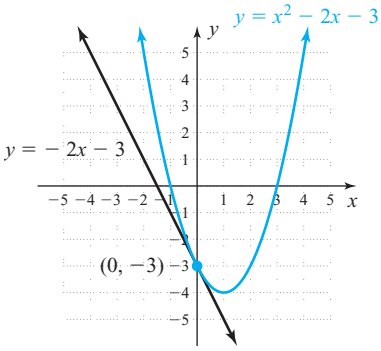
CONNECTIONS TO CALCULUS

Understanding and *internalizing* concepts related to linear functions is one of the main objectives of Chapter 1 and its *Strengthening Core Skills* feature. The ability to quickly and correctly write the equation of a line given sufficient information has a number of substantial applications in the calculus sequence. ln calculus, we will extend our understanding of secant lines to help understand lines drawn tangent to a curve and further to lines and planes drawn tangent to three-dimensional surfaces. These relationships will lead to significant and meaningful applications in topography, meteorology, engineering, and many other areas.

Tangent Lines

In Section 1.4 we learned how to write the equation of a line given its slope and any point on the line. ln that section, Example 6 uses the slope-intercept form $y = mx + b$ as a formula, while Example 10 applies the point-slope form $y - y_1 = m(x - x_1)$. In calculus, we regularly use both forms to write the equations of secant lines *and tongent lines*.



Consider the graph of $f(x) = x^2 - 2x - 3$, a parabola that opens upward, with y-intercept $(0, -3)$ and vertex at $(1, -4)$. Using the tools of calculus, we can show that the function $g(x) = 2x - 2$ gives the *slope* of any line drawn tangent to this graph at a given x. For example, to find the slope of the line tangent to this curve when $x = 3$, we evaluate $g(x)$ at $x = 3$, and find the slope will be $g(3) = 4$. Note how this information is used in Example 1.

EXAMPLE 1 ▶ **Finding the Equation of a Tangent Line**

Find an equation of the line drawn tangent to the graph of $f(x) = x^2 - 2x - 3$ at $x = 0$, and write the result in slope-intercept form.

Solution ▶ To begin, we first determine the *slope* of the tangent line. For $x = 0$, we have

$$\begin{aligned} g(x) &= 2x - 2 && \text{given equation and slope of tangent line} \\ g(0) &= 2(0) - 2 && \text{substitute 0 for } x \\ &= -2 && \text{result} \end{aligned}$$

The slope of the line drawn tangent to this curve at $x = 0$, is $m = -2$. However, recall that to find the equation of this line we also need a point on the line. Using $x = 0$ once again, we note $(0, -3)$ is the y-intercept of the graph of $f(x)$ *and* is also a point on the tangent line. Using the point $(0, -3)$ and the slope $m = -2$,we have

$$\begin{aligned} y - y_1 &= m(x - x_1) && \text{point-slope form} \\ y - (-3) &= -2(x - 0) && \text{substitute } -2 \text{ for } m, (0, -3) \text{ for } (x_1, y_1) \\ y + 3 &= -2x && \text{simplify} \\ y &= -2x - 3 && \text{slope-intercept form} \end{aligned}$$

In the figure shown, note the graph of $y = -2x - 3$ is tangent to the graph of $y = x^2 - 2x - 3$ at the point $(0, -3)$.

Now try Exercises 1 through 8 ▶

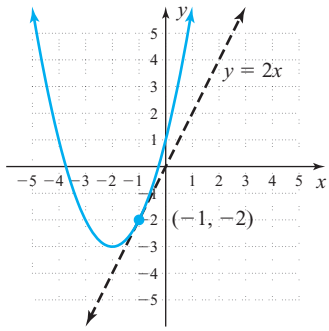
Similar to our work here with tangent lines, many applications of advanced mathematics require that we find the equation of a line drawn *perpendicular* to this tangent line. In this case, the line is called a **normal** to the curve at point (x, y). **See Exercises 9 through 12.**

Connections to Calculus Exercises

For Exercises 1 through 4, the function $g(x) = 2x + 4$ gives the slope of any line drawn tangent to the graph of $f(x) = x^2 + 4x - 5$ at a given x. Find an equation of the line drawn tangent to the graph of $f(x)$ at the following x-values, and write the result in slope-intercept form.

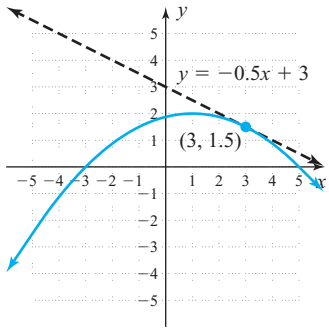
1. $x = -4$ **2.** $x = 0$

3. $x = -2$ **4.** $x = 1$



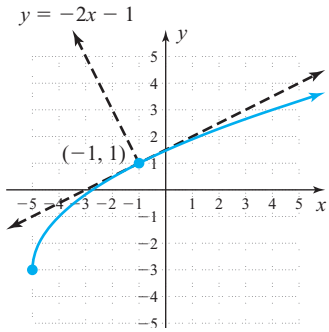
For Exercises 5 through 8, the function $v(x) = 6x^2 - 6x - 36$ gives the slope of any line drawn tangent to the graph of $s(x) = 2x^3 - 3x^2 - 36x$ at given x. Find an equation of the line drawn tangent to the graph of $s(x)$ at the following x-values, and write the result in slope-intercept form.

5. $x = -2$ **6.** $x = 3$

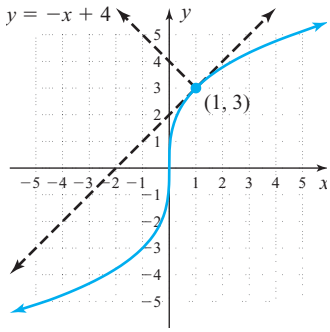


7. $x = 1$ **8.** $x = 4$

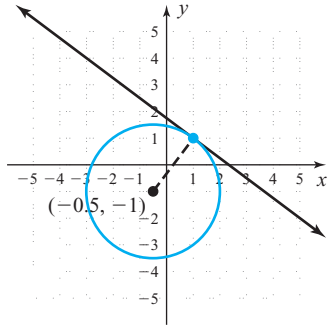
For Exercises 9 through 12, find the equation of the normal to each tangent shown, or the equation of the tangent line for each normal given.



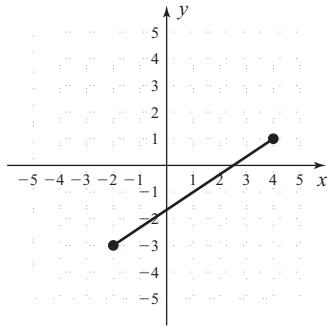
9.



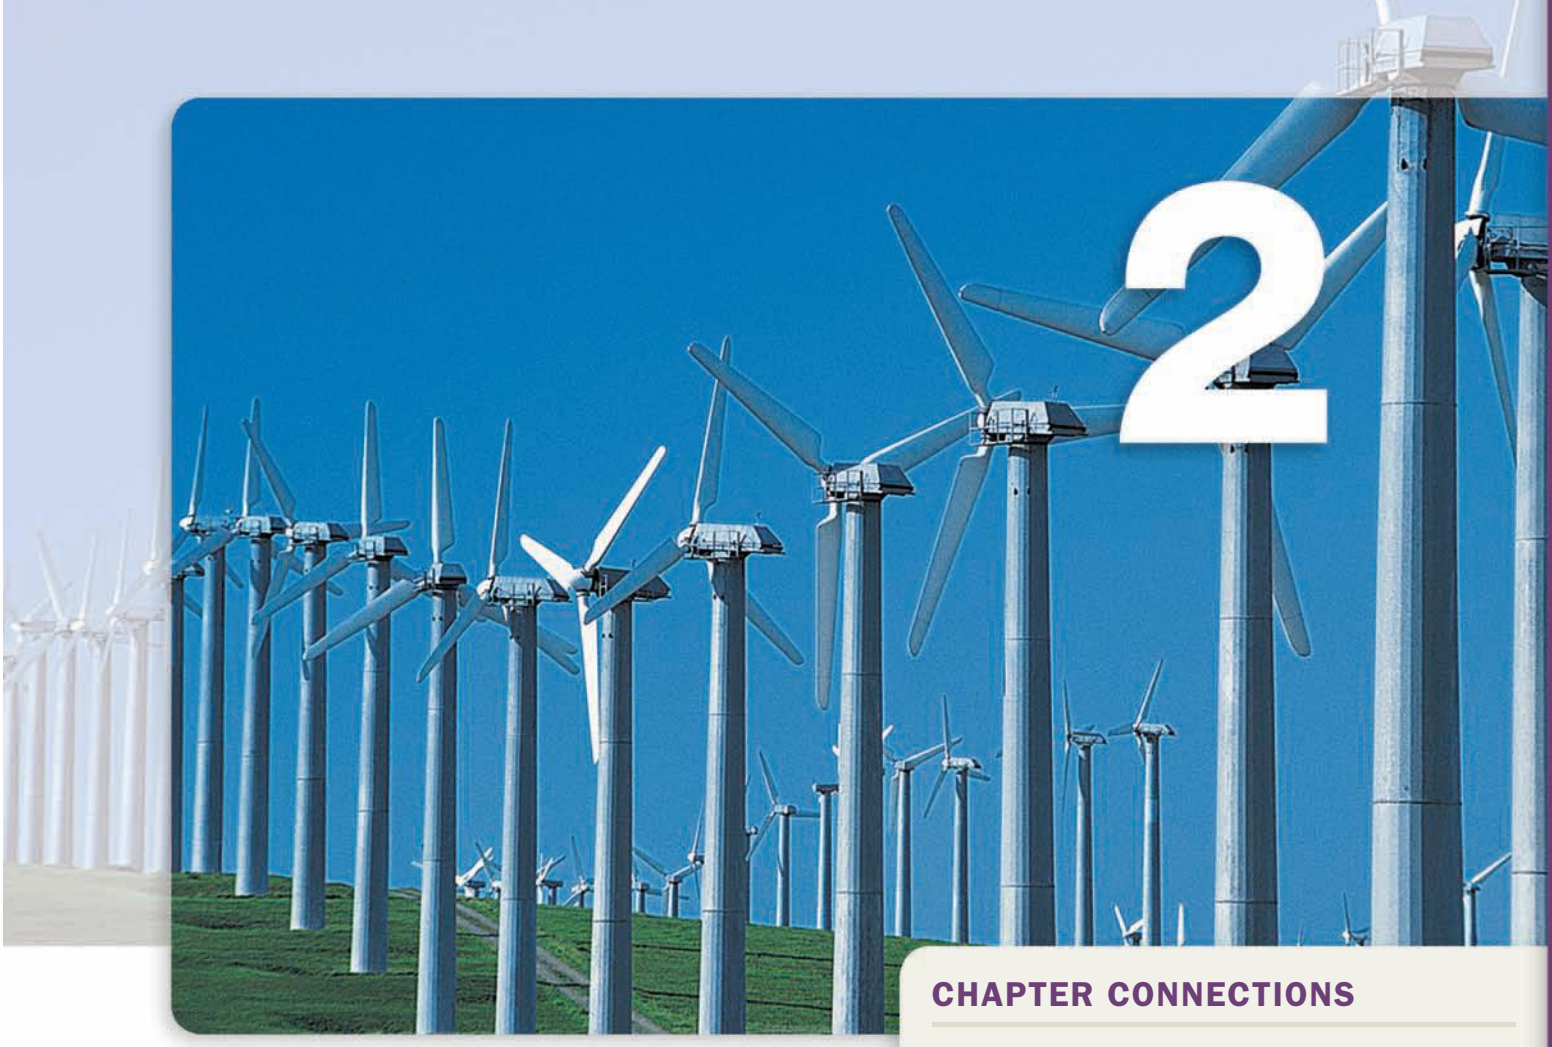
10.



11.



12.



13. A theorem from elementry geometary states, "A line drawn tangent to a circle is perpendicular to the radius at the point of tangency." Find the equation of the tangent line shown in the figure.

14. Find the equation of the line containing the perpendicular bisector of the line segment with endpoints $(-2, -3)$ and $(4, 1)$ shown.

More on Functions

CHAPTER OUTLINE

2.1 Analyzing the Graph of a Function 106

2.2 The Toolbox Functions and Transformations 120

2.3 Absolute Value Functions, Equations, and Inequalities 136

2.4 Basic Rational Functions and Power Functions; More on the Domain 148

2.5 Piecewise-Defined Functions 163

2.6 Variation: The Toolbox Functions in Action 177

CHAPTER CONNECTIONS

Viewing a function in terms of an equation, a table of values, and the related graph, often brings a clearer understanding of the relationships involved. For example, the power generated by a wind turbine is often modeled by the function $P(v) = \frac{8v^3}{125}$, where P is the power in watts and v is the wind velocity in miles per hour. While the formula enables us to predict the power generated for a given wind speed, the graph offers a visual representation of this relationship, where we note a rapid growth in power output as the wind speed increases.

▶ This application appears as Exercise 107 in Section 2.2.

Connections to Calculus

The foundation and study of calculus involves using absolute value inequalities to analyze very small differences. The *Connections to Calculus* for Chapter 2 expands on the notation and language used in this analysis, and explores the need to solve a broad range of equation types.

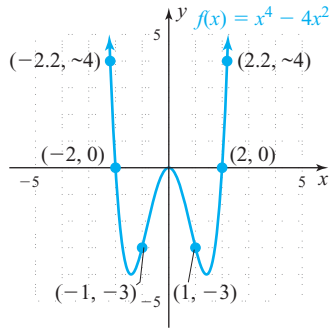
2.1 Analyzing the Graph of a Function

LEARNING OBJECTIVES

In Section 2.1 you will see how we can

- ❑ **A.** Determine whether a function is even, odd, or neither
- ❑ **B.** Determine intervals where a function is positive or negative
- ❑ **C.** Determine where a function is increasing or decreasing
- ❑ **D.** Identify the maximum and minimum values of a function
- ❑ **E.** Locate local maximum and minimum values using a graphing calculator

In this section, we'll consolidate and refine many of the ideas we've encountered related to functions. When functions and graphs are applied as real-world models, we create numeric and visual representations that enable an informed response to questions involving *maximum* efficiency, *positive* returns, *increasing* costs, and other relationships that can have a great impact on our lives.



A. Graphs and Symmetry

While the domain and range of a function will remain dominant themes in our study, for the moment we turn our attention to other characteristics of a function's graph. We begin with the concept of symmetry.

Symmetry with Respect to the *y*-Axis

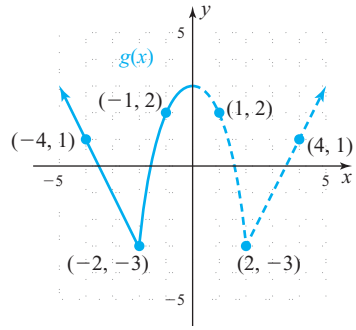
Consider the graph of $f(x) = x^4 - 4x^2$ shown in Figure 2.1, where the portion of the graph to the left of the *y*-axis appears to be a mirror image of the portion to the right. A function is **symmetric to the *y*-axis** if, given any point (x, y) on the graph, the point $(-x, y)$ is also on the graph. We note that $(-1, -3)$ is on the graph, as is $(1, -3)$, and that $(-2, 0)$ is an *x*-intercept of the graph, as is $(2, 0)$. Functions that are symmetric with respect to the *y*-axis are also known as **even functions** and in general we have:

Figure 2.1

Even Functions: *y*-Axis Symmetry

A function *f* is an *even function* if and only if, for each point (x, y) on the graph of *f*, the point $(-x, y)$ is also on the graph. In function notation

$$f(-x) = f(x)$$



Symmetry can be a great help in graphing new functions, enabling us to plot fewer points and to complete the graph using properties of symmetry.

EXAMPLE 1 ▶ **Graphing an Even Function Using Symmetry**

a. The function $g(x)$ in Figure 2.2 (shown in solid blue) is known to be even. Draw the complete graph.

b. Show that $h(x) = x^{\frac{2}{3}}$ is an even function using the arbitrary value $x = k$ [show $h(-k) = h(k)$], then sketch the complete graph using $h(0)$, $h(1)$, $h(8)$, and *y*-axis symmetry.

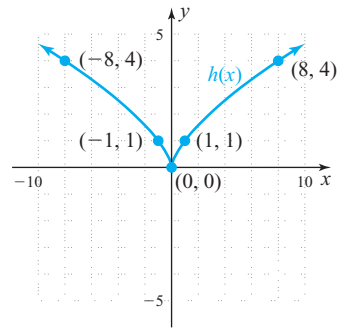
Figure 2.2

Solution ▶

a. To complete the graph of *g* (see Figure 2.2) use the points $(-4, 1)$, $(-2, -3)$, $(-1, 2)$, and *y*-axis symmetry to find additional points. The corresponding ordered pairs are $(4, 1)$, $(2, -3)$, and $(1, 2)$, which we use to help draw a "mirror image" of the partial graph given.

b. To prove that $h(x) = x^{\frac{2}{3}}$ is an even function, we must show $h(-k) = h(k)$ for any constant k. After writing $x^{\frac{2}{3}}$ as $[x^2]^{\frac{1}{3}}$, we have:

$h(-k) \stackrel{?}{=} h(k)$ first step of proof



$[(-k)^2]^{\frac{1}{3}} \stackrel{?}{=} [(k)^2]^{\frac{1}{3}}$ evaluate $h(-k)$ and $h(k)$

$\sqrt[3]{(-k)^2} \stackrel{?}{=} \sqrt[3]{(k)^2}$ radical form

$\sqrt[3]{k^2} = \sqrt[3]{k^2}$ ✓ result: $(-k)^2 = k^2$

Using $h(0) = 0$, $h(1) = 1$, and $h(8) = 4$ with y-axis symmetry produces the graph shown in Figure 2.3.

Figure 2.3

WORTHY OF NOTE

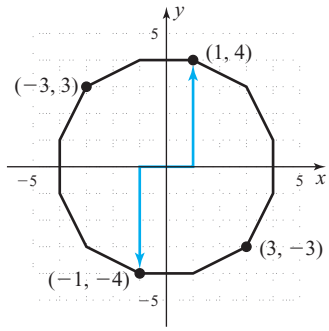
The proof can also be demonstrated by writing $x^{\frac{2}{3}}$ as $(x^{\frac{1}{3}})^2$, and you are asked to complete this proof in **Exercise 69.**

Now try Exercises 7 through 12 ▶

Symmetry with Respect to the Origin

Another common form of symmetry is known as **symmetry to the origin.** As the name implies, the graph is somehow "centered" at (0, 0). This form of symmetry is easy to see for closed figures with their center at (0, 0), like certain polygons, circles, and ellipses (these will exhibit both y-axis symmetry *and* symmetry with respect to the origin). Note the relation graphed in Figure 2.4 contains the points $(-3, 3)$ and $(3, -3)$, along with $(-1, -4)$ and $(1, 4)$. But the function $f(x)$ in Figure 2.5 also contains these points and is, in the same sense, symmetric to the origin (the paired points are on opposite sides of the x- and y-axes, and a like distance from the origin).

Figure 2.4



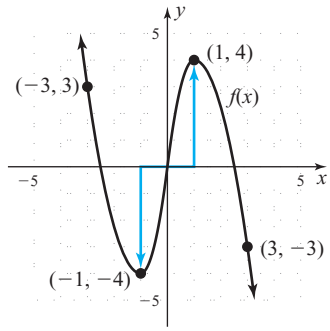


Figure 2.5

Functions symmetric to the origin are known as **odd functions** and in general we have:

Odd Functions: Symmetry About the Origin

A function f is an *odd function* if and only if, for each point (x, y) on the graph of f, the point $(-x, -y)$ is also on the graph. In function notation

$$f(-x) = -f(x)$$

EXAMPLE 2 ▶ **Graphing an Odd Function Using Symmetry**

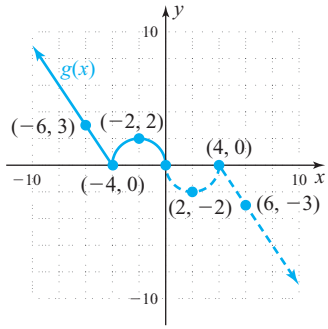
a. In Figure 2.6, the function $g(x)$ given (shown in solid blue) is known to be *odd*. Draw the complete graph.

b. Show that $h(x) = x^3 - 4x$ is an odd function using the arbitrary value $x = k$ [show $h(-x) = -h(x)$], then sketch the graph using $h(-2)$, $h(-1)$, $h(0)$, and odd symmetry.

Solution ▶

a. To complete the graph of g, use the points $(-6, 3)$, $(-4, 0)$, and $(-2, 2)$ and odd symmetry to find additional points. The corresponding ordered pairs are $(6, -3)$, $(4, 0)$, and $(2, -2)$, which we use to help draw a "mirror image" of the partial graph given (see Figure 2.6).

Figure 2.6



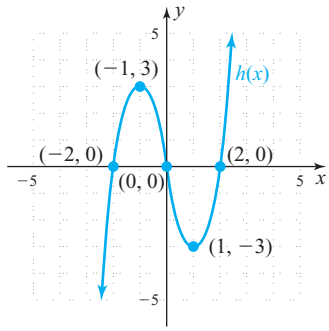


Figure 2.7

b. To prove that $h(x) = x^3 - 4x$ is an odd function, we must show that $h(-k) = -h(k)$.

$$h(-k) \stackrel{?}{=} -h(k)$$
$$(-k)^3 - 4(-k) \stackrel{?}{=} -[k^3 - 4k]$$
$$-k^3 + 4k = -k^3 + 4k \checkmark$$

Using $h(-2) = 0$, $h(-1) = 3$, and $h(0) = 0$ with symmetry about the origin produces the graph shown in Figure 2.7.

Now try Exercises 13 through 24 ▶

A. You've just seen how we can determine whether a function is even, odd, or neither

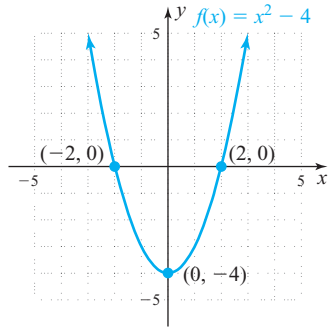
Finally, some relations also exhibit a third form of symmetry, that of symmetry to the x-axis. If the graph of a circle is centered at the origin, the graph has both odd and even symmetry, and is also symmetric to the x-axis. Note that if a graph exhibits x-axis symmetry, *it cannot be the graph of a function*.

B. Intervals Where a Function Is Positive or Negative

Consider the graph of $f(x) = x^2 - 4$ shown in Figure 2.8, which has x-intercepts at $(-2, 0)$ and $(2, 0)$. As in Section 1.5, the x-intercepts have the form $(x, 0)$ and are called the **zeroes** of the function (the x-input causes an output of 0). Just as zero on the number line separates negative numbers from positive numbers, the zeroes of a function that crosses the x-axis separate x-intervals where a function is negative from x-intervals where the function is positive. Noting that outputs (y-values) are positive in Quadrants I and II, $f(x) > 0$ in intervals where its graph is *above the x-axis*. Conversely, $f(x) < 0$

in x-intervals where its graph is *below the x-axis*. To illustrate, compare the graph of f in Figure 2.8, with that of g in Figure 2.9.

Figure 2.8



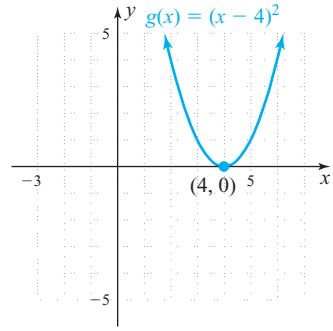


Figure 2.9

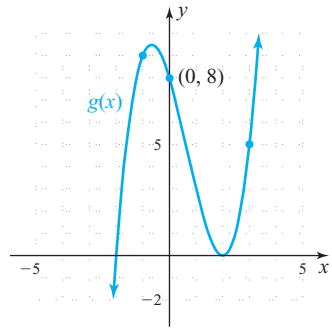
The graph of f is a parabola, with x-intercepts of $(-2, 0)$ and $(2, 0)$. Using our previous observations, we note $f(x) \geq 0$ for $x \in (-\infty, -2] \cup [2, \infty)$ since the graph is above the x-axis, and $f(x) < 0$ for $x \in (-2, 2)$. The graph of g is also a parabola, but is entirely above or on the x-axis, showing $g(x) \geq 0$ for $x \in \mathbb{R}$. The difference is that zeroes coming from factors of the form $(x - r)$ (with degree 1) allow the graph to cross the x-axis. The zeroes of f came from $(x + 2)(x - 2) = 0$. Zeroes that come from factors of the form $(x - r)^2$ (with degree 2) cause the graph to "bounce" off the x-axis (intersect without crossing) since all outputs must be nonnegative. The zero of g came from $(x - 4)^2 = 0$.

WORTHY OF NOTE

These observations form the basis for studying polynomials of higher degree in Chapter 4, where we extend the idea to factors of the form $(x - r)^n$ in a study of **roots of multiplicity.**

EXAMPLE 3 ▶ **Solving an Inequality Using a Graph**



Use the graph of $g(x) = x^3 - 2x^2 - 4x + 8$ given to solve the inequalities

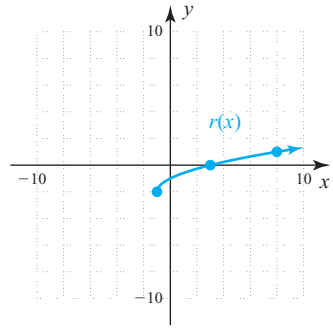
a. $g(x) \geq 0$ **b.** $g(x) < 0$

Solution ▶ From the graph, the zeroes of g (x-intercepts) occur at $(-2, 0)$ and $(2, 0)$.

a. For $g(x) \geq 0$, the graph must be on or above the x-axis, meaning the solution is $x \in [-2, \infty)$.

b. For $g(x) < 0$, the graph must be below the x-axis, and the solution is $x \in (-\infty, -2)$. As we might have anticipated from the graph, factoring by grouping gives $g(x) = (x + 2)(x - 2)^2$, with the graph crossing the x-axis at -2, and bouncing off the x-axis (intersects without crossing) at $x = 2$.

Now try Exercises 25 through 28 ▶



Even if the function is not a polynomial, the zeroes can still be used to find x-intervals where the function is positive or negative.

EXAMPLE 4 ▶ **Solving an Inequality Using a Graph**

For the graph of $r(x) = \sqrt{x + 1} - 2$ shown, solve

a. $r(x) \le 0$

b. $r(x) > 0$

Solution ▶

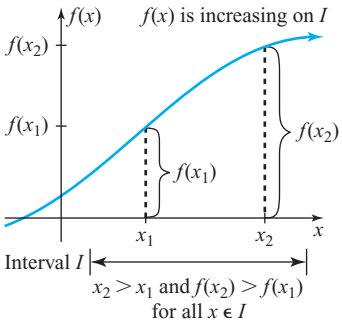
a. The only zero of r is at $(3, 0)$. The graph is on or below the x-axis for $x \in [-1, 3]$, so $r(x) \le 0$ in this interval.

b. The graph is above the x-axis for $x \in (3, \infty)$, and $r(x) > 0$ in this interval.

Now try Exercises 29 through 32 ▶

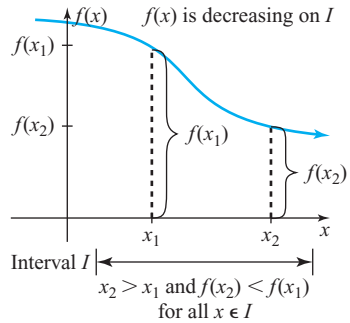
☑ **B.** You've just seen how we can determine intervals where a function is positive or negative

This study of inequalities shows how the graphical solutions studied in Section 1.5 are easily extended to the graph of a general function. It also strengthens the foundation for the graphical solutions studied throughout this text.



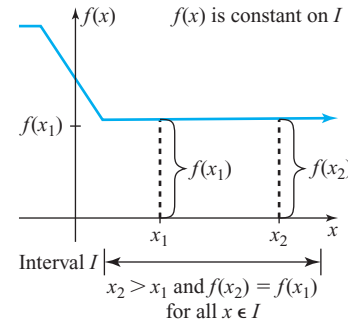
C. Intervals Where a Function Is Increasing or Decreasing

In our study of linear graphs, we said a graph was increasing if it "rose" when viewed from left to right. More generally, we say the graph of a function is increasing *on a given interval* if larger and larger x-values produce larger and larger y-values. This suggests the following tests for intervals where a function is increasing or decreasing.



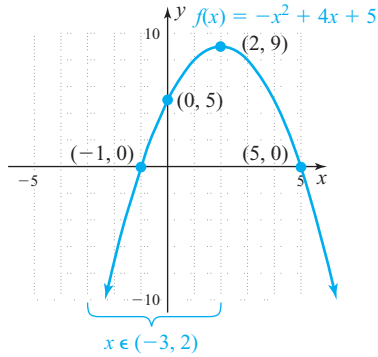
Increasing and Decreasing Functions

Given an interval I that is a subset of the domain, with x_1 and x_2 in I and $x_2 > x_1$,



1. A function is increasing on I if $f(x_2) > f(x_1)$ for all x_1 and x_2 in I (larger inputs produce larger outputs).
2. A function is decreasing on I if $f(x_2) < f(x_1)$ for all x_1 and x_2 in I (larger inputs produce smaller outputs).
3. A function is constant on I if $f(x_2) = f(x_1)$ for all x_1 and x_2 in I (larger inputs produce identical outputs).

graph rises when viewed from left to right

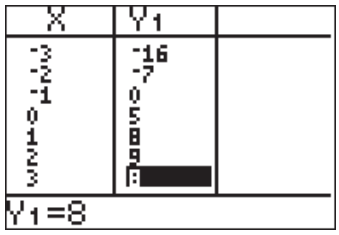


graph falls when viewed from left to right

graph is level when viewed from left to right

Consider the graph of $f(x) = -x^2 + 4x + 5$ given in Figure 2.10. Since the parabola opens downward with the vertex at (2, 9), the function must increase until it reaches this peak at $x = 2$, and decrease thereafter. Notationally we'll write this as $f(x)\uparrow$ for $x \in (-\infty, 2)$ and $f(x)\downarrow$ for $x \in (2, \infty)$. Using the interval $(-3, 2)$ shown below the figure, we see that any larger input value from the interval will indeed produce a larger output value, and $f(x)\uparrow$ on the interval. For instance,

Figure 2.10

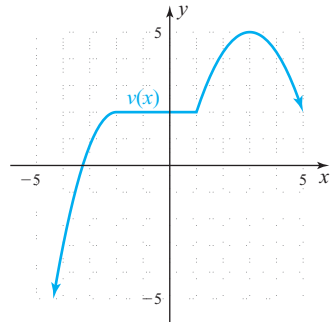


$$1 > -2 \qquad x_2 > x_1$$

and

and

$$f(1) > f(-2) \qquad f(x_2) > f(x_1)$$



$$8 > -7$$

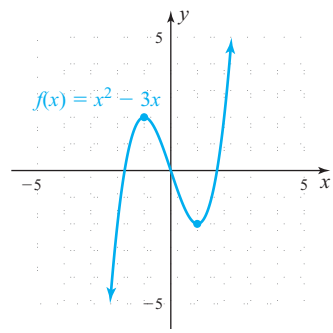
A calculator check is shown in the figure. Note the outputs are increasing until $x = 2$, then they begin decreasing.

EXAMPLE 5 ▶ **Finding Intervals Where a Function Is Increasing or Decreasing**

Use the graph of $v(x)$ given to name the interval(s) where v is increasing, decreasing, or constant.

Solution ▶ From left to right, the graph of v increases until leveling off at $(-2, 2)$, then it remains constant until reaching $(1, 2)$. The graph then increases once again until reaching a peak at $(3, 5)$ and decreases thereafter. The result is $v(x)\uparrow$ for $x \in (-\infty, -2) \cup (1, 3)$, $v(x)\downarrow$ for $x \in (3, \infty)$, and $v(x)$ is constant for $x \in (-2, 1)$.

Now try Exercises 33 through 36 ▶



WORTHY OF NOTE

Questions about the behavior of a function are asked with respect to the *y* outputs: is the *function* positive, is the *function* increasing, etc. Due to the input/output, cause/effect nature of functions, the response is given in terms of *x*, that is, what is *causing* outputs to be positive, or to be increasing.

Notice the graph of f in Figure 2.10 and the graph of v in Example 5 have something in common. It appears that both the far left and far right branches of each graph point downward (in the negative y-direction). We say that the **end-behavior** of both graphs is identical, which is the term used to describe what happens to a graph as $|x|$ becomes very large. For $x > 0$, we say a graph is, "up on the right" or "down on the right," depending on the direction the "end" is pointing. For $x < 0$, we say the graph is "up on the left" or "down on the left," as the case may be.

EXAMPLE 6 ▶ **Describing the End-Behavior of a Graph**

The graph of $f(x) = x^3 - 3x$ is shown. Use the graph to name intervals where f is increasing or decreasing, and comment on the end-behavior of the graph.

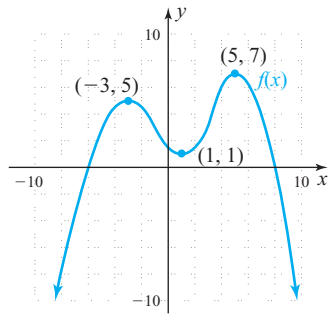
Solution ▶ From the graph we observe that $f(x)\uparrow$ for $x \in (-\infty, -1) \cup (1, \infty)$, and $f(x)\downarrow$ for $x \in (-1, 1)$. The end-behavior of the graph is down on the left, and up on the right (down/up).

C. You've just seen how we can determine where a function is increasing or decreasing

Now try Exercises 37 through 40 ▶

D. Maximum and Minimum Values

The y-coordinate of the vertex of a parabola that opens downward, and the y-coordinate of "peaks" from other graphs are called **maximum values.** A **global maximum** (also called an *absolute* maximum) names the largest y-value over the entire domain. A **local maximum** (also called a *relative* maximum) gives the largest range value in a specified interval; and an **endpoint maximum** can occur at an endpoint of the domain. The same can be said for any corresponding minimum values.



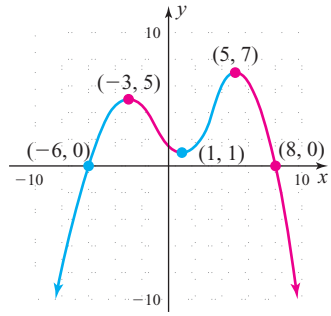
We will soon develop the ability to locate maximum and minimum values for quadratic and other functions. In future courses, methods are developed to help locate maximum and minimum values for almost *any* function. For now, our work will rely chiefly on a function's graph.

EXAMPLE 7 ▶ **Analyzing Characteristics of a Graph**

Analyze the graph of function f shown in Figure 2.11. Include specific mention of

a. domain and range,
b. intervals where f is increasing or decreasing,
c. maximum (max) and minimum (min) values,
d. intervals where $f(x) \geq 0$ and $f(x) < 0$, and
e. whether the function is even, odd, or neither.

Figure 2.11



Solution ▶

a. Using vertical and horizontal boundary lines show the domain is $x \in \mathbb{R}$, with a range of: $y \in (-\infty, 7]$.

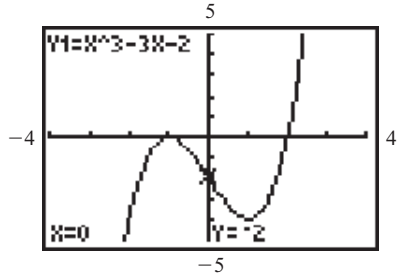
b. $f(x)\uparrow$ for $x \in (-\infty, -3) \cup (1, 5)$ shown in **blue** in Figure 2.12, and $f(x)\downarrow$ for $x \in (-3, 1) \cup (5, \infty)$ as shown in **red**.

Figure 2.12

c. From part (b) we find that $y = 5$ at $(-3, 5)$ and $y = 7$ at $(5, 7)$ are local maximums, with a local minimum of $y = 1$ at $(1, 1)$. The point $(5, 7)$ is also a global maximum (there is no global minimum).

d. $f(x) \geq 0$ for $x \in [-6, 8]$; $f(x) < 0$ for $x \in (-\infty, -6) \cup (8, \infty)$

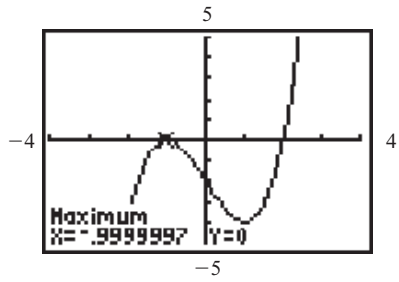
e. The function is neither even nor odd.



Now try Exercises 41 through 48 ▶

D. You've just seen how we can identify the maximum and minimum values of a function

E. Locating Maximum and Minimum Values Using Technology



In Section 1.5, we used the 2nd TRACE **(CALC) 2:zero** option of a graphing calculator to locate the zeroes/x-intercepts of a function. The maximum or minimum values of a function are located in much the same way. To illustrate, enter the function $y = x^3 - 3x - 2$ as Y_1 on the Y= screen, then graph it in the window shown, where $x \in [-4, 4]$ and $y \in [-5, 5]$. As seen in Figure 2.13, it appears a local maximum occurs at $x = -1$ and a local minimum at $x = 1$. To actually find the local maximum, we access the 2nd TRACE **(CALC) 4:maximum** option, which returns you to the graph and asks for a **Left Bound?**, a **Right Bound?**, and a **Guess?** as before. Here, we entered a left bound of "-3," a right bound

Figure 2.13

of "0" and bypassed the guess option by pressing ENTER a third time (the calculator again sets the "▶" and "◀" markers to show the bounds chosen). The cursor will then be located at the local maximum in your selected interval, with the coordinates displayed at the bottom of the screen (Figure 2.14). Due to the algorithm the calculator uses to find these values, a decimal number very close to the expected value is sometimes displayed, even if the actual value is an integer (in Figure 2.14, -0.9999997 is displayed instead of -1). To check, we evaluate $f(-1)$ and find the local maximum is indeed 0.

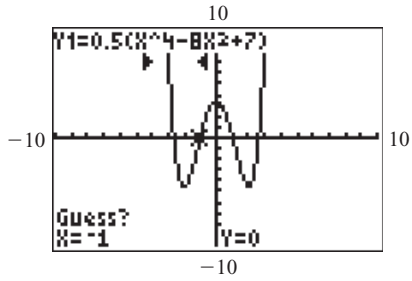
Figure 2.14

EXAMPLE 8 ▶ **Locating Local Maximum and Minimum Values on a Graphing Calculator**

Find the maximum and minimum values of $f(x) = \frac{1}{2}(x^4 - 8x^2 + 7)$.

Solution ▶ Begin by entering $\frac{1}{2}(X^4 - 8X^2 + 7)$ as Y_1 on the Y= screen, and graph the function in the ZOOM **6:ZStandard** window. To locate the leftmost minimum value, we access the 2nd TRACE **(CALC) 3:minimum** option, and enter a left bound of "-4," and a right bound of "-1" (Figure 2.15). After pressing ENTER once more, the cursor is located at the minimum in the interval we selected, and we find that a local minimum of -4.5 occurs at $x = -2$ (Figure 2.16). Repeating these steps using the appropriate options shows a local maximum of $y = 3.5$ occurs at $x = 0$, and a second local minimum of $y = -4.5$ occurs at $x = 2$. Note that $y = -4.5$ is also a global minimum.

Figure 2.15



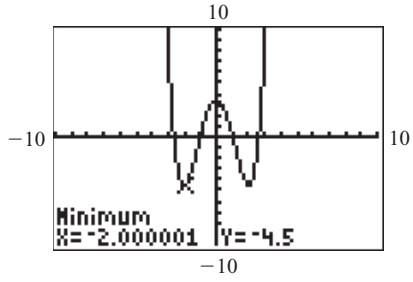


Figure 2.16

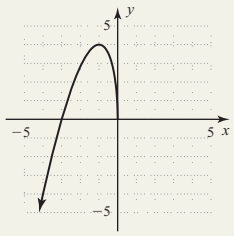
E. You've just seen how we can locate local maximum and minimum values using a graphing calculator

Now try Exercises 49 through 54 ▶

The ideas presented here can be applied to functions of all kinds, including rational functions, piecewise-defined functions, step functions, and so on. There is a wide variety of applications in **Exercises 57 through 64.**

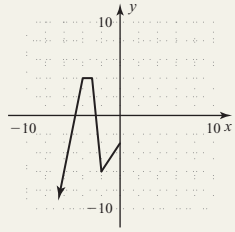
2.1 EXERCISES

▶ CONCEPTS AND VOCABULARY



Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. The graph of a polynomial will cross through the x-axis at zeroes of _____ factors of degree 1, and _____ off the x-axis at the zeroes from linear factors of degree 2.
2. If $f(-x) = f(x)$ for all x in the domain, we say that f is an _____ function and symmetric to the _____ axis. If $f(-x) = -f(x)$, the function is _____ and symmetric to the _____.
3. If $f(x_2) > f(x_1)$ for $x_1 < x_2$ for all x in a given interval, the function is _____ in the interval.
4. If $f(c) \geq f(x)$ for all x in a specified interval, we say that $f(c)$ is a local _____ for this interval.
5. Discuss/Explain the following statement and give an example of the conclusion it makes. "If a function f is decreasing to the left of $(c, f(c))$ and increasing to the right of $(c, f(c))$, then $f(c)$ is either a local or a global minimum."
6. Without referring to notes or textbook, list as many features/attributes as you can that are related to analyzing the graph of a function. Include details on how to locate or determine each attribute.

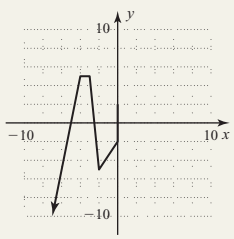


▶ DEVELOPING YOUR SKILLS

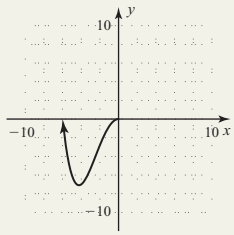
The following functions are known to be even. Complete each graph using symmetry.

7.

8.



Determine whether the following functions are even: $f(-k) = f(k)$.



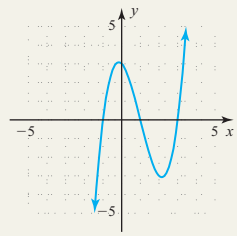
9. $f(x) = -7|x| + 3x^2 + 5$
10. $p(x) = 2x^4 - 6x + 1$
11. $g(x) = \frac{1}{3}x^4 - 5x^2 + 1$
12. $q(x) = \frac{1}{x^2} - |x|$

The following functions are known to be odd. Complete each graph using symmetry.

13.

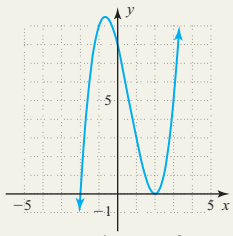
14.

Determine whether the following functions are odd: $f(-k) = -f(k)$.



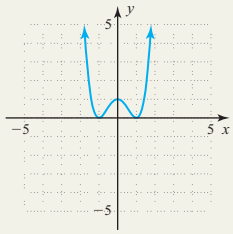
15. $f(x) = 4\sqrt[3]{x} - x$
16. $g(x) = \frac{1}{2}x^3 - 6x$
17. $p(x) = 3x^3 - 5x^2 + 1$
18. $q(x) = \frac{1}{x} - x$

Determine whether the following functions are even, odd, or neither.

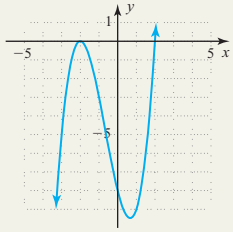


19. $w(x) = x^3 - x^2$
20. $q(x) = \frac{3}{4}x^2 + 3|x|$
21. $p(x) = 2\sqrt[3]{x} - \frac{1}{4}x^3$
22. $g(x) = x^3 + 7x$
23. $v(x) = x^3 + 3|x|$
24. $f(x) = x^4 + 7x^2 - 30$

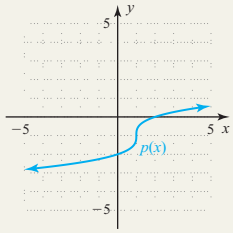
Use the graphs given to solve the inequalities indicated. Write all answers in interval notation.



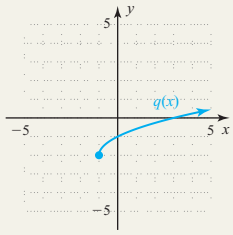
25. $f(x) = x^3 - 3x^2 - x + 3; f(x) \geq 0$



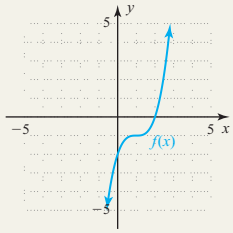
26. $f(x) = x^3 - 2x^2 - 4x + 8; f(x) > 0$



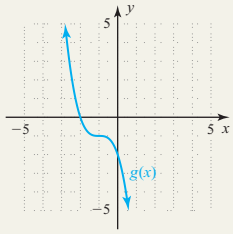
27. $f(x) = x^4 - 2x^2 + 1; f(x) > 0$



28. $f(x) = x^3 + 2x^2 - 4x - 8; f(x) \geq 0$

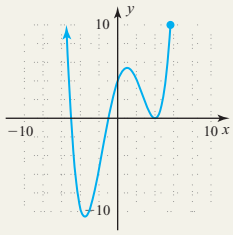


29. $p(x) = \sqrt[3]{x - 1} - 1; p(x) \geq 0$

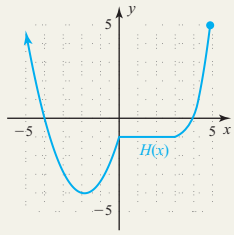


30. $q(x) = \sqrt{x + 1} - 2; q(x) > 0$

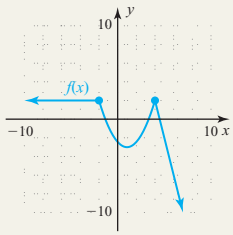
31. $f(x) = (x - 1)^3 - 1; f(x) \leq 0$



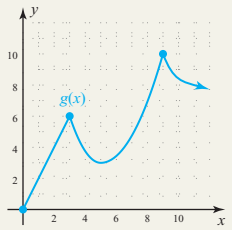
32. $g(x) = -(x + 1)^3 - 1; g(x) < 0$



Name the interval(s) where the following functions are increasing, decreasing, or constant. Write answers using interval notation. Assume all endpoints have integer values.

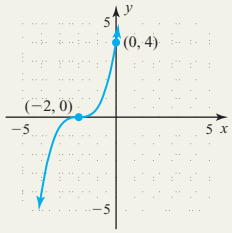


33. $y = V(x)$

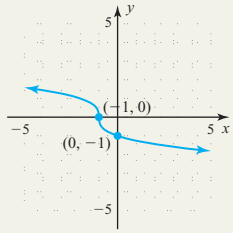


34. $y = H(x)$

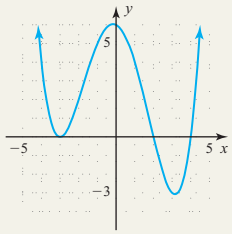
35. $y = f(x)$



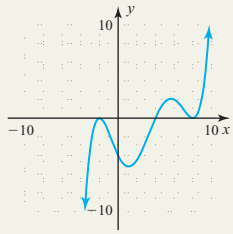
36. $y = g(x)$



For Exercises 37 through 40, determine (a) interval(s) where the function is increasing, decreasing or constant, and (b) comment on the end-behavior.

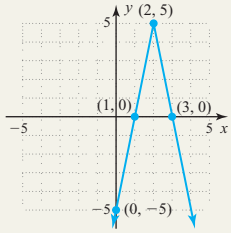


37. $p(x) = 0.5(x + 2)^3$

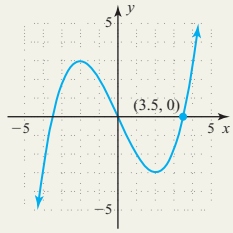


38. $q(x) = -\sqrt[3]{x + 1}$

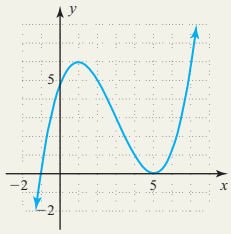
39. $y = f(x)$



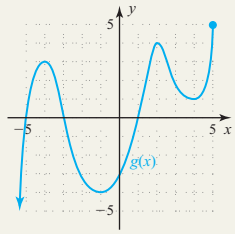
40. $y = g(x)$



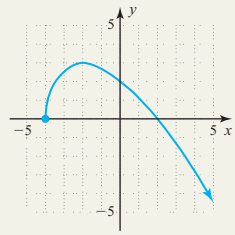
For Exercises 41 through 48, determine the following (answer in interval notation as appropriate): (a) domain and range of the function; (b) zeroes of the function; (c) interval(s) where the function is greater than or equal to zero, or less than or equal to zero; (d) interval(s) where the function is increasing, decreasing, or constant; and (e) location of any local max or min value(s).



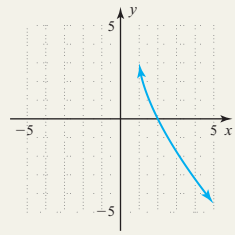
41. $y = H(x)$



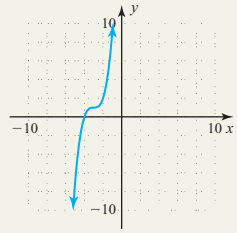
42. $y = f(x)$



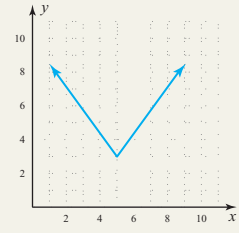
43. $y = g(x)$



44. $y = h(x)$



45. $y = Y_1$



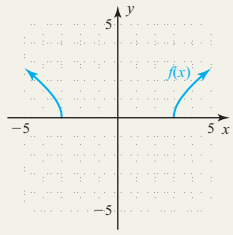
46. $y = Y_2$

47. $p(x) = (x + 3)^3 + 1$

48. $q(x) = |x - 5| + 3$

Use a graphing calculator to find the maximum and minimum values of the following functions. Round answers to nearest hundredth when necessary.

49. $y = \frac{3}{4}(x^3 - 5x^2 + 6x)$ **50.** $y = \frac{6}{5}(x^3 + 4x^2 + 3x)$

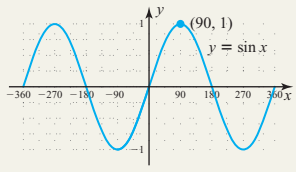


51. $y = 0.0016x^5 - 0.12x^3 + 2x$

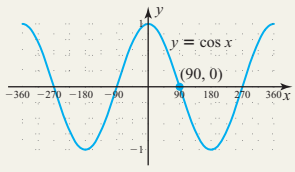
52. $y = -0.01x^5 + 0.03x^4 + 0.25x^3 - 0.75x^2$

53. $y = x\sqrt{4 - x}$ **54.** $y = x^2\sqrt{x + 3} - 2$

▶ WORKING WITH FORMULAS

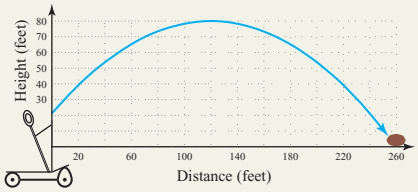


55. Conic sections—hyperbola: $y = \frac{1}{3}\sqrt{4x^2 - 36}$



While the conic sections are not covered in detail until later in the course, we've already developed a number of tools that will help us understand these relations and their graphs. The equation here gives the "upper branches" of a hyperbola, as shown in the figure. Find the following by analyzing the equation: (a) the domain and range; (b) the zeroes of the relation; (c) interval(s) where y is increasing or decreasing; (d) whether the relation is even, odd, or neither, and (e) solve for x in terms of y.

56. Trigonometric graphs: $y = \sin(x)$ and $y = \cos(x)$



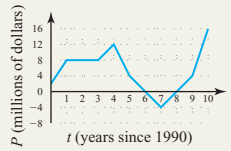
The trigonometric functions are also studied at some future time, but we can apply the same tools to analyze the graphs of these functions as well. The graphs of $y = \sin x$ and $y = \cos x$ are given, graphed over the interval $x \in [-360°, 360°]$. Use them to find (a) the range of the functions; (b) the zeroes of the functions; (c) interval(s) where y is increasing/decreasing; (d) location of minimum/maximum values; and (e) whether each relation is even, odd, or neither.

▶ APPLICATIONS

57. Catapults and projectiles: Catapults have a long and interesting history that dates back to ancient times, when they were used to launch javelins, rocks, and other projectiles. The diagram given illustrates the path of the projectile after release, which follows a parabolic arc. Use the graph to determine the following:

a. State the domain and range of the projectile.

b. What is the maximum height of the projectile?



c. How far from the catapult did the projectile reach its maximum height?

d. Did the projectile clear the castle wall, which was 40 ft high and 210 ft away?

e. On what interval was the height of the projectile increasing?

f. On what interval was the height of the projectile decreasing?

58. Profit and loss: The profit of DeBartolo Construction Inc. is illustrated by the graph shown. Use the graph to estimate the point(s) or the interval(s) for which the profit P was:

a. increasing

b. decreasing

c. constant

d. a maximum

e. a minimum

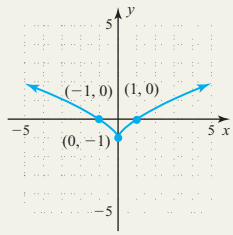
f. positive

g. negative

h. zero

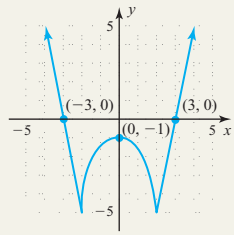
59. Functions and rational exponents: The graph of $f(x) = x^{\frac{2}{3}} - 1$ is shown. Use the graph to find:

a. domain and range of the function



b. zeroes of the function

c. interval(s) where $f(x) \geq 0$ or $f(x) < 0$



d. interval(s) where $f(x)$ is increasing, decreasing, or constant

e. location of any max or min value(s)

Exercise 59

Exercise 60

60. Analyzing a graph: Given $h(x) = |x^2 - 4| - 5$, whose graph is shown, use the graph to find:

a. domain and range of the function

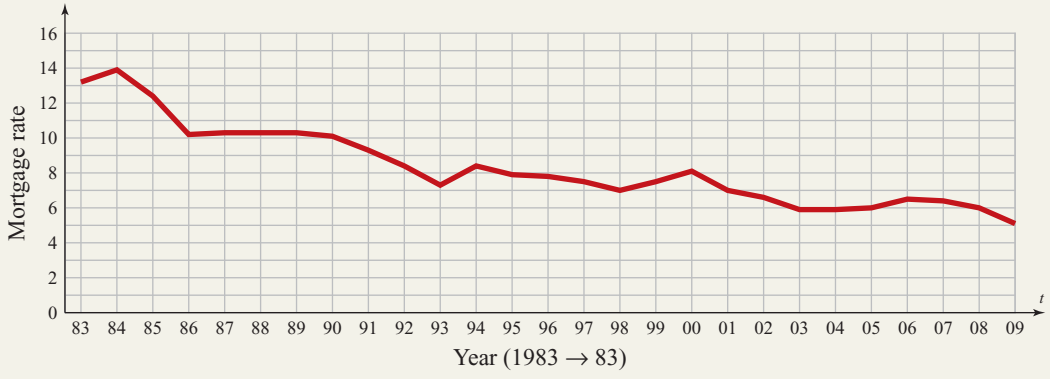
b. zeroes of the function

c. interval(s) where $h(x) \geq 0$ or $h(x) < 0$

d. interval(s) where $f(x)$ is increasing, decreasing, or constant

e. location of any max or min value(s)

61. Analyzing interest rates: The graph shown approximates the average annual interest rates I on 30-yr fixed mortgages, rounded to the nearest $\frac{1}{4}\%$. Use the graph to estimate the following (write all answers in interval notation).



a. domain and range

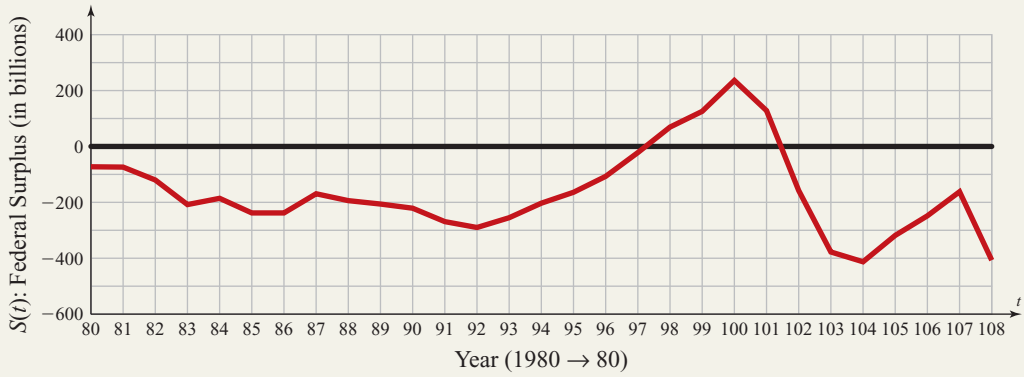
b. interval(s) where $I(t)$ is increasing, decreasing, or constant

c. location of any global maximum or minimum values

d. the one-year period with the greatest rate of increase and the one-year period with the greatest rate of decrease

Source: 2009 Statistical Abstract of the United States, Table 1157

62. Analyzing the surplus *S*: The following graph approximates the federal surplus S of the United States. Use the graph to estimate the following. Write answers in interval notation and estimate all surplus values to the nearest \$10 billion.



a. the domain and range

b. interval(s) where $S(t)$ is increasing, decreasing, or constant

c. the location of any global maximum and minimum values

d. the one-year period with the greatest rate of increase, and the one-year period with the greatest rate of decrease

Source: 2009 Statistical Abstract of the United States, Table 451

63. Constructing a graph: Draw a continuous function f that has the following characteristics, then state the zeroes and the location of all maximum and minimum values. [*Hint:* Write them as $(c, f(c))$.]

a. Domain: $x \in (-10, \infty)$
Range: $y \in (-6, \infty)$

b. $f(0) = 0; f(4) = 0$

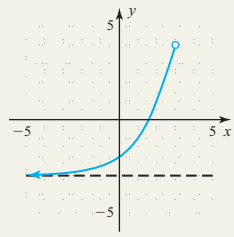
c. $f(x)\uparrow$ for $x \in (-10, -6) \cup (-2, 2) \cup (4, \infty)$
$f(x)\downarrow$ for $x \in (-6, -2) \cup (2, 4)$

d. $f(x) \geq 0$ for $x \in [-8, -4] \cup [0, \infty)$
$f(x) < 0$ for $x \in (-\infty, -8) \cup (-4, 0)$

64. Constructing a graph: Draw a continuous function g that has the following characteristics, then state the zeroes and the location of all maximum and minimum values. [*Hint:* Write them as $(c, g(c))$.]

a. Domain: $x \in (-\infty, 8]$
Range: $y \in [-6, \infty)$

b. $g(0) = 4.5; g(6) = 0$



c. $g(x)\uparrow$ for $x \in (-6, 3) \cup (6, 8)$
$g(x)\downarrow$ for $x \in (-\infty, -6) \cup (3, 6)$

d. $g(x) \geq 0$ for $x \in (-\infty, -9] \cup [-3, 8]$
$g(x) < 0$ for $x \in (-9, -3)$

▶ EXTENDING THE CONCEPT

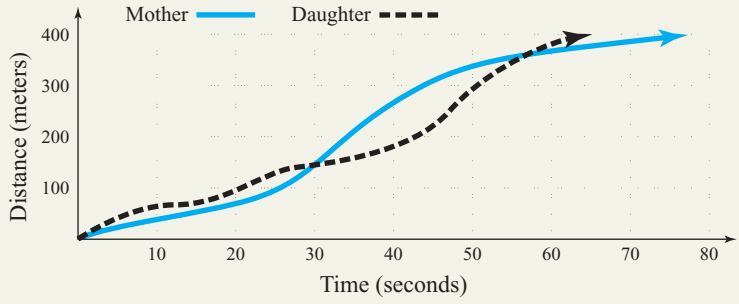
65. Does the function shown have a maximum value? Does it have a minimum value? Discuss/explain/justify why or why not.

Exercise 65

66. The graph drawn here depicts a 400-m race between a mother and her daughter. Analyze the graph to answer questions (a) through (f).

a. Who wins the race, the mother or daughter?

b. By approximately how many meters?



c. By approximately how many seconds?

d. Who was leading at $t = 40$ seconds?

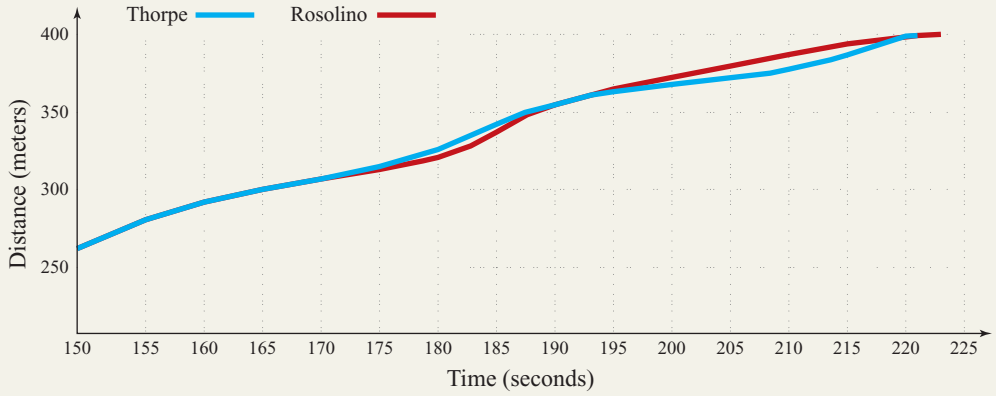
e. During the race, how many seconds was the daughter in the lead?

f. During the race, how many seconds was the mother in the lead?

Exercise 66

67. The graph drawn here depicts the last 75 sec of the competition between Ian Thorpe (Australia) and Massimiliano Rosolino (Italy) in the men's 400-m freestyle at the 2000 Olympics, where a new Olympic record was set.

a. Who was in the lead at 180 sec? 210 sec?



b. In the last 50 m, how many times were they tied, and when did the ties occur?

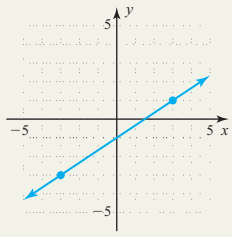
c. About how many seconds did Rosolino have the lead?

d. Which swimmer won the race?

e. By approximately how many seconds?

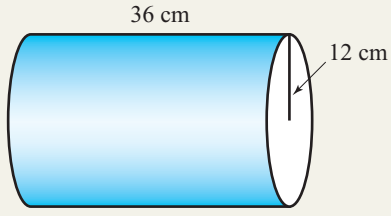
f. Use the graph to approximate the new Olympic record set in the year 2000.

68. Draw the graph of a general function $f(x)$ that has a local *maximum* at $(a, f(a))$ and a local *minimum* at $(b, f(b))$ but with $f(a) < f(b)$.



69. Verify that $h(x) = x^{\frac{2}{3}}$ is an even function, by first rewriting h as $h(x) = (x^{\frac{1}{3}})^2$.

▶ MAINTAINING YOUR SKILLS



70. **(Appendix A.4)** Solve the given quadratic equation by factoring: $x^2 - 8x - 20 = 0$.

71. **(Appendix A.5)** Find the (a) sum and (b) product of the rational expressions $\dfrac{3}{x+2}$ and $\dfrac{3}{2-x}$.

72. **(1.4)** Write the equation of the line shown, in the form $y = mx + b$.

73. **(Appendix A.2)** Find the surface area and volume of the cylinder shown (SA $= 2\pi r^2 + \pi r^2 h$, $V = \pi r^2 h$).

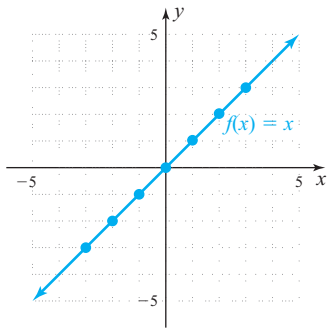
2.2 The Toolbox Functions and Transformations

LEARNING OBJECTIVES

In Section 2.2 you will see how we can:

- ❑ **A.** Identify basic characteristics of the toolbox functions
- ❑ **B.** Apply vertical/horizontal shifts of a basic graph
- ❑ **C.** Apply vertical/horizontal reflections of a basic graph
- ❑ **D.** Apply vertical stretches and compressions of a basic graph
- ❑ **E.** Apply transformations on a general function $f(x)$

Many applications of mathematics require that we select a function known to fit the context, or build a function model from the information supplied. So far we've looked at linear functions. Here we'll introduce the absolute value, squaring, square root, cubing, and cube root functions. Together these are the six **toolbox functions,** so called because they give us a variety of "tools" to model the real world (see Section 2.6). In the same way a study of arithmetic depends heavily on the multiplication table, a study of algebra and mathematical modeling depends (in large part) on a solid working knowledge of these functions. More will be said about each function in later sections.

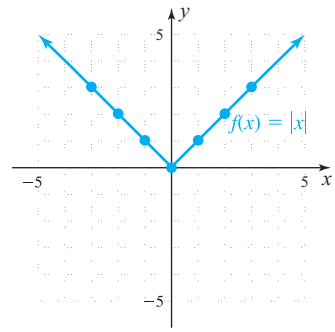


A. The Toolbox Functions

While we can accurately graph a line using only two points, most functions require more points to show all of the graph's important features. However, our work is greatly simplified in that each function belongs to a **function family,** in which all graphs from a given family share the characteristics of one basic graph, called the **parent function.** This means the number of points required for graphing will quickly decrease as we start anticipating what the graph of a given function should look like. The parent functions and their identifying characteristics are summarized here.

The Toolbox Functions

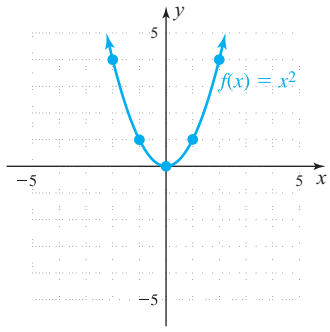
Identity function



x	$f(x) = x$
−3	−3
−2	−2
−1	−1
0	0
1	1
2	2
3	3

Domain: $x \in (-\infty, \infty)$, Range: $y \in (-\infty, \infty)$
Symmetry: odd
Increasing: $x \in (-\infty, \infty)$
End-behavior: down on the left/up on the right

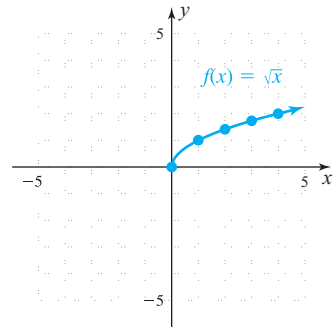
Absolute value function



x	$f(x) = \lvert x \rvert$
−3	3
−2	2
−1	1
0	0
1	1
2	2
3	3

Domain: $x \in (-\infty, \infty)$, Range: $y \in [0, \infty)$
Symmetry: even
Decreasing: $x \in (-\infty, 0)$; Increasing: $x \in (0, \infty)$
End-behavior: up on the left/up on the right
Vertex at (0, 0)

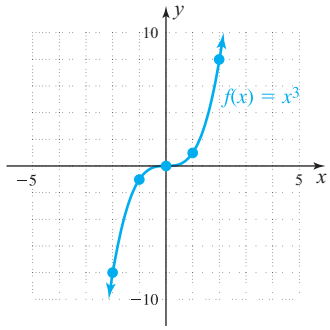
Squaring function



x	$f(x) = x^2$
−3	9
−2	4
−1	1
0	0
1	1
2	4
3	9

Domain: $x \in (-\infty, \infty)$, Range: $y \in [0, \infty)$
Symmetry: even
Decreasing: $x \in (-\infty, 0)$; Increasing: $x \in (0, \infty)$
End-behavior: up on the left/up on the right
Vertex at (0, 0)

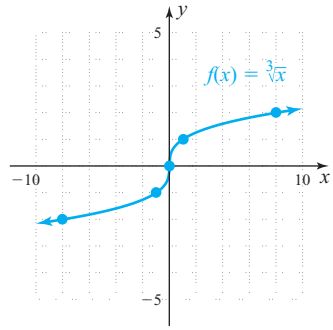
Square root function



x	$f(x) = \sqrt{x}$
−2	–
−1	–
0	0
1	1
2	≈1.41
3	≈1.73
4	2

Domain: $x \in [0, \infty)$, Range: $y \in [0, \infty)$
Symmetry: neither even nor odd
Increasing: $x \in (0, \infty)$
End-behavior: up on the right
Initial point at (0, 0)

Cubing function

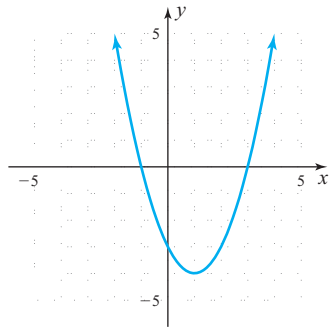


x	$f(x) = x^3$
−3	−27
−2	−8
−1	−1
0	0
1	1
2	8
3	27

Domain: $x \in (-\infty, \infty)$, Range: $y \in (-\infty, \infty)$
Symmetry: odd
Increasing: $x \in (-\infty, \infty)$
End-behavior: down on the left/up on the right
Point of inflection at (0, 0)

Cube root function

x	$f(x) = \sqrt[3]{x}$
−27	−3
−8	−2
−1	−1
0	0
1	1
8	2
27	3



Domain: $x \in (-\infty, \infty)$, Range: $y \in (-\infty, \infty)$
Symmetry: odd
Increasing: $x \in (-\infty, \infty)$
End-behavior: down on the left/up on the right
Point of inflection at (0, 0)

In applications of the toolbox functions, the parent graph may be "morphed" and/or shifted from its original position, yet the graph will still retain its basic shape and features. The result is called a **transformation** of the parent graph.

EXAMPLE 1 ▶ **Identifying the Characteristics of a Transformed Graph**

The graph of $f(x) = x^2 - 2x - 3$ is given. Use the graph to identify each of the features or characteristics indicated.

a. function family
b. domain and range
c. vertex
d. max or min value(s)
e. intervals where f is increasing or decreasing
f. end-behavior
g. x- and y-intercept(s)

Solution ▶

a. The graph is a parabola, from the squaring function family.
b. domain: $x \in (-\infty, \infty)$; range: $y \in [-4, \infty)$
c. vertex: $(1, -4)$
d. minimum value $y = -4$ at $(1, -4)$
e. decreasing: $x \in (-\infty, 1)$, increasing: $x \in (1, \infty)$
f. end-behavior: up/up
g. y-intercept: $(0, -3)$; x-intercepts: $(-1, 0)$ and $(3, 0)$

Now try Exercises 7 through 34 ▶

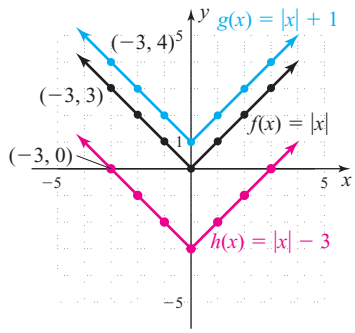
Note that for Example 1(f), we can algebraically verify the x-intercepts by substituting 0 for $f(x)$ and solving the equation by factoring. This gives $0 = (x + 1)(x - 3)$, with solutions $x = -1$ and $x = 3$. It's also worth noting that while the parabola is no longer symmetric to the y-axis, it *is* symmetric to the vertical line $x = 1$. This line is called the **axis of symmetry** for the parabola, and for a vertical parabola, it will always be a vertical line that goes through the vertex.

☑ **A.** You've just seen how we can identify basic characteristics of the toolbox functions

B. Vertical and Horizontal Shifts

As we study specific transformations of a graph, try to develop a *global view* as the transformations can be applied to *any* function. When these are applied to the toolbox functions, we rely on characteristic features of the parent function to assist in completing the transformed graph.

Vertical Translations



We'll first investigate vertical translations or vertical shifts of the toolbox functions, using the absolute value function to illustrate.

EXAMPLE 2 ▶ **Graphing Vertical Translations**

Construct a table of values for $f(x) = |x|$, $g(x) = |x| + 1$, and $h(x) = |x| - 3$ and graph the functions on the same coordinate grid. Then discuss what you observe.

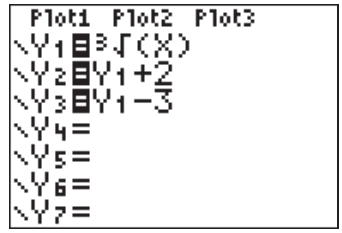
Solution ▶ A table of values for all three functions is given, with the corresponding graphs shown in the figure.

x	$f(x) = \|x\|$	$g(x) = \|x\| + 1$	$h(x) = \|x\| - 3$
−3	3	4	0
−2	2	3	−1
−1	1	2	−2
0	0	1	−3
1	1	2	−2
2	2	3	−1
3	3	4	0

Note that outputs of $g(x)$ are one more than the outputs of $f(x)$, and that each point on the graph of f has been shifted *upward 1 unit* to form the graph of g. Similarly, each point on the graph of f has been shifted *downward 3 units* to form the graph of h, since $h(x) = f(x) - 3$.

Now try Exercises 35 through 42 ▶

We describe the transformations in Example 2 as a **vertical shift** or **vertical translation** of a basic graph. The graph of g is the graph of f *shifted up 1 unit,* and the graph of h, is the graph of f *shifted down 3 units*. In general, we have the following:



Vertical Translations of a Basic Graph

Given $k > 0$ and any function whose graph is determined by $y = f(x)$,

1. The graph of $y = f(x) + k$ is the graph of $f(x)$ shifted upward k units.
2. The graph of $y = f(x) - k$ is the graph of $f(x)$ shifted downward k units.

Graphing calculators are wonderful tools for exploring graphical transformations. To emphasize that a given graph is being shifted vertically as in Example 2, try entering $\sqrt[3]{X}$ as Y_1 on the Y= screen, then $Y_2 = Y_1 + 2$ and $Y_3 = Y_1 - 3$ (Figure 2.17 — recall the Y-variables are accessed using VARS ▸ **(Y-VARS)** ENTER). Using the Y-variables in this way enables us to study identical transformations on a variety of graphs, simply by changing the function in Y_1.

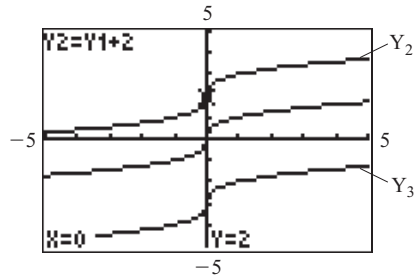


Figure 2.17

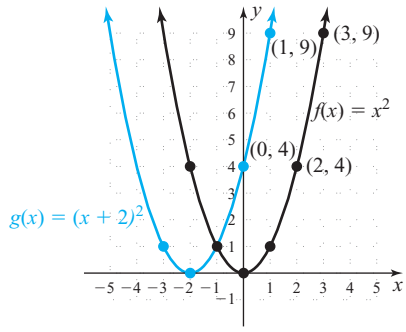
Using a window size of $x \in [-5, 5]$ and $y \in [-5, 5]$ for the cube root function, produces the graphs shown in Figure 2.18, which demonstrate the cube root graph has been shifted upward 2 units (Y_2), and downward 3 units (Y_3).

Try this exploration again using $Y_1 = \sqrt{X}$.

Figure 2.18

Horizontal Translations



The graph of a parent function can also be shifted left or right. This happens when we *alter the inputs to the basic function,* as opposed to adding or subtracting something to the function itself. For $Y_1 = x^2 + 2$ note that we first square inputs, then add 2, which results in a vertical shift. For $Y_2 = (x + 2)^2$, we add 2 to x *prior to squaring* and since the input values are affected, we might anticipate the graph will shift along the x-axis—horizontally.

EXAMPLE 3 ▶ **Graphing Horizontal Translations**

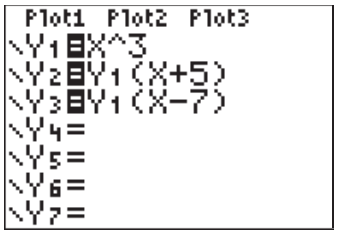
Construct a table of values for $f(x) = x^2$ and $g(x) = (x + 2)^2$, then graph the functions on the same grid and discuss what you observe.

Solution ▶ Both f and g belong to the quadratic family and their graphs are parabolas. A table of values is shown along with the corresponding graphs.

x	$f(x) = x^2$	$g(x) = (x + 2)^2$
−3	9	1
−2	4	0
−1	1	1
0	0	4
1	1	9
2	4	16
3	9	25

It is apparent the graphs of g and f are identical, but the graph of g has been shifted horizontally 2 units left.

Now try Exercises 43 through 46 ▶



We describe the transformation in Example 3 as a **horizontal shift** or **horizontal translation** of a basic graph. The graph of g is the graph of f, *shifted 2 units to the left*. Once again it seems reasonable that since *input* values were altered, the shift must be horizontal rather than vertical. From this example, we also learn the direction of the shift is **opposite the sign:** $y = (x + 2)^2$ is 2 units *to the left* of $y = x^2$. Although it may seem counterintuitive, the shift *opposite the sign* can be "seen" by locating the new x-intercept, which in this case is also the vertex. Substituting 0 for y gives $0 = (x + 2)^2$ with $x = -2$, as shown in the graph. In general, we have

Horizontal Translations of a Basic Graph

Given $h > 0$ and any function whose graph is determined by $y = f(x)$,

1. The graph of $y = f(x + h)$ is the graph of $f(x)$ shifted *to the left* h units.
2. The graph of $y = f(x - h)$ is the graph of $f(x)$ shifted *to the right* h units.

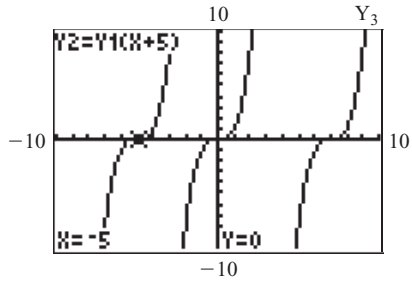


Figure 2.19

To explore horizontal translations on a graphing calculator, we input a basic function in Y_1 and indicate how we want the inputs altered in Y_2 and Y_3. Here we'll enter X^3 as Y_1 on the Y= screen, then $Y_2 = Y_1(X + 5)$ and $Y_3 = Y_1(X - 7)$ (Figure 2.19). Note how this duplicates the definition and notation for horizontal shifts in the orange box. Based on what we saw in Example 3, we expect the graph of $y = x^3$ will first be shifted 5 units left (Y_2), then 7 units right (Y_3). This in confirmed in Figure 2.20.

Try this exploration again using $Y_1 = \text{abs}(X)$.

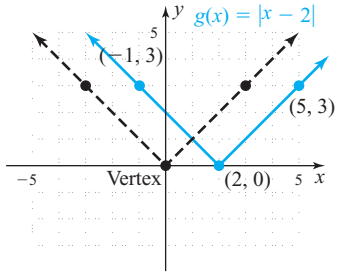
Figure 2.20

EXAMPLE 4 ▶ **Graphing Horizontal Translations**

Sketch the graphs of $g(x) = |x - 2|$ and $h(x) = \sqrt{x + 3}$ using a horizontal shift of the parent function and a few characteristic points (not a table of values).

Solution ▶ The graph of $g(x) = |x - 2|$ (Figure 2.21) is the absolute value function shifted 2 units to the right (shift the vertex and two other points from $y = |x|$). The graph of $h(x) = \sqrt{x + 3}$ (Figure 2.22) is a square root function, shifted 3 units to the left (shift the initial point and one or two points from $y = \sqrt{x}$).

Figure 2.21



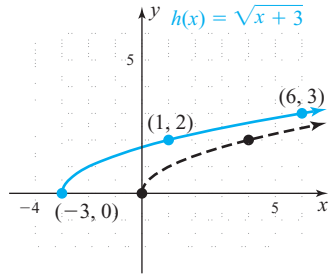


Figure 2.22

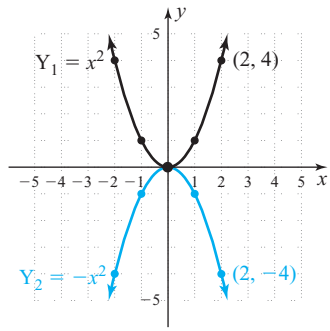
B. You've just seen how we can perform vertical/horizontal shifts of a basic graph

Now try Exercises 47 through 50 ▶

C. Vertical and Horizontal Reflections

The next transformation we investigate is called a **vertical reflection,** in which we compare the function $Y_1 = f(x)$ with the negative of the function: $Y_2 = -f(x)$.



Vertical Reflections

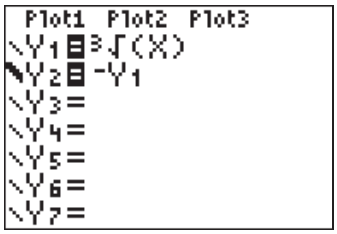
EXAMPLE 5 ▶ **Graphing Vertical Reflections**

Construct a table of values for $Y_1 = x^2$ and $Y_2 = -x^2$, then graph the functions on the same grid and discuss what you observe.

Solution ▶ A table of values is given for both functions, along with the corresponding graphs.

x	$Y_1 = x^2$	$Y_2 = -x^2$
−2	4	−4
−1	1	−1
0	0	0
1	1	−1
2	4	−4

As you might have anticipated, the outputs for f and g differ only in sign. Each output is a **reflection** of the other, being an equal distance from the x-axis but on opposite sides.



Now try Exercises 51 and 52 ▶

The vertical reflection in Example 5 is called a **reflection across the x-axis.** In general,

Vertical Reflections of a Basic Graph

For any function $y = f(x)$, the graph of $y = -f(x)$ is the graph of $f(x)$ reflected across the x-axis.

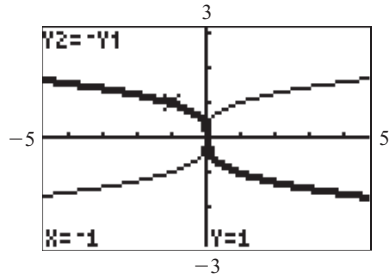


Figure 2.23

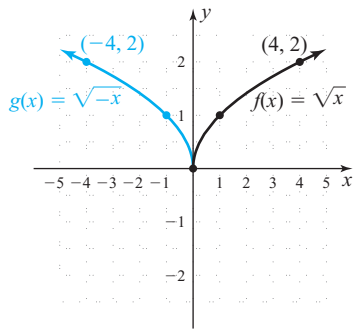
To view vertical reflections on a graphing calculator, we simply define $Y_2 = -Y_1$, as seen here using $\sqrt[3]{X}$ as Y_1 (Figure 2.23). As in Section 1.5, we can have the calculator graph Y_2 using a bolder line, to easily distinguish between the original graph and its reflection (Figure 2.24). To aid in the viewing, we have set a window size of $x \in [-5, 5]$ and $y \in [-3, 3]$.

Try this exploration again using $Y_1 = X^2 - 4$.

Figure 2.24

Horizontal Reflections



It's also possible for a graph to be reflected horizontally *across the y-axis.* Just as we noted that $f(x)$ versus $-f(x)$ resulted in a vertical reflection, $f(x)$ versus $f(-x)$ results in a horizontal reflection.

EXAMPLE 6 ▶ Graphing a Horizontal Reflection

Construct a table of values for $f(x) = \sqrt{x}$ and $g(x) = \sqrt{-x}$, then graph the functions on the same coordinate grid and discuss what you observe.

Solution ▶ A table of values is given here, along with the corresponding graphs.

x	$f(x) = \sqrt{x}$	$g(x) = \sqrt{-x}$
−4	not real	2
−2	not real	$\sqrt{2} \approx 1.41$
−1	not real	1
0	0	0
1	1	not real
2	$\sqrt{2} \approx 1.41$	not real
4	2	not real

The graph of g is the same as the graph of f, but it has been reflected across the y-axis. A study of the domain shows why—f represents a real number only for nonnegative inputs, so its graph occurs to the right of the y-axis, while g represents a real number for nonpositive inputs, so its graph occurs to the left.

Now try Exercises 53 and 54 ▶

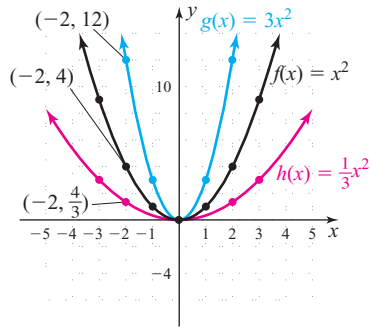
The transformation in Example 6 is called a **horizontal reflection** of a basic graph. In general,

Horizontal Reflections of a Basic Graph

For any function $y = f(x)$, the graph of $y = f(-x)$ is the graph of $f(x)$ reflected across the y-axis.

☑ **C.** You've just seen how we can apply vertical/horizontal reflections of a basic graph

D. Vertically Stretching/Compressing a Basic Graph



As the words "stretching" and "compressing" imply, the graph of a basic function can also become elongated or flattened after certain transformations are applied. However, even these transformations preserve the key characteristics of the graph.

EXAMPLE 7 ▶ Stretching and Compressing a Basic Graph

Construct a table of values for $f(x) = x^2$, $g(x) = 3x^2$, and $h(x) = \frac{1}{3}x^2$, then graph the functions on the same grid and discuss what you observe.

Solution ▶ A table of values is given for all three functions, along with the corresponding graphs.

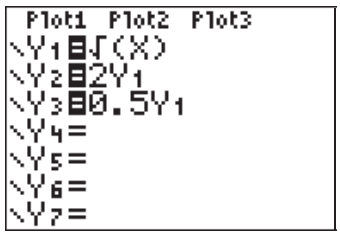
x	$f(x) = x^2$	$g(x) = 3x^2$	$h(x) = \frac{1}{3}x^2$
−3	9	27	3
−2	4	12	$\frac{4}{3}$
−1	1	3	$\frac{1}{3}$
0	0	0	0
1	1	3	$\frac{1}{3}$
2	4	12	$\frac{4}{3}$
3	9	27	3

The outputs of g are triple those of f, making these outputs farther from the x-axis and *stretching* g upward (making the graph more narrow). The outputs of h are one-third those of f, and the graph of h is *compressed* downward, with its outputs closer to the x-axis (making the graph wider).

Now try Exercises 55 through 62 ▶

WORTHY OF NOTE

In a study of trigonometry, you'll find that a basic graph can also be stretched or compressed horizontally, a phenomenon known as *frequency variations.*



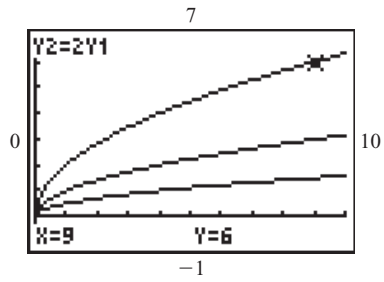
The transformations in Example 7 are called **vertical stretches** or **compressions** of a basic graph. Notice that while the outputs are increased or decreased by a constant factor (making the graph appear more narrow or more wide), the domain of the function remains unchanged. In general,

Stretches and Compressions of a Basic Graph

For any function $y = f(x)$, the graph of $y = af(x)$ is

1. the graph of $f(x)$ stretched vertically if $|a| > 1$,
2. the graph of $f(x)$ compressed vertically if $0 < |a| < 1$.

Figure 2.25



☑ **D.** You've just seen how we can apply vertical stretches and compressions of a basic graph

To use a graphing calculator in a study of stretches and compressions, we simply define Y_2 and Y_3 as constant multiples of Y_1 (Figure 2.25). As seen in Example 7, if $|a| > 1$ the graph will be stretched vertically, if $0 < |a| < 1$, the graph will be vertically compressed. This is further illustrated here using $Y_1 = \sqrt{X}$, with $Y_2 = 2Y_1$ and $Y_3 = 0.5Y_1$. Since the domain of $y = \sqrt{x}$ is restricted to nonnegative values, a window size of $x \in [0, 10]$ and $y \in [-1, 7]$ was used (Figure 2.26).

Try this exploration again using $Y_1 = \text{abs}(X) - 4$.

Figure 2.26

E. Transformations of a General Function

If more than one transformation is applied to a basic graph, it's helpful to use the following sequence for graphing the new function.

General Transformations of a Basic Graph

Given a function $y = f(x)$, the graph of $y = af(x \pm h) \pm k$ can be obtained by applying the following sequence of transformations:

1. horizontal shifts **2.** reflections **3.** stretches/compressions **4.** vertical shifts

We generally use a few characteristic points to track the transformations involved, then draw the transformed graph through the new location of these points.

EXAMPLE 8 ▶ Graphing Functions Using Transformations

Use transformations of a parent function to sketch the graphs of

a. $g(x) = -(x + 2)^2 + 3$ **b.** $h(x) = 2\sqrt[3]{x - 2} - 1$

Solution ▶ **a.** The graph of g is a parabola, shifted left 2 units, reflected across the x-axis, and shifted up 3 units. This sequence of transformations is shown in Figures 2.27 through 2.29. Note that since the graph has been shifted 2 units left and 3 units up, the vertex of the parabola has likewise shifted from $(0, 0)$ to $(-2, 3)$.

Figure 2.27

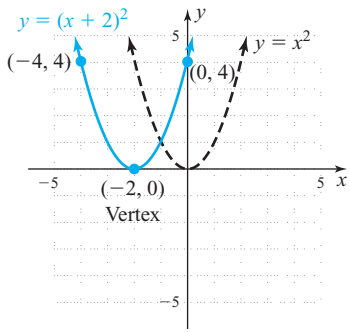


Figure 2.28

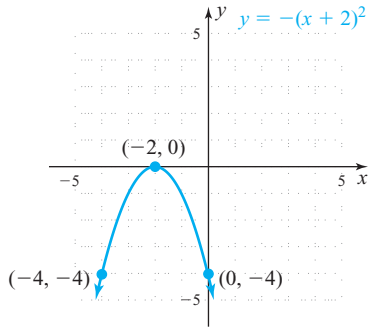

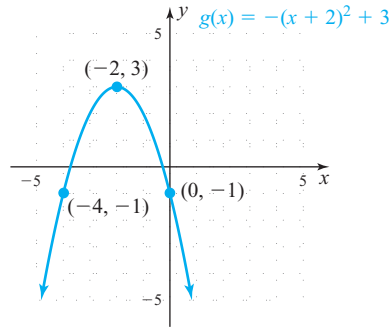

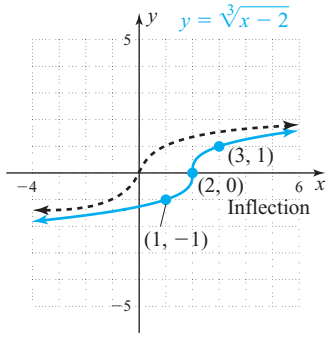

Figure 2.29

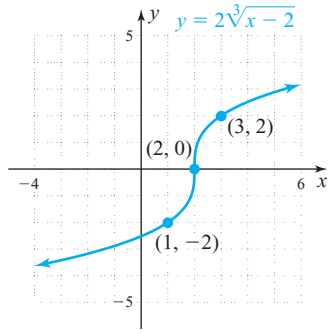
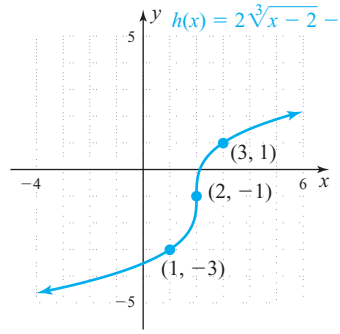


b. The graph of h is a cube root function, shifted right 2, stretched by a factor of 2, then shifted down 1. This sequence is shown in Figures 2.30 through 2.32 and illustrate how the inflection point has shifted from $(0, 0)$ to $(2, -1)$.

Figure 2.30



Shifted right 2

Figure 2.31

Stretched by a factor of 2

Figure 2.32

Shifted down 1

Now try Exercises 63 through 92 ▶

It's important to note that the transformations can actually be applied to *any function,* even those that are new and unfamiliar. Consider the following pattern:

Parent Function	Transformation of Parent Function
quadratic: $y = x^2$	$y = -2(x - 3)^2 + 1$
absolute value: $y = \|x\|$	$y = -2\|x - 3\| + 1$
cube root: $y = \sqrt[3]{x}$	$y = -2\sqrt[3]{x - 3} + 1$
general: $y = f(x)$	$y = -2f(x - 3) + 1$

In each case, the transformation involves a horizontal shift 3 units right, a vertical reflection, a vertical stretch, and a vertical shift up 1. Since the shifts are the same regardless of the initial function, we can generalize the results to any function $f(x)$.

General Function	Transformed Function
$y = f(x)$	$y = af(x \pm h) \pm k$

vertical reflections, vertical stretches and compressions

horizontal shift h units, opposite direction of sign

vertical shift k units, same direction as sign

WORTHY OF NOTE

Since the shape of the initial graph does not change when translations or reflections are applied, these are called **rigid transformations.** Stretches and compressions of a basic graph are called **nonrigid transformations,** as the graph is distended in some way.

Also bear in mind that the graph will be reflected across the y-axis (horizontally) if x is replaced with $-x$. This process is illustrated in Example 9 for selected transformations. Remember—if the graph of a function is shifted, the *individual points* on the graph are likewise shifted.

EXAMPLE 9 ▶ **Graphing Transformations of a General Function**

Given the graph of $f(x)$ shown in Figure 2.33, graph $g(x) = -f(x + 1) - 2$.

Solution ▶ For g, the graph of f is (1) shifted horizontally 1 unit left (Figure 2.34), (2) reflected across the x-axis (Figure 2.35), and (3) shifted vertically 2 units down (Figure 2.36). The final result is that in Figure 2.36.

Figure 2.33

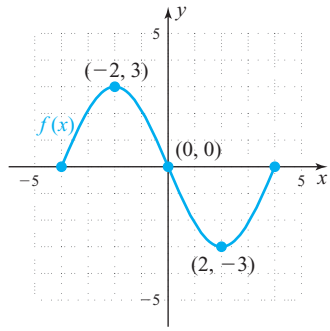


Figure 2.34

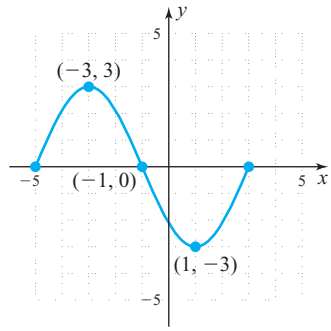

Figure 2.35

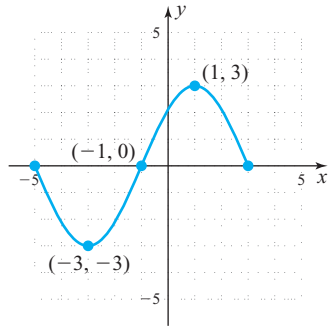

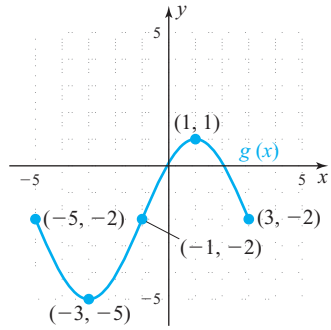

Figure 2.36

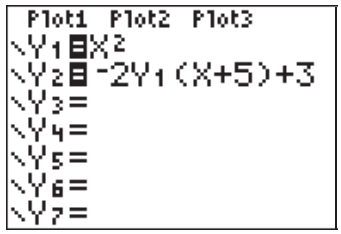
Now try Exercises 93 through 96 ▶

As noted in Example 9, these shifts and transformation are often combined—particularly when the toolbox functions are used as real-world models (Section 2.6). On a graphing calculator we again define Y_1 as needed, then define Y_2 as any desired combination of shifts, stretches, and/or reflections. For $Y_1 = X^2$, we'll define Y_2 as $-2\,Y_1(X + 5) + 3$ (Figure 2.37), and expect that the graph of Y_2 will be that of Y_1 shifted left 5 units, reflected across the x-axis, stretched vertically, and shifted up three units. This shows the new vertex should be at $(-5, 3)$, which is confirmed in Figure 2.38 along with the other transformations.

Figure 2.37



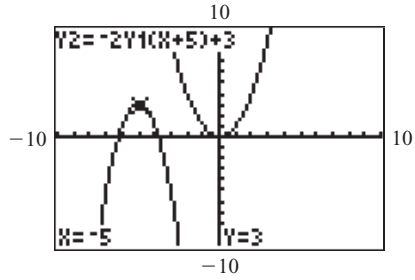


Figure 2.38

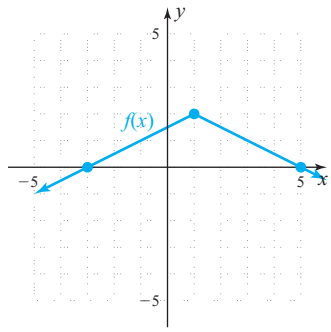


Try this exploration again using $Y_1 = \text{abs}(X)$.

Using the general equation $y = af(x \pm h) \pm k$, we can identify the vertex, initial point, or inflection point of any toolbox function and sketch its graph. Given the *graph* of a toolbox function, we can likewise identify these points and reconstruct its equation. We first identify the function family and the location (h, k) of any characteristic point. By selecting one other point (x, y) on the graph, we then use the general equation as a formula (substituting h, k, and the x- and y-values of the second point) to solve for a and complete the equation.

EXAMPLE 10 ▶ **Writing the Equation of a Function Given Its Graph**

Find the equation of the function $f(x)$ shown in the figure.

Solution ▶ The function f belongs to the absolute value family. The vertex (h, k) is at $(1, 2)$. For an additional point, choose the x-intercept $(-3, 0)$ and work as follows:

$y = a\|x - h\| + k$	general equation (function is shifted right and up)
$0 = a\|(-3) - 1\| + 2$	substitute 1 for h and 2 for k, substitute -3 for x and 0 for y
$0 = 4a + 2$	simplify
$-2 = 4a$	subtract 2
$-\frac{1}{2} = a$	solve for a

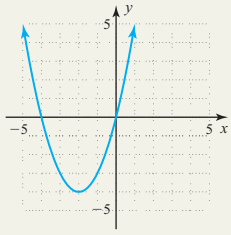
The equation for f is $y = -\frac{1}{2}|x - 1| + 2$.

☑ **E.** You've just seen how we can apply transformations on a general function $f(x)$

Now try Exercises 97 through 102 ▶

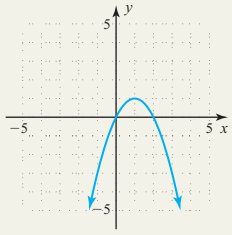
2.2 EXERCISES

▶ CONCEPTS AND VOCABULARY



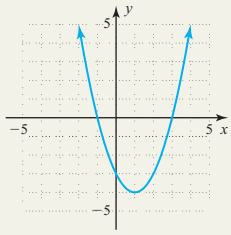
Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. After a vertical _____, points on the graph are farther from the x-axis. After a vertical _____, points on the graph are closer to the x-axis.
2. Transformations that change only the location of a graph and not its shape or form, include _____ and _____.
3. The vertex of $h(x) = 3(x + 5)^2 - 9$ is at _____ and the graph opens _____.
4. The inflection point of $f(x) = -2(x - 4)^3 + 11$ is at _____ and the end-behavior is _____, _____.
5. Given the graph of a general function $f(x)$, discuss/explain how the graph of $F(x) = -2f(x + 1) - 3$ can be obtained. If $(0, 5)$, $(6, 7)$, and $(-9, -4)$ are on the graph of f, where do they end up on the graph of F?
6. Discuss/Explain why the shift of $f(x) = x^2 + 3$ is a *vertical shift* of 3 units in the *positive* direction, while the shift of $g(x) = (x + 3)^2$ is a *horizontal shift* 3 units in the *negative* direction. Include several examples along with a table of values for each.

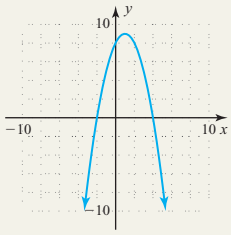


▶ DEVELOPING YOUR SKILLS

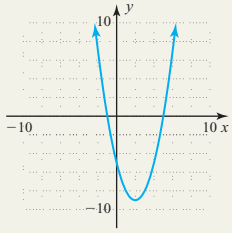
By carefully inspecting each graph given, (a) identify the function family; (b) describe or identify the end-behavior, vertex, intervals where the function is increasing or decreasing, maximum or minimum value(s) and *x*- and *y*-intercepts; and (c) determine the domain and range. Assume required features have integer values.



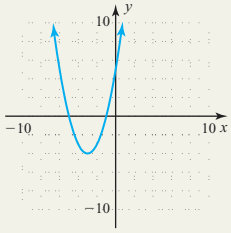
7. $f(x) = x^2 + 4x$



8. $g(x) = -x^2 + 2x$

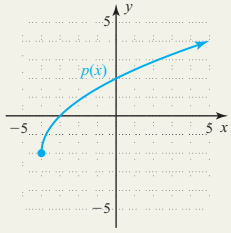


9. $p(x) = x^2 - 2x - 3$

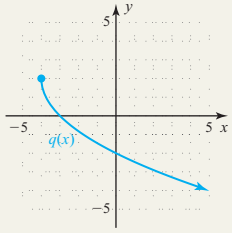


10. $q(x) = -x^2 + 2x + 8$

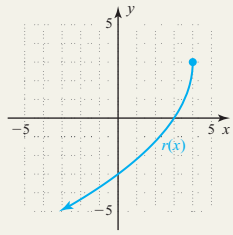
11. $f(x) = x^2 - 4x - 5$



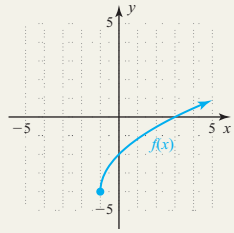
12. $g(x) = x^2 + 6x + 5$



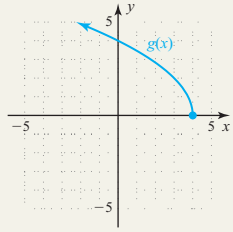
For each graph given, (a) identify the function family; (b) describe or identify the end-behavior, initial point, intervals where the function is increasing or decreasing, and *x*- and *y*-intercepts; and (c) determine the domain and range. Assume required features have integer values.



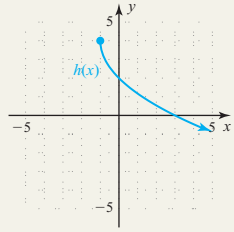
13. $p(x) = 2\sqrt{x + 4} - 2$



14. $q(x) = -2\sqrt{x + 4} + 2$

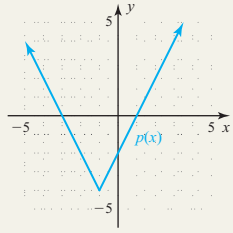


15. $r(x) = -3\sqrt{4 - x} + 3$

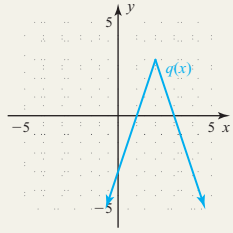


16. $f(x) = 2\sqrt{x + 1} - 4$

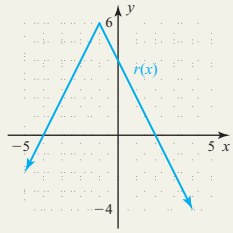
17. $g(x) = 2\sqrt{4 - x}$



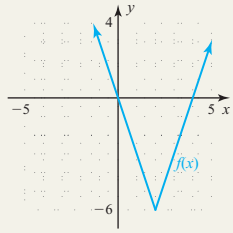
18. $h(x) = -2\sqrt{x + 1} + 4$



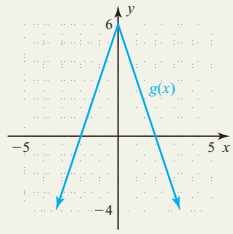
For each graph given, (a) identify the function family; (b) describe or identify the end-behavior, vertex, intervals where the function is increasing or decreasing, maximum or minimum value(s) and *x*- and *y*-intercepts; and (c) determine the domain and range. Assume required features have integer values.



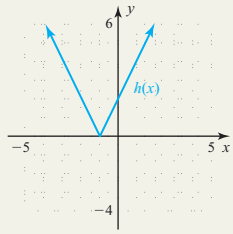
19. $p(x) = 2|x + 1| - 4$



20. $q(x) = -3|x - 2| + 3$

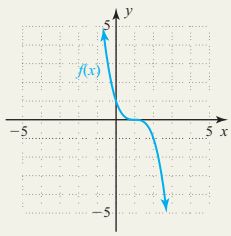


21. $r(x) = -2|x + 1| + 6$

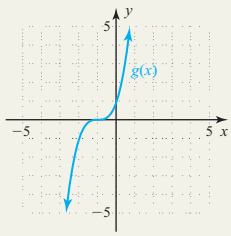


22. $f(x) = 3|x - 2| - 6$

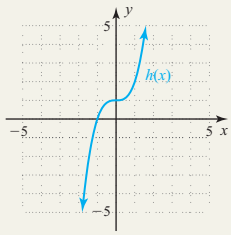
23. $g(x) = -3|x| + 6$



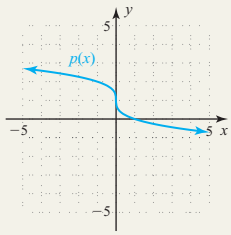
24. $h(x) = 2|x + 1|$



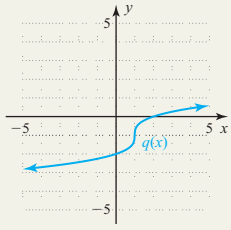
For each graph given, (a) identify the function family; (b) describe or identify the end-behavior, inflection point, and *x*- and *y*-intercepts; and (c) determine the domain and range. Assume required features have integer values. Be sure to note the scaling of each axis.



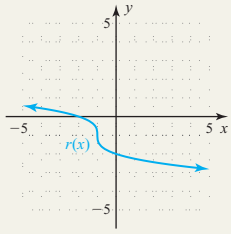
25. $f(x) = -(x - 1)^3$



26. $g(x) = (x + 1)^3$

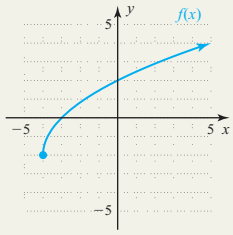


27. $h(x) = x^3 + 1$

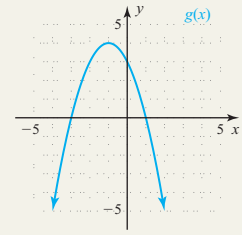


28. $p(x) = -\sqrt[3]{x} + 1$

29. $q(x) = \sqrt[3]{x - 1} - 1$



30. $r(x) = -\sqrt[3]{x + 1} - 1$



For Exercises 31–34, identify and state the characteristic features of each graph, including (as applicable) the function family, end-behavior, vertex, axis of symmetry, point of inflection, initial point, maximum and minimum value(s), *x*- and *y*-intercepts, and the domain and range.

▶ WORKING WITH FORMULAS

103. Volume of a sphere: $V(r) = \frac{4}{3}\pi r^3$

The volume of a sphere is given by the function shown, where $V(r)$ is the volume in cubic units and r is the radius. Note this function belongs to the *cubic family* of functions. (a) Approximate the value of $\frac{4}{3}\pi$ to one decimal place, then graph the function on the interval $[0, 3]$. (b) From your *graph,* estimate the volume of a sphere with radius 2.5 in., then compute the actual volume. Are the results close? (c) For $V = \frac{4}{3}\pi r^3$, solve for r in terms of V.

104. Fluid motion: $V(h) = -4\sqrt{h} + 20$

Suppose the velocity of a fluid flowing from an open tank (no top) through an opening in its side is given by the function shown, where $V(h)$ is the velocity of the fluid (in feet per second) at water height h (in feet). Note this function belongs to the *square root family* of functions. An open tank is 25 ft deep and filled to the brim with fluid. (a) Use a table of values to graph the function on the interval $[0, 25]$. (b) From your graph, estimate the velocity of the fluid when the water level is 7 ft, then find the actual velocity. Are the answers close? (c) If the fluid velocity is 5 ft/sec, how high is the water in the tank?

▶ APPLICATIONS

105. Gravity, distance, time: After being released, the time it takes an object to fall x ft is given by the function $T(x) = \frac{1}{4}\sqrt{x}$, where $T(x)$ is in seconds. (a) Describe the transformation applied to obtain the graph of T from the graph of $y = \sqrt{x}$, then sketch the graph of T for $x \in [0, 100]$. (b) How long would it take an object to hit the ground if it were dropped from a height of 81 ft?

106. Stopping distance: In certain weather conditions, accident investigators will use the function $v(x) = 4.9\sqrt{x}$ to estimate the speed of a car (in miles per hour) that has been involved in an accident, based on the length of the skid marks x (in feet). (a) Describe the transformation applied to obtain the graph of v from the graph of $y = \sqrt{x}$, then sketch the graph of v for $x \in [0, 400]$. (b) If the skid marks were 225 ft long, how fast was the car traveling? Is this point on your graph?

107. Wind power: The power P generated by a certain wind turbine is given by the function $P(v) = \frac{8}{125}v^3$ where $P(v)$ is the power in watts at wind velocity v (in miles per hour). (a) Describe the transformation applied to obtain the graph of P from the graph of $y = v^3$, then sketch the graph of P for $v \in [0, 25]$ (scale the axes appropriately). (b) How much power is being generated when the wind is blowing at 15 mph?

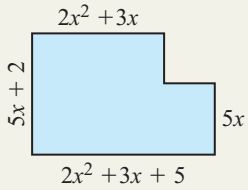
108. Wind power: If the power P (in watts) being generated by a wind turbine is known, the velocity of the wind can be determined using the function $v(P) = \frac{5}{2}\sqrt[3]{P}$. (a) Describe the transformation applied to obtain the graph of v from the graph of $y = \sqrt[3]{P}$, then sketch the graph of v for $P \in [0, 512]$ (scale the axes appropriately). (b) How fast is the wind blowing if 343W of power is being generated? Is this point on your graph?

109. Distance rolled due to gravity: The *distance* a ball rolls down an inclined plane is given by the function $d(t) = 2t^2$, where $d(t)$ represents the distance in feet after t sec. (a) Describe the transformation applied to obtain the graph of d from the graph of $y = t^2$, then sketch the graph of d for $t \in [0, 3]$. (b) How far has the ball rolled after 2.5 sec?

110. Acceleration due to gravity: The *velocity* of a steel ball bearing as it rolls down an inclined plane is given by the function $v(t) = 4t$, where $v(t)$ represents the velocity in feet per second after t sec. (a) Describe the transformation applied to obtain the graph of v from the graph of $y = t$, then sketch the graph of v for $t \in [0, 3]$. (b) What is the velocity of the ball bearing after 2.5 sec? Is this point on your graph?

▶ EXTENDING THE CONCEPT

111. Carefully graph the functions $f(x) = |x|$ and $g(x) = 2\sqrt{x}$ on the same coordinate grid. From the graph, in what interval is the graph of $g(x)$ *above* the graph of $f(x)$? Pick a number (call it h) from this interval and substitute it in both functions. Is $g(h) > f(h)$? In what interval is the graph of $g(x)$ below the graph of $f(x)$? Pick a number from this interval (call it k) and substitute it in both functions. Is $g(k) < f(k)$?



112. Sketch the graph of $f(x) = -2|x - 3| + 8$ using transformations of the parent function, then determine the area of the region in quadrant I that is beneath the graph and bounded by the vertical lines $x = 0$ and $x = 6$.

113. Sketch the graph of $f(x) = x^2 - 4$, then sketch the graph of $F(x) = |x^2 - 4|$ using your intuition and the meaning of absolute value (not a table of values). What happens to the graph?

▶ MAINTAINING YOUR SKILLS

114. **(1.1)** Find the distance between the points $(-13, 9)$ and $(7, -12)$, and the slope of the line containing these points.

115. **(Appendix A.2)** Find the perimeter of the figure shown.

116. **(1.5)** Solve for x: $\frac{2}{3}x + \frac{1}{4} = \frac{1}{2}x - \frac{7}{12}$.

117. **(2.1)** Without graphing, state intervals where $f(x)\uparrow$ and $f(x)\downarrow$ for $f(x) = (x - 4)^2 + 3$.

2.3 Absolute Value Functions, Equations, and Inequalities

LEARNING OBJECTIVES

In Section 2.3 you will see how we can:

- ❑ **A.** Solve absolute value equations
- ❑ **B.** Solve "less than" absolute value inequalities
- ❑ **C.** Solve "greater than" absolute value inequalities
- ❑ **D.** Solve absolute value equations and inequalities graphically
- ❑ **E.** Solve applications involving absolute value

While the equations $x + 1 = 5$ and $|x + 1| = 5$ are similar in many respects, note the first has only the solution $x = 4$, while either $x = 4$ or $x = -6$ will satisfy the second. The fact there are two solutions shouldn't surprise us, as it's a natural result of how absolute value is defined.

A. Solving Absolute Value Equations

The absolute value of a number x can be thought of as its distance from zero on the number line, regardless of direction. This means $|x| = 4$ will have *two solutions,* since there are two numbers that are four units from zero: $x = -4$ and $x = 4$ (see Figure 2.39).

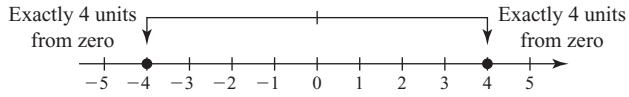


Figure 2.39

This basic idea can be extended to include situations where the quantity within absolute value bars *is an algebraic expression,* and suggests the following property.

Property of Absolute Value Equations

If X represents an algebraic expression and k is a positive real number,

$$\text{then } |X| = k$$
$$\text{implies } X = -k \text{ or } X = k$$

As the statement of this property suggests, it can only be applied *after* the absolute value expression has been isolated on one side.

WORTHY OF NOTE

Note if $k < 0$, the equation $|X| = k$ has no solutions since the absolute value of any quantity is always positive or zero. On a related note, we can verify that if $k = 0$, the equation $|X| = 0$ has only the solution $X = 0$.

EXAMPLE 1 ▶ Solving an Absolute Value Equation

Solve: $-5|x - 7| + 2 = -13$.

Solution ▶ Begin by isolating the absolute value expression.

$$\begin{aligned} -5|x - 7| + 2 &= -13 && \text{original equation} \\ -5|x - 7| &= -15 && \text{subtract 2} \\ |x - 7| &= 3 && \text{divide by } -5 \text{ (simplified form)} \end{aligned}$$

Now consider $x - 7$ as the variable expression "X" in the property of absolute value equations, giving

$$\begin{aligned} x - 7 = -3 \quad &\text{or} \quad x - 7 = 3 && \text{apply the property of absolute value equations} \\ x = 4 \quad &\text{or} \quad x = 10 && \text{add 7} \end{aligned}$$

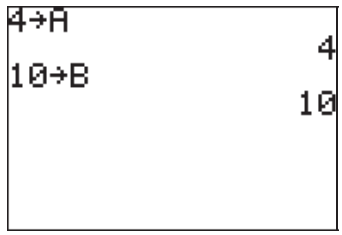
Substituting into the original equation verifies the solution set is $\{4, 10\}$.

Now try Exercises 7 through 18 ▶

CAUTION ▶ For equations like those in Example 1, be careful not to treat the absolute value bars as simple grouping symbols. The equation $-5(x - 7) + 2 = -13$ has only the solution $x = 10$, and "misses" the second solution since it yields $x - 7 = 3$ in simplified form. The equation $-5|x - 7| + 2 = -13$ simplifies to $|x - 7| = 3$ and there are actually *two* solutions. Also note that $-5|x - 7| \neq |-5x + 35|$!

If an equation has more than one solution as in Example 1, they cannot be simultaneously stored using the, X,T,θ,n key to perform a calculator check (in function or "**Func**" mode, this is the variable X). While there are other ways to "get around" this (using Y_1 on the home screen, using a **TABLE** in **ASK** mode, enclosing the solutions in braces as in {4, 10}, etc.), we can also store solutions using the ALPHA keys. To illustrate, we'll place the solution $x = 4$ in storage location A, using 4 STO▸ ALPHA MATH (**A**). Using this "STO▸ ALPHA" sequence we'll next place the solution $x = 10$ in storage location B (Figure 2.40). We can then check both solutions in turn. Note that after we check the first solution, we can recall the expression using 2nd ENTER and simply change the A to B (Figure 2.41).

Figure 2.40



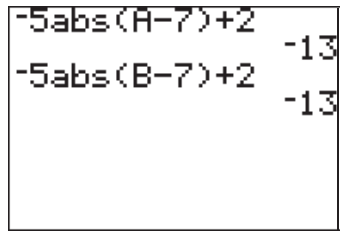


Figure 2.41

Absolute value equations come in many different forms. Always begin by isolating the absolute value expression, then apply the property of absolute value equations to solve.

EXAMPLE 2 ▶ **Solving an Absolute Value Equation**

Solve: $\left|5 - \frac{2}{3}x\right| - 9 = 8.$

Solution ▶

$$\left|5 - \frac{2}{3}x\right| - 9 = 8 \qquad \text{original equation}$$

$$\left|5 - \frac{2}{3}x\right| = 17 \qquad \text{add 9}$$

$$5 - \frac{2}{3}x = -17 \quad \text{or} \quad 5 - \frac{2}{3}x = 17 \qquad \text{apply the property of absolute value equations}$$

$$-\frac{2}{3}x = -22 \quad \text{or} \quad -\frac{2}{3}x = 12 \qquad \text{subtract 5}$$

$$x = 33 \quad \text{or} \quad x = -18 \qquad \text{multiply by } -\tfrac{3}{2}$$

Check ▶

For $x = 33$: $\left|5 - \frac{2}{3}(33)\right| - 9 = 8$

$|5 - 2(11)| - 9 = 8$

$|5 - 22| - 9 = 8$

$|-17| - 9 = 8$

$17 - 9 = 8$

$8 = 8$ ✓

For $x = -18$: $\left|5 - \frac{2}{3}(-18)\right| - 9 = 8$

$|5 - 2(-6)| - 9 = 8$

$|5 + 12| - 9 = 8$

$|17| - 9 = 8$

$17 - 9 = 8$

$8 = 8$ ✓

Both solutions check. The solution set is $\{-18, 33\}$.

WORTHY OF NOTE

As illustrated in both Examples 1 and 2, the property we use to solve absolute value equations can only be applied *after* the absolute value term has been isolated. As you will see, the same is true for the properties used to solve absolute value inequalities.

Now try Exercises 19 through 22 ▶

For some equations, it's helpful to apply the **multiplicative property of absolute value:**

Multiplicative Property of Absolute Value

If A and B represent algebraic expressions,

$$\text{then } |AB| = |A||B|.$$

Note that if $A = -1$ the property says $|-1 \cdot B| = |-1|\,|B| = |B|$. More generally the property is applied where A is any constant.

EXAMPLE 3 ▶ **Solving Equations Using the Multiplicative Property of Absolute Value**

Solve: $|-2x| + 5 = 13$.

Solution ▶

$\|-2x\| + 5 = 13$		original equation
$\|-2x\| = 8$		subtract 5
$\|-2\|\|x\| = 8$		apply multiplicative property of absolute value
$2\|x\| = 8$		simplify
$\|x\| = 4$		divide by 2
$x = -4$	or $x = 4$	apply property of absolute value equations

Both solutions check. The solution set is $\{-4, 4\}$.

Now try Exercises 23 and 24 ▶

In some instances, we have one absolute value quantity equal to another, as in $|A| = |B|$. From this equation, four possible solutions are immediately apparent:

$$(1)\ A = B \qquad (2)\ A = -B \qquad (3)\ -A = B \qquad (4)\ -A = -B$$

However, basic properties of equality show that equations (1) and (4) are equivalent, as are equations (2) and (3), meaning all solutions can be found using only equations (1) and (2).

EXAMPLE 4 ▶ **Solving Absolute Value Equations with Two Absolute Value Expressions**

Solve the equation $|2x + 7| = |x - 1|$.

Solution ▶ This equation has the form $|A| = |B|$, where $A = 2x + 7$ and $B = x - 1$. From our previous discussion, all solutions can be found using $A = B$ and $A = -B$.

$A = B$	solution template	$A = -B$	solution template
$2x + 7 = x - 1$	substitute	$2x + 7 = -(x - 1)$	substitute
$2x = x - 8$	subtract 7	$2x + 7 = -x + 1$	distribute
$x = -8$	subtract x	$3x = -6$	add x, subtract 7
		$x = -2$	divide by 3

The solutions are $x = -8$ and $x = -2$. Verify the solutions by substituting them into the original equation.

Now try Exercises 25 and 26 ▶

☑ **A.** You've just seen how we can solve absolute value equations

B. Solving "Less Than" Absolute Value Inequalities

Absolute value *inequalities* can be solved using the basic concept underlying the property of absolute value equalities. Whereas the equation $|x| = 4$ asks for all numbers x whose distance from zero is *equal* to 4, the inequality $|x| < 4$ asks for all numbers x whose distance from zero is *less than* 4.

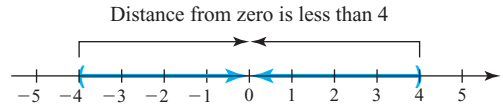

Figure 2.42

As Figure 2.42 illustrates, the solutions are $x > -4$ and $x < 4$, which can be written as the joint inequality $-4 < x < 4$. This idea can likewise be extended to include the absolute value of an algebraic expression X as follows.

Property I: Absolute Value Inequalities (Less Than)

If X represents an algebraic expression and k is a positive real number,

$$\text{then } |X| < k$$
$$\text{implies } -k < X < k$$

Property I can also be applied when the "≤" symbol is used. Also notice that if $k < 0$, the solution is the empty set since the absolute value of any quantity is always positive or zero.

EXAMPLE 5 ▶ **Solving "Less Than" Absolute Value Inequalities**

Solve the inequalities:

a. $\dfrac{|3x + 2|}{4} \le 1$ **b.** $|2x - 7| < -5$

Solution ▶

a.
$$\frac{|3x + 2|}{4} \le 1 \quad \text{original inequality}$$
$$|3x + 2| \le 4 \quad \text{multiply by 4}$$
$$-4 \le 3x + 2 \le 4 \quad \text{apply Property I}$$
$$-6 \le 3x \le 2 \quad \text{subtract 2 from all three parts}$$
$$-2 \le x \le \frac{2}{3} \quad \text{divide all three parts by 3}$$

The solution interval is $[-2, \frac{2}{3}]$.

b. $|2x - 7| < -5$ original inequality

Since the absolute value of any quantity is always positive or zero, the solution for this inequality is the empty set: $\{\ \}$.

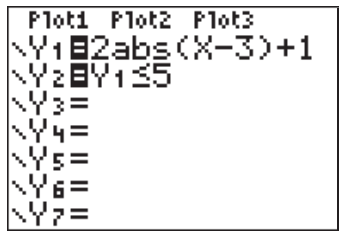
Now try Exercises 27 through 38 ▶

As with the inequalities from Section 1.5, solutions to absolute value inequalities can be checked using a test value. For Example 5(a), substituting $x = 0$ from the solution interval yields:

$$\frac{1}{2} \le 1 \checkmark$$

In addition to checking absolute value inequalities using a test value, the **TABLE** feature of a graphing calculator can be used, alone or in conjunction with a **relational test.** Relational tests have the calculator return a "1" if a given statement is true, and a "0" otherwise. To illustrate, consider the inequality $2|x - 3| + 1 \le 5$. Enter the expression on the left as Y_1, recalling the **"abs("** notation is accessed in the MATH menu: MATH ▸ **(NUM) "1:abs("** ENTER (note this option gives only the left parenthesis, you must supply the right). We can then simply inspect the Y_1 column of the **TABLE** to find outputs that are less than or equal to 5. To use a relational test, we enter $Y_1 \le 5$ as Y_2 (Figure 2.43), with the "less than or equal to" symbol accessed using 2nd MATH **6:≤**. Now the calculator will automatically check the truth of the statement for any value of x (but note we are only checking integer values), and display the result in the Y_2 column of the **TABLE** (Figure 2.44). After scrolling through the table, both approaches show that $2|x - 3| + 1 \le 5$ for $x \in [1, 5]$.

Figure 2.43



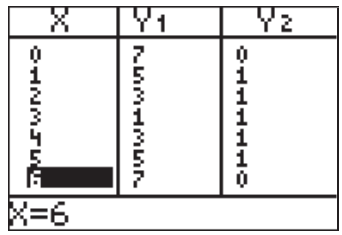


Figure 2.44

☑ **B.** You've just seen how we can solve "less than" absolute value inequalities

C. Solving "Greater Than" Absolute Value Inequalities

For "greater than" inequalities, consider $|x| > 4$. Now we're asked to find all numbers x whose distance from zero is *greater than* 4. As Figure 2.45 shows, solutions are found in the interval to the left of -4, or to the right of 4. The fact the intervals are disjoint (disconnected) is reflected in this graph, in the inequalities $x < -4$ **or** $x > 4$, as well as the interval notation $x \in (-\infty, -4) \cup (4, \infty)$.

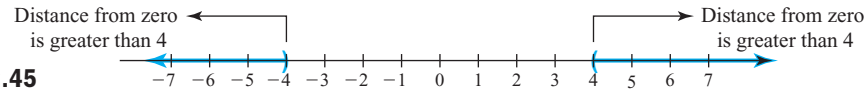

Figure 2.45

As before, we can extend this idea to include algebraic expressions, as follows:

Property II: Absolute Value Inequalities (Greater Than)

If X represents an algebraic expression and k is a positive real number,

$$\text{then } |X| > k$$

$$\text{implies } X < -k \quad \text{or} \quad X > k$$

EXAMPLE 6 ▸ Solving "Greater Than" Absolute Value Inequalities

Solve the inequalities:

a. $-\frac{1}{3}\left|3 + \frac{x}{2}\right| < -2$ **b.** $|5x + 2| \ge -\frac{3}{2}$

Solution ▶

a. Note the exercise is given as a *less than* inequality, but as we multiply both sides by -3, we must *reverse the inequality symbol*.

$$-\frac{1}{3}\left|3+\frac{x}{2}\right| < -2 \qquad \text{original inequality}$$

$$\left|3+\frac{x}{2}\right| > 6 \qquad \text{multiply by } -3, \textit{ reverse the symbol}$$

$$3+\frac{x}{2} < -6 \quad \text{or} \quad 3+\frac{x}{2} > 6 \qquad \text{apply Property II}$$

$$\frac{x}{2} < -9 \quad \text{or} \quad \frac{x}{2} > 3 \qquad \text{subtract 3}$$

$$x < -18 \quad \text{or} \quad x > 6 \qquad \text{multiply by 2}$$

Property II yields the disjoint intervals $x \in (-\infty, -18) \cup (6, \infty)$ as the solution.

b. $|5x + 2| \geq -\frac{3}{2}$ original inequality

Since the absolute value of any quantity is always positive or zero, the solution for this inequality is all real numbers: $x \in \mathbb{R}$.

Now try Exercises 39 through 54 ▶

A calculator check is shown for part (a) in Figures 2.46 through 2.48.

Figure 2.46

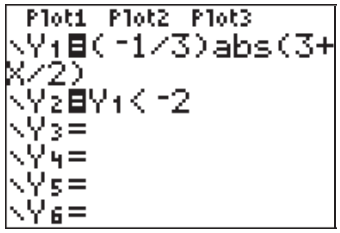

Figure 2.47

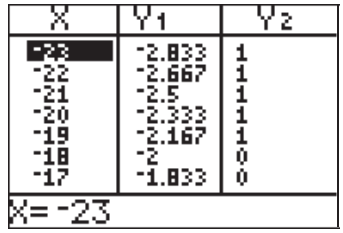

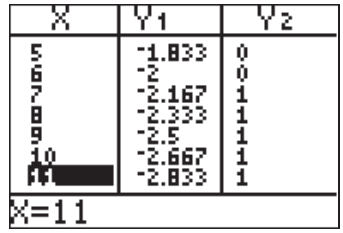

Figure 2.48

This helps to verify the solution interval is $x \in (-\infty, -18) \cup (6, \infty)$.

Due to the nature of absolute value functions, there are times when an absolute value relation cannot be satisfied. For instance the equation $|x - 4| = -2$ has no solutions, as the left-hand expression will always represent a nonnegative value. The inequality $|2x + 3| < -1$ has no solutions for the same reason. On the other hand, the inequality $|9 - x| \geq 0$ is true for all real numbers, since any value substituted for x will result in a nonnegative value. We can generalize many of these special cases as follows.

☑ **C.** You've just seen how we can solve "greater than" absolute value inequalities

Absolute Value Functions—Special Cases

Given k is a positive real number and A represents an algebraic expression,

$\lvert A\rvert = -k$	$\lvert A\rvert < -k$	$\lvert A\rvert > -k$
has no solutions	has no solutions	is true for all real numbers

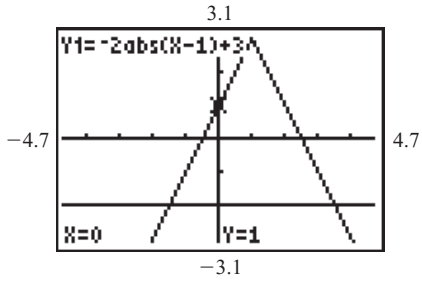
See **Exercises 51 through 54.**

CAUTION ▶ Be sure you note the difference between the individual solutions of an absolute value equation, and the solution intervals that often result from solving absolute value inequalities. The solution $\{-2, 5\}$ indicates that both $x = -2$ and $x = 5$ are solutions, while the solution $[-2, 5)$ indicates that all numbers between -2 and 5, including -2, are solutions.

D. Solving Absolute Value Equations and Inequalities Graphically

The concepts studied in Section 1.5 (solving linear equations and inequalities graphically) are easily extended to other kinds of relations. Essentially, we treat each expression forming the equation or inequality as a *separate function,* then graph both functions to find points of intersection (equations) or where one graph is above or

Figure 2.49



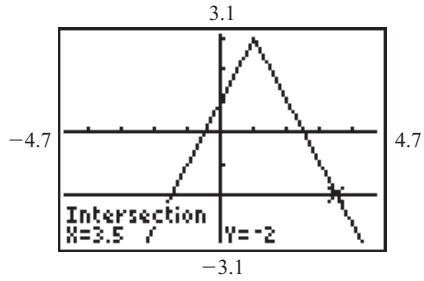


Figure 2.50

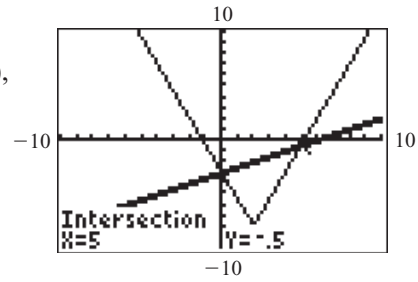
below the other (inequalities). For $-2|x-1|+3<-2$, enter the expression $-2|X-1|+3$ as Y_1 on the Y= screen, and -2 as Y_2. Using ZOOM **4:ZDecimal** produces the graph shown in Figure 2.49. Using 2nd TRACE **(CALC) 5:intersect,** we find the graphs intersect at $x=-1.5$ and $x=3.5$ (Figure 2.50), and the graph of Y_1 is above the graph of Y_2 in this interval. Since this is a "less than" inequality, the solutions are *outside* of this interval, which gives $x\in(-\infty,-1.5)\cup(3.5,\infty)$ as the solution interval. Note that the zeroes/x-intercept method could also have been used.



EXAMPLE 7 ▶ **Solving Absolute Equations and Inequalities Graphically**

For $f(x)=2.5|x-2|-8$ and $g(x)=\frac{1}{2}x-3$, solve

a. $f(x)=g(x)$ **b.** $f(x)\le g(x)$ **c.** $f(x)>g(x)$

Solution ▶

a. With $f(x)=2.5|x-2|-8$ as Y_1 and $g(x)=\frac{1}{2}x-3$ as Y_2 (set to graph in **bold**), using 2nd TRACE **(CALC) 5:intersect** shows the graphs intersect ($Y_1=Y_2$) at $x=0$ and $x=5$ (see figure). These are the solutions to $2.5|x-2|-8=\frac{1}{2}x-3$.

b. The graph of Y_1 is *below* the graph of Y_2 ($Y_1<Y_2$) between these points of intersection, so the solution interval for $2.5|x-2|-8\le\frac{1}{2}x-3$ is $x\in[0,5]$.

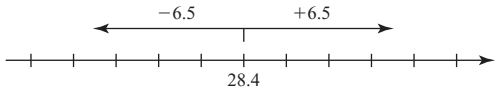
c. The graph of Y_1 is *above* the graph of Y_2 ($Y_1>Y_2$) outside this interval, giving a solution of $x\in(-\infty,0)\cup(5,\infty)$ for $2.5|x-2|-8>\frac{1}{2}x-3$.

Now try Exercises 55 through 58 ▶

D. You've just seen how we can solve absolute value equations and inequalities graphically

E. Applications Involving Absolute Value

Applications of absolute value often involve finding a range of values for which a given statement is true. Many times, the equation or inequality used must be modeled after a given description or from given information, as in Example 8.



EXAMPLE 8 ▶ **Solving Applications Involving Absolute Value Inequalities**

For new cars, the number of miles per gallon (mpg) a car will get is heavily dependent on whether it is used mainly for short trips and city driving, or primarily on the highway for longer trips. For a certain car, the number of miles per gallon that a driver can expect varies by no more than 6.5 mpg above or below its field tested average of 28.4 mpg. What range of mileage values can a driver expect for this car?

Solution ▶

Field tested average: 28.4 mpg — gather information

mileage varies by no more than 6.5 mpg — highlight key phrases

make the problem visual

Let m represent the miles per gallon a driver can expect. Then the difference between m and 28.4 can be no more than 6.5, or $|m - 28.4| \le 6.5$. — assign a variable; write an equation model

$$|m - 28.4| \le 6.5 \quad \text{equation model}$$

$$-6.5 \le m - 28.4 \le 6.5 \quad \text{apply Property I}$$

$$21.9 \le m \le 34.9 \quad \text{add 28.4 to all three parts}$$

The mileage that a driver can expect ranges from a low of 21.9 mpg to a high of 34.9 mpg.

E. You've just seen how we can solve applications involving absolute value

Now try Exercises 61 through 70 ▶

2.3 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in the blank with the appropriate word or phrase. Carefully reread the section if needed.

1. When multiplying or dividing by a negative quantity, we _____ the inequality symbol to maintain a true statement.
2. To write an absolute value equation or inequality in simplified form, we _____ the absolute value expression on one side.
3. The absolute value equation $|2x + 3| = 7$ is true when $2x + 3 =$ _____ or when $2x + 3 =$ _____.
4. The absolute value inequality $|3x - 6| < 12$ is true when $3x - 6 >$ _____ and $3x - 6 <$ _____.

Describe the solution set for each inequality (assume $k > 0$). Justify your answer.

5. $|ax + b| < -k$
6. $|ax + b| > -k$

▶ DEVELOPING YOUR SKILLS

Solve each absolute value equation. Write the solution in set notation. For Exercises 7 to 18, verify solutions by substituting into the original equation. For Exercises 19–26 verify solutions using a calculator.

7. $2|m - 1| - 7 = 3$

8. $3|n - 5| - 14 = -2$

9. $-3|x + 5| + 6 = -15$

10. $-2|y + 3| - 4 = -14$

11. $2|4v + 5| - 6.5 = 10.3$

12. $7|2w + 5| + 6.3 = 11.2$

13. $-|7p - 3| + 6 = -5$

14. $-|3q + 4| + 3 = -5$

15. $-2|b| - 3 = -4$

16. $-3|c| - 5 = -6$

17. $-2|3x| - 17 = -5$

18. $-5|2y| - 14 = 6$

19. $-3\left|\frac{w}{2} + 4\right| - 1 = -4$

20. $-2\left|3 - \frac{v}{3}\right| + 1 = -5$

21. $8.7|p - 7.5| - 26.6 = 8.2$

22. $5.3|q + 9.2| + 6.7 = 43.8$

23. $8.7|-2.5x| - 26.6 = 8.2$

24. $5.3|1.25n| + 6.7 = 43.8$

25. $|x - 2| = |3x + 4|$

26. $|2x - 1| = |x + 3|$

Solve each absolute value inequality. Write solutions in interval notation. Check solutions by back substitution, or using a calculator.

27. $3|p + 4| + 5 < 8$

28. $5|q - 2| - 7 \le 8$

29. $-3|m| - 2 > 4$

30. $-2|n| + 3 > 7$

31. $|3b - 11| + 6 \le 9$

32. $|2c + 3| - 5 < 1$

33. $|4 - 3z| + 12 < 7$

34. $|2 - 3u| + 5 \le 4$

35. $\frac{|5v + 1|}{4} + 8 < 9$

36. $\frac{|3w - 2|}{2} + 6 < 8$

37. $\left|\frac{4x + 5}{3} - \frac{1}{2}\right| \le \frac{7}{6}$

38. $\left|\frac{2y - 3}{4} - \frac{3}{8}\right| \le \frac{15}{16}$

39. $|n + 3| > 7$

40. $|m - 1| > 5$

41. $-2|w| - 5 \le -11$

42. $-5|v| - 3 \le -23$

43. $\frac{|q|}{2} - \frac{5}{6} \ge \frac{1}{3}$

44. $\frac{|p|}{5} + \frac{3}{2} \ge \frac{9}{4}$

45. $3|5 - 7d| + 9 \ge 15$

46. $5|2c + 7| + 1 \ge 11$

47. $2 < \left|-3m + \frac{4}{5}\right| - \frac{1}{5}$

48. $4 \le \left|\frac{5}{4} - 2n\right| - \frac{3}{4}$

49. $4|5 - 2h| - 9 > 11$

50. $3|7 + 2k| - 11 > 10$

51. $3.9|4q - 5| + 8.7 \le -22.5$

52. $0.9|2p + 7| + 16.11 \le 10.89$

53. $|4z - 9| + 6 \ge 4$

54. $|5u - 3| + 8 > 6$

Use the intersect command on a graphing calculator and the given functions to solve (a) $f(x) = g(x)$, (b) $f(x) \ge g(x)$, and (c) $f(x) < g(x)$.

55. $f(x) = |x - 3| + 2, g(x) = \frac{1}{2}x + 2$

56. $f(x) = -|x + 2| - 1, g(x) = -\frac{3}{2}x - 9$

57. $f(x) = 0.5|x + 3| + 1, g(x) = -2|x + 1| + 5$

58. $f(x) = 2|x - 3| + 2, g(x) = |x - 4| + 6$

▶ WORKING WITH FORMULAS

59. Spring Oscillation: $|d - x| \leq L$

A weight attached to a spring hangs at rest a distance of x in. off the ground. If the weight is pulled down (stretched) a distance of L inches and released, the weight begins to bounce and its distance d off the ground must satisfy the indicated formula. (a) If x equals 4 ft and the spring is stretched 3 in. and released, solve the inequality to find what distances from the ground the weight will oscillate between. (b) Solve for x in terms of L and d.

60. A "Fair" Coin: $\left|\frac{h - 50}{5}\right| < 1.645$

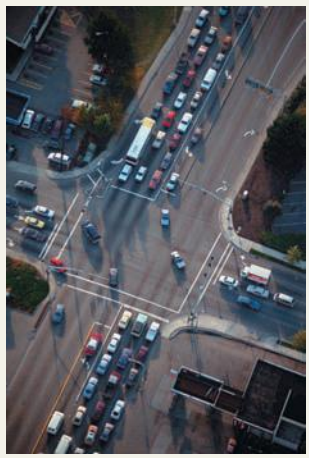
If we flipped a coin 100 times, we expect "heads" to come up about 50 times if the coin is "fair." In a study of probability, it can be shown that the number of heads h that appears in such an experiment should satisfy the given inequality to be considered "fair." (a) Solve this inequality for h. (b) If you flipped a coin 100 times and obtained 40 heads, is the coin "fair"?

▶ APPLICATIONS

Solve each application of absolute value.

61. Altitude of jet stream: To take advantage of the jet stream, an airplane must fly at a height h (in feet) that satisfies the inequality $|h - 35{,}050| \leq 2550$. Solve the inequality and determine if an altitude of 34,000 ft will place the plane in the jet stream.

62. Quality control tests: In order to satisfy quality control, the marble columns a company produces must earn a stress test score S that satisfies the inequality $|S - 17{,}750| \leq 275$. Solve the inequality and determine if a score of 17,500 is in the passing range.



63. Submarine depth: The sonar operator on a submarine detects an old World War II submarine net and must decide to detour over or under the net. The computer gives him a depth model $|d - 394| - 20 > 164$, where d is the depth in feet that represents safe passage. At what depth should the submarine travel to go under or over the net? Answer using simple inequalities.

64. Optimal fishing depth: When deep-sea fishing, the optimal depths d (in feet) for catching a certain type of fish satisfy the inequality $28|d - 350| - 1400 < 0$. Find the range of depths that offer the best fishing. Answer using simple inequalities.

For Exercises 65 through 68, (a) develop a model that uses an absolute value inequality, and (b) solve.

65. Stock value: My stock in MMM Corporation fluctuated a great deal in 2009, but never by more than \$3.35 from its current value. If the stock is worth \$37.58 today, what was its range in 2009?

66. Traffic studies: On a given day, the volume of traffic at a busy intersection averages 726 cars per hour (cph). During rush hour the volume is much higher, during "off hours" much lower. Find the range of this volume if it never varies by more than 235 cph from the average.

67. Physical training for recruits: For all recruits in the 3rd Armored Battalion, the average number of sit-ups is 125. For an individual recruit, the amount varies by no more than 23 sit-ups from the battalion average. Find the range of sit-ups for this battalion.

68. Computer consultant salaries: The national average salary for a computer consultant is \$53,336. For a large computer firm, the salaries offered to their employees vary by no more than \$11,994 from this national average. Find the range of salaries offered by this company.

69. Tolerances for sport balls: According to the official rules for golf, baseball, pool, and bowling, (a) golf balls must be within 0.03 mm of $d = 42.7$ mm, (b) baseballs must be within 1.01 mm of $d = 73.78$ mm, (c) billiard balls must be within 0.127 mm of $d = 57.150$ mm, and (d) bowling balls must be within 12.05 mm of $d = 2171.05$ mm. Write each statement using an absolute value inequality, then (e) determine which sport gives the least tolerance t $\left(t = \frac{\text{width of interval}}{\textit{average value}}\right)$ for the diameter of the ball.

70. Automated packaging: The machines that fill boxes of breakfast cereal are programmed to fill each box within a certain tolerance. If the box is overfilled, the company loses money. If it is underfilled, it is considered unsuitable for sale. Suppose that boxes marked "14 ounces" of cereal must be filled to within 0.1 oz. Find the acceptable range of weights for this cereal.

▶ EXTENDING THE CONCEPT

71. Determine the value or values (if any) that will make the equation or inequality true.

a. $|x| + x = 8$ **b.** $|x - 2| \le \frac{x}{2}$

c. $x - |x| = x + |x|$ **d.** $|x + 3| \ge 6x$

e. $|2x + 1| = x - 3$

72. The equation $|5 - 2x| = |3 + 2x|$ has only one solution. Find it and explain why there is only one.

73. In many cases, it can be helpful to view the solutions to absolute value equations and inequalities as follows. For any algebraic expression X and positive constant k, the equation $|X| = k$ has solutions $X = k$ and $-X = k$, since the absolute value of either quantity on the left will indeed yield the positive constant k. Likewise, $|X| < k$ has solutions $X < k$ and $-X < k$. Note the inequality symbol has not been reversed as yet, but will naturally be reversed as part of the solution process. Solve the following equations or inequalities using this idea.

a. $|x - 3| = 5$

b. $|x - 7| > 4$

c. $3|x + 2| \le 12$

d. $-3|x - 4| + 7 = -11$

▶ MAINTAINING YOUR SKILLS

74. **(Appendix A.4)** Factor the expression completely: $18x^3 + 21x^2 - 60x$.

75. **(1.5)** Solve $V^2 = \frac{2W}{C\rho A}$ for ρ (physics).

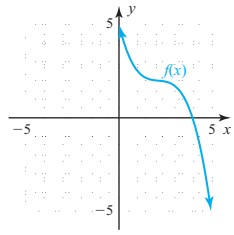
76. **(Appendix A.6)** Simplify $\frac{-1}{3 + \sqrt{3}}$ by rationalizing the denominator. State the result in exact form and approximate form (to hundredths).

77. **(Appendix A.3)** Solve the inequality, then write the solution set in interval notation:

$-3(2x - 5) > 2(x + 1) - 7$.

MID-CHAPTER CHECK

1. Determine whether the following function is even, odd, or neither. $f(x) = x^2 + \frac{|x|}{4x}$



2. Use a graphing calculator to find the maximum and minimum values of $f(x) = -1.9(x^4 - 2.3x^3 + 2.2x - 5.1)$. Round to the nearest hundredth.

3. Use interval notation to identify the interval(s) where the function from Exercise 2 is increasing, decreasing, or constant. Round to the nearest hundredth.

4. Write the equation of the function that has the same graph of $f(x) = \sqrt{x}$, shifted left 4 units and up 2 units.

5. For the graph given, (a) identify the function family, (b) describe or identify the end-behavior, inflection point, and x- and y-intercepts, (c) determine the domain and range, and (d) determine the value of k if $f(k) = 2.5$. Assume required features have integer values.

Exercise 5

6. Use a graphing calculator to graph the given functions in the same window and comment on what you observe.

$p(x) = (x - 3)^2$ $\quad q(x) = -(x - 3)^2$

$r(x) = -\frac{1}{2}(x - 3)^2$

7. Solve the following absolute value equations. Write the solution in set notation.

a. $\frac{2}{3}|d - 5| + 1 = 7$ **b.** $5 - |s + 3| = \frac{11}{2}$

8. Solve the following absolute value inequalities. Write solutions in interval notation.

a. $3|q + 4| - 2 < 10$ **b.** $\left|\frac{x}{3} + 2\right| + 5 \leq 5$

9. Solve the following absolute value inequalities. Write solutions in interval notation.

a. $3.1|d - 2| + 1.1 \geq 7.3$

b. $\frac{|1 - y|}{3} + 2 > \frac{11}{2}$

c. $-5|k - 2| + 3 < 4$

10. Kiteboarding: With the correct sized kite, a person can kiteboard when the wind is blowing at a speed w (in mph) that satisfies the inequality $|w - 17| \leq 9$. Solve the inequality and determine if a person can kiteboard with a windspeed of (a) 5 mph? (b) 12 mph?

REINFORCING BASIC CONCEPTS

Using Distance to Understand Absolute Value Equations and Inequalities

For any two numbers a and b on the number line, *the distance between a and b* can be written $|a - b|$ or $|b - a|$. In exactly the same way, the equation $|x - 3| = 4$ can be read, "the distance between 3 and an unknown number is equal to 4." The advantage of reading it in this way (instead of "the absolute value of x minus 3 is 4"), is that a much clearer *visualization* is formed, giving a constant reminder there are two solutions. In diagram form we have Figure 2.51.

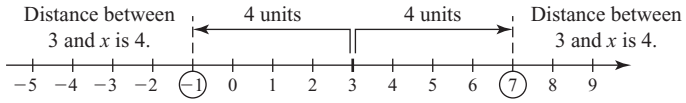


Figure 2.51

From this we note the solutions are $x = -1$ and $x = 7$.

In the case of an inequality such as $|x + 2| \leq 3$, we rewrite the inequality as $|x - (-2)| \leq 3$ and read it, "the distance between -2 and an unknown number is less than or equal to 3." With some practice, visualizing this relationship mentally enables a quick statement of the solution: $x \in [-5, 1]$. In diagram form we have Figure 2.52.

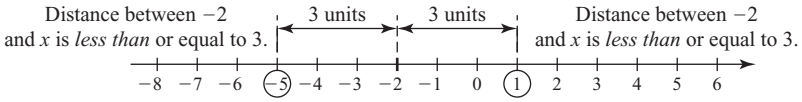

Figure 2.52

Equations and inequalities where the coefficient of x is not 1 still lend themselves to this form of conceptual understanding. For $|2x - 1| \geq 3$ we read, "the distance between 1 and twice an unknown number is greater than or equal to 3." On the number line (Figure 2.53), the number 3 units to the right of 1 is 4, and the number 3 units to the left of 1 is -2.

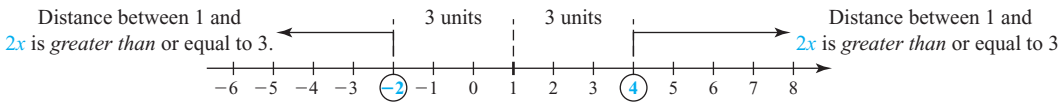

Figure 2.53

For $2x \leq -2$, $x \leq -1$, and for $2x \geq 4$, $x \geq 2$, and the solution set is $x \in (-\infty, -1] \cup [2, \infty)$.

Attempt to solve the following equations and inequalities by visualizing a number line. Check all results algebraically.

Exercise 1: $|x - 2| = 5$ **Exercise 2:** $|x + 1| \leq 4$ **Exercise 3:** $|2x - 3| \geq 5$

2.4 Basic Rational Functions and Power Functions; More on the Domain

LEARNING OBJECTIVES

In Section 2.4 you will see how we can:

- ❑ **A.** Graph basic rational functions, identify vertical and horizontal asymptotes, and describe end-behavior
- ❑ **B.** Use transformations to graph basic rational functions and write the equation for a given graph
- ❑ **C.** Graph basic power functions and state their domains
- ❑ **D.** Solve applications involving basic rational and power functions

In this section, we introduce two new kinds of relations, **rational functions** and **power functions.** While we've already studied a variety of functions, we still lack the ability to model a large number of important situations. For example, functions that model the amount of medication remaining in the bloodstream over time, the relationship between altitude and weightlessness, and the equations modeling planetary motion come from these two families.

A. Rational Functions and Asymptotes

Just as a rational number is the ratio of two integers, a **rational function** is the ratio of two polynomials. In general,

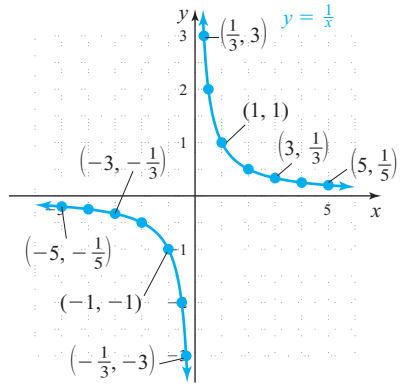
Rational Functions

A rational function $V(x)$ is one of the form

$$V(x) = \frac{p(x)}{d(x)},$$

where p and d are polynomials and $d(x) \neq 0$.
The domain of $V(x)$ is all real numbers, *except the zeroes of d.*

The simplest rational functions are the reciprocal function $y = \frac{1}{x}$ and the reciprocal square function $y = \frac{1}{x^2}$, as both have a constant numerator and a single term in the denominator. Since division by zero is undefined, the domain of both excludes $x = 0$. A preliminary study of these two functions will provide a strong foundation for our study of general rational functions in Chapter 4.



The Reciprocal Function: $y = \frac{1}{x}$

The reciprocal function takes any input (other than zero) and gives its reciprocal as the output. This means large inputs produce small outputs and vice versa. A table of values (Table 2.1) and the resulting graph (Figure 2.54) are shown.

Table 2.1

x	y	x	y
−1000	−1/1000	1/1000	1000
−5	−1/5	1/3	3
−4	−1/4	1/2	2
−3	−1/3	1	1
−2	−1/2	2	1/2
−1	−1	3	1/3
−1/2	−2	4	1/4
−1/3	−3	5	1/5
−1/1000	−1000	1000	1/1000
0	undefined		

Figure 2.54

WORTHY OF NOTE

The notation used for graphical behavior always begins by describing what is happening to the x-values, and the resulting effect on the y-values. Using Figure 2.55, visualize that for a point (x, y) on the graph of $y = \frac{1}{x}$, as x gets larger, y must become smaller, particularly since their product must always be 1 ($y = \frac{1}{x} \Rightarrow xy = 1$).

Figure 2.55

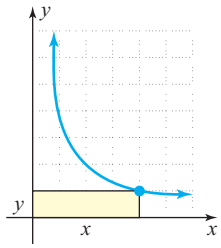


Table 2.1 and Figure 2.54 reveal some interesting features. First, the graph passes the vertical line test, verifying $y = \frac{1}{x}$ is indeed a function. Second, since division by zero is undefined, there can be no corresponding point on the graph, *creating a break at* $x = 0$. In line with our definition of rational functions, the domain is $x \in (-\infty, 0) \cup (0, \infty)$. Third, this is an odd function, with a "branch" of the graph in the first quadrant and one in the third quadrant, as the reciprocal of any input maintains its sign. Finally, we note in QI that as x becomes an infinitely large positive number, y becomes infinitely small and closer to zero. It seems convenient to symbolize this end-behavior using the following notation:

$$\underbrace{\text{as } x \to \infty,}_{\substack{\text{as } x \text{ becomes an infinitely} \\ \text{large positive number}}} \qquad \underbrace{y \to 0}_{\substack{\\ y \text{ approaches } 0}}$$

Graphically, the curve becomes very close to, or *approaches the x-axis*.

We also note that as x approaches zero from the right, y becomes an infinitely large positive number: as $x \to 0^+$, $y \to \infty$. Note a superscript $+$ or $-$ sign is used to indicate the *direction of the approach,* meaning *from the positive side* (right) or *from the negative side* (left).

EXAMPLE 1 ▶ Describing the End-Behavior of Rational Functions

For $y = \frac{1}{x}$ in QIII (Figure 2.54),

a. Describe the end-behavior of the graph.

b. Describe what happens as x approaches zero.

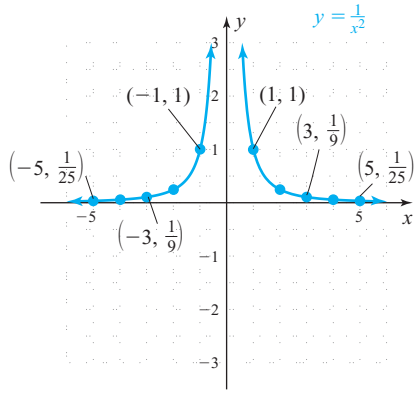
Solution ▶

Similar to the graph's behavior in QI, we have

a. In words: As x becomes an infinitely large negative number, y approaches zero. In notation: As $x \to -\infty$, $y \to 0$.

b. In words: As x approaches zero from the left, y becomes an infinitely large negative number. In notation: As $x \to 0^-$, $y \to -\infty$.

Now try Exercises 7 and 8 ▶



The Reciprocal Square Function: $y = \frac{1}{x^2}$

From our previous work, we anticipate this graph will also have a break at $x = 0$. But since the square of any negative number is positive, the branches of the **reciprocal square function** are both *above the x-axis*. Note the result is the graph of an even function. See Table 2.2 and Figure 2.56.

Table 2.2

x	y	x	y
−1000	1/1,000,000	1/1000	1,000,000
−5	1/25	1/3	9
−4	1/16	1/2	4
−3	1/9	1	1
−2	1/4	2	1/4
−1	1	3	1/9
−1/2	4	4	1/16
−1/3	9	5	1/25
−1/1000	1,000,000	1000	1/1,000,000
0	undefined		

Figure 2.56

Similar to $y = \frac{1}{x}$, large positive inputs generate small, positive outputs: as $x \to \infty$, $y \to 0$. This is one indication of **asymptotic behavior** in the *horizontal* direction, and we say the line $y = 0$ (the x-axis) is a **horizontal asymptote** for the reciprocal and reciprocal square functions. In general,

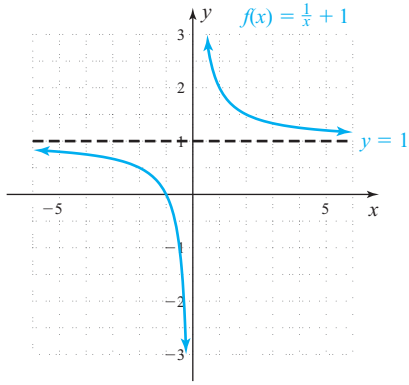
Horizontal Asymptotes

Given a constant k, the line $y = k$ is a horizontal asymptote for V if, as x increases or decreases without bound, $V(x)$ approaches k:

$$\text{as } x \to -\infty,\ V(x) \to k \qquad \text{or} \qquad \text{as } x \to \infty,\ V(x) \to k$$

As shown in Figures 2.57 and 2.58, asymptotes are represented graphically as dashed lines that seem to "guide" the branches of the graph. Figure 2.57 shows a horizontal asymptote at $y = 1$, which suggests the graph of $f(x)$ is the graph of $y = \frac{1}{x}$ shifted up 1 unit. Figure 2.58 shows a horizontal asymptote at $y = -2$, which suggests the graph of $g(x)$ is the graph of $y = \frac{1}{x^2}$ shifted down 2 units.

Figure 2.57



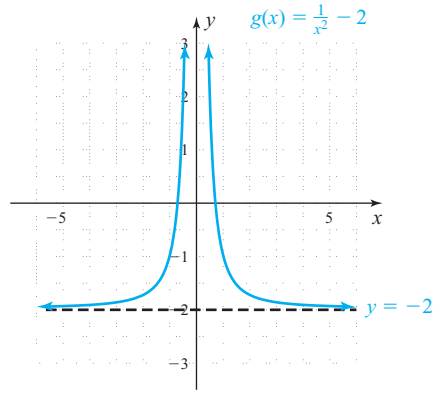


Figure 2.58

EXAMPLE 2 ▶ **Describing the End-Behavior of Rational Functions**

For the graph in Figure 2.58, use mathematical notation to

a. Describe the end-behavior of the graph and name the horizontal asymptote.

b. Describe what happens as x approaches zero.

Solution ▶

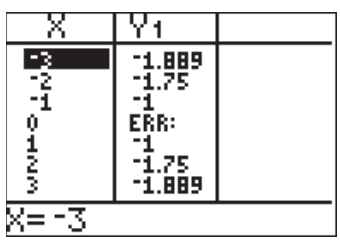
a. as $x \to -\infty$, $g(x) \to -2$,
as $x \to \infty$, $g(x) \to -2$,
$y = -2$ is a horizontal asymptote

b. as $x \to 0^-$, $g(x) \to \infty$,
as $x \to 0^+$, $g(x) \to \infty$

Now try Exercises 9 and 10 ▶

While the graphical view of Example 2(a) (Figure 2.58) makes these concepts believable, a numerical view of this end-behavior can be even more compelling. Try entering $\frac{1}{x^2} - 2$ as Y_1 on the Y= screen, then go to the **TABLE** feature (TblStart $= -3$, ΔTbl $= 1$; Figure 2.59). Scrolling in either direction shows that as $|x|$ becomes very large, Y_1 becomes closer and closer to -2, but will never be equal to -2 (Figure 2.60).

Figure 2.59



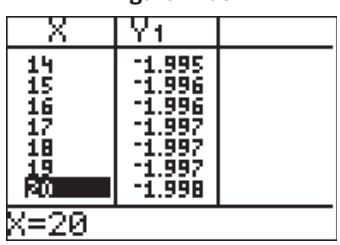


Figure 2.60

From Example 2(b), we note that as x becomes *smaller and close to 0*, g becomes very large and *increases without bound*. This is one indication of asymptotic behavior in the *vertical* direction, and we say the line $x = 0$ (the y-axis) is a **vertical asymptote** for g ($x = 0$ is also a vertical asymptote for f in Figure 2.57). In general,

Vertical Asymptotes

Given a constant h, the vertical line $x = h$ is a vertical asymptote for a function V if, as x approaches h, $V(x)$ increases or decreases without bound:

$$\text{as } x \to h^+,\ V(x) \to \pm\infty \qquad \text{or} \qquad \text{as } x \to h^-,\ V(x) \to \pm\infty$$

Here is a brief summary:

Reciprocal Function	**Reciprocal Quadratic Function**
$f(x) = \frac{1}{x}$	$g(x) = \frac{1}{x^2}$
Domain: $x \in (-\infty, 0) \cup (0, \infty)$	Domain: $x \in (-\infty, 0) \cup (0, \infty)$
Range: $y \in (-\infty, 0) \cup (0, \infty)$	Range: $y \in (0, \infty)$
Horizontal asymptote: $y = 0$	Horizontal asymptote: $y = 0$
Vertical asymptote: $x = 0$	Vertical asymptote: $x = 0$

A. You've just seen how we can graph basic rational functions, identify vertical and horizontal asymptotes, and describe end-behavior

B. Using Asymptotes to Graph Basic Rational Functions

Identifying these asymptotes is useful because the graphs of $y = \frac{1}{x}$ and $y = \frac{1}{x^2}$ can be transformed *in exactly the same way as the toolbox functions.* When their graphs shift—the vertical and horizontal asymptotes shift with them and can be used as guides to redraw the graph. In shifted form,

$$f(x) = \frac{a}{x \pm h} \pm k \text{ for the reciprocal function, and}$$

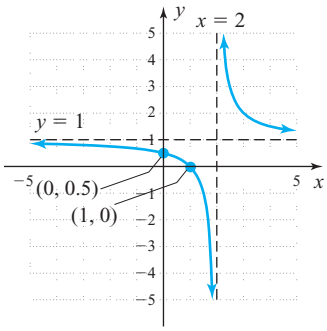
$$g(x) = \frac{a}{(x \pm h)^2} \pm k \text{ for the reciprocal square function.}$$

When horizontal and/or vertical shifts are applied to simple rational functions, we first apply them to the asymptotes, then calculate the x- and y-intercepts as before. An additional point or two can be computed as needed to round out the graph.

EXAMPLE 3 ▶ **Graphing Transformations of the Reciprocal Function**

Sketch the graph of $g(x) = \dfrac{1}{x - 2} + 1$ using transformations of the parent function.

Solution ▶ The graph of g is the same as that of $y = \dfrac{1}{x}$, but shifted 2 units right and 1 unit upward. This means the vertical asymptote is also shifted 2 units right, and the horizontal asymptote is shifted 1 unit up. The y-intercept is $g(0) = \dfrac{1}{2}$. For the x-intercept:



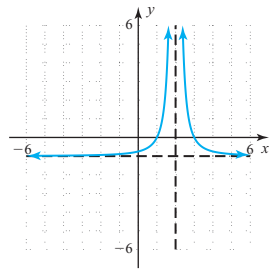
$$0 = \frac{1}{x - 2} + 1 \qquad \text{substitute 0 for } g(x)$$

$$-1 = \frac{1}{x - 2} \qquad \text{subtract 1}$$

$$-1(x - 2) = 1 \qquad \text{multiply by } (x - 2)$$

$$x = 1 \qquad \text{solve}$$

The x-intercept is (1, 0). Knowing the graph is from the reciprocal function family and shifting the asymptotes and intercepts yields the graph shown.



Now try Exercises 11 through 26 ▶

These ideas can be "used in reverse" to determine the equation of a basic rational function from its given graph, as in Example 4.

EXAMPLE 4 ▶ Writing the Equation of a Basic Rational Function, Given Its Graph

Identify the function family for the graph given, then use the graph to write the equation of the function in "shifted form." Assume $|a| = 1$.

Solution ▶ The graph appears to be from the reciprocal square family, and has been shifted 2 units right (the vertical asymptote is at $x = 2$), and 1 unit down (the horizontal asymptote is at $y = -1$). From $y = \frac{1}{x^2}$, we obtain $f(x) = \frac{1}{(x-2)^2} - 1$ as the shifted form.

Now try Exercises 27 through 38 ▶

B. You've just seen how we can use asymptotes and transformations to graph basic rational functions and write the equation for a given graph

Using the definition of negative exponents, the basic reciprocal and reciprocal square functions can be written as $y = x^{-1}$ and $y = x^{-2}$, respectively. In this form, we note that these functions also belong to a family of functions known as the *power functions* **(see Exercise 80).**

C. Graphs of Basic Power Functions

Italian physicist and astronomer Galileo Galilei (1564–1642) made numerous contributions to astronomy, physics, and other fields. But perhaps he is best known for his experiments with gravity, in which he dropped objects of different weights from the Leaning Tower of Pisa. Due in large part to his work, we know that the velocity of an object after it has fallen a certain distance is $v = \sqrt{2gs}$, where g is the acceleration due to gravity (32 ft/sec^2), s is the distance in feet the object has fallen, and v is the velocity of the object in feet per second **(see Exercise 71).** As you will see, this is an example of a formula that uses a power function.

From previous coursework or a review of radicals and rational exponents (Appendix A.6), we know that $\sqrt{x}$ can be written as $x^{\frac{1}{2}}$, and $\sqrt[3]{x}$ as $x^{\frac{1}{3}}$, enabling us to write these functions in *exponential form:* $f(x) = x^{\frac{1}{2}}$ and $g(x) = x^{\frac{1}{3}}$. In this form, we see that these actually belong to a larger family of functions, where x is raised to some power, called the **power functions.**

Power Functions and Root Functions

For any constant real number p and variable x, functions of the form

$$f(x) = x^p$$

are called *power functions* in x. If p is of the form $\frac{1}{n}$ for integers $n \geq 2$, the functions

$$f(x) = x^{\frac{1}{n}} \Leftrightarrow f(x) = \sqrt[n]{x}$$

are called *root functions* in x.

The functions $y = x^2$, $y = x^{\frac{1}{4}}$, $y = x^3$, $y = \sqrt[5]{x}$, and $y = x^{\frac{3}{2}}$ are all power functions, but only $y = x^{\frac{1}{4}}$ and $y = \sqrt[5]{x}$ are also root functions. Initially we will focus on power functions where $p > 0$.

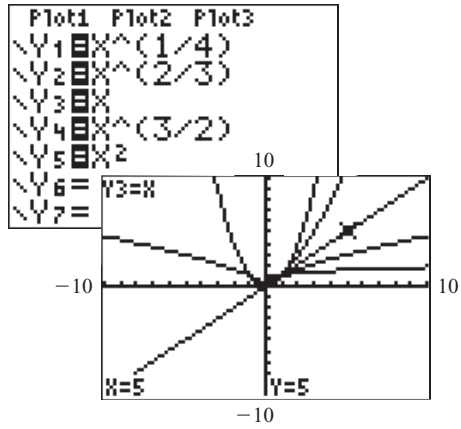
EXAMPLE 5 ▶ **Comparing the Graphs of Power Functions**

Use a graphing calculator to graph the power functions $f(x) = x^{\frac{1}{4}}$, $g(x) = x^{\frac{2}{3}}$, $h(x) = x^1$, $p(x) = x^{\frac{3}{2}}$, and $q(x) = x^2$ in the standard viewing window. Make an observation in QI regarding the effect of the exponent on each function, then discuss what the graphs of $y = x^{\frac{1}{6}}$ and $y = x^{\frac{7}{2}}$ would look like.

Solution ▶

First we enter the functions in sequence as Y_1 through Y_5 on the Y= screen (Figure 2.61). Using ZOOM **6:ZStandard** produces the graphs shown in Figure 2.62. Narrowing the window to focus on QI (Figure 2.63: $x \in [-4, 10]$, $y \in [-4, 10]$), we quickly see that for $x \geq 1$, larger values of p cause the graph of $y = x^p$ to increase at a faster rate, and smaller values at a slower rate. In other words (for $x \geq 1$), since $\frac{1}{6} < \frac{1}{4}$, the graph of $y = x^{\frac{1}{6}}$ would increase slower and appear to be "under" the graph of $Y_1 = X^{\frac{1}{4}}$. Since $\frac{7}{2} > 2$, the graph of $y = x^{\frac{7}{2}}$ would increase faster and appear to be "more narrow" than the graph of $Y_5 = X^2$ (verify this).

Figure 2.61, 2.62



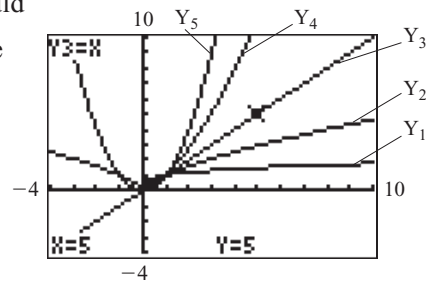


Figure 2.63

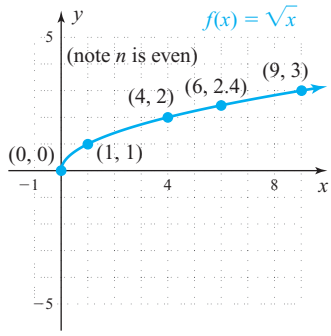
Now try Exercises 39 through 48 ▶

The Domain of a Power Function

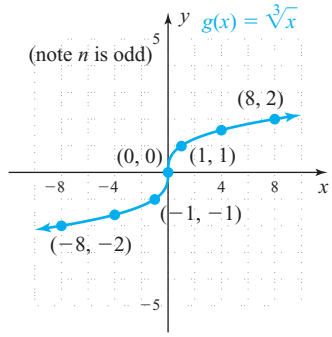
In addition to the observations made in Example 5, we can make other important notes, particularly regarding the *domains* of power functions. When the exponent on a power function is a rational number $\frac{m}{n} > 0$ in simplest form, it appears the domain is all real numbers if n is odd, as seen in the graphs of $g(x) = x^{\frac{2}{3}}$, $h(x) = x^1 = x^{\frac{1}{1}}$, and $q(x) = x^2 = x^{\frac{2}{1}}$. If n is an even number, the domain is all nonnegative real numbers as seen in the graphs of $f(x) = x^{\frac{1}{4}}$ and $p(x) = x^{\frac{3}{2}}$. Further exploration will show that if p is irrational, as in $y = x^{\pi}$, the domain is also all nonnegative real numbers and we have the following:



The Domain of a Power Function

Given a power function $f(x) = x^p$ with $p > 0$.

1. If $p = \frac{m}{n}$ is a rational number in simplest form,
   - **a.** the domain of f is all real numbers if n is odd: $x \in (-\infty, \infty)$,
   - **b.** the domain of f is all nonnegative real numbers if n is even: $x \in [0, \infty)$.
2. If p is an irrational number, the domain of f is all nonnegative real numbers: $x \in [0, \infty)$.



Further confirmation of statement 1 can be found by recalling the graphs of $y = \sqrt{x} = x^{\frac{1}{2}}$ and $y = \sqrt[3]{x} = x^{\frac{1}{3}}$ from Section 2.2 (Figures 2.64 and 2.65).

Figure 2.64

Domain: $x \in [0, \infty)$
Range: $y \in [0, \infty)$

Figure 2.65

Domain: $x \in [-\infty, \infty)$
Range: $y \in [-\infty, \infty)$

EXAMPLE 6 ▶ **Determining the Domains of Power Functions**

State the domain of the following power functions, and identity whether each is also a root function.

a. $f(x) = x^{\frac{4}{5}}$ **b.** $g(x) = x^{\frac{1}{10}}$ **c.** $h(x) = \sqrt[8]{x}$ **d.** $q(x) = x^{\frac{2}{3}}$ **e.** $r(x) = x^{\sqrt{5}}$

Solution ▶

a. Since n is odd, the domain of f is all real numbers; f is not a root function.

b. Since n is even, the domain of g is $x \in [0, \infty)$; g is a root function.

c. In exponential form $h(x) = x^{\frac{1}{8}}$. Since n is even, the domain of h is $x \in [0, \infty)$; h is a root function.

d. Since n is odd, the domain of q is all real numbers; q is not a root function

e. Since p is irrational, the domain of r is $x \in [0, \infty)$; r is not a root function

Now try Exercises 49 through 58 ▶

Transformations of Power and Root Functions

As we saw in Section 2.2 (Toolbox Functions and Transformations), the graphs of the root functions $y = \sqrt{x}$ and $y = \sqrt[3]{x}$ can be transformed using shifts, stretches, reflections, and so on. In Example 8(b) (Section 2.2) we noted the graph of $h(x) = 2\sqrt[3]{x - 2} - 1$ was the graph of $y = \sqrt[3]{x}$ shifted 2 units right, stretched by a factor of 2, and shifted 1 unit down. Graphs of other power functions can be transformed in exactly the same way.

EXAMPLE 7 ▶ **Graphing Transformations of Power Functions**

Based on our previous observations,

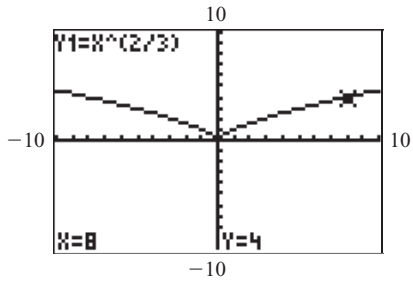
a. Determine the domain of $f(x) = x^{\frac{2}{3}}$ and $g(x) = x^{\frac{3}{2}}$, then verify by graphing them on a graphing calculator.

b. Next, discuss what the graphs of $F(x) = (x - 2)^{\frac{2}{3}} - 3$ and $G(x) = -x^{\frac{3}{2}} + 2$ will look like, then graph each on a graphing calculator to verify.

Solution ▶

a. Both f and g are power functions of the form $y = x^{\frac{m}{n}}$. For f, n is odd so its domain is all real numbers. For g, n is even and the domain is $x \in [0, \infty)$. Their graphs support this conclusion (Figures 2.66 and 2.67).

Figure 2.66



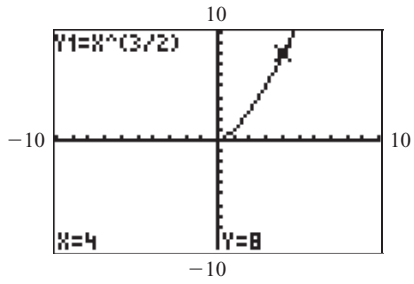


Figure 2.67

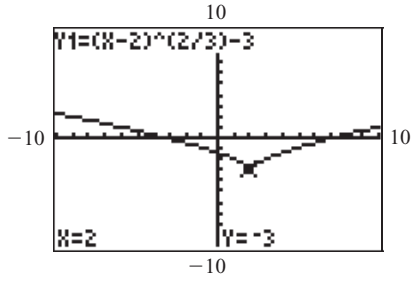
b. The graph of F will be the same as the graph of f, but shifted two units right and three units down, moving the vertex to $(2, -3)$. The graph of G will be the same as the graph of g, but reflected across the x-axis, and shifted 2 units up (Figures 2.68 and 2.69).

Figure 2.68



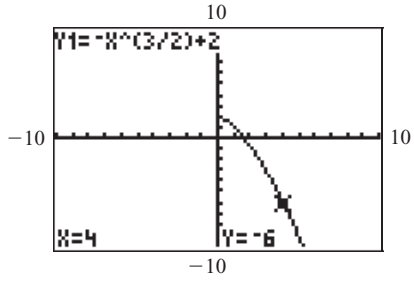


Figure 2.69

☑ **C.** You've just seen how we can graph basic power functions and state their domains

Now try Exercises 59 through 62 ▶

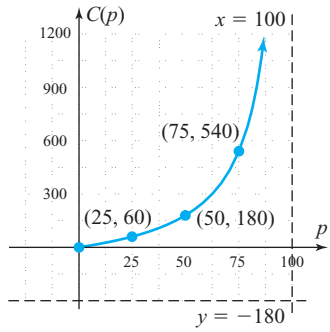
D. Applications of Rational and Power Functions

These new functions have a variety of interesting and significant applications in the real world. Examples 8 through 10 provide a small sample, and there are a number of additional applications in the Exercise Set. In many applications, the coefficients may be rather large, and the axes should be scaled accordingly.

EXAMPLE 8 ▶ **Modeling the Cost to Remove Waste**

For a large urban-centered county, the cost to remove chemical waste and other pollutants from a local river is given by the function $C(p) = \dfrac{-18{,}000}{p - 100} - 180$, where $C(p)$ represents the cost (in thousands of dollars) to remove p percent of the pollutants.

a. Find the cost to remove 25%, 50%, and 75% of the pollutants and comment on the results.



b. Graph the function using an appropriate scale.

c. Use mathematical notation to state what happens as the county attempts to remove 100% of the pollutants.

Solution ▶

a. We evaluate the function as indicated, finding that $C(25) = 60$, $C(50) = 180$, and $C(75) = 540$. The cost is escalating rapidly. The change from 25% to 50% brought a \$120,000 increase, but the change from 50% to 75% brought *a \$360,000 increase!*

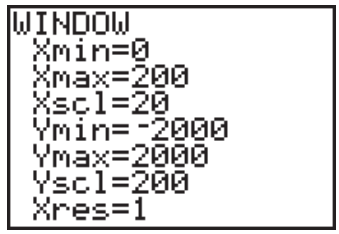
b. From the context, we need only graph the portion from $0 \le p < 100$. For the C-intercept we substitute $p = 0$ and find $C(0) = 0$, which seems reasonable as 0% would be removed if \$0 were spent. We also note there must be a vertical asymptote at $x = 100$, since this x-value causes a denominator of 0. Using this information and the points from part (a) produces the graph shown.

c. As the percentage of pollutants removed approaches 100%, the cost of the cleanup skyrockets. Using notation: as $p \to 100^-$, $C \to \infty$.

Now try Exercises 65 through 70 ▶

While not obvious at first, the function $C(p)$ in Example 8 is from the family of reciprocal functions $y = \frac{1}{x}$. A closer inspection shows it has the form $y = \frac{-a}{x - h} - k \to \frac{-18{,}000}{x - 100} - 180$, showing the graph of $y = \frac{1}{x}$ is shifted right 100 units, reflected across the x-axis, stretched by a factor of 18,000 and shifted 180 units down (the horizontal asymptote is $y = -180$). As sometimes occurs in real-world applications, portions of the graph were ignored due to the context. To see the full graph, we reason that the second branch occurs on the opposite side of the vertical and horizontal asymptotes, and set the window as shown in Figure 2.70. After entering $C(p)$ as Y_1 on the Y= screen and pressing GRAPH, the full graph appears as shown in Figure 2.71 (for effect, the vertical and horizontal asymptotes were drawn separately using the 2nd PRGM **(DRAW)** options).

Figure 2.70



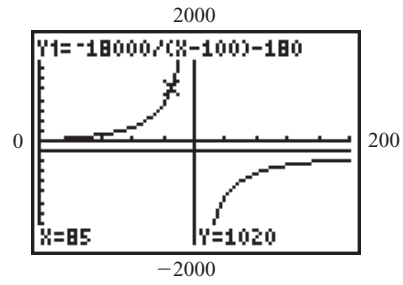


Figure 2.71

Next, we'll use a root function to model the distance to the horizon from a given height.

EXAMPLE 9 ▶ **The Distance to the Horizon**

On a clear day, the distance a person can see from a certain height (the distance to the horizon) is closely approximated by the root function $d(h) = 3.57\sqrt{h}$, where $d(h)$ represents the viewing distance (in kilometers) from a height of h meters above sea level.

a. To the nearest kilometer, how far can a person see when standing on the observation level of the John Hancock building in Chicago, Illinois, about 335 m high?

b. To the nearest meter, how high is the observer's eyes, if the viewing distance is 130 km?

Solution ▶

a. Substituting 335 for h we have

$$\begin{aligned} d(h) &= 3.57\sqrt{h} && \text{original function} \\ d(335) &= 3.57\sqrt{335} && \text{substitute 335 for } h \\ &\approx 65.34 && \text{result} \end{aligned}$$

On a clear day, a person can see about 65 kilometers.

b. We substitute 130 for $d(h)$:

$$\begin{aligned} d(h) &= 3.57\sqrt{h} && \text{original function} \\ 130 &= 3.57\sqrt{h} && \text{substitute 130 for } d(h) \\ 36.415 &\approx \sqrt{h} && \text{divide by 3.57} \\ 1326.052 &\approx h && \text{square both sides} \end{aligned}$$

If the distance to the horizon is 130 km, the observer's eyes are at a height of approximately 1326 m. Check the answer to part (b) by solving graphically.

Now try Exercises 71 through 74 ▶

One area where power functions and modeling with regression are used extensively is **allometric studies.** This area of inquiry studies the relative growth of a part of an animal in relation to the growth of the whole, like the wingspan of a bird compared to its weight, or the daily food intake of a mammal or bird compared to its size.

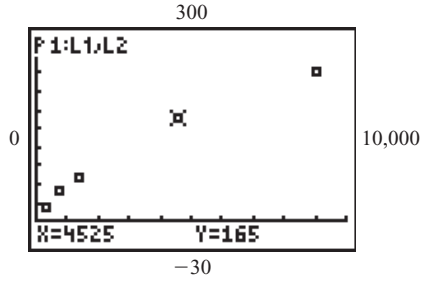
EXAMPLE 10 ▶ **Modeling the Food Requirements of Certain Bird Species**

To study the relationship between the weight of a nonpasserine bird and its daily food intake, the data shown in the table was collected (nonpasserine: nonsinging, nonperching birds).

a. On a graphing calculator, enter the data in L1 and L2, then set an appropriate window to view a scatterplot of the data. Does a power regression STAT **CALC, A:PwrReg** seem appropriate?

Bird	Average weight (g)	Daily food intake (g)
Common pigeon	350	25
Ring-necked duck	725	50
Ring-necked pheasant	1400	70
Canadian goose	4525	165
White swan	9075	240

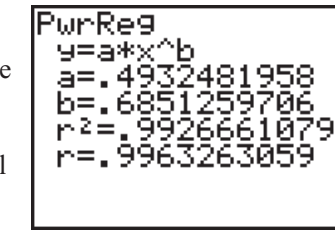
b. Use a graphing calculator to find an equation model using a power regression on the data, and enter the equation in Y_1 (round values to three decimal places).



c. Use the equation to estimate the daily food intake required by a barn owl (470 g), and a gray-headed albatross (6800 g).

d. Use the intersection of graphs method to find the weight of a Great-Spotted Kiwi, given the daily food requirement is 130 g.

Solution ►



a. After entering the weights in L1 and food intake in L2, we set a window that will comfortably fit the data. Using $x \in [0, 10{,}000]$ and $y \in [-30, 300]$ produces the scatterplot shown (Figure 2.72). The data does not appear linear, and based on our work in Example 5, a power function seems appropriate.

Figure 2.72

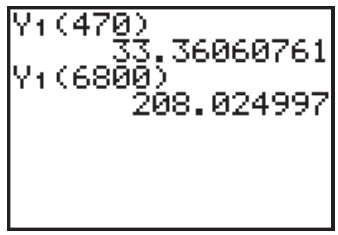
b. To access the power regression option, use STAT ▸ **(CALC) A:PwrReg.** To three decimal places the equation for Y_1 would be $0.493X^{0.685}$ (Figure 2.73).

Figure 2.73

c. For the barn owl, $x = 470$ and we find the estimated food requirement is about 33.4 g per day (Figure 2.74). For the gray-headed albatross $x = 6800$ and the model estimates about 208.0 g of food daily is required.

d. Here we're given the food intake of the Great-Spotted Kiwi (the output value), and want to know what input value (weight) was used. Entering $Y_2 = 130$, we'll attempt to find where the graphs of Y_1 and Y_2 intersect (it will help to deactivate **Plot1** on the Y= screen, so that only the graphs of Y_1 and Y_2 appear). Using 2nd TRACE **(CALC) 5:Intersect** shows the graphs intersect at about (3423.3, 130) (Figure 2.75), indicating the average weight of a Great-Spotted Kiwi is near 3423.3 g (about 7.5 lb).

Figure 2.74



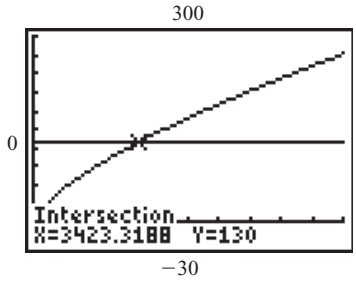


Figure 2.75

D. You've just seen how we can solve applications involving basic rational and power functions

Now try Exercises 75 through 78 ►

2.4 EXERCISES

▶ CONCEPTS AND VOCABULARY

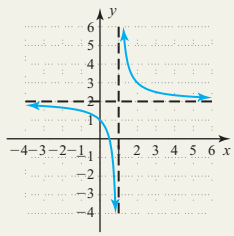
Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. Write the following in notational form. *As x becomes an infinitely large negative number, y approaches 2.* _____

2. For any constant k, the notation "as $|x| \to +\infty, y \to k$" is an indication of a _____ asymptote, while "$x \to k, |y| \to +\infty$" indicates a _____ asymptote.

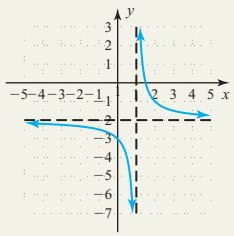
3. Given the function $g(x) = \dfrac{1}{(x-3)^2} + 2$, a _____ asymptote occurs at $x = 3$ and a horizontal asymptote at _____.

4. The graph of $Y_1 = \dfrac{1}{x}$ has branches in Quadrants I and III. The graph of $Y_2 = -\dfrac{1}{x}$ has branches in Quadrants _____ and _____.



5. Discuss/Explain how and why the range of the reciprocal function differs from the range of the reciprocal quadratic function. In the reciprocal quadratic function, all range values are positive.

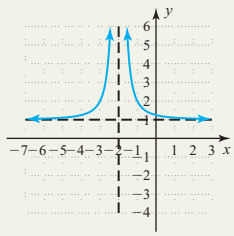
6. If the graphs of $Y_1 = \dfrac{1}{x}$ and $Y_2 = \dfrac{1}{x^2}$ were drawn on the same grid, where would they intersect? In what interval(s) is $Y_1 > Y_2$?



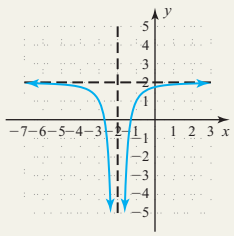
▶ DEVELOPING YOUR SKILLS

For each graph given, (a) use mathematical notation to describe the end-behavior of each graph and (b) describe what happens as x approaches 1.

7. $V(x) = \dfrac{1}{x-1} + 2$



8. $v(x) = \dfrac{1}{x-1} - 2$



For each graph given, (a) use mathematical notation to describe the end-behavior of each graph, (b) name the horizontal asymptote, and (c) describe what happens as x approaches -2.

9. $Q(x) = \dfrac{1}{(x+2)^2} + 1$

10. $q(x) = \dfrac{-1}{(x+2)^2} + 2$

Sketch the graph of each function using transformations of the parent function (not by plotting points). Clearly state the transformations used, and label the horizontal and vertical asymptotes as well as the x- and y-intercepts (if they exist). Also state the domain and range of each function.

11. $f(x) = \dfrac{1}{x} - 1$

12. $g(x) = \dfrac{1}{x} + 2$

13. $h(x) = \dfrac{1}{x+2}$

14. $f(x) = \dfrac{1}{x-3}$

15. $g(x) = \dfrac{-1}{x-2}$

16. $h(x) = \dfrac{-1}{x} - 2$

17. $f(x) = \dfrac{1}{x+2} - 1$

18. $g(x) = \dfrac{1}{x-3} + 2$

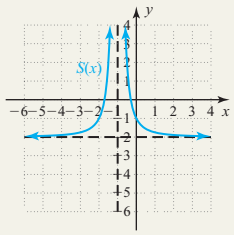
19. $h(x) = \dfrac{1}{(x-1)^2}$

20. $f(x) = \dfrac{1}{(x+5)^2}$

21. $g(x) = \dfrac{-1}{(x+2)^2}$

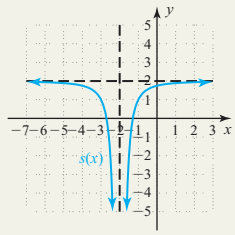
22. $h(x) = \dfrac{-1}{x^2} - 2$

23. $f(x) = \dfrac{1}{x^2} - 2$



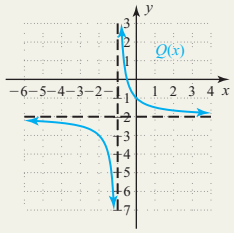
24. $g(x) = \dfrac{1}{x^2} + 3$

25. $h(x) = 1 + \dfrac{1}{(x+2)^2}$

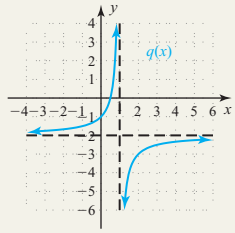


26. $g(x) = -2 + \dfrac{1}{(x-1)^2}$

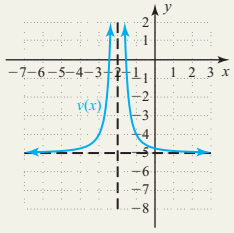
Identify the parent function for each graph given, then use the graph to construct the equation of the function in shifted form. Assume $|a| = 1$.



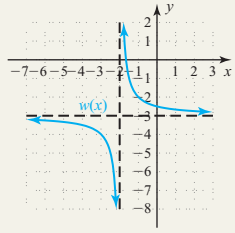
27.



28.

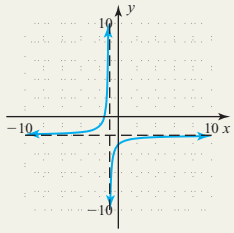


29.



30.

31.



32.

Use the graph shown to complete each statement using the direction/approach notation.

Exercises 33 through 38

33. As $x \to -\infty$, y _____.

34. As $x \to \infty$, y _____.

35. As $x \to -1^+$, y _____.

36. As $x \to -1^-$, y _____.

37. The line $x = -1$ is a vertical asymptote, since: as $x \to$ _____, $y \to$ _____.

38. The line $y = -2$ is a horizontal asymptote, since: as $x \to$ _____, $y \to$ _____.

For each pair of functions given, state which function increases faster for $x > 1$, then use the INTERSECT command of a graphing calculator to find where (a) $f(x) = g(x)$, (b) $f(x) > g(x)$, and (c) $f(x) < g(x)$.

39. $f(x) = x^2, g(x) = x^3$

40. $f(x) = x^4, g(x) = x^5$

41. $f(x) = x^4, g(x) = x^2$

42. $f(x) = x^3, g(x) = x^5$

43. $f(x) = x^{\frac{2}{3}}, g(x) = x^{\frac{4}{5}}$

44. $f(x) = x^{\frac{7}{4}}, g(x) = x^{\frac{3}{2}}$

45. $f(x) = \sqrt[6]{x}, g(x) = \sqrt[3]{x}$

46. $f(x) = \sqrt[5]{x}, g(x) = \sqrt[4]{x}$

47. $f(x) = \sqrt[3]{x^2}, g(x) = x^{\frac{5}{4}}$

48. $f(x) = x^{\frac{3}{2}}, g(x) = \sqrt[4]{x^3}$

State the domain of the following functions.

49. $f(x) = x^{\frac{7}{8}}$

50. $g(x) = x^{\frac{6}{7}}$

51. $h(x) = x^{\frac{6}{5}}$

52. $q(x) = x^{\frac{5}{6}}$

53. $r(x) = \sqrt[7]{x}$

54. $s(x) = x^{\frac{1}{6}}$

Using the functions from Exercises 49–54, identify which of the following are defined and which are not. Do not use a calculator or evaluate.

55. **a.** $f(-2)$ **b.** $f(2)$ **c.** $g(-2)$ **d.** $g(2)$

56. **a.** $h(0.3)$ **b.** $h(-0.3)$ **c.** $q(0.3)$ **d.** $q(-0.3)$

57. **a.** $h(-1.2)$ **b.** $r(-7)$ **c.** $s(-\pi)$ **d.** $s(0)$

58. **a.** $f\left(-\frac{7}{8}\right)$ **b.** $g\left(-\frac{8}{7}\right)$ **c.** $q(-1.9)$ **d.** $q(0)$

Compare and discuss the graphs of the following functions. Verify your answer by graphing both on a graphing calculator.

59. $f(x) = x^{\frac{7}{8}}$; $F(x) = (x + 1)^{\frac{7}{8}} - 2$

60. $g(x) = x^{\frac{8}{7}}$; $G(x) = (x - 3)^{\frac{8}{7}} + 2$

61. $p(x) = x^{\frac{6}{5}}$; $P(x) = -(x - 2)^{\frac{6}{5}}$

62. $q(x) = x^{\frac{5}{6}}$; $Q(x) = 2x^{\frac{5}{6}} - 5$

▶ WORKING WITH FORMULAS

63. Gravitational attraction: $F = \dfrac{km_1m_2}{d^2}$

The gravitational force F between two objects with masses m_1 and m_2 depends on the distance d between them and some constant k. (a) If the masses of the two objects are constant while the distance between them gets larger and larger, what happens to F? (b) Let m_1 and m_2 equal 1 mass unit with $k = 1$ as well, and investigate using a table of values. What family does this function belong to? (c) Solve for m_2 in terms of k, m_1, d and F.

64. Velocity of a bullet: $v = \dfrac{m + M}{m}\sqrt{2gh}$

For centuries, the velocity v of a bullet of mass m has been found using a device called a **ballistic pendulum.** In one such device, a bullet is fired into a stationary block of wood of mass M, suspended from the end of a pendulum. The height h the pendulum swings after impact is measured, and the approximate velocity of the bullet can then be calculated using $g = 9.8$ m/sec^2 (acceleration due to gravity). When a .22-caliber bullet of mass 2.6 g is fired into a wood block of mass 400 g, their combined mass swings to a height of 0.23 m. To the nearest meter per second, find the velocity of the bullet the moment it struck the wood.

▶ APPLICATIONS

65. Deer and predators: By banding deer over a period of 10 yr, a capture-and-release project determines the number of deer per square mile in the Mark Twain National Forest can be modeled by the function $D(p) = \dfrac{75}{p}$, where p is the number of predators present and D is the number of deer. Use this model to answer the following.

a. As the number of predators increases, what will happen to the population of deer? Evaluate the function at $D(1)$, $D(3)$, and $D(5)$ to verify.

b. What happens to the deer population if the number of predators becomes very large?

c. Graph the function using an appropriate scale. Judging from the graph, use mathematical notation to describe what happens to the deer population if the number of predators becomes very small (less than 1 per square mile).

66. Balance of nature: A marine biology research group finds that in a certain reef area, the number of fish present depends on the number of sharks in the area. The relationship can be modeled by the function $F(s) = \dfrac{20{,}000}{s}$, where $F(s)$ is the fish population when s sharks are present.

a. As the number of sharks increases, what will happen to the population of fish? Evaluate the function at $F(10)$, $F(50)$, and $F(200)$ to verify.

b. What happens to the fish population if the number of sharks becomes very large?

c. Graph the function using an appropriate scale. Judging from the graph, use mathematical notation to describe what happens to the fish population if the number of sharks becomes very small.

67. Intensity of light: The intensity I of a light source depends on the distance of the observer from the source. If the intensity is 100 W/m^2 at a distance of 5 m, the relationship can be modeled by the function $I(d) = \dfrac{2500}{d^2}$. Use the model to answer the following.

a. As the distance from the lightbulb increases, what happens to the intensity of the light? Evaluate the function at $I(5)$, $I(10)$, and $I(15)$ to verify.

b. If the intensity is increasing, is the observer moving away or toward the light source?

c. Graph the function using an appropriate scale. Judging from the graph, use mathematical notation to describe what happens to the intensity if the distance from the lightbulb becomes very small.

68. Electrical resistance: The resistance R (in ohms) to the flow of electricity is related to the length of the wire and its gauge (diameter in fractions of an inch). For a certain wire with fixed length, this relationship can be modeled by the function $R(d) = \dfrac{0.2}{d^2}$, where $R(d)$ represents the resistance in a wire with diameter d.

a. As the diameter of the wire increases, what happens to the resistance? Evaluate the function at $R(0.05)$, $R(0.25)$, and $R(0.5)$ to verify.

b. If the resistance is increasing, is the diameter of the wire getting larger or smaller?

c. Graph the function using an appropriate scale. Judging from the graph, use mathematical notation to describe what happens to the resistance in the wire as the diameter gets larger and larger.

69. Pollutant removal: For a certain coal-burning power plant, the cost to remove pollutants from plant emissions can be modeled by $C(p) = \dfrac{-8000}{p - 100} - 80$, where $C(p)$ represents the cost (in thousands of dollars) to remove p percent of the pollutants. (a) Find the cost to remove 20%, 50%, and 80% of the pollutants, then comment on the results; (b) graph the function using an appropriate scale; and (c) use mathematical notation to state what happens if the power company attempts to remove 100% of the pollutants.

70. City-wide recycling: A large city has initiated a new recycling effort, and wants to distribute recycling bins for use in separating various recyclable materials. City planners anticipate the cost of the program can be modeled by the function $C(p) = \dfrac{-22{,}000}{p - 100} - 220$, where $C(p)$ represents the cost (in \$10,000) to distribute the bins to p percent of the population. (a) Find the cost to distribute bins to 25%, 50%, and 75% of the population, then comment on the results; (b) graph the function using an appropriate scale; and (c) use mathematical notation to state what happens if the city attempts to give recycling bins to 100% of the population.

71. Hot air ballooning: If air resistance is neglected, the velocity (in ft/s) of a falling object can be closely approximated by the function $V(s) = 8\sqrt{s}$, where s is the distance the object has fallen (in feet). A balloonist suddenly finds it necessary to release some ballast in order to quickly gain altitude. (a) If she were flying at an altitude of 1000 ft, with what velocity will the ballast strike the ground? (b) If the ballast strikes the ground with a velocity of 225 ft/sec, what was the altitude of the balloon?

72. River velocities: The ability of a river or stream to move sand, dirt, or other particles depends on the size of the particle and the velocity of the river. This relationship can be used to approximate the velocity (in mph) of the river using the function $V(d) = 1.77\sqrt{d}$, where d is the diameter (in inches) of the particle being moved. (a) If a creek can move a particle of diameter 0.095 in., how fast is it moving? (b) What is the largest particle that can be moved by a stream flowing 1.1 mph?

73. Shoe sizes: Although there may be some notable exceptions, the size of shoe worn by the average man is related to his height. This relationship is modeled by the function $S(h) = 0.75h^{\frac{3}{2}}$, where h is the person's height in feet and S is the U.S. shoe size. (a) Approximate Denzel Washington's shoe size given he is 6 ft, 0 in. tall. (b) Approximate Dustin Hoffman's height given his shoe size is 9.5.

74. Whale weight: For a certain species of whale, the relationship between the length of the whale and the weight of the whale can be modeled by the function $W(l) = 0.03l^{\frac{27}{11}}$, where l is the length of the whale in meters and W is the weight of the whale in metric tons (1 metric ton $\approx$ 2205 pounds). (a) Estimate the weight of a newborn calf that is 6 m long. (b) At 81 metric tons, how long is an average adult?

75. Gestation periods: The data shown in the table can be used to study the relationship between the weight of mammal and its length of pregnancy. Use a graphing calculator to (a) graph a scatterplot of the data and (b) find an equation model using a power regression (round to three decimal places). Use the equation to estimate (c) the length of pregnancy of a racoon (15.5 kg) and (d) the weight of a fox, given the length of pregnancy is 52 days.

Mammal	Average Weight (kg)	Gestation (days)
Rat	0.4	24
Rabbit	3.5	50
Armadillo	6.0	51
Coyote	13.1	62
Dog	24.0	64

76. Bird wingspans: The data in the table explores the relationship between a bird's weight and its wingspan. Use a graphing calculator to (a) graph a scatterplot of the data and (b) find an equation model using a power regression (round to three decimal places). Use the equation to estimate (c) the wingspan of a Bald Eagle (16 lb) and (d) the weight of a Bobwhite Quail with a wingspan of 0.9 ft.

Bird	Weight (lb)	Wingspan (ft)
Golden Eagle	10.5	6.5
Horned Owl	3.1	2.6
Peregrine Falcon	3.3	4.0
Whooping Crane	17.0	7.5
Raven	1.5	2.0

77. Species-area relationship: To study the relationship between the number of species of birds on islands in the Caribbean, the data shown in the table was collected. Use a graphing calculator to (a) graph a scatterplot of the data and (b) find an equation model using a power regression (round to three decimal places). Use the equation to estimate (c) the number of species of birds on Andros (2300 mi^2) and (d) the area of Cuba, given there are 98 such species.

Island	Area (mi^2)	Species
Great Inagua	600	16
Trinidad	2000	41
Puerto Rico	3400	47
Jamaica	4500	38
Hispaniola	30,000	82

78. Planetary orbits: The table shown gives the time required for the first five planets to make one complete revolution around the Sun (in years), along with the average orbital radius of the planet in astronomical units (1 AU = 92.96 million miles). Use a graphing calculator to (a) graph a scatterplot of the data and (b) find an equation model using a power regression (round to four decimal places). Use the equation to estimate (c) the average orbital radius of Saturn, given it orbits the Sun every 29.46 yr, and (d) estimate how many years it takes Uranus to orbit the Sun, given it has an average orbital radius of 19.2 AU.

Planet	Years	Radius
Mercury	0.24	0.39
Venus	0.62	0.72
Earth	1.00	1.00
Mars	1.88	1.52
Jupiter	11.86	5.20

▶ EXTENDING THE CONCEPT

79. Consider the graph of $f(x) = \dfrac{1}{x}$ once again, and the x by $f(x)$ rectangles mentioned in the Worthy of Note on page 149. Calculate the area of each rectangle formed for $x \in \{1, 2, 3, 4, 5, 6\}$. What do you notice? Repeat the exercise for $g(x) = \dfrac{1}{x^2}$ and the x by $g(x)$ rectangles. Can you detect the pattern formed here?

80. All of the power functions presented in this section had positive exponents, but the definition of these types of functions does allow for negative exponents as well. In addition to the reciprocal and reciprocal square functions ($y = x^{-1}$ and $y = x^{-2}$), these types of power functions have significant applications. For example, the temperature of ocean water depends on several factors, including salinity, latitude, depth, and density. However, between depths of 125 m and 2000 m, ocean temperatures are relatively predictable, as indicated by the data shown for tropical oceans in the table. Use a graphing calculator to find the power regression model and use it to estimate the water temperature at a depth of 2850 m.

Depth (meters)	Temp (°C)
125	13.0
250	9.0
500	6.0
750	5.0
1000	4.4
1250	3.8
1500	3.1
1750	2.8
2000	2.5

▶ MAINTAINING YOUR SKILLS

81. (1.4) Solve the equation for y, then sketch its graph using the slope/intercept method: $2x + 3y = 15$.

82. (1.3) Using a scale from 1 (lousy) to 10 (great), Charlie gave the following ratings: {(The Beatles, 9.5), (The Stones, 9.6), (The Who, 9.5), (Queen, 9.2), (The Monkees, 6.1), (CCR, 9.5), (Aerosmith, 9.2), (Lynyrd Skynyrd, 9.0), (The Eagles, 9.3), (Led Zeppelin, 9.4), (The Stones, 9.8)}. Is the relation (group, rating) as given, also a function? State why or why not.

83. (1.5) Solve for c: $E = mc^2$.

84. (2.3) Use a graphing calculator to solve $|x - 2| + 1 \geq -2|x + 1| + 3$.

2.5 Piecewise-Defined Functions

LEARNING OBJECTIVES

In Section 2.5 you will see how we can:

- ❑ **A.** State the equation, domain, and range of a piecewise-defined function from its graph
- ❑ **B.** Graph functions that are piecewise-defined
- ❑ **C.** Solve applications involving piecewise-defined functions

Most of the functions we've studied thus far have been smooth and continuous. Although "smooth" and "continuous" are defined more formally in advanced courses, for our purposes *smooth* simply means the graph has no sharp turns or jagged edges, and *continuous* means you can draw the entire graph without lifting your pencil. In this section, we study a special class of functions, called **piecewise-defined functions**, whose graphs may be various combinations of smooth/not smooth and continuous/not continuous. The absolute value function is one example (**see Exercise 31**). Such functions have a tremendous number of applications in the real world.

A. The Domain of a Piecewise-Defined Function

For the years 1990 to 2000, the American bald eagle remained on the nation's endangered species list, although the number of breeding pairs was growing slowly. After 2000, the population of eagles grew at a much faster rate, and they were removed from the list soon afterward. From Table 2.3 and plotted points modeling this growth (see Figure 2.76), we observe that a linear model would fit the period from 1992 to 2000 very well, but a line with greater slope would be needed for the years 2000 to 2006 and (perhaps) beyond.

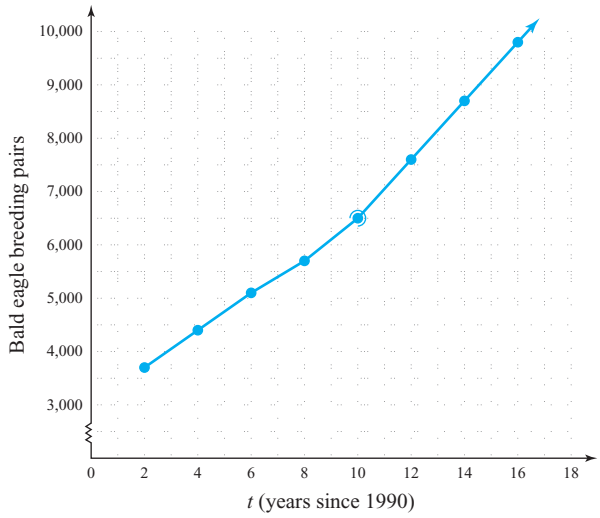


Table 2.3

Year (1990 → 0)	Bald Eagle Breeding Pairs	Year (1990 → 0)	Bald Eagle Breeding Pairs
2	3700	10	6500
4	4400	12	7600
6	5100	14	8700
8	5700	16	9800

Source: www.fws.gov/midwest/eagle/population

Figure 2.76

WORTHY OF NOTE

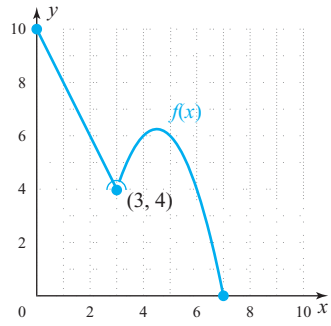
For the years 1992 to 2000, we can estimate the growth in breeding pairs $\frac{\Delta \text{pairs}}{\Delta \text{time}}$ using the points (2, 3700) and (10, 6500) in the slope formula. The result is $\frac{350}{1}$, or 350 pairs per year. For 2000 to 2006, using (10, 6500) and (16, 9800) shows the rate of growth is significantly larger: $\frac{\Delta \text{pairs}}{\Delta \text{years}} = \frac{550}{1}$ or 550 pairs per year.

The combination of these two lines would be a single function that modeled the population of breeding pairs from 1990 to 2006, but it would be *defined in two pieces*. This is an example of a **piecewise-defined function.**

The notation for these functions is a large "left brace" indicating the equations it groups are part of a single function. Using selected data points and techniques from Section 1.4, we find equations that could represent each piece are $p(t) = 350t + 3000$ for $0 \le t \le 10$ and $p(t) = 550t + 1000$ for $t > 10$, where $p(t)$ is the number of breeding pairs in year t. The complete function is then written:

function name — function pieces — domain of each piece

$$p(t) = \begin{cases} 350t + 3000, & 2 \le t \le 10 \\ 550t + 1000, & t > 10 \end{cases}$$



In Figure 2.76, note that we indicated the exclusion of $t = 10$ from the second piece of the function using an open half-circle.

EXAMPLE 1 ▶ **Writing the Equation and Domain of a Piecewise-Defined Function**

The linear piece of the function shown has an equation of $y = -2x + 10$. The equation of the quadratic piece is $y = -x^2 + 9x - 14$.

a. Use the correct notation to write them as a single piecewise-defined function and state the domain of each piece by inspecting the graph.

b. State the range of the function.

Solution ▶

a. From the graph we note the linear portion is defined between 0 and 3, with these endpoints included as indicated by the closed dots. The domain here is $0 \le x \le 3$. The quadratic portion begins at $x = 3$ *but does not include 3*, as indicated by the half-circle notation. The equation is

function name function pieces domain

$$f(x) = \begin{cases} -2x + 10, & 0 \le x \le 3 \\ -x^2 + 9x - 14, & 3 < x \le 7 \end{cases}$$

b. The largest y-value is 10 and the smallest is zero. The range is $y \in [0, 10]$.

A. You've just seen how we can state the equation, domain, and range of a piecewise-defined function from its graph

Now try Exercises 7 and 8 ▶

Piecewise-defined functions can be composed of more than two pieces, and can involve functions of many kinds.

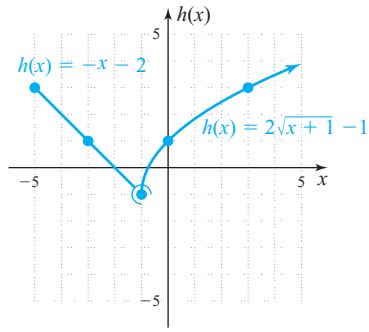
B. Graphing Piecewise-Defined Functions

As with other functions, piecewise-defined functions can be graphed by simply plotting points. Careful attention must be paid to the domain of each piece, both to evaluate the function correctly and to consider the inclusion/exclusion of endpoints. In addition, try to keep the transformations of a basic function in mind, as this will often help graph the function more efficiently.

EXAMPLE 2 ▶ **Graphing a Piecewise-Defined Function**

Evaluate the piecewise-defined function by noting the effective domain of each piece, then graph by plotting these points and using your knowledge of basic functions.

$$h(x) = \begin{cases} -x - 2, & -5 \le x < -1 \\ 2\sqrt{x + 1} - 1, & x \ge -1 \end{cases}$$



Solution ▶ The first piece of h is a line with negative slope, while the second is a transformed square root function. Using the endpoints of each domain specified and a few additional points, we obtain the following:

For $h(x) = -x - 2, -5 \le x < -1$, For $h(x) = 2\sqrt{x + 1} - 1, x \ge -1$,

x	$h(x)$
-5	3
-3	1
-1	(-1)

x	$h(x)$
-1	-1
0	1
3	3

After plotting the points from the first piece, we connect them with a line segment noting the left endpoint is included, while the right endpoint is not (indicated using a semicircle around the point). Then we plot the points from the second piece and draw a square root graph, noting the left endpoint here *is* included, and the graph rises to the right. From the graph we note the complete domain of h is $x \in [-5, \infty)$, and the range is $y \in [-1, \infty)$.

Now try Exercises 9 through 12 ▶

Most graphing calculators are able to graph piecewise-defined functions. Consider Example 3.

EXAMPLE 3 ▶ Graphing a Piecewise-Defined Function Using Technology

Graph the function $f(x) = \begin{cases} x + 5, & -5 \le x < 2 \\ (x - 4)^2 + 3, & x \ge 2 \end{cases}$ on a graphing calculator and evaluate $f(2)$.

Solution ▶

Both "pieces" are well known—the first is a line with slope $m = 1$ and y-intercept (0, 5). The second is a parabola that opens upward, shifted 4 units to the right and 3 units up. If we attempt to graph $f(x)$ using $Y_1 = X + 5$ and $Y_2 = (X - 4)^2 + 3$ as they stand, the resulting graph may be difficult to analyze because the pieces overlap and intersect (Figure 2.77). To graph the functions we must indicate the domain for each piece, separated by a slash and enclosed in parentheses. For instance, for the first piece we enter $Y_1 = X + 5/(X \ge -5$ and $X < 2)$, and for the second, $Y_2 = (X - 4)^2 + 3/(X \ge 2)$ (Figure 2.78). The slash looks like (is) the division symbol, but in this context, the calculator interprets it as a means of separating the function from the domain. The inequality symbols are accessed using the 2nd MATH **(TEST)** keys. As shown for Y_1, compound inequalities must be entered in two parts, using the logical connector "and": 2nd MATH ▸ **(LOGIC) 1:and.** The graph is shown in Figure 2.79, where we see the function is linear for $x \in [-5, 2)$ and quadratic for $x \in [2, \infty)$. Using the 2nd GRAPH **(TABLE)** feature reveals the calculator will give an **ERR:** (ERROR) message for inputs outside the domains of Y_1 and Y_2, and we see that f is defined for $x = 2$ only for Y_2: $f(2) = 7$ (Figure 2.80).

Figure 2.77

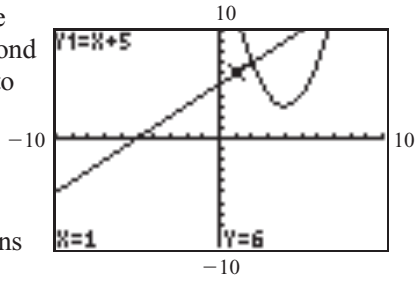


Figure 2.78

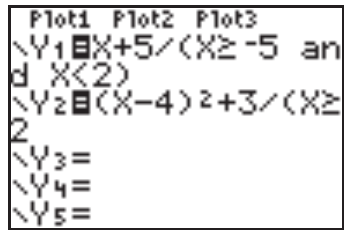

Figure 2.79

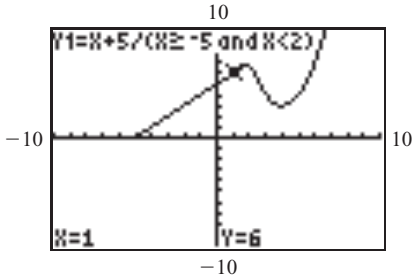

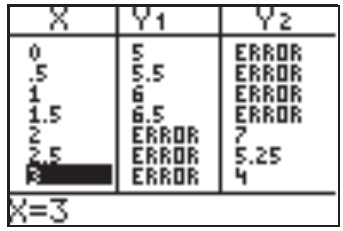

Figure 2.80

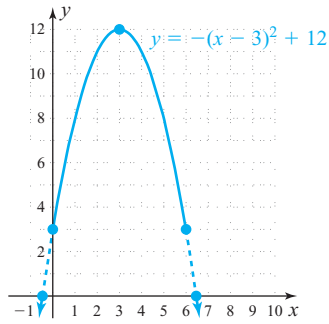
Now try Exercises 13 and 14 ▶

As an alternative to plotting points, we can graph each piece of the function using transformations of a basic graph, then erase those parts that are outside of the corresponding domain. Repeat this procedure for each piece of the function. One interesting and highly instructive aspect of these functions is the opportunity to investigate restrictions on their domain and the ranges that result.

Piecewise and Continuous Functions

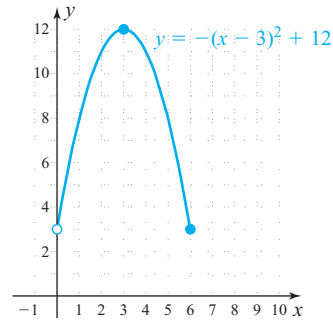
EXAMPLE 4 ▶ **Graphing a Piecewise-Defined Function**



Graph the function and state its domain and range:

$$f(x) = \begin{cases} -(x-3)^2 + 12, & 0 < x \le 6 \\ 3, & x > 6 \end{cases}$$

Solution ▶ The first piece of f is a basic parabola, shifted three units right, reflected across the x-axis (opening downward), and shifted 12 units up. The vertex is at (3, 12) and the axis of symmetry is $x = 3$, producing the following graphs.



1. Graph first piece of f (Figure 2.81)

Figure 2.81

2. Erase portion outside domain of $0 < x \le 6$ (Figure 2.82).

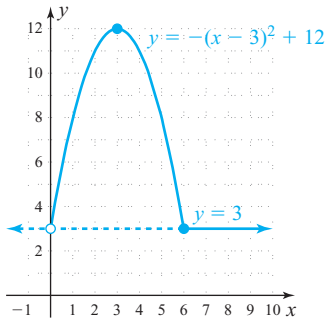


Figure 2.82

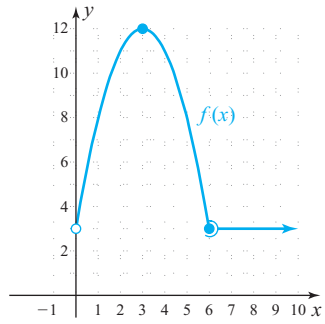
The second function is simply a horizontal line through (0, 3).



3. Graph second piece of f (Figure 2.83).

Figure 2.83

4. Erase portion outside domain of $x > 6$ (Figure 2.84).

Figure 2.84

The domain of f is $x \in (0, \infty)$, and the corresponding range is $y \in [3, 12]$.

Now try Exercises 15 through 18 ▶

Piecewise and Discontinuous Functions

Notice that although the function in Example 4 was piecewise-defined, the graph was actually continuous—we could draw the entire graph without lifting our pencil. Piecewise graphs also come in the *discontinuous* variety, which makes the domain and range issues all the more important.

EXAMPLE 5 ▶ **Graphing a Discontinuous Piecewise-Defined Function**

Graph $g(x)$ and state the domain and range:

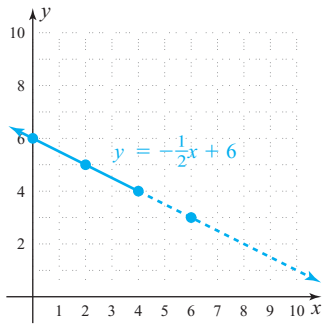
$$g(x) = \begin{cases} -\frac{1}{2}x + 6, & 0 \le x \le 4 \\ -|x - 6| + 10, & 4 < x \le 9 \end{cases}$$

Solution ▶ The first piece of g is a line, with y-intercept $(0, 6)$ and slope $\frac{\Delta y}{\Delta x} = -\frac{1}{2}$.

1. Graph first piece of g (Figure 2.85)

2. Erase portion outside domain of $0 \le x \le 4$ (Figure 2.86).

Figure 2.85



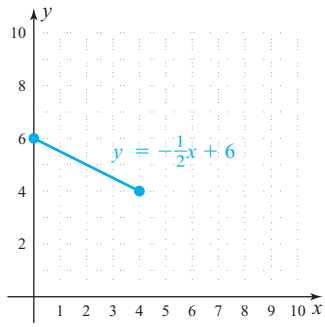


Figure 2.86

The second is an absolute value function, shifted right 6 units, reflected across the x-axis, then shifted up 10 units.

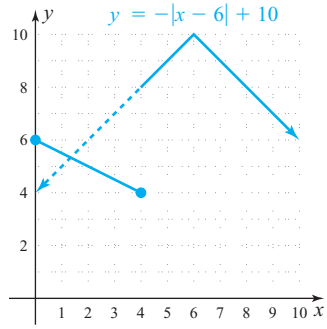
WORTHY OF NOTE

As you graph piecewise-defined functions, keep in mind that they *are* functions and the end result must pass the vertical line test. This is especially important when we are drawing each piece as a complete graph, then erasing portions outside the effective domain.

3. Graph second piece of g (Figure 2.87).

4. Erase portion outside domain of $4 < x \le 9$ (Figure 2.88).

Figure 2.87



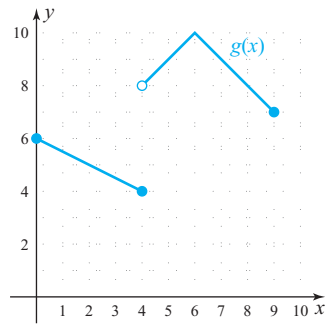


Figure 2.88

Note that the left endpoint of the absolute value portion is not included (this piece is not defined at $x = 4$), signified by the open dot. The result is a discontinuous graph, as there is no way to draw the graph other than by "jumping" the pencil from where one piece ends to where the next begins. Using a vertical boundary line, we note the domain of g includes all values between 0 and 9 inclusive: $x \in [0, 9]$. Using a horizontal boundary line shows the smallest y-value is 4 and the largest is 10, but no range values exist between 6 and 7. The range is $y \in [4, 6] \cup [7, 10]$.

Now try Exercises 19 and 20 ▶

EXAMPLE 6 ▶ Graphing a Discontinuous Function

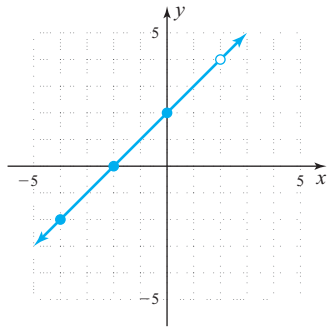
The given piecewise-defined function is not continuous. Graph $h(x)$ to see why, then comment on what could be done to make it continuous.

$$h(x) = \begin{cases} \dfrac{x^2 - 4}{x - 2}, & x \neq 2 \\ 1, & x = 2 \end{cases}$$

Solution ▶ The first piece of h is unfamiliar to us, so we elect to graph it by plotting points, noting $x = 2$ is outside the domain. This produces the table shown. After connecting the points, the graph turns out to be a straight line, but with no corresponding y-value for $x = 2$. This leaves a "hole" in the graph at (2, 4), as designated by the open dot (see Figure 2.89).

x	$h(x)$
−4	−2
−2	0
0	2
2	—
4	6

Figure 2.89



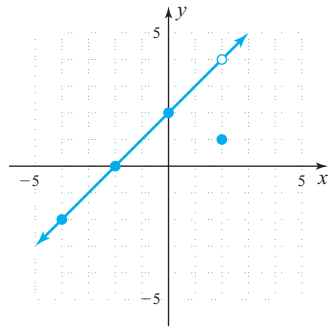


Figure 2.90

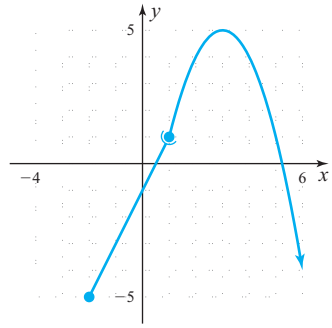
WORTHY OF NOTE

The discontinuity illustrated here is called a **removable discontinuity,** as the discontinuity can be removed by redefining a single point on the function. Note that after factoring the first piece, the denominator is a factor of the numerator, and writing the result in lowest terms gives $h(x) = \frac{(x+2)(x-2)}{x-2} = x + 2, x \neq 2$. This is precisely the equation of the line in Figure 2.89 $[y = x + 2]$.



The second piece is pointwise-defined, and its graph is simply the point (2, 1) shown in Figure 2.90. It's interesting to note that while the domain of h is all real numbers (h *is* defined at all points), the range is $y \in (-\infty, 4) \cup (4, \infty)$ as the function never takes on the value $y = 4$. In order for h to be continuous, we would need to redefine the second piece as $y = 4$ when $x = 2$.

Now try Exercises 21 through 26 ▶

To develop these concepts more fully, it will help to practice finding the equation of a piecewise-defined function *given its graph,* a process similar to that of Example 10 in Section 2.2.

EXAMPLE 7 ▶ Determining the Equation of a Piecewise-Defined Function

Determine the equation of the piecewise-defined function shown, including the domain for each piece.

Solution ▶ By counting $\frac{\Delta y}{\Delta x}$ from (−2, −5) to (1, 1), we find the linear portion has slope $m = 2$, and the y-intercept must be (0, −1). The equation of the line is $y = 2x - 1$. The second piece appears to be a parabola with vertex (h, k) at (3, 5). Using this vertex with the point (1, 1) in the general form $y = a(x - h)^2 + k$ gives

$$\begin{aligned} y &= a(x-h)^2 + k && \text{general form, parabola is shifted right and up} \\ 1 &= a(1-3)^2 + 5 && \text{substitute 1 for } x, 1 \text{ for } y, 3 \text{ for } h, 5 \text{ for } k \\ -4 &= a(-2)^2 && \text{simplify; subtract 5} \\ -4 &= 4a && (-2)^2 = 4 \\ -1 &= a && \text{divide by 4} \end{aligned}$$

The equation of the parabola is $y = -(x - 3)^2 + 5$. Considering the domains shown in the figure, the equation of this piecewise-defined function must be

$$p(x) = \begin{cases} 2x - 1, & -2 \le x < 1 \\ -(x - 3)^2 + 5, & x \ge 1 \end{cases}$$

B. You've just seen how we can graph functions that are piecewise-defined

Now try Exercises 27 through 30 ▶

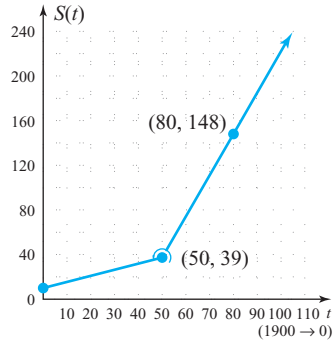
C. Applications of Piecewise-Defined Functions

The number of applications for piecewise-defined functions is practically limitless. It is actually fairly rare for a single function to accurately model a situation over a long period of time. Laws change, spending habits change, and technology can bring abrupt alterations in many areas of our lives. To accurately model these changes often requires a piecewise-defined function.

EXAMPLE 8 ▶ **Modeling with a Piecewise-Defined Function**

For the first half of the twentieth century, per capita spending on police protection can be modeled by $S(t) = 0.54t + 12$, where $S(t)$ represents per capita spending on police protection in year t (1900 corresponds to year 0). After 1950, perhaps due to the growth of American cities, this spending greatly increased: $S(t) = 3.65t - 144$. Write these as a piecewise-defined function $S(t)$, state the domain for each piece, then graph the function. According to this model, how much was spent (per capita) on police protection in 2000 and 2010? How much will be spent in 2014?

Source: Data taken from the *Statistical Abstract of the United States* for various years.



Solution ▶

function name / function pieces / effective domain

$$S(t) = \begin{cases} 0.54t + 12, & 0 \le t \le 50 \\ 3.65t - 144, & t > 50 \end{cases}$$

Since both pieces are linear, we can graph each part using two points. For the first function, $S(0) = 12$ and $S(50) = 39$. For the second function $S(50) \approx 39$ and $S(80) = 148$. The graph for each piece is shown in the figure. Evaluating S at $t = 100$:

$$\begin{aligned} S(t) &= 3.65t - 144 \\ S(100) &= 3.65(100) - 144 \\ &= 365 - 144 \\ &= 221 \end{aligned}$$

About \$221 per capita was spent on police protection in the year 2000. For 2010, the model indicates that \$257.50 per capita was spent: $S(110) = 257.5$. By 2014, this function projects the amount spent will grow to $S(114) = 272.1$ or \$272.10 per capita.

Now try Exercises 33 through 44 ▶

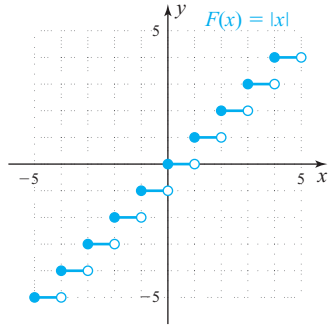
Step Functions

The last group of piecewise-defined functions we'll explore are the **step functions,** so called because the pieces of the function form a series of horizontal steps. These functions find frequent application in the way consumers are charged for services, and have several applications in number theory. Perhaps the most common is called the **greatest integer function,** though recently its alternative name, **floor function,** has gained popularity (see Figure 2.91). This is in large part due to an improvement in notation

and as a better contrast to **ceiling functions.** The floor function of a real number x, denoted $f(x) = \lfloor x \rfloor$ or $[\![x]\!]$ (we will use the first), is the largest integer less than or equal to x. For instance, $\lfloor 5.9 \rfloor = 5$, $\lfloor 7 \rfloor = 7$, and $\lfloor -3.4 \rfloor = -4$.

In contrast, the ceiling function $C(x) = \lceil x \rceil$ is the smallest integer greater than or equal to x, meaning $\lceil 5.9 \rceil = 6$, $\lceil 7 \rceil = 7$, and $\lceil -3.4 \rceil = -3$ (see Figure 2.92). In simple terms, for any noninteger value on the number line, the floor function returns the integer to the left, while the ceiling function returns the integer to the right. A graph of each function is shown.

Figure 2.91



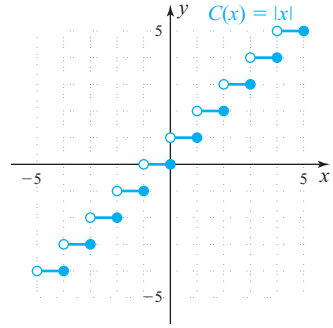


Figure 2.92

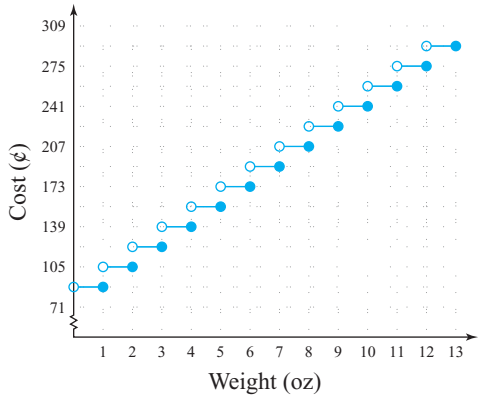


One common application of floor functions is the price of theater admission, where children 12 and under receive a discounted price. Right up until the day they're 13, they qualify for the lower price: $\lfloor 12\frac{364}{365} \rfloor = 12$. Applications of ceiling functions would include how phone companies charge for the minutes used (charging the 12-min rate for a phone call that only lasted 11.3 min: $\lceil 11.3 \rceil = 12$), and postage rates, as in Example 9.

EXAMPLE 9 ▶ **Modeling Using a Step Function**

In 2009 the first-class postage rate for large envelopes sent through the U.S. mail was 88¢ for the first ounce, then an additional 17¢ per ounce thereafter, up to 13 ounces. Graph the function and state its domain and range. Use the graph to state the cost of mailing a report weighing (a) 7.5 oz, (b) 8 oz, and (c) 8.1 oz in a large envelope.

Solution ▶ The 88¢ charge applies to letters weighing between 0 oz and 1 oz. Zero is not included since we have to mail *something,* but 1 is included since a large envelope and its contents weighing exactly one ounce still costs 88¢. The graph will be a horizontal line segment.

The function is defined for all weights between 0 and 13 oz, excluding zero and including 13: $x \in (0, 13]$. The range consists of single outputs corresponding to the step intervals: $R \in \{88, 105, 122, \ldots, 275, 292\}$.

a. The cost of mailing a 7.5-oz report is 207¢.

b. The cost of mailing an 8.0-oz report is still 207¢.

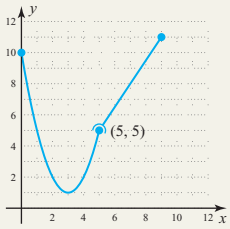
c. The cost of mailing an 8.1-oz report is 207 + 17 = 224¢, since this brings you up to the next step.

Now try Exercises 45 through 48 ▶

☑ **C.** You've just seen how we can solve applications involving piecewise-defined functions

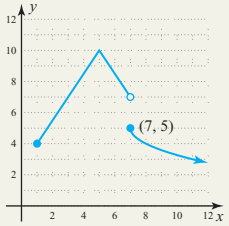
2.5 EXERCISES

▶ CONCEPTS AND VOCABULARY



Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. A function whose entire graph can be drawn without lifting your pencil is called a _____ function.
2. The input values for which each part of a piecewise function is defined is the _____ of the function.
3. A graph is called _____ if it has no sharp turns or jagged edges.
4. When graphing $2x + 3$ over a domain of $x > 0$, we leave an _____ dot at (0, 3).
5. Discuss/Explain how to determine if a piecewise-defined function is continuous, without having to graph the function. Illustrate with an example.
6. Discuss/Explain how it is possible for the domain of a function to be defined for all real numbers, but have a range that is defined on more than one interval. Construct an illustrative example.



▶ DEVELOPING YOUR SKILLS

For Exercises 7 and 8, (a) use the correct notation to write them as a single piecewise-defined function and state the domain for each piece by inspecting the graph, then (b) state the range of the function.

7. $Y_1 = X^2 - 6x + 10$; $Y_2 = \frac{3}{2}X - \frac{5}{2}$

8. $Y_1 = -1.5|X - 5| + 10$; $Y_2 = -\sqrt{X - 7} + 5$

Evaluate each piecewise-defined function as indicated (if possible).

9. $$h(x) = \begin{cases} -2 & x < -2 \\ |x| & -2 \le x < 3 \\ 5 & x \ge 3 \end{cases}$$

$h(-5)$, $h(-2)$, $h(-\frac{1}{2})$, $h(0)$, $h(2.999)$, and $h(3)$

10. $$H(x) = \begin{cases} 2x + 3 & x < 0 \\ x^2 + 1 & 0 \le x < 2 \\ 5 & x > 2 \end{cases}$$

$H(-3)$, $H(-\frac{3}{2})$, $H(-0.001)$, $H(1)$, $H(2)$, and $H(3)$

11. $$p(x) = \begin{cases} 5 & x < -3 \\ x^2 - 4 & -3 \le x \le 3 \\ 2x + 1 & x > 3 \end{cases}$$

$p(-5)$, $p(-3)$, $p(-2)$, $p(0)$, $p(3)$, and $p(5)$

12. $$q(x) = \begin{cases} -x - 3 & x < -1 \\ 2 & -1 \le x < 2 \\ -\frac{1}{2}x^2 + 3x - 2 & x \ge 2 \end{cases}$$

$q(-3)$, $q(-1)$, $q(0)$, $q(1.999)$, $q(2)$, and $q(4)$

Graph each piecewise-defined function using a graphing calculator. Then evaluate each at $x = 2$ and $x = 0$.

13. $$p(x) = \begin{cases} x + 2 & -6 \le x \le 2 \\ 2|x - 4| & x > 2 \end{cases}$$

14. $$q(x) = \begin{cases} \sqrt{x + 4} & -4 \le x \le 0 \\ |x - 2| & 0 < x \le 7 \end{cases}$$

Graph each piecewise-defined function and state its domain and range. Use transformations of the toolbox functions where possible.

15. $$g(x) = \begin{cases} -(x - 1)^2 + 5 & -2 \le x \le 4 \\ 2x - 12 & x > 4 \end{cases}$$

16. $$h(x) = \begin{cases} \frac{1}{2}x + 1 & x \le 0 \\ (x - 2)^2 - 3 & 0 < x \le 5 \end{cases}$$

17. $H(x) = \begin{cases} -x + 3 & x < 1 \\ -|x - 5| + 6 & 1 \le x < 9 \end{cases}$

18. $w(x) = \begin{cases} \sqrt[3]{x - 1} & x < 2 \\ (x - 3)^2 & 2 \le x \le 6 \end{cases}$

19. $f(x) = \begin{cases} -x - 3 & x < -3 \\ 9 - x^2 & -3 \le x < 2 \\ 4 & x \ge 2 \end{cases}$

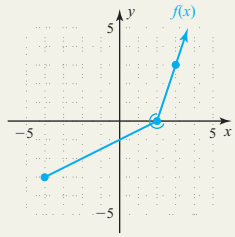
20. $h(x) = \begin{cases} -\frac{1}{2}x - 1 & x < -3 \\ -|x| + 5 & -3 \le x \le 5 \\ 3\sqrt{x - 5} & x > 5 \end{cases}$

21. $p(x) = \begin{cases} \frac{1}{2}x + 1 & x \ne 4 \\ 2 & x = 4 \end{cases}$

22. $q(x) = \begin{cases} \frac{1}{2}(x - 1)^3 - 1 & x \ne 3 \\ -2 & x = 3 \end{cases}$

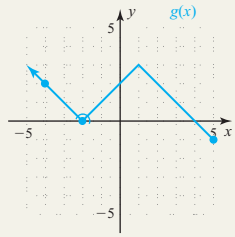
Each of the following functions has a removable discontinuity. Graph the first piece of each function, then find the value of c so that a continuous function results.

23. $f(x) = \begin{cases} \dfrac{x^2 - 9}{x + 3} & x \ne -3 \\ c & x = -3 \end{cases}$



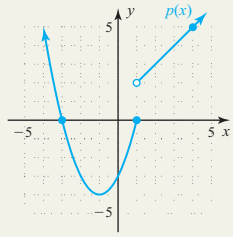
24. $f(x) = \begin{cases} \dfrac{x^2 - 3x - 10}{x - 5} & x \ne 5 \\ c & x = 5 \end{cases}$

25. $f(x) = \begin{cases} \dfrac{x^3 - 1}{x - 1} & x \ne 1 \\ c & x = 1 \end{cases}$

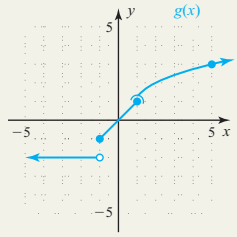


26. $f(x) = \begin{cases} \dfrac{4x - x^3}{x + 2} & x \ne -2 \\ c & x = -2 \end{cases}$

Determine the equation of each piecewise-defined function shown, including the domain for each piece. Assume all pieces are toolbox functions.



27.



28.

29.

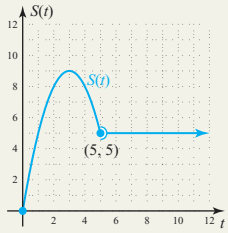
30.

▶ WORKING WITH FORMULAS

31. Definition of absolute value: $|x| = \begin{cases} -x & x < 0 \\ x & x \ge 0 \end{cases}$

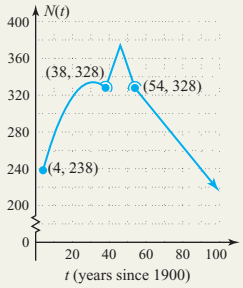
The absolute value function can be stated as a piecewise-defined function, a technique that is sometimes useful in graphing variations of the function or solving absolute value equations and inequalities. How does this definition ensure that the absolute value of a number is always positive? Use this definition to help sketch the graph of $f(x) = \frac{|x|}{x}$. Discuss what you notice.

32. Sand dune function:



$$f(x) = \begin{cases} -|x - 2| + 1 & 1 \le x < 3 \\ -|x - 4| + 1 & 3 \le x < 5 \\ -|x - 2k| + 1 & 2k - 1 \le x < 2k + 1, \text{ for } k \in N \end{cases}$$

There are a number of interesting graphs that can be created using piecewise-defined functions, and these functions have been the basis for more than one piece of modern art. (a) Use the descriptive name and the pieces given to graph the function f. Is the function accurately named? (b) Use any combination of the toolbox functions to explore your own creativity by creating a piecewise-defined function with some interesting or appealing characteristics. (c) For $y = -|x - 2| + 1$, solve for x in terms of y.



▶ APPLICATIONS

For Exercises 33 and 34, (a) write the information given as a piecewise-defined function, and state the domain for each piece by inspecting the graph. (b) Give the range of each.

33. Results from advertising: Due to heavy advertising, initial sales of the Lynx Digital Camera grew very rapidly, but started to decline once the advertising blitz was over. During the advertising campaign, sales were modeled by the function $S(t) = -t^2 + 6t$, where $S(t)$ represents hundreds of sales in month t. However, as Lynx Inc. had hoped, the new product secured a foothold in the market and sales leveled out at a steady 500 sales per month.

34. Decline of newspaper publishing: From the turn of the twentieth century, the number of newspapers (per thousand population) grew rapidly until the 1930s, when the growth slowed down and then declined. The years 1940 to 1946 saw a "spike" in growth, but the years 1947 to 1954 saw an almost equal decline. Since 1954 the number has continued to decline, but at a slower rate.

The number of papers N per thousand population for each period, respectively, can be approximated by

$$N_1(t) = -0.13t^2 + 8.1t + 208,$$

$$N_2(t) = -5.75|t - 46| + 374, \text{ and}$$

$$N_3(t) = -2.45t + 460.$$

Source: Data from the *Statistical Abstract of the United States,* various years; data from *The First Measured Century, The AEI Press,* Caplow, Hicks, and Wattenberg, 2001.

35. Families that own stocks: The percentage of American households that own publicly traded stocks began rising in the early 1950s, peaked in 1970, then began to decline until 1980 when there was a dramatic increase due to easy access over the Internet, an improved economy, and other factors. This phenomenon is modeled by the function $P(t)$, where $P(t)$ represents the percentage of households owning stock in year t, with 1950 corresponding to year 0.

$$P(t) = \begin{cases} -0.03t^2 + 1.28t + 1.68 & 0 \le t \le 30 \\ 1.89t - 43.5 & t > 30 \end{cases}$$

a. According to this model, what percentage of American households held stock in the years 1955, 1965, 1975, 1985, and 1995? If this pattern continues, what percentage held stock in 2005? What percent will hold stock in 2015?

b. Why is there a discrepancy in the outputs of each piece of the function for the year 1980 ($t = 30$)? According to how the function is defined, which output should be used?

Source: 2004 *Statistical Abstract of the United States,* Table 1204; various other years.

36. Dependence on foreign oil: America's dependency on foreign oil has always been a "hot" political topic, with the amount of imported oil fluctuating over the years due to political climate, public awareness, the economy, and other factors. The amount of crude oil imported can be approximated by the function given, where $A(t)$ represents the number of barrels imported in year t (in billions), with 1980 corresponding to year 0.

$$A(t) = \begin{cases} 0.047t^2 - 0.38t + 1.9 & 0 \le t < 8 \\ -0.075t^2 + 1.495t - 5.265 & 8 \le t \le 11 \\ 0.133t + 0.685 & t > 11 \end{cases}$$

a. Use $A(t)$ to estimate the number of barrels imported in the years 1983, 1989, 1995, and 2005. If this trend continues, how many barrels will be imported in 2015?

b. What was the minimum number of barrels imported between 1980 and 1988?

Source: 2004 *Statistical Abstract of the United States,* Table 897; various other years.

37. Energy rationing: In certain areas of the United States, power blackouts have forced some counties to ration electricity. Suppose the cost is \$0.09 per kilowatt (kW) for the first 1000 kW a household uses. After 1000 kW, the cost increases to 0.18 per kW. (a) Write these charges for electricity in the form of a piecewise-defined function $C(h)$, where $C(h)$ is the cost for h kilowatt hours. Include the domain for each piece. Then (b) sketch the graph and determine the cost for 1200 kW.

38. Water rationing: Many southwestern states have a limited water supply, and some state governments try to control consumption by manipulating the cost of water usage. Suppose for the first 5000 gal a household uses per month, the charge is \$0.05 per gallon. Once 5000 gal is used the charge doubles to \$0.10 per gallon. (a) Write these charges for water usage in the form of a piecewise-defined function $C(w)$, where $C(w)$ is the cost for w gallons of water. Include the domain for each piece. Then (b) sketch the graph and determine the cost to a household that used 9500 gal of water during a very hot summer month.

39. Pricing for natural gas: A local gas company charges \$0.75 per therm for natural gas, up to 25 therms. Once the 25 therms has been exceeded, the charge doubles to \$1.50 per therm due to limited supply and great demand. (a) Write these charges for natural gas consumption in the form of a piecewise-defined function $C(t)$, where $C(t)$ is the charge for t therms. Include the domain for each piece. Then (b) sketch the graph and determine the cost to a household that used 45 therms during a very cold winter month.

40. Multiple births: The number of multiple births has steadily increased in the United States during the twentieth century and beyond. Between 1985 and 1995 the number of twin births could be modeled by the function $T(x) = -0.21x^2 + 6.1x + 52$, where x is the number of years since 1980 and T is in thousands. After 1995, the incidence of twins becomes more linear, with $T(x) = 4.53x + 28.3$ serving as a better model. (a) Write the piecewise-defined function modeling the incidence of twins for these years. Include the domain of each piece. Then (b) sketch the graph and use the function to estimate the incidence of twins in 1990, 2000, and 2005. If this trend continued, how many sets of twins were born in 2010?

Source: National Vital Statistics Report, Vol. 50, No. 5, February 12, 2002

41. U.S. military expenditures: Except for the year 1991 when military spending was cut drastically, the amount spent by the U.S. government on national defense and veterans' benefits rose steadily from 1980 to 1992. These expenditures can be modeled by the function $S(t) = -1.35t^2 + 31.9t + 152$, where $S(t)$ is in billions of dollars and 1980 corresponds to $t = 0$. From 1992 to 1996 this spending declined, then began to rise in the following years. From 1992 to 2002, military-related spending can be modeled by $S(t) = 2.5t^2 - 80.6t + 950$.

Source: 2004 *Statistical Abstract of the United States,* Table 492

(a) Write $S(t)$ as a single piecewise-defined function. Include stating the domain for each piece. Then (b) sketch the graph and use the function to estimate the amount spent by the United States in 2005, 2008, and 2012 if this trend continues.

42. Amusement arcades: At a local amusement center, the owner has the SkeeBall machines programmed to reward very high scores. For scores of 200 or less, the function $T(x) = \frac{x}{10}$ models the number of tickets awarded (rounded to the nearest whole). For scores over 200, the number of tickets is modeled by $T(x) = 0.001x^2 - 0.3x + 40$. (a) Write these equation models of the number of tickets awarded in the form of a piecewise-defined function. Include the domain for each piece. Then (b) sketch the graph and find the number of tickets awarded to a person who scores 390 points.

43. Phone service charges: When it comes to phone service, a large number of calling plans are available. Under one plan, the first 30 min of any phone call costs only 3.3¢ per minute. The charge increases to 7¢ per minute thereafter. (a) Write this information in the form of a piecewise-defined function. Include the domain for each piece. Then (b) sketch the graph and find the cost of a 46-min phone call.

44. Overtime wages: Tara works on an assembly line, putting together computer monitors. She is paid \$9.50 per hour for regular time (0, 40 hr], \$14.25 for overtime (40, 48 hr], and when demand for computers is high, \$19.00 for double-overtime (48, 84 hr]. (a) Write this information in the form of a simplified piecewise-defined function. Include the domain for each piece. (b) Then sketch the graph and find the gross amount of Tara's check for the week she put in 54 hr.

45. Admission prices: At Wet Willy's Water World, infants under 2 are free, then admission is charged according to age. Children 2 and older but less than 13 pay \$2, teenagers 13 and older but less than 20 pay \$5, adults 20 and older but less than 65 pay \$7, and senior citizens 65 and older get in at the teenage rate. (a) Write this information in the form of a piecewise-defined function. Include the domain for each piece. Then (b) sketch the graph and find the cost of admission for a family of nine which includes: one grandparent (70), two adults (44/45), 3 teenagers, 2 children, and one infant.

46. Demographics: One common use of the floor function $y = \lfloor x \rfloor$ is the reporting of ages. As of 2007, the record for longest living human is 122 yr, 164 days for the life of Jeanne Calment, formerly of France. While she actually lived $x = 122\frac{164}{365}$ years, ages are normally reported using the floor function, or the greatest integer number of years less than or equal to the actual age: $\lfloor 122\frac{164}{365} \rfloor = 122$ years. (a) Write a function $A(t)$ that gives a person's age, where $A(t)$ is the reported age at time t. (b) State the domain of the function (be sure to consider Madame Calment's record). Report the age of a person who has been living for (c) 36 years; (d) 36 years, 364 days; (e) 37 years; and (f) 37 years, 1 day.

47. Postage rates: The postal charge function from Example 9 is simply a transformation of the basic ceiling function $y = \lceil x \rceil$. Using the ideas from Section 2.2, (a) write the postal charges as a step function $C(w)$, where $C(w)$ is the cost of mailing a large envelope weighing w ounces, and (b) state the domain of the function. Then use the function to find the cost of mailing reports weighing: (c) 0.7 oz, (d) 5.1 oz, (e) 5.9 oz; (f) 6 oz, and (g) 6.1 oz.

48. Cell phone charges: A national cell phone company advertises that calls of 1 min or less do not count toward monthly usage. Calls lasting longer than 1 min are calculated normally using a ceiling function, meaning a call of 1 min, 1 sec will be counted as a 2-min call. Using the ideas from Section 2.2, (a) write the cell phone charges as a piecewise-defined function $C(m)$, where $C(m)$ is the cost of a call lasting m minutes, and include the domain of the function. Then (b) graph the function, and (c) use the graph or function to determine if a cell phone subscriber has exceeded the 30 free minutes granted by her calling plan for calls lasting 2 min 3 sec, 13 min 46 sec, 1 min 5 sec, 3 min 59 sec, and 8 min 2 sec. (d) What was the actual usage in minutes and seconds?

49. Combined absolute value graphs: Carefully graph the function $h(x) = |x - 2| - |x + 3|$ using a table of values over the interval $x \in [-5, 5]$. Is the function continuous? Write this function in piecewise-defined form and state the domain for each piece.

50. Combined absolute value graphs: Carefully graph the function $H(x) = |x - 2| + |x + 3|$ using a table of values over the interval $x \in [-5, 5]$. Is the function continuous? Write this function in piecewise-defined form and state the domain for each piece.

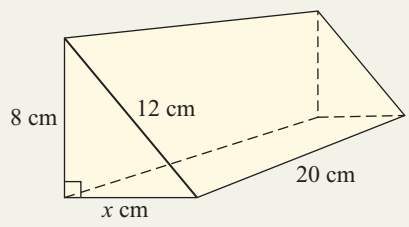
▶ EXTENDING THE CONCEPT

51. You've heard it said, "*any number divided by itself is one*." Consider the functions $f(x) = \frac{x+2}{x+2}$, and $g(x) = \frac{|x+2|}{x+2}$. Are these functions continuous?

52. Find a linear function $h(x)$ that will make the function shown a *continuous* function. Be sure to include its domain.

$$f(x) = \begin{cases} x^2 & x < 1 \\ h(x) & \\ 2x + 3 & x > 3 \end{cases}$$

▶ MAINTAINING YOUR SKILLS



53. (Appendix A.5) Solve: $\dfrac{3}{x-2} + 1 = \dfrac{30}{x^2-4}$.

54. (Appendix A.5) Compute the following and write the result in lowest terms:

$$\frac{x^3 + 3x^2 - 4x - 12}{x - 3} \cdot \frac{2x - 6}{x^2 + 5x + 6} \div (3x - 6)$$

55. (1.4) Find an equation of the line perpendicular to $3x + 4y = 8$, and through the point $(0, -2)$. Write the result in slope-intercept form.

56. (Appendix A.6/1.1) For the figure shown, (a) use the Pythagorean Theorem to find the length of the missing side and (b) state the area of the triangular side.

2.6 Variation: The Toolbox Functions in Action

LEARNING OBJECTIVES

In Section 2.6 you will see how we can:

- ❑ **A.** Solve direct variations
- ❑ **B.** Solve inverse variations
- ❑ **C.** Solve joint variations

A study of direct and inverse variation offers perhaps our clearest view of how mathematics is used to model real-world phenomena. While the basis of our study is elementary, involving only the toolbox functions, the applications are at the same time elegant, powerful, and far reaching. In addition, these applications unite some of the most important ideas in algebra, including functions, transformations, rates of change, and graphical analysis, to name a few.

A. Toolbox Functions and Direct Variation

If a car gets 24 miles per gallon (mpg) of gas, we could express the distance d it could travel as $d = 24g$. Table 2.4 verifies the distance traveled by the car changes in *direct* or *constant proportion* to the number of gallons used, and here we say, "distance traveled *varies directly* with gallons used." The equation $d = 24g$ is called a **direct variation,** and the coefficient 24 is called the **constant of variation.** Using the rate of change notation, $\frac{\Delta\text{distance}}{\Delta\text{gallons}} = \frac{\Delta d}{\Delta g} = \frac{24}{1}$, and we note this is actually a *linear equation* with slope $m = 24$. When working with variations, the constant k is preferred over m, and in general we have the following:

Table 2.4

g	d
1	24
2	48
3	72
4	96

Direct Variation

y varies directly with x, or *y is directly proportional to x*, if there is a nonzero constant k such that

$$y = kx.$$

k is called the *constant of variation*

EXAMPLE 1 ▶ **Writing a Variation Equation**

Write the variation equation for these statements:

a. Wages earned varies directly with the number of hours worked.

b. The value of an office machine varies directly with time.

c. The circumference of a circle varies directly with the length of the diameter.

Solution ▶

a. **W**ages varies directly with **h**ours worked: $W = kh$

b. The **V**alue of an office machine varies directly with **t**ime: $V = kt$

c. The **C**ircumference varies directly with the **d**iameter: $C = kd$

Now try Exercises 7 through 10 ▶

Once we determine the relationship between two variables is a direct variation, we try to find the value of k and develop an equation model that can more generally be applied. Note that "varies directly" indicates that one value is a constant multiple of the other. In Example 1, you may have realized that if any one relationship between the variables is known, we can solve for k by substitution. For instance, if the circumference of a circle is 314 cm when the diameter is 100 cm, $C = kd$ becomes $314 = k(100)$ and division shows $k = 3.14$ (our estimate for π). The result is a formula for the circumference of *any* circle. This suggests the following procedure:

Solving Applications of Variation

1. Translate the information given into an equation model, using k as the constant of variation.
2. Substitute the first relationship (pair of values) given and solve for k.
3. Substitute this value for k in the original model to obtain the variation equation.
4. Use the variation equation to complete the application.

EXAMPLE 2 ▶ **Solving an Application of Direct Variation**

The weight of an astronaut on the surface of another planet **varies directly** with their weight on Earth. An astronaut weighing 140 lb on Earth weighs only 53.2 lb on Mars. How much would a 170-lb astronaut weigh on Mars?

Solution ▶

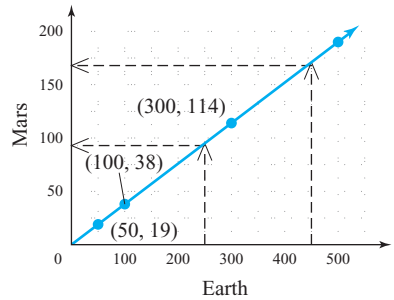
1. $M = kE$ "**M**ars weight varies directly with **E**arth weight"
2. $53.2 = k(140)$ substitute 53.2 for M and 140 for E
   $k = 0.38$ solve for k (constant of variation)

Substitute this value of k in the original equation to obtain the variation equation, then find the weight of a 170-lb astronaut that landed on Mars.

3. $M = 0.38E$ variation equation
4. $= 0.38(170)$ substitute 170 for E
   $= 64.6$ result

An astronaut weighing 170 lb on Earth weighs only 64.6 lb on Mars.

Now try Exercises 11 through 14 ▶



The toolbox function from Example 2 was a line with slope $k = 0.38$, or $k = \frac{19}{50}$ as a fraction in simplest form. As a rate of change, $k = \frac{\Delta M}{\Delta E} = \frac{19}{50}$, and we see that for every 50 additional pounds on Earth, the weight of an astronaut would increase by only 19 lb on Mars.

EXAMPLE 3 ▶ **Making Estimates from the Graph of a Variation**

The scientists at NASA are planning to send additional probes to the red planet (Mars), that will weigh from 250 to 450 lb. Graph the variation equation from Example 2, then *use the graph* to estimate the corresponding range of weights on Mars. Check your estimate using the variation equation.

Solution ▶

After selecting an appropriate scale, begin at (0, 0) and count off the slope $k = \frac{\Delta M}{\Delta E} = \frac{19}{50}$. This gives the points (50, 19), (100, 38), (200, 76), and so on. From the graph (see dashed arrows), it appears the weights corresponding to 250 lb and 450 lb on Earth are near 95 lb and 170 lb on Mars. Using the equation gives

$M = 0.38E$ variation equation
$= 0.38(250)$ substitute 250 for E
$= 95,$
$M = 0.38E$ variation equation
$= 0.38(450)$ substitute 450 for E
$= 171$, very close to our estimate from the graph.

Now try Exercises 15 and 16 ▶

When toolbox functions are used to model variations, our knowledge of their graphs and defining characteristics strengthens a contextual understanding of the application. Consider Examples 4 and 5, where the squaring function is used.

EXAMPLE 4 ▶ Writing Variation Equations

Write the variation equation for these statements:

a. In free fall, the distance traveled by an object varies directly with the square of the time.

b. The area of a circle varies directly with the square of its radius.

Solution ▶

a. Distance varies directly with the square of the time: $D = kt^2$.

b. Area varies directly with the square of the radius: $A = kr^2$.

Now try Exercises 17 through 20 ▶

Both variations in Example 4 use the squaring function, where k represents the amount of stretch or compression applied, and whether the graph will open upward or downward. However, regardless of the function used, the four-step solution process remains the same.

EXAMPLE 5 ▶ Solving an Application of Direct Variation

The range of a projectile varies directly with the square of its initial velocity. As part of a circus act, Bailey the Human Bullet is shot out of a cannon with an initial velocity of 80 feet per second (ft/sec), into a net 200 ft away.

a. Find the constant of variation and write the variation equation.

b. Graph the equation and *use the graph* to estimate how far away the net should be placed if initial velocity is increased to 95 ft/sec.

c. Determine the accuracy of the estimate from (b) using the variation equation.

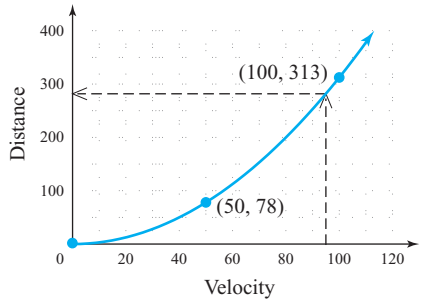
Solution ▶

a.

1. $R = kv^2$ "Range varies directly with the square of the velocity"

2. $200 = k(80)^2$ substitute 200 for R and 80 for v

$k = 0.03125$ solve for k (constant of variation)



3. $R = 0.03125v^2$ variation equation (substitute 0.03125 for k)

b. Since velocity and distance are positive, we again use only QI. The graph is a parabola that opens upward, with the vertex at (0, 0). Selecting velocities from 50 to 100 ft/sec, we have:

$R = 0.03125v^2$ variation equation

$= 0.03125(50)^2$ substitute 50 for v

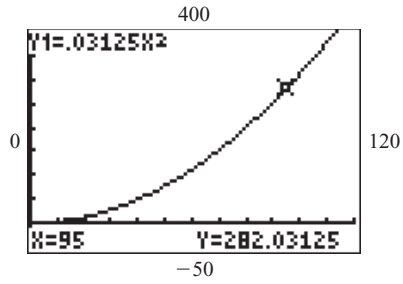
$= 78.125$ result

Likewise substituting 100 for v gives $R = 312.5$ ft. Scaling the axes and using (0, 0), (50, 78), and (100, 313) produces the graph shown. At 95 ft/sec (dashed lines), it appears the net should be placed about 280 ft away.

c. Using the variation equation gives:

4. $R = 0.03125v^2$ variation equation

$= 0.03125(95)^2$ substitute 95 for v



$R = 282.03125$ result

Our estimate was off by about 2 ft. The net should be placed about 282 ft away.

Now try Exercises 21 through 26 ▶

We now have a complete picture of this relationship, in which the required information can be presented graphically (Figure 2.93), numerically (Figure 2.94), verbally, and in equation form. This enables the people requiring the information, i.e., Bailey himself (for obvious reasons) and the Circus Master who is responsible, to make more informed (and safe) decisions.

Figure 2.93

Range R varies as the square of the velocity

Figure 2.94

X	Y1
40	50
50	78.125
60	112.5
70	153.13
80	200
90	253.13
100	312.5

X=100

$R = 0.03125v^2$

☑ **A.** You've just seen how we can solve direct variations

Note: For Examples 7 and 8, the four steps of the solution process were used in sequence, but not numbered.

B. Inverse Variation

Table 2.5

Price (dollars)	Demand (1000s)
8	288
9	144
10	96
11	72
12	57.6

Numerous studies have been done that relate the price of a commodity to the demand—the willingness of a consumer to pay that price. For instance, if there is a sudden increase in the price of a popular tool, hardware stores know there will be a corresponding decrease in the demand for that tool. The question remains, "What is this rate of decrease?" Can it be modeled by a linear function with a negative slope? A parabola that opens downward? Some other function? Table 2.5 shows some (simulated) data regarding price versus demand. It appears that a linear function is not appropriate because the rate of change in the number of tools sold is not constant. Likewise a quadratic model seems inappropriate, since we don't expect demand to suddenly start rising again as the price continues to increase. This phenomenon is actually an example of **inverse variation,** modeled by a transformation of the reciprocal function $y = \frac{k}{x}$. We will often rewrite the equation as $y = k(\frac{1}{x})$ to clearly see the inverse relationship. In the case at hand, we might write $D = k(\frac{1}{P})$, where k is the constant of variation, D represents the demand for the product, and P the price of the product. In words, we say that "demand *varies inversely* as the price." In other applications of inverse variation, one quantity may vary inversely as the *square* of another [Example 6(b)], and in general we have

Inverse Variation

y varies inversely with x, or *y is inversely proportional to x,* if there is a nonzero constant k such that

$$y = k\left(\frac{1}{x}\right).$$

k is called the *constant of variation*

EXAMPLE 6 ▶ **Writing Inverse Variation Equations**

Write the variation equation for these statements:

a. In a closed container, pressure varies inversely with the volume of gas.

b. The intensity of light varies inversely with the square of the distance from the source.

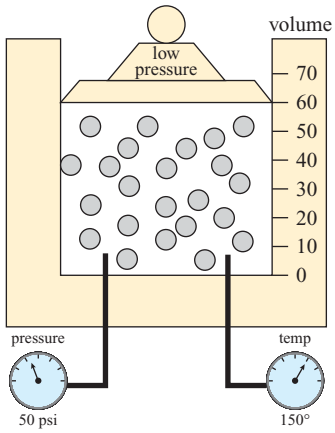
Solution ▶

a. Pressure varies inversely with the *V*olume of gas: $P = k(\frac{1}{V})$.

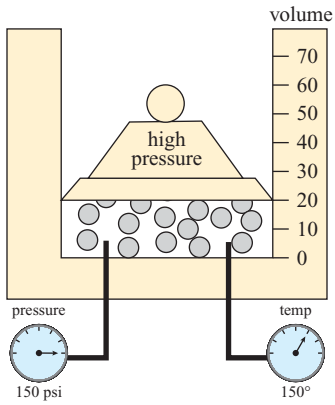
b. Intensity of light varies inversely with the square of the distance: $I = k\left(\frac{1}{d^2}\right)$.

Now try Exercises 27 through 30 ▶

EXAMPLE 7 ▶ **Solving an Application of Inverse Variation**



Boyle's law tells us that in a closed container with constant temperature, the volume of a gas varies inversely with the pressure applied (see illustration). Suppose the air pressure in a closed cylinder is 50 pounds per square inch (psi) when the volume of the cylinder is 60 in^3.



a. Find the constant of variation and write the variation equation.

b. Use the equation to find the volume, if the pressure is increased to 150 psi.

Solution ▶

Illustration of Boyle's Law

a. $V = k\left(\frac{1}{P}\right)$ "volume varies inversely with the pressure"

$60 = k\left(\frac{1}{50}\right)$ substitute 60 for *V* and 50 for *P*

$k = 3000$ constant of variation

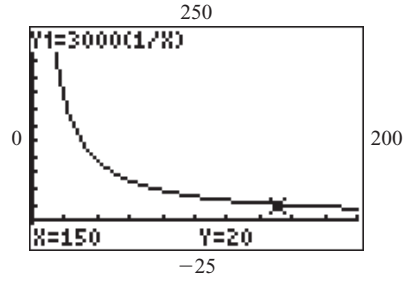
$V = 3000\left(\frac{1}{P}\right)$ variation equation (substitute 3000 for *k*)

b. Using the variation equation we have:

$V = 3000\left(\frac{1}{P}\right)$ variation equation

$= 3000\left(\frac{1}{150}\right)$ substitute 150 for *P*

$= 20$ result



When the pressure is increased to 150 psi, the volume decreases to 20 in^3.

Now try Exercises 31 through 34 ▶

B. You've just seen how we can solve inverse variations

As an application of the reciprocal function, the relationship in Example 7 is easily graphed as a transformation of $y = \frac{1}{x}$. Using an appropriate scale and values in QI, only a vertical stretch of 3000 is required and the result is shown in Figure 2.95. As noted, when the pressure increases the volume decreases, or in notation: as $P \to \infty$, $V \to 0$. Applications of this sort can be as sophisticated as the manufacturing of industrial pumps and synthetic materials, or as simple as cooking a homemade dinner. Simply based on the equation, how much pressure is required to reduce the volume of gas to 1 in^3?

Figure 2.95

C. Joint or Combined Variations

Figure 2.96

Just as some decisions might be based on many considerations, often the relationship between two variables depends on a combination of factors. Imagine a wooden plank laid across the banks of a stream for hikers to cross the streambed (see Figure 2.96). The amount of weight the plank will support depends on the type of wood, the width and height of the plank's cross section, and the distance between the supported ends **(see Exercises 59 and 60).** This is an example of a **joint variation,** which can combine any number of variables in different ways. Two general possibilities are: (1) *y varies jointly with the product of x and p:* $y = kxp$; and (2) *y varies jointly with the product of x and p, and inversely with the square of q:* $y = kxp(\frac{1}{q^2})$. For practice writing joint variations as an equation model, **see Exercises 35 through 40.**

EXAMPLE 8 ▶ **Solving an Application of Joint Variation**

The amount of fuel used by a certain ship traveling at a uniform speed varies jointly with the distance it travels and the square of the velocity. If 200 barrels of fuel are used to travel 10 mi at 20 nautical miles per hour, how far does the ship travel on 500 barrels of fuel at 30 nautical miles per hour?

Solution ▶

$F = kdv^2$	"**F**uel use *varies jointly* with **d**istance and **v**elocity squared"
$200 = k(10)(20)^2$	substitute 200 for F, 10 for d, and 20 for v
$200 = 4000k$	simplify and solve for k
$0.05 = k$	constant of variation
$F = 0.05dv^2$	equation of variation

To find the distance traveled at 30 nautical miles per hour using 500 barrels of fuel, substitute 500 for F and 30 for v:

$F = 0.05dv^2$	equation of variation
$500 = 0.05d(30)^2$	substitute 500 for F and 30 for v
$500 = 45d$	simplify
$11.\overline{1} = d$	result

If 500 barrels of fuel are consumed while traveling 30 nautical miles per hour, the ship covers a distance of just over 11 mi.

Now try Exercises 41 through 44 ▶

It's interesting to note that the ship covers just over one additional mile, but consumes 2.5 times the amount of fuel. The additional speed requires a great deal more fuel.

There is a variety of additional applications in the Exercise Set. **See Exercises 47 through 55.**

☑ **C.** You've just seen how we can solve joint variations

2.6 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. The phrase "y varies directly with x" is written $y = kx$, where k is called the _____ of variation.
2. If more than two quantities are related in a variation equation, the result is called a _____ variation.
3. For a right circular cylinder, $V = \pi r^2 h$ and we say, the volume varies _____ with the _____ and the _____ of the radius.
4. The statement "y varies inversely with the square of x" is written _____.
5. Discuss/Explain the general procedure for solving applications of variation. Include references to keywords, and illustrate using an example.
6. The basic percent formula is *amount equals percent times base,* or $A = PB$. In words, write this out as a direct variation with B as the constant of variation, then as an inverse variation with the amount A as the constant of variation.

▶ DEVELOPING YOUR SKILLS

Write the variation equation for each statement.

7. distance traveled varies directly with rate of speed
8. cost varies directly with the quantity purchased
9. force varies directly with acceleration
10. length of a spring varies directly with attached weight

For Exercises 11 and 12, find the constant of variation and write the variation equation. Then use the equation to complete the table.

11. y varies directly with x; $y = 0.6$ when $x = 24$.

x	y
500	
	16.25
750	

12. w varies directly with v; $w = \frac{1}{3}$ when $v = 5$.

v	w
291	
	21.8
339	

13. **Wages and hours worked:** Wages earned varies directly with the number of hours worked. Last week I worked 37.5 hr and my gross pay was $344.25. Write the variation equation and determine how much I will gross this week if I work 35 hr. What does the value of k represent in this case?
14. **Pagecount and thickness of books:** The thickness of a paperback book varies directly as the number of pages. A book 3.2 cm thick has 750 pages. Write the variation equation and approximate the thickness of *Roget's 21st Century Thesaurus* (paperback—2nd edition), which has 957 pages.
15. **Building height and number of stairs:** The number of stairs in the stairwells of tall buildings and other structures varies directly as the height of the structure. The base and pedestal for the Statue of Liberty are 47 m tall, with 192 stairs from ground level to the observation deck at the top of the pedestal (at the statue's feet). (a) Find the constant of variation and write the variation equation, (b) graph the variation equation, (c) use the graph to estimate the number of stairs from ground level to the observation deck in the statue's crown 81 m above ground level, and (d) use the equation to check this estimate. Was it close?

16. **Projected images:** The height of a projected image varies directly as the distance of the projector from the screen. At a distance of 48 in., the image on the screen is 16 in. high. (a) Find the constant of variation and write the variation equation, (b) graph the variation equation, (c) use the graph to estimate the height of the image if the projector is placed at a distance of 5 ft 3 in., and (d) use the equation to check this estimate. Was it close?

Write the variation equation for each statement.

17. Surface area of a cube varies directly with the square of a side.
18. Potential energy in a spring varies directly with the square of the distance the spring is compressed.
19. Electric power varies directly with the square of the current (amperes).
20. Manufacturing cost varies directly as the square of the number of items made.

For Exercises 21 and 22, find the constant of variation and write the variation equation. Then use the equation to complete the table.

21. p varies directly with the square of q; $p = 280$ when $q = 50$

q	p
45	
	338.8
70	

22. n varies directly with m squared; $n = 24.75$ when $m = 30$

m	n
40	
	99
88	

For Exercises 23 to 26, supply the relationship indicated (a) in words, (b) in equation form, (c) graphically, and (d) in table form, then (e) solve the application.

23. **The Borg Collective:** The surface area of a cube varies directly as the square of one side. A cube with sides of $14\sqrt{3}$ cm has a surface area of 3528 cm^2. Find the surface area in square meters of the spaceships used by the Borg Collective in *Star Trek—The Next Generation,* cubical spacecraft with sides of 3036 m.
24. **Geometry and geography:** The area of an equilateral triangle varies directly as the square of one side. A triangle with sides of 50 yd has an area of 1082.5 yd^2. Find the area in mi^2 of the region bounded by straight lines connecting the cities of Cincinnati, Ohio, Washington, D.C., and Columbia, South Carolina, which are each approximately 400 mi apart.
25. **Galileo and gravity:** The distance an object falls varies directly as the square of the time it has been falling. The cannonballs dropped by Galileo from the Leaning Tower of Pisa fell about 169 ft in 3.25 sec. How long would it take a hammer, accidentally dropped from a height of 196 ft by a bridge repair crew, to splash into the water below? According to the equation, if a camera accidentally fell out of the *News 4 Eye-in-the-Sky* helicopter and hit the ground in 2.75 sec, how high was the helicopter?
26. **Soap bubble surface area:** When a child blows small soap bubbles, they come out in the form of a sphere because the surface tension in the soap seeks to minimize the surface area. The surface area of any sphere varies directly with the square of its radius. A soap bubble with a $\frac{3}{4}$ in. radius has a surface area of approximately 7.07 in^2. What is the radius of a seventeenth-century cannonball that has a surface area of 113.1 in^2? What is the surface area of an orange with a radius of $1\frac{1}{2}$ in.?

Write the variation equation for each statement.

27. The force of gravity varies inversely as the square of the distance between objects.
28. Pressure varies inversely as the area over which it is applied.
29. The safe load of a beam supported at both ends varies inversely as its length.
30. The intensity of sound varies inversely as the square of its distance from the source.

For Exercises 31 through 34, find the constant of variation and write the variation equation. Then use the equation to complete the table or solve the application.

31. Y varies inversely as the square of Z; $Y = 1369$ when $Z = 3$

Z	Y
37	
	2.25
111	

32. A varies inversely with B; $A = 2450$ when $B = 0.8$

B	A
140	
	6.125
560	

33. Gravitational force: The effect of Earth's gravity on an object (its weight) varies inversely as the square of its distance from the center of the planet (assume the Earth's radius is 6400 km). If the weight of an astronaut is 75 kg on Earth (when $r = 6400$), what would this weight be at an altitude of 1600 km *above the surface* of the Earth?

34. Popular running shoes: The demand for a popular new running shoe varies inversely with the price of the shoes. When the wholesale price is set at \$45, the manufacturer ships 5500 orders per week to retail outlets. Based on this information, how many orders would be shipped per week if the wholesale price rose to \$55?

Write the variation equation for each statement.

35. Interest earned varies jointly with the rate of interest and the length of time on deposit.

36. Horsepower varies jointly as the number of cylinders in the engine and the square of the cylinder's diameter.

37. The area of a trapezoid varies jointly with its height and the sum of the bases.

38. The area of a triangle varies jointly with its base and its height.

39. The volume of metal in a circular coin varies directly with the thickness of the coin and the square of its radius.

40. The electrical resistance in a wire varies directly with its length and inversely as the cross-sectional area of the wire.

For Exercises 41–44, find the constant of variation and write the related variation equation. Then use the equation to complete the table or solve the application.

41. C varies jointly with R and inversely with S squared, and $C = 21$ when $R = 7$ and $S = 1.5$.

R	S	C
120		22.5
200	12.5	
	15	10.5

42. J varies jointly with P and inversely with the square root of Q, and $J = 19$ when $P = 4$ and $Q = 25$.

P	Q	J
47.5		118.75
112	31.36	
	44.89	66.5

43. Kinetic energy: Kinetic energy (energy attributed to motion) varies jointly with the mass of the object and the square of its velocity. Assuming a unit mass of $m = 1$, an object with a velocity of 20 m per sec (m/s) has kinetic energy of 200 J. How much energy is produced if the velocity is increased to 35 m/s?

44. Safe load: The load that a horizontal beam can support varies jointly as the width of the beam, the square of its height, and inversely as the length of the beam. A beam 4 in. wide and 8 in. tall can safely support a load of 1 ton when the beam has a length of 12 ft. How much could a similar beam 10 in. tall safely support?

▶ WORKING WITH FORMULAS

45. Required interest rate: $R(A) = \sqrt[3]{A} - 1$
To determine the simple interest rate R that would be required for each dollar (\$1) left on deposit for 3 yr to grow to an amount A, the formula $R(A) = \sqrt[3]{A} - 1$ can be applied. (a) To what function family does this formula belong? (b) Complete the table using a calculator, then use the table to estimate the interest rate required for each \$1 to grow to \$1.17. (c) Compare your estimate to the value you get by evaluating $R(1.17)$. (d) For $R = \sqrt[3]{A} - 1$, solve for A in terms of R.

Amount A	Rate R
1.0	
1.05	
1.10	
1.15	
1.20	
1.25	

46. Force between charged particles: $F = k\dfrac{Q_1 Q_2}{d^2}$

The force between two charged particles is given by the formula shown, where F is the force (in joules—J), Q_1 and Q_2 represent the electrical charge on each particle (in coulombs—C), and d is the distance between them (in meters). If the particles have a like charge, the force is repulsive; if the charges are unlike, the force is attractive. (a) Write the variation equation in words. (b) Solve for k and use the formula to find the electrical constant k, given $F = 0.36$ J, $Q_1 = 2 \times 10^{-6}$ C, $Q_2 = 4 \times 10^{-6}$ C, and $d = 0.2$ m. Express the result in scientific notation.

▶ APPLICATIONS

Find the constant of variation "k" and write the variation equation, then use the equation to solve.

47. Cleanup time: The time required to pick up the trash along a stretch of highway varies inversely as the number of volunteers who are working. If 12 volunteers can do the cleanup in 4 hr, how many volunteers are needed to complete the cleanup in just 1.5 hr?

48. Wind power: The wind farms in southern California contain wind generators whose power production varies directly with the cube of the wind's speed. If one such generator produces 1000 W of power in a 25 mph wind, find the power it generates in a 35 mph wind.

49. Pull of gravity: The weight of an object on the moon varies directly with the weight of the object on Earth. A 96-kg object on Earth would weigh only 16 kg on the moon. How much would a fully suited 250-kg astronaut weigh on the moon?

50. Period of a pendulum: The time that it takes for a simple pendulum to complete one period (swing over and back) varies directly as the square root of its length. If a pendulum 20 ft long has a period of 5 sec, find the period of a pendulum 30 ft long.

51. Stopping distance: The stopping distance of an automobile varies directly as the square root of its speed when the brakes are applied. If a car requires 108 ft to stop from a speed of 25 mph, estimate the stopping distance if the brakes were applied when the car was traveling 45 mph.

52. Supply and demand: A chain of hardware stores finds that the demand for a special power tool varies inversely with the advertised price of the tool. If the price is advertised at \$85, there is a monthly demand for 10,000 units at all participating stores. Find the projected demand if the price were lowered to \$70.83.

53. Cost of copper tubing: The cost of copper tubing varies jointly with the length and the diameter of the tube. If a 36-ft spool of $\frac{1}{4}$-in.-diameter tubing costs \$76.50, how much does a 24-ft spool of $\frac{3}{8}$-in.-diameter tubing cost?

54. Electrical resistance: The electrical resistance of a copper wire varies directly with its length and inversely with the square of the diameter of the wire. If a wire 30 m long with a diameter of 3 mm has a resistance of 25 Ω, find the resistance of a wire 40 m long with a diameter of 3.5 mm.

55. Volume of phone calls: The number of phone calls per day between two cities varies directly as the product of their populations and inversely as the square of the distance between them. The city of Tampa, Florida (pop. 300,000), is 430 mi from the city of Atlanta, Georgia (pop. 420,000). Telecommunications experts estimate there are about 300 calls per day between the two cities. Use this information to estimate the number of daily phone calls between Amarillo, Texas (pop. 170,000), and Denver, Colorado (pop. 550,000), which are also separated by a distance of about 430 mi. Note: Population figures are for the year 2000 and rounded to the nearest ten-thousand.

Source: 2005 World Almanac, p. 626.

56. Internet commerce: The likelihood of an eBay® item being sold for its "Buy it Now®" price P, varies directly with the feedback rating of the seller, and inversely with the cube of $\frac{P}{MSRP}$, where MSRP represents the manufacturer's suggested retail price. A power eBay® seller with a feedback rating of 99.6%, knows she has a 60% likelihood of selling an item at 90% of the MSRP. What is the likelihood a seller with a 95.3% feedback rating can sell the same item at 95% of the MSRP?

57. Volume of an egg: The volume of an egg laid by an average chicken varies jointly with its length and the square of its width. An egg measuring 2.50 cm wide and 3.75 cm long has a volume of 12.27 cm^3. A Barret's Blue Ribbon hen can lay an egg measuring 3.10 cm wide and 4.65 cm long. (a) What is the volume of this egg? (b) As a percentage, how much greater is this volume than that of an average chicken's egg?

58. Athletic performance: Researchers have estimated that a sprinter's time in the 100-m dash varies directly as the square root of her age and inversely as the number of hours spent training each week. At 20 yr old, Gail trains 10 hr per week (hr/wk) and has an average time of 11 sec. Assuming she continues to train 10 hr/wk, (a) what will her average time be at 30 yr old? (b) If she wants to keep her average time at 11 sec, how many hours per week should she train?

59. Maximum safe load: The maximum safe load M that can be placed on a uniform horizontal beam supported at both ends varies directly as the width w and the square of the height h of the beam's cross section, and inversely as its length L (width and height are assumed to be in inches, and length in feet). (a) Write the variation equation. (b) If a beam 18 in. wide, 2 in. high, and 8 ft long can safely support 270 lb, what is the safe load for a beam of like dimensions with a length of 12 ft?

60. Maximum safe load: Suppose a 10-ft wooden beam with dimensions 4 in. by 6 in. is made from the same material as the beam in Exercise 59 (the same k value can be used). (a) What is the maximum safe load if the beam is placed so that width is 6 in. and height is 4 in.? (b) What is the maximum safe load if the beam is placed so that width is 4 in. and height is 6 in.?

▶ EXTENDING THE CONCEPT

61. The gravitational force F between two celestial bodies varies jointly as the product of their masses and inversely as the square of the distance d between them. The relationship is modeled by Newton's law of universal gravitation: $F = k\frac{m_1 m_2}{d^2}$. Given that $k = 6.67 \times 10^{-11}$, what is the gravitational force exerted by a 1000-kg sphere on another identical sphere that is 10 m away?

62. The intensity of light and sound both vary inversely as the square of their distance from the source.

a. Suppose you're relaxing one evening with a copy of *Twelfth Night* (Shakespeare), and the reading light is placed 5 ft from the surface of the book. At what distance would the intensity of the light be twice as great?

b. *Tamino's Aria* (*The Magic Flute*—Mozart) is playing in the background, with the speakers 12 ft away. At what distance from the speakers would the intensity of sound be three times as great?

▶ MAINTAINING YOUR SKILLS

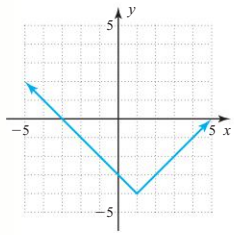
63. (Appendix A.2) Evaluate: $\left(\frac{2x^4}{3x^3y}\right)^{-2}$

64. (Appendix A.4) Solve: $x^3 + 6x^2 + 8x = 0$.

65. (2.4) State the domains of f and g given here:

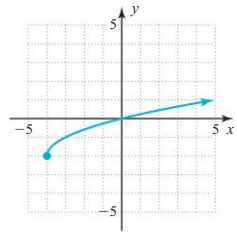
a. $f(x) = \frac{x - 3}{x^2 - 16}$

b. $g(x) = \frac{x - 3}{\sqrt{x^2 - 16}}$



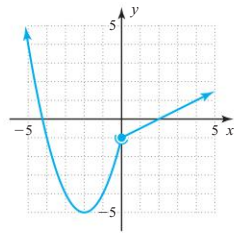
66. (2.3) Graph by using transformations of the parent function and plotting a minimum number of points: $f(x) = -2|x - 3| + 5$.

MAKING CONNECTIONS

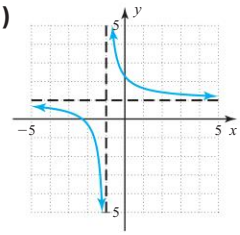


Making Connections: Graphically, Symbolically, Numerically, and Verbally

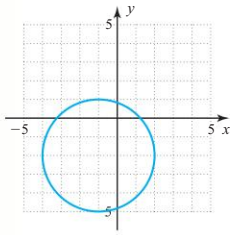
Eight graphs (a) through (h) are given. Match the characteristics shown in 1 through 16 to one of the eight graphs.



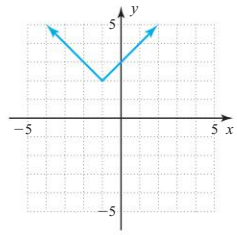
(a)



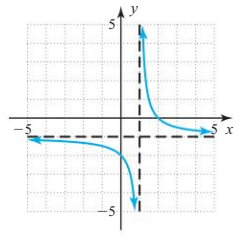
(b)



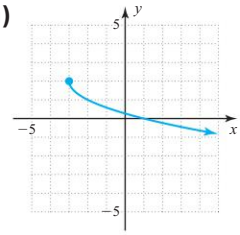
(c)



(d)



(e)



(f)

(g)

(h)

1. ____ domain: $x \in (-\infty, 1) \cup (1, \infty)$

2. ____ $y = \sqrt{x + 4} - 2$

3. ____ $f(x)\uparrow$ for $x \in (1, \infty)$

4. ____ horizontal asymptote at $y = -1$

5. ____ $y = \dfrac{1}{x + 1} + 1$

6. ____ domain: $x \in [-4, 2]$

7. ____ $y = |x - 1| - 4$

8. ____ $f(x) \le 0$ for $x \in [1, \infty)$

9. ____ domain: $x \in [-4, \infty)$

10. ____ $f(-3) = -1, f(5) = 1$

11. ____ basic function is shifted 3 units left, reflected across x-axis, then shifted up 2 units

12. ____ basic function is shifted 1 unit left, 2 units up

13. ____ $f(-3) = -4, f(2) = 0$

14. ____ as $x \to \infty, y \to 1$

15. ____ $f(x) > 0$ for $x \in (-\infty, \infty)$

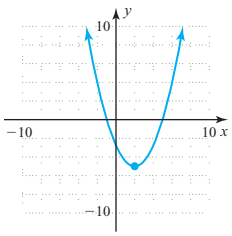
16. ____ $y = \begin{cases} (x + 2)^2 - 5, & x < 0 \\ \dfrac{1}{2}x - 1, & x \ge 0 \end{cases}$

SUMMARY AND CONCEPT REVIEW

SECTION 2.1 Analyzing the Graph of a Function

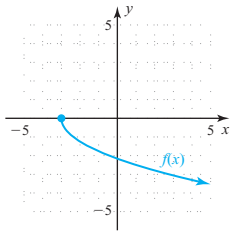
KEY CONCEPTS

- A function f is even (symmetric to the y-axis), if and only if when a point (x, y) is on the graph, then $(-x, y)$ is also on the graph. In function notation: $f(-x) = f(x)$.
- A function f is odd (symmetric to the origin), if and only if when a point (x, y) is on the graph, then $(-x, -y)$ is also on the graph. In function notation: $f(-x) = -f(x)$.



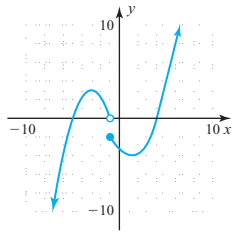
Intuitive descriptions of the characteristics of a graph are given here. The formal definitions can be found within Section 2.1.

- A function is *increasing* in an interval if the graph rises from left to right (larger inputs produce larger outputs).
- A function is *decreasing* in an interval if the graph falls from left to right (larger inputs produce smaller outputs).
- A function is *positive* in an interval if the graph is above the x-axis in that interval.
- A function is *negative* in an interval if the graph is below the x-axis in that interval.
- A function is *constant* in an interval if the graph is parallel to the x-axis in that interval.
- A maximum value can be a *local* maximum, or *global* maximum. An *endpoint* maximum can occur at the endpoints of the domain. Similar statements can be made for minimum values.



EXERCISES

State the domain and range for each function $f(x)$ given. Then state the intervals where f is increasing or decreasing and intervals where f is positive or negative. Assume all endpoints have integer values.



1.

2.

3.

4. Determine whether the following are even $[f(-k) = f(k)]$, odd $[f(-k) = -f(k)]$, or neither.

a. $f(x) = 2x^5 - \sqrt[3]{x}$ **b.** $g(x) = x^4 - \dfrac{\sqrt[3]{x}}{x}$

c. $p(x) = |3x| - x^3$ **d.** $q(x) = \dfrac{x^2 - |x|}{x}$

5. Draw the function f that has all of the following characteristics, then name the zeroes of the function and the location of all local maximum and minimum values. [*Hint:* Write them in the form $(c, f(c))$.]

a. Domain: $x \in [-6, 10)$ **b.** Range: $y \in [-8, 6)$

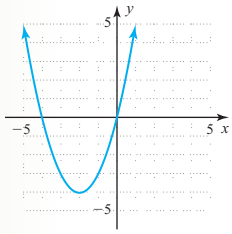
c. $f(0) = 0$ **d.** $f(x)\downarrow$ for $x \in (-6, -3) \cup (3, 7.5)$

e. $f(x)\uparrow$ for $x \in (-3, 3) \cup (7.5, 10)$ **f.** $f(x) < 0$ for $x \in (-6, 0) \cup (6, 9)$

g. $f(x) > 0$ for $x \in (0, 6) \cup (9, 10)$

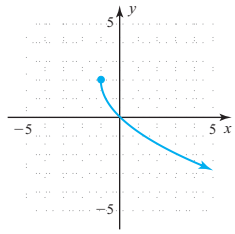
6. Use a graphing calculator to find the maximum and minimum values of $f(x) = 2x^5 - \sqrt[3]{x}$. Round to the nearest hundredth.

SECTION 2.2 The Toolbox Functions and Transformations



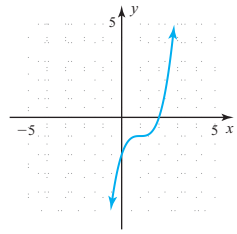
KEY CONCEPTS

- The *toolbox functions* and graphs commonly used in mathematics are
  - the identity function $f(x) = x$
  - square root function: $f(x) = \sqrt{x}$
  - cubing function: $f(x) = x^3$
  - squaring function: $f(x) = x^2$
  - absolute value function: $f(x) = |x|$
  - cube root function: $f(x) = \sqrt[3]{x}$
- For a basic or parent function $y = f(x)$, the general equation of the transformed function is $y = af(x \pm h) \pm k$. For any function $y = f(x)$ and $h, k > 0$,
  - the graph of $y = f(x) + k$ is the graph of $y = f(x)$ shifted upward k units
  - the graph of $y = f(x) - k$ is the graph of $y = f(x)$ shifted downward k units
  - the graph of $y = f(x + h)$ is the graph of $y = f(x)$ shifted left h units
  - the graph of $y = f(x - h)$ is the graph of $y = f(x)$ shifted right h units
  - the graph of $y = -f(x)$ is the graph of $y = f(x)$ reflected across the x-axis
  - the graph of $y = f(-x)$ is the graph of $y = f(x)$ reflected across the y-axis
  - $y = af(x)$ results in a vertical stretch when $a > 1$
  - $y = af(x)$ results in a vertical compression when $0 < a < 1$
- Transformations are applied in the following order: (1) horizontal shifts, (2) reflections, (3) stretches or compressions, and (4) vertical shifts.

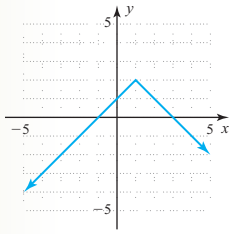


EXERCISES

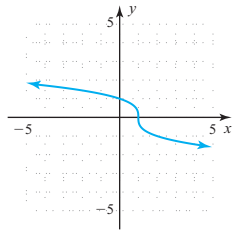
Identify the function family for each graph given, then (a) describe the end-behavior; (b) name the x- and y-intercepts; (c) identify the vertex, initial point, or point of inflection (as applicable); and (d) state the domain and range.



7.



8.



9.

10.

11.

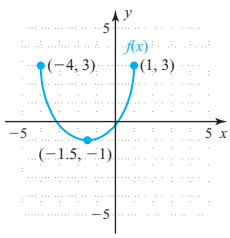
Identify each function as belonging to the linear, quadratic, square root, cubic, cube root, or absolute value family. Then sketch the graph using shifts of a parent function and a few characteristic points.

12. $f(x) = -(x + 2)^2 - 5$

13. $f(x) = 2|x + 3|$

14. $f(x) = x^3 - 1$

15. $f(x) = \sqrt{x - 5} + 2$



16. $f(x) = \sqrt[3]{x + 2}$

17. Apply the transformations indicated for the graph of $f(x)$ given.

a. $f(x - 2)$

b. $-f(x) + 4$

c. $\frac{1}{2}f(x)$

SECTION 2.3 Absolute Value Functions, Equations, and Inequalities

KEY CONCEPTS

- To solve absolute value equations and inequalities, begin by writing the equation in simplified form, with the absolute value isolated on one side.
- If X and Y represent algebraic expressions and k is a nonnegative constant:
  - Absolute value equations: $|X| = k$ is equivalent to $X = -k$ or $X = k$
    $|X| = |Y|$ is equivalent to $X = Y$ or $X = -Y$
  - "Less than" inequalities: $|X| < k$ is equivalent to $-k < X < k$
  - "Greater than" inequalities: $|X| > k$ is equivalent to $X < -k$ or $X > k$
- These properties also apply when the symbols "$\leq$" or "$\geq$"are used.
- If the absolute value quantity has been isolated on the left, the solution to a less-than inequality will be a single interval, while the solution to a greater-than inequality will consist of two disjoint intervals.
- The multiplicative property states that for algebraic expressions A and B, $|AB| = |A||B|$.
- Absolute value equations and inequalities can be solved graphically using the intersect method *or* the zeroes/x-intercept method.

EXERCISES

Solve each equation or inequality. Write solutions to inequalities in interval notation.

18. $7 = |x - 3|$

19. $-2|x + 2| = -10$

20. $|-2x + 3| = 13$

21. $\dfrac{|2x + 5|}{3} + 8 = 9$

22. $-3|x + 2| - 2 < -14$

23. $\left|\dfrac{x}{2} - 9\right| \leq 7$

24. $|3x + 5| = -4$

25. $3|x + 1| < -9$

26. $2|x + 1| > -4$

27. $5|m - 2| - 12 \leq 8$

28. $\dfrac{|3x - 2|}{2} + 6 \geq 10$

29. Monthly rainfall received in Omaha, Nebraska, rarely varies by more than 1.7 in. from an average of 2.5 in. per month. (a) Use this information to write an absolute value inequality model, then (b) solve the inequality to find the highest and lowest amounts of monthly rainfall for this city.

SECTION 2.4 Basic Rational Functions and Power Functions; More on the Domain

KEY CONCEPTS

- A rational function is one of the form $V(x) = \dfrac{p(x)}{d(x)}$, where p and d are polynomials and $d(x) \neq 0$.
- The most basic rational functions are the reciprocal function $f(x) = \dfrac{1}{x}$ and the reciprocal square function $g(x) = \dfrac{1}{x^2}$.
- The line $y = k$ is a horizontal asymptote of V if as $|x|$ increases without bound, $V(x)$ approaches k: as $|x| \to \infty$, $V(x) \to k$.
- The line $x = h$ is a vertical asymptote of V if as x approaches h, $V(x)$ increases/decreases without bound: as $x \to h$, $|V(x)| \to \infty$.
- The reciprocal and reciprocal square functions can be transformed using the same shifts, stretches, and reflections as applied to other basic functions, with the asymptotes also shifted.
- A power function can be written in the form $f(x) = x^p$ where p is a constant real number and x is a variable. If $p = \dfrac{1}{n}$, where n is a natural number, $f(x) = x^{\frac{1}{n}} = \sqrt[n]{x}$ is called a root function in x.
- Given the rational exponent $\frac{m}{n}$ is in simplest form, the domain of $f(x) = x^{\frac{m}{n}}$ is $(-\infty, \infty)$ if n is odd, and $[0, \infty)$ if n is even.

EXERCISES

Sketch the graph of each function using shifts of the parent function (not by using a table of values). Find and label the x- and y-intercepts (if they exist) and redraw the asymptotes.

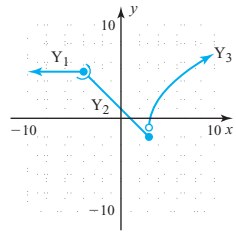
30. $f(x) = \dfrac{1}{x+2} - 1$

31. $h(x) = \dfrac{-1}{(x-2)^2} - 3$

32. In a certain county, the cost to keep public roads free of trash is given by $C(p) = \dfrac{-7500}{p-100} - 75$, where $C(p)$ represents the cost (thousands of dollars) to keep p percent of the trash picked up. (a) Find the cost to pick up 30%, 50%, 70%, and 90% of the trash, and comment on the results. (b) Sketch the graph using the transformation of a toolbox function. (c) Use mathematical notation to describe what happens if the county tries to keep 100% of the trash picked up.

33. Use a graphing calculator to graph the functions $f(x) = x^1$, $g(x) = x^{\frac{1}{2}}$, and $h(x) = x^{\pi}$ in the same viewing window. What is the domain of each function?

34. The expression $T = \dfrac{2\pi}{37{,}840} r^{\frac{3}{2}}$ models the time T (in hr) it takes for a satellite to complete one revolution around the Earth, where r represents the radius (in km) of the orbit measured from the center of the Earth. If the Earth has a radius of 6370 km, (a) how long does it takes for a satellite at a height of 200 km to complete one orbit? (b) What is the orbital height of a satellite that completes one revolution in 4 days (96 hr)?



SECTION 2.5 Piecewise-Defined Functions

KEY CONCEPTS

- Each piece of a piecewise-defined function has a domain over which that piece is defined.
- To evaluate a piecewise-defined function, identify the domain interval containing the input value, then use the piece of the function corresponding to this interval.
- To graph a piecewise-defined function you can plot points, or graph each piece in its entirety, then erase portions of the graph outside the domain indicated for each piece.
- If the graph of a function can be drawn without lifting your pencil from the paper, the function is continuous.
- A discontinuity is said to be removable if we can redefine the function to "fill the hole."
- Step functions are discontinuous and formed by a series of horizontal steps.
- The floor function $\lfloor x \rfloor$ gives the largest integer less than or equal to x.
- The ceiling function $\lceil x \rceil$ is the smallest integer greater than or equal to x.

EXERCISES

35. For the graph and functions given, (a) use the correct notation to write the relation as a single piecewise-defined function, stating the effective domain for each piece by inspecting the graph; and (b) state the range of the function: $Y_1 = 5$, $Y_2 = -X + 1$, $Y_3 = 3\sqrt{X-3} - 1$.

36. Use a table of values as needed to graph $h(x)$, then state its domain and range. If the function has a pointwise (removable) **discontinuity,** state how the second piece could be redefined so that a continuous function results.

$$h(x) = \begin{cases} \dfrac{x^2 - 2x - 15}{x+3}, & x \neq -3 \\ -6, & x = -3 \end{cases}$$

37. Evaluate the piecewise-defined function $p(x)$: $p(-4)$, $p(-2)$, $p(2.5)$, $p(2.99)$, $p(3)$, and $p(3.5)$

$$p(x) = \begin{cases} -4, & x < -2 \\ -|x| - 2, & -2 \le x < 3 \\ 3\sqrt{x} - 9, & x \ge 3 \end{cases}$$

38. Sketch the graph of the function and state its domain and range. Use transformations of the toolbox functions where possible.

$$q(x) = \begin{cases} 2\sqrt{-x-3} - 4, & x \le -3 \\ -2|x| + 2, & -3 < x < 3 \\ 2\sqrt{x-3} - 4, & x \ge 3 \end{cases}$$

39. Many home improvement outlets now rent flatbed trucks in support of customers that purchase large items. The cost is \$20 per hour for the first 2 hr, \$30 for the next 2 hr, then \$40 for each hour afterward. Write this information as a piecewise-defined function, then sketch its graph. What is the total cost to rent this truck for 5 hr?

SECTION 2.6 Variation: The Toolbox Functions in Action

KEY CONCEPTS

- *Direct variation:* If there is a nonzero constant k such that $y = kx$, we say, "y varies directly with x" or "y is directly proportional to x" (k is called the constant of variation).
- *Inverse variation:* If there is a nonzero constant k such that $y = k\left(\frac{1}{x}\right)$ we say, "y varies inversely with x" or y is inversely proportional to x.
- In some cases, direct and inverse variations work simultaneously to form a *joint variation.*
- The process for solving variation applications can be found on page 178.

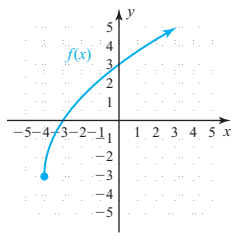
EXERCISES

Find the constant of variation and write the equation model, then use this model to complete the table.

40. y varies directly as the cube root of x; $y = 52.5$ when $x = 27$.

x	y
216	
	12.25
729	

41. z varies directly as v and inversely as the square of w; $z = 1.62$ when $w = 8$ and $v = 144$.



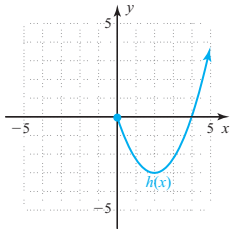
v	w	z
196	7	
	1.25	17.856
24		48

42. Given t varies jointly with u and v, and inversely as w, if $t = 30$ when $u = 2$, $v = 3$, and $w = 5$, find t when $u = 8$, $v = 12$, and $w = 15$.

43. The time that it takes for a simple pendulum to complete one period (swing over and back) is directly proportional to the square root of its length. If a pendulum 16 ft long has a period of 3 sec, find the time it takes for a 36-ft pendulum to complete one period.

PRACTICE TEST

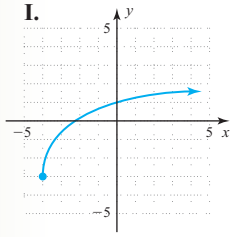
1. Determine the following from the graph shown.



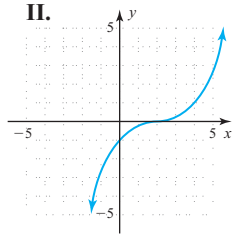
a. the domain and range
b. estimate the value of $f(-1)$
c. interval(s) where $f(x)$ is negative or positive
d. interval(s) where $f(x)$ is increasing, decreasing, or constant.
e. an equation for $f(x)$

For the function $h(x)$ whose partial graph is given.

2. Complete the graph if h is known to be even.

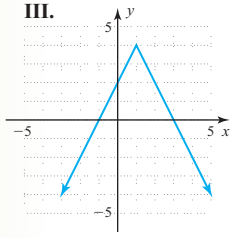


3. Complete the graph if h is known to be odd.

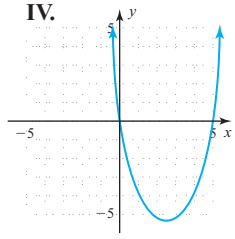


4. Use a graphing calculator to find the maximum and minimum values of $f(x) = |x^2 + 4x - 11| - 7$. Round answers to nearest hundredth when necessary.

5. Each function graphed here is from a toolbox function family. For each graph, (a) identify the function family, (b) state the domain and range, (c) identify x- and y-intercepts, (d) discuss the end-behavior, and (e) solve the inequalities $f(x) > 0$ and $f(x) < 0$.



I.



II.

III.

IV.

Sketch each graph using a transformation.

6. $f(x) = |x - 2| + 3$

7. $g(x) = -(x + 3)^2 - 2$

Solve each inequality. Write the solutions in interval notation.

8. $\frac{2}{3}|3x - 1| > 14$ **9.** $5 - 2|x + 2| \geq 1$

10. Use a graphing calculator to solve the equation.

$$1.7|x - 0.75| + 3 = 3 - \frac{3}{5}\left|x - \frac{3}{4}\right|$$

11. Sketch the graph of $f(x) = \dfrac{2}{x + 3}$. Find and label the x- and y-intercepts, if they exist, along with all asymptotes.

12. After the engine is cut at $t = 0$, a boat coasts for a while before stopping. The distance D it travels over t sec can be modeled by $D(t) = 60 - \dfrac{240}{(t + 2)^2}$. If the boat comes to a complete stop after traveling 59 ft, use a graphing calculator to determine the time required to stop. Round your answer to the nearest tenth.

13. Find the domains of the following functions.

a. $f(x) = 2.09x^{\frac{2}{5}}$ **b.** $g(x) = -4.22x^{\frac{5}{2}}$

c. $h(t) = 4.5t^{\pi}$

14. Identify the vertical and horizontal asymptotes of $g(x) = \dfrac{3}{(x + 2)^2} - 1$.

15. Using time-lapse photography, the spread of a liquid is tracked in one-fifth of a second intervals, as a small amount of liquid is dropped on a piece of fabric. A power function provides a reasonable model for the first second. Use a graphing calculator to (a) graph a scatterplot of the data and (b) find an equation model using a power regression (round to two decimal places). Use the equation to estimate (c) the size of the stain after 0.5 sec and (d) how long it will take the stain to reach a size of 15 mm.

Time (sec)	Size (mm)
0.2	0.39
0.4	1.27
0.6	3.90
0.8	10.60
1	21.50

16. The following function has two removable discontinuities. Find the values of a and b so that a continuous function results.

$$g(x) = \begin{cases} \dfrac{x^3 + x^2 - 4x - 4}{x^2 - x - 2}, & x \neq -1, 2 \\ a, & x = -1 \\ b, & x = 2 \end{cases}$$

17. The annual output of a wind turbine varies jointly with the square of the blade diameter and the cube of the average wind speed. If a 10-ft-diameter turbine in 12 mph average winds produces 2300 KWH/year, how much will a 6 ft-diameter turbine produce in 15 mph average winds? Round to the nearest KWH/year.

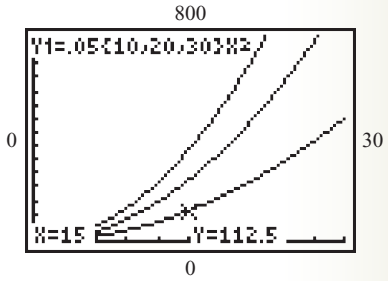
18. Given $h(x) = \begin{cases} 4, & x < -2 \\ 2x, & -2 \leq x \leq 2 \\ x^2, & x > 2 \end{cases}$

a. Find $h(-3)$, $h(-2)$, and $h(\frac{5}{2})$

b. Sketch the graph of h. Label important points.

19. By observing a significantly smaller object orbiting a large celestial body, astronomers can easily determine the mass of the larger. Appealing to Kepler's third law of planetary motion, we know the mass of the large body varies directly with the cube of the mean distance to the smaller and inversely with the square of its orbital period. Write the variation equation. Using the mean Earth/Sun distance of 1.496×10^8 km and the Earth's orbital period of 1 yr, the mass of the Sun has been calculated to be 1.98892×10^{30} kg. Given the orbital period of Mars is 1.88 yr, find its mean distance from the Sun.

20. The maximum load that can be supported by a rectangular beam varies jointly with its width and its height squared and inversely with its length. If a beam 10 ft long, 3 in. wide, and 4 in. high can support 624 lb, how many pounds could a 12-ft-long beam with the same dimensions support?



CALCULATOR EXPLORATION AND DISCOVERY

Studying Joint Variations

Although a graphing calculator is limited to displaying the relationship between only two variables (for the most part), it has a feature that enables us to see how these two are related with respect to a third. Consider the variation equation from Example 8 in Section 2.6: $F = 0.05dv^2$. If we want to investigate the relationship between fuel consumption and velocity, we can have the calculator display multiple versions of the relationship *simultaneously for different values of d*. This is accomplished using the "{" and "}" symbols, which are 2nd functions to the parentheses. When the calculator sees values between these grouping symbols and separated by commas, it is programmed to use each value independently of the others, graphing or evaluating the relation for each value in the set. We illustrate by graphing the relationship $f = 0.05dv^2$ for three different values of d. Enter the equation on the Y= screen as $Y_1 = 0.05\{10, 20, 30\}X^2$, which tells the calculator to graph the equations $Y_1 = 0.05(10)X^2$, $Y_1 = 0.05(20)X^2$, and $Y_1 = 0.05(30)X^2$ on the same grid. Note that since d is constant, each graph is a parabola. Set the viewing window using the values given in Example 8 as a guide. The result is the graph shown in Figure 2.97, where we can study the relationship between these three variables using the up and down arrows. From our work with the toolbox functions and transformations, we know the widest parabola used the coefficient "10," while the narrowest parabola used the coefficient "30." As shown, the graph tells us that at a speed of 15 nautical miles per hour (X = 15), it will take 112.5 barrels of fuel to travel 10 mi (the first number in the list). After pressing the key, the cursor jumps to the second curve, which shows values of X = 15 and Y = 225. This means at 15 nautical miles per hour, it would take 225 barrels of fuel to travel 20 mi. Use these ideas to complete the following exercises:

Figure 2.97

Exercise 1: The comparison of distance covered versus fuel consumption at different speeds also makes an interesting study. This time velocities are constant values and the distance varies. On the Y= screen, enter $Y_1 = 0.05x\{10, 20, 30\}^2$. What family of equations results? Use the up/down arrow keys for $x = 15$ (a distance of 15 mi) to find how many barrels of fuel it takes to travel 15 mi at 10 mph, 15 mi at 20 mph, and 15 mi at 30 mph. Comment on what you notice.

Exercise 2: The maximum safe load S for a wooden horizontal plank supported at both ends varies jointly with the width W of the beam, the square of its thickness T, and inversely with its length L. A plank 10 ft long, 12 in. wide, and 1 in. thick will safely support 450 lb. Find the value of k and write the variation equation, then use the equation to explore:

a. Safe load versus thickness for a constant width and given lengths (quadratic function). Use $w = 8$ in. and $\{8, 12, 16\}$ for L.

b. Safe load versus length for a constant width and given thickness (reciprocal functional). Use $w = 8$ in. and $\{\frac{1}{4}, \frac{1}{2}, \frac{3}{4}\}$ for thickness.

STRENGTHENING CORE SKILLS

Variation and Power Functions: $y = kx^p$

You may have noticed that applications of power functions (Section 2.4) can also be stated as variations (Section 2.6): From the general equation shown in the title of this feature, "... y varies directly as x to the p power." Due to the nature of real data and data collection, applications of power functions based on regression yield values of k (the constant of variation) and p (the power) that cannot be written in exact form. However, "fixed" relationships modeled by power functions produce values of k and p that can be written in exact form. For instance, the power function that models planetary orbits states: The time T it takes a planet to complete one orbit varies directly with its orbital radius to the three-halves power: $T = kR^{\frac{3}{2}}$. Here, the power is exactly $\frac{3}{2}$ and the constant of variation turns out to be exactly 1 (also **see Section 2.4, Exercise 78**). Many times, finding this constant takes more effort, and utilizes the skills developed in this and previous chapters. Consider the following.

Illustration 1 ▶ The volume V of a sphere varies directly with its surface area S to the three-halves power. If the volume is approximately 33.51 cm^3 when the surface area is 50.30 cm^2, (a) find the constant of variation yielded by these values (round to two decimal places), and (b) find the exact constant of variation dictated by the geometry of the sphere and write the variation equation.

Solution ▶ **a.**

$$V = kS^{\frac{3}{2}} \qquad \text{variation equation}$$
$$33.51 = k(50.30)^{\frac{3}{2}} \qquad \text{substitute 33.51 for } V\text{, 50.30 for } S$$
$$\frac{33.51}{(50.30)^{\frac{3}{2}}} = k \qquad \text{solve for } k$$
$$0.09 \approx k \qquad \text{approximate value for } k$$

This gives $V \approx 0.09S^{\frac{3}{2}}$ as an approximate relationship.

b. To find the true constant of variation fixed by the nature of spheres, we begin with the same set up, but *substitute the actual formulas* for volume and surface area, then simplify.

$$V = kS^{\frac{3}{2}} \qquad \text{variation equation}$$
$$\frac{4}{3}\pi r^3 = k(4\pi r^2)^{\frac{3}{2}} \qquad \text{substitute } \tfrac{4}{3}\pi r^3 \text{ for } V\text{, } 4\pi r^2 \text{ for } S$$
$$\frac{4}{3}\pi r^3 = 8\pi^{\frac{3}{2}} r^3 k \qquad \text{properties of exponents: } 4^{\frac{3}{2}} = 8$$
$$\pi = 6\pi^{\frac{3}{2}} k \qquad \text{multiply by } \tfrac{3}{4}\text{, divide by } r^3$$
$$\frac{\pi}{6\pi^{\frac{3}{2}}} = k \qquad \text{solve for } k$$
$$\frac{1}{6\pi^{\frac{1}{2}}} = k \qquad \text{simplify (exact form)}$$

The constant of variation for this relationship is $\frac{1}{6\sqrt{\pi}}$, giving a variation equation of $V = \frac{1}{6\sqrt{\pi}}S^{\frac{3}{2}}$. Note that $\frac{1}{6\sqrt{\pi}} \approx 0.09$.

Studies of this type are important, because as the radius of the sphere gets larger, so does the error generated by using an approximate value. Using a radius of $r = 18$ cm with the approximate relationship $[V \approx 0.09\,(4\pi 18^2)^{3/2}]$, gives a volume of near 23,381.6 cm^3, while the volume found using the exact value for k is about 24,429.0 cm^3.

Exercise 1: Use this *Strengthening Core Skills* feature to find the exact constant of variation for the following relationship: The volume of a cube varies directly with its surface area to the three-halves power.

CUMULATIVE REVIEW CHAPTERS 1–2

1. Given $f(x) = 2x^3 + 4x^2 + 8x - 7$, find $f(-2)$ and $f\left(\frac{1}{2}\right)$.

2. Find the solution set for: $2 - x < 5$ **and** $3x + 2 < 8$.

3. The area of a circle is 69 cm^2. Find the circumference of the same circle.

4. The surface area of a cylinder is $A = 2\pi r^2 + 2\pi rh$. Write r in terms of A and h (solve for r).

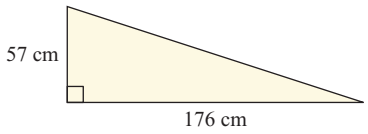
5. Solve for x: $-2(3 - x) + 5x = 4(x + 1) - 7$.

6. Evaluate without using a calculator: $\left(\frac{27}{8}\right)^{\frac{-2}{3}}$.

7. Find the slope of each line:

a. through the points: $(-4, 7)$ and $(2, 5)$.

b. the line with equation $3x - 5y = 20$.



8. Graph using transformations of a parent function.

a. $f(x) = \sqrt{x - 2} + 3$.

b. $f(x) = -|x + 2| - 3$.

9. Graph the line passing through $(-3, 2)$ with a slope of $m = \frac{1}{2}$, then state its equation.

10. Find (a) the length of the hypotenuse and (b) the perimeter of the triangle shown.

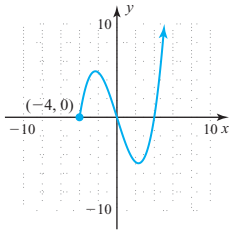
11. Sketch the graph of $h(x) = \frac{-1}{(x - 1)^2} + 3$ using a transformation of the parent function.

12. Graph by plotting the y-intercept, then counting $\frac{\Delta y}{\Delta x}$ to find additional points: $y = \frac{1}{3}x - 2$

13. Graph the piecewise-defined function $f(x) = \begin{cases} x^2 - 4, & x < 2 \\ x - 1, & 2 \le x \le 8 \end{cases}$ and determine the following:

a. the domain and range

b. the value of $f(-3), f(-1), f(1), f(2)$, and $f(3)$



c. the zeroes of the function

d. interval(s) where $f(x)$ is negative/positive

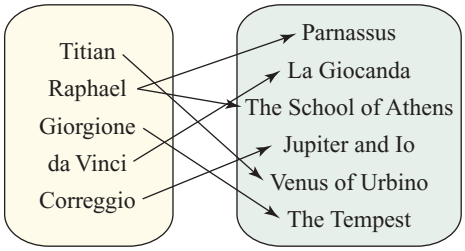
e. location of any local max/min values

f. interval(s) where $f(x)$ is increasing/decreasing

14. The graph of a function $h(x)$ is shown. (a) State the domain and estimate the range of h. (b) What are the zeroes of the function? (c) What is the value of $h(-1)$? (d) If $h(k) = 9$ what is the value of k?

15. Add the rational expressions:

a. $\frac{-2}{x^2 - 3x - 10} + \frac{1}{x + 2}$



b. $\frac{b^2}{4a^2} - \frac{c}{a}$

16. Simplify the radical expressions:

a. $\frac{-10 + \sqrt{72}}{4}$ **b.** $\frac{1}{\sqrt{2}}$

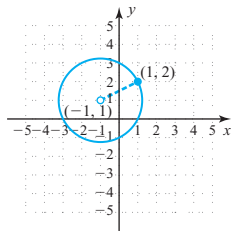
17. Perform the division by factoring the numerator: $(x^3 - 5x^2 + 2x - 10) \div (x - 5)$.

18. Determine if the following relation is a function. If not, how is the definition of a function violated?

19. Find the center and radius of the circle defined by $x^2 + 6x + y^2 - 12y + 36 = 0$.

20. The amount of pressure (in pounds per square inch—psi) felt by a professional pearl diver as she dives to harvest oysters, is 14.7 more than 0.43 times the depth of the dive (in feet). Write the equation model for this situation. If the oyster bed is at a depth of 60 ft, how much pressure is felt?

21. The *National Geographic Atlas of the World* is a very large, rectangular book with an almost inexhaustible panoply of information about the world we live in. The length of the front cover is 16 cm more than its width, and the area of the cover is 1457 cm^2. Use this information to write an equation model, then use the quadratic formula to determine the length and width of the *Atlas*.



22. During a table tennis tournament, the championship game between J.W. and Mike took a dramatic and unexpected turn. At one point in the game, J.W. was losing 5–15. Facing a crushing loss, he summoned all his willpower and battled on to a 21–19 victory! Assuming the game score relationship is linear, find the slope of the line between these two scores and discuss its meaning in this context.

23. Solve by factoring:

a. $6x^2 - 7x = 20$

b. $x^3 + 5x^2 - 15 = 3x$

24. A theorem from elementary geometry states, "*A line tangent to a circle is perpendicular to the radius at the point of tangency.*" Find the equation of the tangent line for the circle and radius shown.

25. A triangle has its vertices at $(-4, 5)$, $(4, -1)$, and $(0, 8)$. Find the perimeter of the triangle and determine whether or not it is a *right* triangle.

Exercises 26 through 30 require the use of a graphing calculator.

26. Use the zeroes method to solve the equation $2.7(x - 3) + 0.3 = 1.8 - 1.2(x + 4)$. Round your answer to two decimal places.

27. Use a graphing calculator to graph the circle defined by $(x + 2)^2 + y^2 = 4$.

28. Use a graphing calculator and the intersection-of-graphs method to solve the inequality. $|1.2(x - 0.5)| < 0.4x + 1.4$

29. Graph the following piecewise-defined function using a graphing calculator. Then use the TRACE command to evaluate the function at $x = 1.2$.

$$f(x) = \begin{cases} -x + 2 & -5 \le x < -2 \\ (x - 2)^2 - 3 & x \ge 1 \end{cases}$$

30. The data given shows the growth of the total U.S. National Debt (in billions) for the years 1993 to 1999 (1993 → 1), and for the years 2001 to 2007 (2001 → 1), for each set of data, enter the data into a graphing calculator, then

Year (scaled)	1993 to 1999	2001 to 2007
1	4.5	5.9
2	4.8	6.4
3	5.0	7.0
4	5.3	7.6
5	5.5	8.2
6	5.6	8.7
7	5.8	9.2

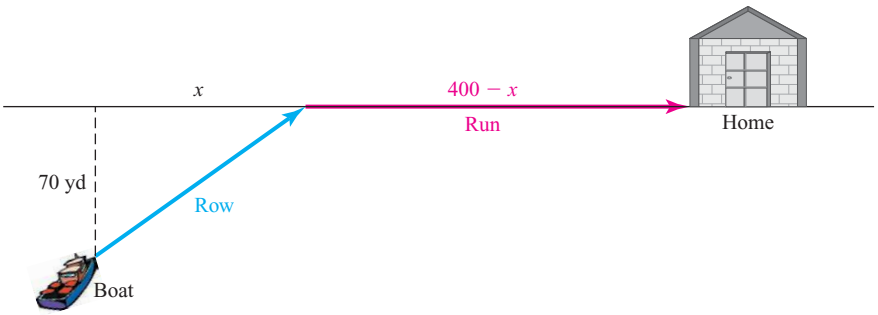
a. Set an appropriate window for viewing the scatterplots, and determine if the associations are linear or nonlinear.

b. If linear, find the regression equation for each data set and graph both (as Y_1 and Y_2) in the same window (round to two decimal places).

c. During which 7-year period did the national debt increase faster? How much faster?

CONNECTIONS TO CALCULUS

Chapter 2 actually highlights numerous concepts and skills that transfer directly into a study of calculus. In the *Connections to Calculus* introduction (page 105), we noted that analyzing very small differences is one such skill, with this task carried out using the absolute value concept. The ability to solve a wide variety of equation types will also be a factor of your success in calculus. Here we'll explore how these concepts and skills are "connected."



Solving Various Types of Equations

The need to solve equations of various types occurs frequently in both *differential* and *integral* calculus, and the required skills will span a broad range of your algebraic experience. Here we'll solve a type of radical equation that occurs frequently in a study of *optimization* [finding the maximum or minimum value(s) of a function].

EXAMPLE 1 ▶ **Minimizing Response Time**

A boater is 70 yd away from a straight shoreline when she gets an emergency call from her home, 400 yd downshore. Knowing she can row at 200 yd/min and run at 300 yd/min, how far downshore should she land the boat to make it home in the shortest time possible?

Solution ▶ As with other forms of problem solving, drawing an accurate sketch is an important first step.

From the diagram, we note the rowing distance will be $\sqrt{x^2 + 4900}$ (using the Pythagorean theorem), and the running distance will be $400 - x$ (total minus distance downshore).

From the relationship $\text{time} = \dfrac{\text{distance}}{\text{rate}}$, we find the total time required to reach home is $t(x) = \dfrac{\sqrt{x^2 + 4900}}{200} + \dfrac{400 - x}{300}$. Using the tools of calculus it can be shown that the distance x downshore that results in the shortest possible time, is a zero of $T(x) = \dfrac{x}{200\sqrt{x^2 + 4900}} - \dfrac{1}{300}$. Find the zero(es) of $T(x)$ and state the result in both exact and approximate form.

Solution ▶ Begin by isolating the radical on one side.

$$\frac{x}{200\sqrt{x^2+4900}} - \frac{1}{300} = 0 \qquad t'(x) = 0$$

$$\frac{x}{200\sqrt{x^2+4900}} = \frac{1}{300} \qquad \text{add } \frac{1}{300}$$

$$300x = 200\sqrt{x^2+4900} \qquad \text{clear denominators}$$

$$1.5x = \sqrt{x^2+4900} \qquad \text{divide by 200}$$

$$2.25x^2 = x^2 + 4900 \qquad \text{square both sides}$$

$$1.25x^2 = 4900 \qquad \text{subtract } x^2$$

$$x^2 = 3920 \qquad \text{divide by 1.25}$$

$$x = \sqrt{3920} \qquad \text{solve for } x;\ x > 0 \text{ (distance)}$$

$$x = 28\sqrt{5} \qquad \text{simplify radical (exact form)}$$

$$\approx 62.6 \qquad \text{approximate form}$$

The boater should row to a spot about 63 yd downshore, then run the remaining 337 yd.

Now try Exercises 1 and 2 ▶

In addition to radical equations, equations involving rational exponents are often seen in a study of calculus. Many times, solving these equations involves combining the basic properties of exponents with other familiar skills such as factoring, or in this case, *factoring least powers*.

EXAMPLE 2 ▶ Modeling the Motion of a Particle

Suppose the motion of an object floating in turbulent water is modeled by the function $d(t) = \sqrt{t}(t^2 - 9t + 22)$, where $d(t)$ represents the displacement (in meters) at t sec. Using the tools of calculus, it can be shown that the velocity v of the particle is given by $v(t) = \frac{5}{2}t^{\frac{3}{2}} - \frac{27}{2}t^{\frac{1}{2}} + 11t^{-\frac{1}{2}}$. Find any time(s) t when the particle is motionless ($v = 0$).

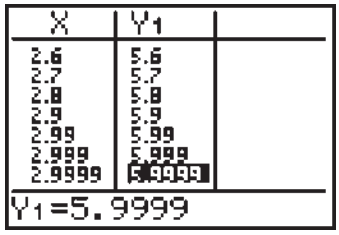
Solution ▶ Set the equation equal to zero and factor out the fraction and least power.

$$\frac{5}{2}t^{\frac{3}{2}} - \frac{27}{2}t^{\frac{1}{2}} + 11t^{-\frac{1}{2}} = 0 \qquad \text{original equation}$$

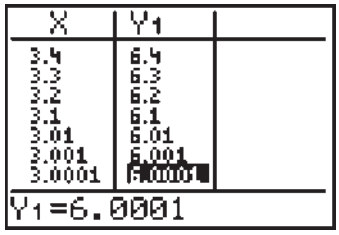
$$5t^{\frac{4}{2}}\left(\frac{1}{2}\right)t^{-\frac{1}{2}} - 27t^{\frac{2}{2}}\left(\frac{1}{2}\right)t^{-\frac{1}{2}} + 22\left(\frac{1}{2}\right)t^{-\frac{1}{2}} = 0 \qquad \text{rewrite to help factor } \frac{1}{2}t^{-\frac{1}{2}} \text{ (least power)}$$

$$\frac{1}{2}t^{-\frac{1}{2}}(5t^2 - 27t + 22) = 0 \qquad \text{common factor}$$

$$\frac{1}{2}t^{-\frac{1}{2}}(5t - 22)(t - 1) = 0 \qquad \text{factor the trinomial}$$



$$t^{-\frac{1}{2}} \neq 0;\ t = \frac{22}{5} \text{ or } t = 1 \qquad \text{result}$$



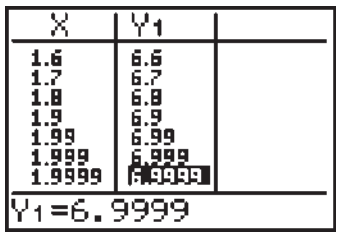
The particle is temporarily motionless at $t = 4.4$ sec and $t = 1$ sec.

Now try Exercises 3 and 4 ▶

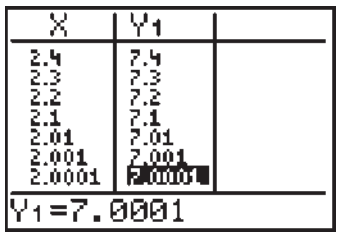
Absolute Value Inequalities and Delta/Epsilon Form

While the terms may mean little to you now, the concept of absolute value plays an important role in the *precise definition of a limit, intervals of convergence,* and *derivatives*. In the case of *limits,* the study of calculus concerns itself with very small differences, as in the difference between the number 3 itself, and a number very close to 3. Consider the function $f(x) = \dfrac{x^2 - 9}{x - 3}$. From the implicit domain and the figures shown, we see that $f(x)$ (shown as Y_1) is not defined at 3, but is defined for any number near 3.

The figures also suggest that when x is a number very close to 3, $f(x)$ is a number very close to 6. Alternatively, we might say, "if the difference between x and 3 is very small, the difference between $f(x)$ and 6 is very small." The most convenient way to express this idea and make it practical is through the use of absolute value (which allows that the difference can be either positive or negative). Using the symbols δ (delta) and ϵ (epsilon) to represent very small (and possibly unequal) numbers, we can write this phrase in *delta/epsilon form* as



$$\textit{if } |x - 3| < \delta, \textit{ then } |f(x) - 6| < \epsilon$$



For now, we'll simply practice translating similar relationships from words into symbols, leaving any definitive conclusions for our study of limits in Chapter 12, or a future study of calculus.

EXAMPLE 3 ▶ **Using Delta/Epsilon Form**

Use a graphing calculator to explore the value of $g(x) = \dfrac{x^2 + 3x - 10}{x - 2}$ when x is near 2, then write the relationship in delta/epsilon form.

Solution ▶ Using a graphing calculator and the approach outlined above produces the tables in the figures.

From these, it appears that, "if the difference between x and 2 is very small, the difference between $f(x)$ and 7 is very small." In delta/epsilon form:

$$\text{if } |x - 2| < \delta, \text{ then } |f(x) - 7| < \epsilon.$$

Now try Exercises 5 through 8 ▶

At first, modeling this relationship may seem like a minor accomplishment. But historically and in a practical sense, it is actually a major achievement as it enables us to "tame the infinite," since we can now verify that no matter how small ϵ is, there is a corresponding δ that *guarantees*

$$\underset{f(x) \text{ is } \textit{infinitely} \text{ close to } 7}{|f(x) - 7| < \epsilon} \quad \text{whenever} \quad \underset{x \text{ is } \textit{infinitely} \text{ close to } 2}{|x - 2| < \delta}$$

This observation leads directly to the precise definition of a limit, the type of "limit" referred to in our *Introduction to Calculus,* found in the Preface (page xxii). As noted there, such limits will enable us to find a precise formula for the instantaneous speed of a cue ball as it falls, and a precise formula for the volume of an irregular solid.

Connections to Calculus Exercises

Solve the following equations.

1. To find the length of a rectangle with maximum area that can be circumscribed by a circle of radius 3 in. requires that we solve $\sqrt{9 - x^2} - \dfrac{x^2}{\sqrt{9 - x^2}} = 0$, where the length of the rectangle is $2x$. To the nearest hundredth, what is the length of the rectangle?

2. To find the height of an isosceles triangle with maximum area that can be inscribed in a circle of radius $r = 5$ in. requires that we solve $\dfrac{-5x}{\sqrt{25 - x^2}} + \sqrt{25 - x^2} - \dfrac{x^2}{\sqrt{25 - x^2}} = 0$, where the height is $5 + x$. What is the height of the triangle?

3. If the motion of a particle in turbulent air is modeled by $d = \sqrt{t}(2t^2 - 9t + 18)$, the velocity of the particle is given by $v = 5t^{\frac{3}{2}} - \dfrac{27}{2}t^{\frac{1}{2}} + 9t^{-\frac{1}{2}}$ (d in meters, t in seconds). Find any time(s) t when velocity $v = 0$.

4. In order for a light source to provide maximum (circular) illumination to a workroom, the light must be hung at a certain height. While the complete development requires trigonometry, we find that maximum illumination is obtained at the solutions of the equation shown, where h is the height of the light, k is a constant, and the radius of illumination is 12 ft. Solve the equation for h by factoring the least power and simplifying the result: $k\dfrac{(h^2 + 12^2)^{\frac{3}{2}} - 3h^2(h^2 + 12^2)^{\frac{1}{2}}}{(h^2 + 12^2)^3} = 0.$

Use a graphing calculator to explore the value of the function given for values of x near the one indicated. Then write the relationship in words and in delta/epsilon form.

5. $h(x) = \dfrac{4x^2 - 9}{2x - 3}; x = \dfrac{3}{2}$

6. $v(x) = \dfrac{x^3 + 27}{x + 3}; x = -3$

7. $w(x) = \dfrac{7x^3 - 28x}{x^2 - 4}; x = 2$

8. $F(x) = \dfrac{x^2 + 7x}{x}; x = 0$

Quadratic Functions and Operations on Functions

CHAPTER OUTLINE

3.1 Complex Numbers 204
3.2 Solving Quadratic Equations and Inequalities 214
3.3 Quadratic Functions and Applications 235
3.4 Quadratic Models; More on Rates of Change 250
3.5 The Algebra of Functions 262
3.6 The Composition of Functions and the Difference Quotient 274

CHAPTER CONNECTIONS

Whether it be in business, industry, animal science, space, sports, or some other sector, decision makers are preoccupied with maximum and minimum values. Questions concerning minimum cost, maximum efficiency, least amount of waste, greatest amount of area, and other similar questions require and deserve a great deal of attention. In this chapter, we'll learn to calculate some of these maximums and minimums, like the height achieved by a motocross or snowboarding athlete in the performance of jumps.

▶ This application appears as Exercise 51 in Section 3.3.

Connections to Calculus

In this chapter, we use the average rate of change formula to develop the difference quotient. In a calculus course, the difference quotient is combined with the concept of a limit to find the *instantaneous velocity* of an object. While the speedometer of a motorcycle (on the ground) can provide this information, determining the velocity of a projectile like an arrow is more challenging. The *Connections to Calculus* for Chapter 3 highlights the algebraic skills necessary to make the transition from the discrete view to the instantaneous view a smooth one.

3.1 Complex Numbers

LEARNING OBJECTIVES

In Section 3.1 you will see how we can:

- ❑ **A.** Identify and simplify imaginary and complex numbers
- ❑ **B.** Add and subtract complex numbers
- ❑ **C.** Multiply complex numbers and find powers of i
- ❑ **D.** Divide complex numbers

For centuries, even the most prominent mathematicians refused to work with equations like $x^2 + 1 = 0$. Using the principal of square roots gave the "solutions" $x = \sqrt{-1}$ and $x = -\sqrt{-1}$, which they found baffling and mysterious, since there is no real number whose square is -1. In this section, we'll see how this dilemma was finally resolved.

A. Identifying and Simplifying Imaginary and Complex Numbers

The equation $x^2 = -1$ has no real solutions, since the square of any real number is positive. But if we apply the principle of square roots we get $x = \sqrt{-1}$ and $x = -\sqrt{-1}$, which seem to check when substituted into the original equation:

	$x^2 + 1 = 0$	original equation
(1)	$(\sqrt{-1})^2 + 1 = 0$	substitute $\sqrt{-1}$ for x
	$-1 + 1 = 0$ ✓	answer "checks"
(2)	$(-\sqrt{-1})^2 + 1 = 0$	substitute $-\sqrt{-1}$ for x
	$-1 + 1 = 0$ ✓	answer "checks"

This observation likely played a part in prompting Renaissance mathematicians to study such numbers in greater depth, as they reasoned that while these were not *real number* solutions, they must be *solutions of a new and different kind*. Their study eventually resulted in the introduction of the set of **imaginary numbers** and the **imaginary unit *i*,** as follows.

Imaginary Numbers and the Imaginary Unit

- Imaginary numbers are those of the form $\sqrt{-k}$, where k is a positive real number.
- The imaginary unit i represents the number whose square is -1:

$$i = \sqrt{-1}, \text{ where } i^2 = -1$$

WORTHY OF NOTE

It was René Descartes (in 1637) who first used the term *imaginary* to describe these numbers; Leonhard Euler (in 1777) who introduced the letter i to represent $\sqrt{-1}$; and Carl F. Gauss (in 1831) who first used the phrase *complex number* to describe solutions that had both a real number part and an imaginary part. For more on complex numbers and their story, see www.mhhe.com/coburn

As a convenience to understanding and working with imaginary numbers, we rewrite them in terms of i, allowing that the product property of radicals ($\sqrt{AB} = \sqrt{A}\sqrt{B}$) still applies if *only one* of the radicands is negative. For $\sqrt{-3}$, we have $\sqrt{-1 \cdot 3} = \sqrt{-1}\sqrt{3} = i\sqrt{3}$. More generally, we simply make the following statement regarding imaginary numbers.

Rewriting Imaginary Numbers

For any positive real number k,

$$\sqrt{-k} = i\sqrt{k}.$$

For $\sqrt{-16}$ and $\sqrt{-20}$ we have:

$$\begin{aligned} \sqrt{-16} &= i\sqrt{16} \\ &= i(4) \\ &= 4i \end{aligned} \qquad \begin{aligned} \sqrt{-20} &= i\sqrt{20} \\ &= i\sqrt{4 \cdot 5} \\ &= 2i\sqrt{5}, \end{aligned}$$

and we say the expressions have been simplified and written in terms of i. Note that for $\sqrt{-20}$ we've written the result with the unit "i" *in front of the radical* to prevent it being interpreted as being *under the radical.* In symbols, $2i\sqrt{5} = 2\sqrt{5}i \neq 2\sqrt{5i}$.

The solutions to $x^2 = -1$ also serve to illustrate that for $k > 0$, there are two solutions to $x^2 = -k$, namely, $i\sqrt{k}$ and $-i\sqrt{k}$. In other words, every negative number has two square roots, one positive and one negative. The first of these, $i\sqrt{k}$, is called the **principal square root** of $-k$.

EXAMPLE 1 ▶ **Simplifying Imaginary Numbers**

Rewrite the imaginary numbers in terms of i and simplify if possible.

a. $\sqrt{-7}$ **b.** $\sqrt{-81}$ **c.** $\sqrt{-24}$ **d.** $-3\sqrt{-16}$

Solution ▶

a. $\sqrt{-7} = i\sqrt{7}$

b. $\sqrt{-81} = i\sqrt{81}$
$= 9i$

c. $\sqrt{-24} = i\sqrt{24}$
$= i\sqrt{4 \cdot 6}$
$= 2i\sqrt{6}$

d. $-3\sqrt{-16} = -3i\sqrt{16}$
$= -3i(4)$
$= -12i$

Now try Exercises 7 through 12 ▶

EXAMPLE 2 ▶ **Writing an Expression in Terms of *i***

The numbers $x = \dfrac{-6 + \sqrt{-16}}{2}$ and $x = \dfrac{-6 - \sqrt{-16}}{2}$ are not real, but are known to be solutions of $x^2 + 6x + 13 = 0$. Simplify $\dfrac{-6 + \sqrt{-16}}{2}$.

Solution ▶ Using the i notation, we have

$$\frac{-6 + \sqrt{-16}}{2} = \frac{-6 + i\sqrt{16}}{2} \quad \text{write } \sqrt{-16} \text{ in } i \text{ notation}$$

$$= \frac{-6 + 4i}{2} \quad \text{simplify}$$

$$= \frac{2(-3 + 2i)}{2} \quad \text{factor numerator and reduce}$$

$$= -3 + 2i \quad \text{result}$$

Now try Exercises 13 through 16 ▶

WORTHY OF NOTE

The expression $\dfrac{-6 + 4i}{2}$ from the solution of Example 2 can also be simplified by rewriting it as two separate terms, then simplifying each term:

$$\frac{-6 + 4i}{2} = \frac{-6}{2} + \frac{4i}{2}$$
$$= -3 + 2i.$$

The result in Example 2 contains both a **real number part** (-3) and an **imaginary part** $(2i)$. Numbers of this type are called **complex numbers.**

Complex Numbers

Complex numbers are those that can be written in the form $a + bi$, where a and b are real numbers and $i = \sqrt{-1}$.

The expression $a + bi$ is called the **standard form** of a complex number. From this definition we note that all real numbers are also complex numbers, since $a + 0i$ is complex with $b = 0$. In addition, all imaginary numbers are complex numbers, since $0 + bi$ is a complex number with $a = 0$ (See Figure 3.1).

EXAMPLE 3 ▶ **Writing Complex Numbers in Standard Form**

Write each complex number in the form $a + bi$, and identify the values of a and b.

a. $2 + \sqrt{-49}$ **b.** $\sqrt{-12}$ **c.** 7 **d.** $\dfrac{4 + 3\sqrt{-25}}{20}$

Solution ▶

a. $2 + \sqrt{-49} = 2 + i\sqrt{49}$
$= 2 + 7i$
$a = 2, b = 7$

b. $\sqrt{-12} = 0 + i\sqrt{12}$
$= 0 + 2i\sqrt{3}$
$a = 0, b = 2\sqrt{3}$

c. $7 = 7 + 0i$
$a = 7, b = 0$

d. $\dfrac{4 + 3\sqrt{-25}}{20} = \dfrac{4 + 3i\sqrt{25}}{20}$
$= \dfrac{4 + 15i}{20}$
$= \dfrac{1}{5} + \dfrac{3}{4}i$
$a = \dfrac{1}{5}$ or $0.2, b = \dfrac{3}{4}$ or 0.75

Now try Exercises 17 through 24 ▶

☑ **A.** You've just seen how we can identify and simplify imaginary and complex numbers

Complex numbers complete the development of our "numerical landscape." Sets of numbers and their relationships are represented in Figure 3.1, which shows how some sets of numbers are nested within larger sets and highlights the fact that complex numbers consist of a real number part (any number within the orange rectangle), and an imaginary number part (any number within the yellow rectangle).

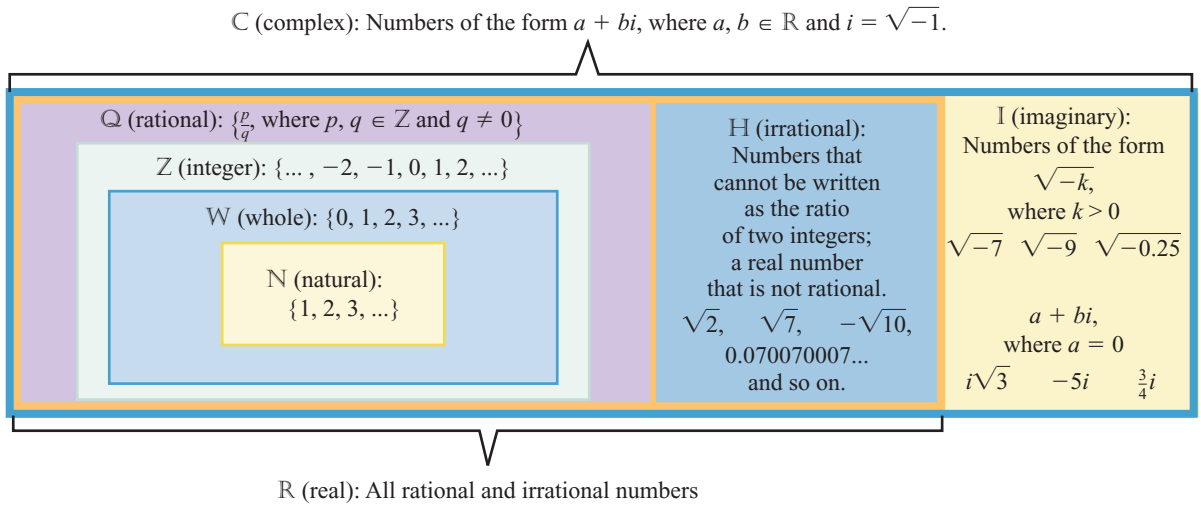


Figure 3.1

B. Adding and Subtracting Complex Numbers

The sum and difference of two polynomials is computed by identifying and combining like terms. The sum or difference of two complex numbers is computed in a similar way, by adding the real number parts from each, and the imaginary parts from each. Notice in Example 4 that the commutative, associative, and distributive properties also apply to complex numbers.

EXAMPLE 4 ▶ Adding and Subtracting Complex Numbers

Perform the indicated operation and write the result in $a + bi$ form.

a. $(2 + 3i) + (-5 + 2i)$ **b.** $(-5 - 4i) - (-2 - i\sqrt{2})$

Solution ▶

a. $(2 + 3i) + (-5 + 2i)$ original sum
$= 2 + 3i + (-5) + 2i$ distribute
$= 2 + (-5) + 3i + 2i$ commute terms
$= [2 + (-5)] + (3i + 2i)$ group like terms
$= -3 + 5i$ result
$a = -3, b = 5$

b. $(-5 - 4i) - (-2 - i\sqrt{2})$ original difference
$= -5 - 4i + 2 + i\sqrt{2}$ distribute
$= -5 + 2 + (-4i) + i\sqrt{2}$ commute terms
$= (-5 + 2) + [(-4i) + i\sqrt{2}]$ group like terms
$= -3 + (-4 + \sqrt{2})i$ result
$a = -3, b = -4 + \sqrt{2}$

Now try Exercises 25 through 30 ▶

Most graphing calculators are programmed to work with imaginary and complex numbers, though for some models the calculator must be placed in complex number mode. After pressing the MODE key (located to the right of the 2nd option key), the screen shown in Figure 3.2 appears and we use the arrow keys to access "$a + bi$" and active this mode (by pressing ENTER). Once active, we can validate our previous statements about imaginary numbers (Figure 3.3), as well as verify our previous calculations like those in Examples 3(a), 3(d), and 4(a) (Figure 3.4). Note the imaginary unit i is the 2nd option for the decimal point.

Figure 3.2

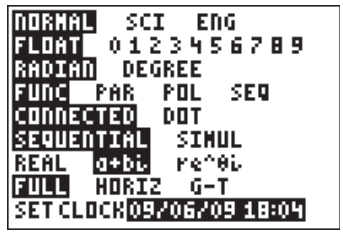

Figure 3.3

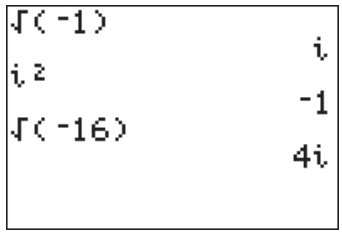

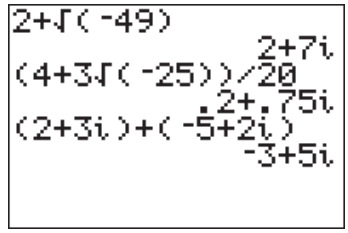

Figure 3.4

☑ **B.** You've just seen how we can add and subtract complex numbers

C. Multiplying Complex Numbers; Powers of *i*

The product of two binomials is computed using the distributive property and the F-O-I-L process, then combining like terms. The product of two complex numbers is computed in a similar manner. If any result gives a factor of i^2, remember that $i^2 = -1$.

EXAMPLE 5 ▶ **Multiplying Complex Numbers**

Find the indicated product and write the answer in $a + bi$ form.

a. $\sqrt{-4}\sqrt{-9}$ **b.** $\sqrt{-6}\,(2 + \sqrt{-3})$

c. $(6 - 5i)(4 + i)$ **d.** $(2 + 3i)(2 - 3i)$

Solution ▶

a.
$$\begin{aligned}\sqrt{-4}\sqrt{-9} &= i\sqrt{4}\cdot i\sqrt{9} && \text{rewrite in terms of } i\\ &= 2i\cdot 3i && \text{simplify}\\ &= 6i^2 && \text{multiply}\\ &= -6 + 0i && \text{result } (i^2 = -1)\end{aligned}$$

b.
$$\begin{aligned}\sqrt{-6}\,(2+\sqrt{-3}) &= i\sqrt{6}(2+i\sqrt{3}) && \text{rewrite in terms of } i\\ &= 2i\sqrt{6} + i^2\sqrt{18} && \text{distribute}\\ &= 2i\sqrt{6} + (-1)\sqrt{9}\sqrt{2} && i^2 = -1\\ &= 2i\sqrt{6} - 3\sqrt{2} && \text{simplify}\\ &= -3\sqrt{2} + 2i\sqrt{6} && \text{standard form}\end{aligned}$$

c.
$$\begin{aligned}(6 - 5i)(4 + i) &\\ = (6)(4) + 6i + (-5i)(4) + (-5i)(i) & && \text{F-O-I-L}\\ = 24 + 6i + (-20i) + (-5)i^2 & && i\cdot i = i^2\\ = 24 + 6i + (-20i) + (-5)(-1) & && i^2 = -1\\ = 29 - 14i & && \text{result}\end{aligned}$$

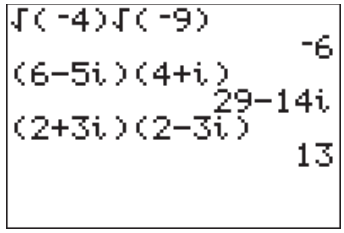
d.
$$\begin{aligned}(2 + 3i)(2 - 3i) &\\ = (2)^2 - (3i)^2 & && (A+B)(A-B) = A^2 - B^2\\ = 4 - 9i^2 & && (3i)^2 = 9i^2\\ = 4 - 9(-1) & && i^2 = -1\\ = 13 + 0i & && \text{result}\end{aligned}$$

Now try Exercises 31 through 44 ▶

CAUTION ▶ When computing with imaginary and complex numbers, always write the square root of a negative number in terms of i before you begin, as shown in Examples 5(a) and 5(b). Otherwise we get conflicting results, since $\sqrt{-4}\,\sqrt{-9} = \sqrt{36} = 6$ if we multiply the radicands first, which is an incorrect result because the original factors were imaginary. **See Exercise 80.**

As before, computations with complex numbers are easily checked using a graphing calculator. The results from Example 5(a), 5(c), and 5(d) are verified in Figure 3.5. For Example 5(b), the coefficients are irrational numbers that run off of the screen (Figure 3.6). To check this answer, we *could* compare the decimal forms of $-3\sqrt{2}$ and $2\sqrt{6}$ to the given decimal numbers, but instead we chose to simply *check the product using division* (to check the result of a multiplication, divide by one of the factors). Dividing the result by the factor $\sqrt{-6}$, gives $2 + 1.732050808i$, which we easily recognize as the other original factor $2 + i\sqrt{3}$ ✓.

Figure 3.5



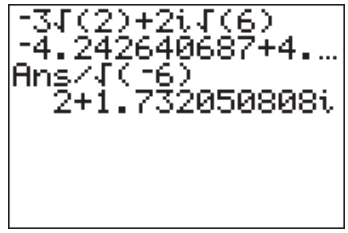


Figure 3.6

Recall that expressions $2x + 5$ and $2x - 5$ are called binomial conjugates. In the same way, $a + bi$ and $a - bi$ are called **complex conjugates.** Note from Example 5(d) that the *product* of the complex number $a + bi$ with its complex conjugate $a - bi$ *is a real number.* This relationship is useful when rationalizing expressions with a complex number in the denominator, and we generalize the result as follows:

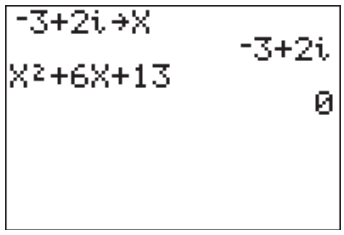
Product of Complex Conjugates

For a complex number $a + bi$ and its conjugate $a - bi$,
their product $(a + bi)(a - bi)$ is the real number $a^2 + b^2$;

$$(a + bi)(a - bi) = a^2 + b^2$$

WORTHY OF NOTE

Notice that the product of a complex number and its conjugate also gives us a method for *factoring the sum of two squares* using complex numbers! For the expression $x^2 + 4$, the factored form would be $(x + 2i)(x - 2i)$. For more on this idea, **see Exercise 79.**



Showing that $(a + bi)(a - bi) = a^2 + b^2$ is left as an exercise (**see Exercise 79**), but from here on, when asked to compute the product of complex conjugates, simply refer to the formula as illustrated here: $(-3 + 5i)(-3 - 5i) = (-3)^2 + 5^2$ or 34. **See Exercises 45 through 48.**

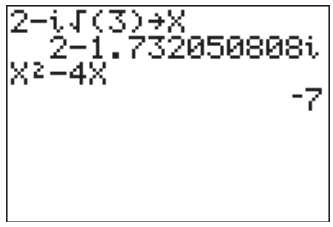
These operations on complex numbers enable us to verify complex solutions by substitution, in the same way we verify solutions for real numbers. In Example 2 we stated that $x = -3 + 2i$ was one solution to $x^2 + 6x + 13 = 0$. This is verified here.

EXAMPLE 6 ▶ **Checking a Complex Root by Substitution**

Verify that $x = -3 + 2i$ is a solution to $x^2 + 6x + 13 = 0$.

Solution ▶

$$\begin{aligned}
x^2 + 6x + 13 &= 0 && \text{original equation}\\
(-3 + 2i)^2 + 6(-3 + 2i) + 13 &= 0 && \text{substitute } -3 + 2i \text{ for } x\\
(-3)^2 + 2(-3)(2i) + (2i)^2 - 18 + 12i + 13 &= 0 && \text{square and distribute}\\
9 - 12i + 4i^2 + 12i - 5 &= 0 && \text{simplify}\\
9 + (-4) - 5 &= 0 && \text{combine terms } (12i - 12i = 0;\ i^2 = -1)\\
0 &= 0 \checkmark
\end{aligned}$$



A calculator verification is also shown.

Now try Exercises 49 through 56 ▶

EXAMPLE 7 ▶ **Checking a Complex Root by Substitution**

Show that $x = 2 - i\sqrt{3}$ is a solution of $x^2 - 4x = -7$.

Solution ▶

$$\begin{aligned} x^2 - 4x &= -7 && \text{original equation} \\ (2 - i\sqrt{3})^2 - 4(2 - i\sqrt{3}) &= -7 && \text{substitute } 2 - i\sqrt{3} \text{ for } x \\ 4 - 4i\sqrt{3} + (i\sqrt{3})^2 - 8 + 4i\sqrt{3} &= -7 && \text{square and distribute} \\ 4 - 4i\sqrt{3} - 3 - 8 + 4i\sqrt{3} &= -7 && (i\sqrt{3})^2 = -3 \\ -7 &= -7\checkmark && \text{solution checks} \end{aligned}$$

A calculator verification is also shown.

Now try Exercises 57 through 60 ▶

The imaginary unit i has another interesting and useful property. Since $i = \sqrt{-1}$ and $i^2 = -1$, it follows that $i^3 = i^2 \cdot i = (-1)i = -i$ and $i^4 = (i^2)^2 = 1$. We can now simplify any *higher power of* i by rewriting the expression in terms of i^4, since $(i^4)^n = 1$ for any natural number n.

$$\begin{aligned} i &= i & \qquad i^5 &= i^4 \cdot i = i \\ i^2 &= -1 & \qquad i^6 &= i^4 \cdot i^2 = -1 \\ i^3 &= -i & \qquad i^7 &= i^4 \cdot i^3 = -i \\ i^4 &= 1 & \qquad i^8 &= (i^4)^2 = 1 \end{aligned}$$

Notice the powers of i "cycle through" the four values i, -1, $-i$ and 1. In more advanced classes, powers of complex numbers play an important role, and next we learn to reduce higher powers using the power property of exponents and $i^4 = 1$. Essentially, we divide the exponent on i by 4, then use the remainder to compute the value of the expression. For i^{35}, $35 \div 4 = 8$ remainder 3, showing $i^{35} = (i^4)^8 \cdot i^3 = -i$.

EXAMPLE 8 ▶ **Simplifying Higher Powers of *i***

Simplify:

a. i^{22} **b.** i^{28} **c.** i^{57} **d.** i^{75}

Solution ▶

a. $22 \div 4 = 5$ remainder 2

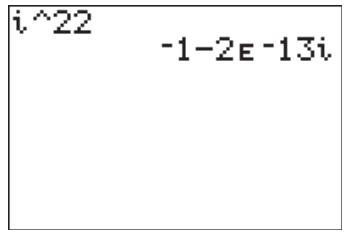
$$\begin{aligned} i^{22} &= (i^4)^5 \cdot (i^2) \\ &= (1)^5(-1) \\ &= -1 \end{aligned}$$

b. $28 \div 4 = 7$ remainder 0

$$\begin{aligned} i^{28} &= (i^4)^7 \\ &= (1)^7 \\ &= 1 \end{aligned}$$

c. $57 \div 4 = 14$ remainder 1

$$\begin{aligned} i^{57} &= (i^4)^{14} \cdot i \\ &= (1)^{14} i \\ &= i \end{aligned}$$



d. $75 \div 4 = 18$ remainder 3

$$\begin{aligned} i^{75} &= (i^4)^{18} \cdot (i^3) \\ &= (1)^{18}(-i) \\ &= -i \end{aligned}$$

Now try Exercises 61 and 62 ▶

While powers of i can likewise be checked on a graphing calculator, the result must be interpreted carefully. For instance, while we know $i^{22} = -1$, the calculator returns an answer of $-1 - 2\text{E} - 13i$ (Figure 3.7). To interpret this result correctly, we identify the real number part as $a = -1$, and the imaginary part as $b = 0$, which due to limitations in the technology is *approximated by* $-2\text{E} - 13 = -2 \times 10^{-13}$ (an extremely small number).

Figure 3.7

☑ **C.** You've just seen how we can multiply complex numbers and find powers of i

D. Division of Complex Numbers

Since $i = \sqrt{-1}$, expressions like $\dfrac{3 - i}{2 + i}$ actually have a radical in the denominator. To divide complex numbers, we simply apply our earlier method of rationalizing denominators (Appendix A.6), but this time using a *complex* conjugate.

EXAMPLE 9 ▶ **Dividing Complex Numbers**

Divide and write each result in $a + bi$ form.

a. $\dfrac{2}{5 - i}$ **b.** $\dfrac{3 - i}{2 + i}$ **c.** $\dfrac{6 + \sqrt{-36}}{3 + \sqrt{-9}}$

Solution ▶

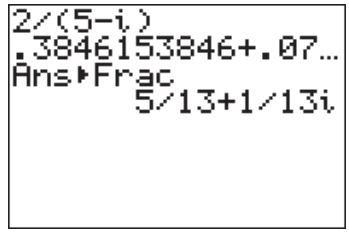
a.
$$\frac{2}{5 - i} = \frac{2}{5 - i} \cdot \frac{5 + i}{5 + i} = \frac{2(5 + i)}{5^2 + 1^2} = \frac{10 + 2i}{26} = \frac{10}{26} + \frac{2}{26}i = \frac{5}{13} + \frac{1}{13}i$$

b.
$$\frac{3 - i}{2 + i} = \frac{3 - i}{2 + i} \cdot \frac{2 - i}{2 - i} = \frac{6 - 3i - 2i + i^2}{2^2 + 1^2} = \frac{6 - 5i + (-1)}{5} = \frac{5 - 5i}{5} = \frac{5}{5} - \frac{5i}{5} = 1 - i$$

c.
$$\frac{6 + \sqrt{-36}}{3 + \sqrt{-9}} = \frac{6 + i\sqrt{36}}{3 + i\sqrt{9}} \quad \text{convert to } i \text{ notation}$$
$$= \frac{6 + 6i}{3 + 3i} \quad \text{simplify}$$

The expression can be further simplified by reducing common factors.

$$= \frac{6(1 + i)}{3(1 + i)} = 2 + 0i \quad \text{factor and reduce}$$



Now try Exercises 63 through 68 ▶

As mentioned, operations on complex numbers can be checked using inverse operations, just as we do for real numbers. To check the division from Example 9(b), we multiply $1 - i$ by the divisor $2 + i$:

$$\begin{aligned}(1 - i)(2 + i) &= 2 + i - 2i - i^2 \\ &= 2 - i - (-1) \\ &= 2 - i + 1 \\ &= 3 - i \checkmark\end{aligned}$$

Several checks are asked for in the exercises. A calculator check is shown for Example 9(a) in Figure 3.8, where we note that converting the coefficients to rational numbers (where possible): MATH **1:▶Frac**, makes the result easier to understand. As you read and interpret *this* result, note the intent is $\dfrac{5}{13} + \dfrac{1}{13}i$, which must not be confused with $\dfrac{5}{13} + \dfrac{1}{13i}$. The latter is an entirely different (and incorrect) number.

Figure 3.8

☑ **D.** You've just seen how we can divide complex numbers

3.1 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section, if necessary.

1. Given the complex number $3 + 2i$, its complex conjugate is _____.

2. The product $(3 + 2i)(3 - 2i)$ gives the real number _____.

3. If the expression $\dfrac{4 + 6i\sqrt{2}}{2}$ is written in the standard form $a + bi$, then $a =$ _____ and $b =$ _____.

4. For $i = \sqrt{-1}$, $i^2 =$ ___, $i^4 =$ ___, $i^6 =$ ___, and $i^8 =$ ___, $i^3 =$ ___, $i^5 =$ ___, $i^7 =$ ___, and $i^9 =$ ___.

5. Discuss/Explain which is correct:
   a. $\sqrt{-4} \cdot \sqrt{-9} = \sqrt{(-4)(-9)} = \sqrt{36} = 6$
   b. $\sqrt{-4} \cdot \sqrt{-9} = 2i \cdot 3i = 6i^2 = -6$

6. Compare/Contrast the product $(1 + \sqrt{2})(1 - \sqrt{3})$ with the product $(1 + i\sqrt{2})(1 - i\sqrt{3})$. What is the same? What is different?

▶ DEVELOPING YOUR SKILLS

Simplify each radical (if possible). If imaginary, rewrite in terms of *i* and simplify.

7. **a.** $\sqrt{-144}$ **b.** $\sqrt{-49}$ **c.** $\sqrt{27}$ **d.** $\sqrt{72}$

8. **a.** $\sqrt{-100}$ **b.** $\sqrt{-169}$ **c.** $\sqrt{64}$ **d.** $\sqrt{98}$

9. **a.** $-\sqrt{-18}$ **b.** $-\sqrt{-50}$ **c.** $3\sqrt{-25}$ **d.** $2\sqrt{-9}$

10. **a.** $-\sqrt{-32}$ **b.** $-\sqrt{-75}$ **c.** $3\sqrt{-144}$ **d.** $2\sqrt{-81}$

11. **a.** $\sqrt{-19}$ **b.** $\sqrt{-31}$ **c.** $\sqrt{\dfrac{-12}{25}}$ **d.** $\sqrt{\dfrac{-9}{32}}$

12. **a.** $\sqrt{-17}$ **b.** $\sqrt{-53}$ **c.** $\sqrt{\dfrac{-45}{36}}$ **d.** $\sqrt{\dfrac{-49}{75}}$

Simplify each expression, writing the result in terms of *i*.

13. **a.** $\dfrac{2 + \sqrt{-4}}{2}$ **b.** $\dfrac{6 + \sqrt{-27}}{3}$

14. **a.** $\dfrac{16 - \sqrt{-8}}{2}$ **b.** $\dfrac{4 + 3\sqrt{-20}}{2}$

15. **a.** $\dfrac{8 + \sqrt{-16}}{2}$ **b.** $\dfrac{10 - \sqrt{-50}}{5}$

16. **a.** $\dfrac{6 - \sqrt{-72}}{4}$ **b.** $\dfrac{12 + \sqrt{-200}}{8}$

Write each complex number in the standard form $a + bi$ and clearly identify the values of *a* and *b*.

17. **a.** 5 **b.** $3i$

18. **a.** -2 **b.** $-4i$

19. **a.** $2\sqrt{-81}$ **b.** $\dfrac{\sqrt{-32}}{8}$

20. **a.** $-3\sqrt{-36}$ **b.** $\dfrac{\sqrt{-75}}{15}$

21. **a.** $4 + \sqrt{-50}$ **b.** $-5 + \sqrt{-27}$

22. **a.** $-2 + \sqrt{-48}$ **b.** $7 + \sqrt{-75}$

23. **a.** $\dfrac{14 + \sqrt{-98}}{8}$ **b.** $\dfrac{5 + \sqrt{-250}}{10}$

24. **a.** $\dfrac{21 + \sqrt{-63}}{12}$ **b.** $\dfrac{8 + \sqrt{-27}}{6}$

Perform the addition or subtraction. Write the result in $a + bi$ form. Check your answers using a calculator.

25. **a.** $(12 - \sqrt{-4}) + (7 + \sqrt{-9})$
    b. $(3 + \sqrt{-25}) + (-1 - \sqrt{-81})$
    c. $(11 + \sqrt{-108}) - (2 - \sqrt{-48})$

26. **a.** $(-7 - \sqrt{-72}) + (8 + \sqrt{-50})$
    b. $(\sqrt{3} + \sqrt{-2}) - (\sqrt{12} + \sqrt{-8})$
    c. $(\sqrt{20} - \sqrt{-3}) + (\sqrt{5} - \sqrt{-12})$

27. **a.** $(2 + 3i) + (-5 - i)$
    b. $(5 - 2i) + (3 + 2i)$
    c. $(6 - 5i) - (4 + 3i)$

28. **a.** $(-2 + 5i) + (3 - i)$
b. $(7 - 4i) - (2 - 3i)$
c. $(2.5 - 3.1i) + (4.3 + 2.4i)$

29. **a.** $(3.7 + 6.1i) - (1 + 5.9i)$
b. $\left(8 + \frac{3}{4}i\right) - \left(-7 + \frac{2}{3}i\right)$
c. $\left(-6 - \frac{5}{8}i\right) + \left(4 + \frac{1}{2}i\right)$

30. **a.** $(9.4 - 8.7i) - (6.5 + 4.1i)$
b. $\left(3 + \frac{3}{5}i\right) - \left(-11 + \frac{7}{15}i\right)$
c. $\left(-4 - \frac{5}{6}i\right) + \left(13 + \frac{3}{8}i\right)$

Multiply and write your answer in *a* + *bi* form.

31. **a.** $5i \cdot (-3i)$ **b.** $(4i)(-4i)$

32. **a.** $3(2 - 3i)$ **b.** $-7(3 + 5i)$

33. **a.** $-7i(5 - 3i)$ **b.** $6i(-3 + 7i)$

34. **a.** $(-4 - 2i)(3 + 2i)$ **b.** $(2 - 3i)(-5 + i)$

35. **a.** $(-3 + 2i)(2 + 3i)$ **b.** $(3 + 2i)(1 + i)$

36. **a.** $(5 + 2i)(-7 + 3i)$ **b.** $(4 - i)(7 + 2i)$

Compute the special products.

37. **a.** $(4 - 5i)(4 + 5i)$
b. $(7 - 5i)(7 + 5i)$

38. **a.** $(-2 - 7i)(-2 + 7i)$
b. $(2 + i)(2 - i)$

39. **a.** $(3 - i\sqrt{2})(3 + i\sqrt{2})$
b. $(\frac{1}{6} + \frac{2}{3}i)(\frac{1}{6} - \frac{2}{3}i)$

40. **a.** $(5 + i\sqrt{3})(5 - i\sqrt{3})$
b. $(\frac{1}{2} + \frac{3}{4}i)(\frac{1}{2} - \frac{3}{4}i)$

41. **a.** $(2 + 3i)^2$ **b.** $(3 - 4i)^2$

42. **a.** $(2 - i)^2$ **b.** $(3 - i)^2$

43. **a.** $(-2 + 5i)^2$ **b.** $(3 + i\sqrt{2})^2$

44. **a.** $(-2 - 5i)^2$ **b.** $(2 - i\sqrt{3})^2$

For each complex number given, name the complex conjugate and compute the product.

45. **a.** $4 + 5i$ **b.** $3 - i\sqrt{2}$

46. **a.** $2 - i$ **b.** $-1 + i\sqrt{5}$

47. **a.** $7i$ **b.** $\frac{1}{2} - \frac{2}{3}i$

48. **a.** $-5i$ **b.** $\frac{3}{4} + \frac{1}{5}i$

Use substitution to determine if the value shown is a solution to the given equation. Use a calculator check for Exercises 57 to 60.

49. $x^2 + 36 = 0; x = -6$

50. $x^2 + 16 = 0; x = -4$

51. $x^2 + 49 = 0; x = -7i$

52. $x^2 + 25 = 0; x = -5i$

53. $(x - 3)^2 = -9; x = 3 - 3i$

54. $(x + 1)^2 = -4; x = -1 + 2i$

55. $x^2 - 2x - 5 = 0; x = 1 - 2i$

56. $x^2 + 6x + 11 = 0; x = -1 - 3i$

57. $x^2 - 4x + 9 = 0; x = 2 + i\sqrt{5}$

58. $x^2 - 2x + 4 = 0; x = 1 - i\sqrt{3}$

59. Verify that $x = 1 + 4i$ is a solution to $x^2 - 2x + 17 = 0$. Then show its complex conjugate $1 - 4i$ is also a solution.

60. Verify that $x = 2 - 3i\sqrt{2}$ is a solution to $x^2 - 4x + 22 = 0$. Then show its complex conjugate $2 + 3i\sqrt{2}$ is also a solution.

Simplify using powers of *i*.

61. **a.** i^{48} **b.** i^{26} **c.** i^{39} **d.** i^{53}

62. **a.** i^{36} **b.** i^{50} **c.** i^{19} **d.** i^{65}

Divide and write your answer in *a* + *bi* form. Check your answer using multiplication.

63. **a.** $\dfrac{-2}{\sqrt{-49}}$ **b.** $\dfrac{4}{\sqrt{-25}}$

64. **a.** $\dfrac{2}{1 - \sqrt{-4}}$ **b.** $\dfrac{3}{2 + \sqrt{-9}}$

65. **a.** $\dfrac{7}{3 + 2i}$ **b.** $\dfrac{-5}{2 - 3i}$

66. **a.** $\dfrac{6}{1 + 3i}$ **b.** $\dfrac{7}{7 - 2i}$

67. **a.** $\dfrac{3 + 4i}{4i}$ **b.** $\dfrac{2 - 3i}{3i}$

68. **a.** $\dfrac{-4 + 8i}{2 - 4i}$ **b.** $\dfrac{3 - 2i}{-6 + 4i}$

▶ WORKING WITH FORMULAS

69. Absolute value of a complex number:
$|a + bi| = \sqrt{a^2 + b^2}$

The absolute value of any complex number $a + bi$ (sometimes called the *modulus* of the number) is computed by taking the square root of the sum of the squares of a and b. Find the absolute value of the given complex numbers.

a. $|2 + 3i|$ **b.** $|4 - 3i|$

c. $|3 + i\sqrt{2}|$

70. Binomial cubes:
$(A + B)^3 = A^3 + 3A^2B + 3AB^2 + B^3$

The cube of any binomial can be found using the formula shown, where A and B are the terms of the binomial. Use the formula to compute $(1 - 2i)^3$ (note $A = 1$ and $B = -2i$).

▶ APPLICATIONS

71. Dawn of imaginary numbers: In a day when imaginary numbers were imperfectly understood, Girolamo Cardano (1501–1576) once posed the problem, "Find two numbers that have a sum of 10 and whose product is 40." In other words, $A + B = 10$ and $AB = 40$. Although the solution is routine today, at the time the problem posed an enormous challenge. Verify that $A = 5 + i\sqrt{15}$ and $B = 5 - i\sqrt{15}$ satisfy these conditions.

72. Verifying calculations using *i*: Suppose Cardano had said, "Find two numbers that have a sum of 4 and a product of 7" (see Exercise 71). Verify that $A = 2 + i\sqrt{3}$ and $B = 2 - i\sqrt{3}$ satisfy these conditions.

Although it may seem odd, complex numbers have several applications in the real world. Many of these involve a study of electrical circuits, in particular *alternating current* or AC circuits. Briefly, the components of an AC circuit are current I (in amperes), voltage V (in volts), and the impedance Z (in ohms). The impedance of an electrical circuit is a measure of the total opposition to the flow of current through the circuit and is calculated as $Z = R + iX_L - iX_C$ where R represents a pure resistance, X_C represents the capacitance, and X_L represents the inductance. Each of these is also measured in ohms (symbolized by Ω).

73. Find the impedance Z if $R = 7\ \Omega$, $X_L = 6\ \Omega$, and $X_C = 11\ \Omega$.

74. Find the impedance Z if $R = 9.2\ \Omega$, $X_L = 5.6\ \Omega$, and $X_C = 8.3\ \Omega$.

The voltage V (in volts) across any element in an AC circuit is calculated as a product of the current I and the impedance Z: $V = IZ$.

75. Find the voltage in a circuit with a current $I = 3 - 2i$ amperes and an impedance of $Z = 5 + 5i\ \Omega$.

76. Find the voltage in a circuit with a current $I = 2 - 3i$ amperes and an impedance of $Z = 4 + 2i\ \Omega$.

In an AC circuit, the total impedance (in ohms) is given by $Z = \dfrac{Z_1 Z_2}{Z_1 + Z_2}$, where Z represents the total impedance of a circuit that has Z_1 and Z_2 wired in parallel.

77. Find the total impedance Z if $Z_1 = 1 + 2i$ and $Z_2 = 3 - 2i$.

78. Find the total impedance Z if $Z_1 = 3 - i$ and $Z_2 = 2 + i$.

▶ EXTENDING THE CONCEPT

79. Up to this point, we've said that expressions like $x^2 - 9$ and $p^2 - 7$ are factorable:

$$x^2 - 9 = (x + 3)(x - 3) \text{ and}$$

$$p^2 - 7 = (p + \sqrt{7})(p - \sqrt{7}),$$

while $x^2 + 9$ and $p^2 + 7$ are prime. More correctly, we should state that $x^2 + 9$ and $p^2 + 7$ are nonfactorable *using real numbers,* since they actually *can* be factored if complex numbers are used. Specifically,

$$(x + 3i)(x - 3i) = x^2 + 9 \text{ and}$$

$$(p + i\sqrt{7})(p - i\sqrt{7}) = p^2 + 7.$$

a. Verify that in general, $(a + bi)(a - bi) = a^2 + b^2$.

Use this idea to factor the following.

b. $x^2 + 36$ **c.** $m^2 + 3$

d. $n^2 + 12$ **e.** $4x^2 + 49$

80. In this section, we noted that the product property of radicals $\sqrt{AB} = \sqrt{A}\sqrt{B}$, can still be applied when at most one of the factors is negative. So what happens if *both* are negative? First consider the expression $\sqrt{-4 \cdot -25}$. What happens if you first multiply in the radicand, then compute the square root? Next consider the product $\sqrt{-4} \cdot \sqrt{-25}$. Rewrite each factor using the i notation, then compute the product. Do you get the same result as before? What can you say about $\sqrt{-4 \cdot -25}$ and $\sqrt{-4} \cdot \sqrt{-25}$?

81. Simplify the expression $i^{17}(3 - 4i) - 3i^3(1 + 2i)^2$.

82. While it is a simple concept for real numbers, the square root of a complex number is much more involved due to the interplay between its real and imaginary parts. For $z = a + bi$ the square root of z can be found using the formula: $\sqrt{z} = \frac{\sqrt{2}}{2}(\sqrt{|z| + a} \pm i\sqrt{|z| - a})$, where the sign is chosen to match the sign of b (see Exercise 69). Use the formula to find the square root of each complex number, then check by squaring.

a. $z = -7 + 24i$ **b.** $z = 5 - 12i$

c. $z = 4 + 3i$

▶ MAINTAINING YOUR SKILLS

83. **(1.4)** Two boats leave Nawiliwili (Kauai) at the same time, traveling in opposite directions. One travels at 15 knots (nautical miles per hour) and the other at 20 knots. How long until they are 196 mi apart?

84. **(2.4)** State the domain of the following functions using interval notation.

a. $f(x) = x^{\frac{2}{3}}$ **b.** $f(x) = x^{\frac{3}{2}}$

c. $f(x) = \dfrac{x}{x - 3}$

85. **(1.5)** John can run 10 m/sec, while Rick can only run 9 m/sec. If Rick gets a 2-sec head start, who will reach the 200-m finish line first?

86. **(Appendix A.4)** Factor the following expressions completely.

a. $x^4 - 16$ **b.** $n^3 - 27$

c. $x^3 - x^2 - x + 1$ **d.** $4n^2m - 12nm^2 + 9m^3$

3.2 Solving Quadratic Equations and Inequalities

LEARNING OBJECTIVES

In Section 3.2 you will see how we can:

- ❑ **A.** Establish a relationship between zeroes of a quadratic function and the x-intercepts of its graph
- ❑ **B.** Solve quadratic equations using the square root property of equality
- ❑ **C.** Solve quadratic equations by completing the square
- ❑ **D.** Solve quadratic equations using the quadratic formula and the discriminant
- ❑ **E.** Solve quadratic inequalities
- ❑ **F.** Solve applications of quadratic functions and inequalities

In Appendix A.4 we reviewed how to solve polynomials by factoring and applying the zero factor property. While this is an extremely valuable skill, many polynomials are unfactorable, and a more general method for finding solutions is necessary. We begin our search here, with the family of quadratic polynomials (degree 2).

A. Zeroes of Quadratic Functions and x-Intercepts of Quadratic Graphs

Understanding quadratic equations and functions is an important step towards a more general study of polynomial functions. Due to their importance, we begin by restating their definition:

Quadratic Equations

A quadratic equation is one that can be written in the form

$$ax^2 + bx + c = 0,$$

where a, b, and c are real numbers and $a \neq 0$.

As shown, the equation is in standard form, meaning the terms are in decreasing order of degree and the equation is set equal to zero. The family of quadratic functions is similarly defined.

Quadratic Functions

A quadratic function is one that can be written in the form

$$f(x) = ax^2 + bx + c,$$

where a, b, and c are real numbers and $a \neq 0$.

In Appendix A.4, we noted that some quadratic equations have two real solutions, others have only one, and still others have none. When these possibilities are explored graphically, we note a clear connection between the zeroes of a quadratic function and the x-intercepts of its graph.

EXAMPLE 1 ▶ Noting Relationships between Zeroes and x-Intercepts

Consider the functions $f(x) = x^2 - 2x - 3$ and $g(x) = x^2 - 4x + 4$.

a. Find the zeroes of each function algebraically.

b. Find the x-intercepts of each function graphically.

c. Comment on how the zeroes and x-intercepts are related.

Solution ▶

a. To find the zeroes algebraically, replace $f(x)$ and $g(x)$ with 0, then solve. In each case, the solutions can be found by factoring.

For $f(x)$:
$$x^2 - 2x - 3 = 0$$
$$(x - 3)(x + 1) = 0$$
$$x = 3 \text{ or } x = -1$$

There are two real solutions, $x = 3$ and $x = -1$.

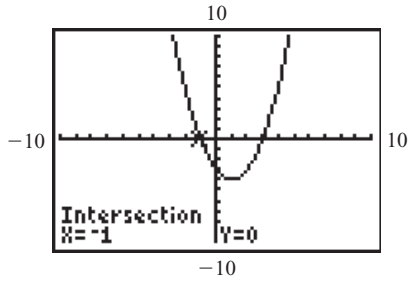
For $g(x)$:
$$x^2 - 4x + 4 = 0$$
$$(x - 2)(x - 2) = 0$$
$$x = 2 \text{ or } x = 2$$

There is only one real solution, but it is repeated twice.

b. To find the x-intercepts, go to the Y= screen and enter the first function as Y_1 with $Y_2 = 0$ (the x-axis), then graph them in the standard window. Locate the x-intercepts using the 2nd TRACE **(CALC) 5:Intersect** feature.

- For $f(x) = x^2 - 2x - 3$

Figure 3.9



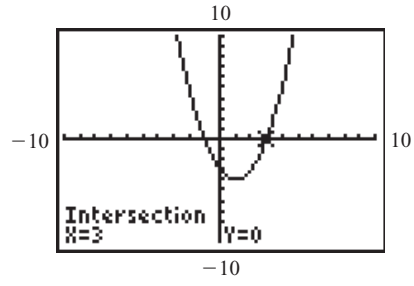


Figure 3.10

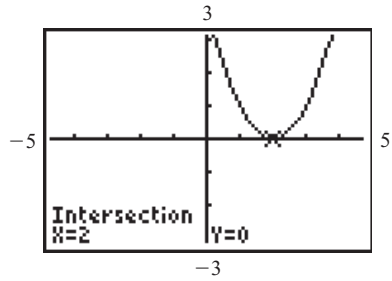
The result shows there are two x-intercepts, which occur at $x = -1$ (Figure 3.9) and $x = 3$ (Figure 3.10). These were also the real zeroes of $f(x) = x^2 - 2x - 3$.

- For $g(x) = x^2 - 4x + 4$

After entering $x^2 - 4x + 4$ as Y_1 (leaving $Y_2 = 0$) we again graph both functions in the standard window. This time we find there is only one x-intercept, located at $x = 2$ (Figure 3.11), a fact supported by the accompanying table (Figure 3.12). The graph is **tangent** to the x-axis at $x = 2$ (touching the axis at just this one point) and a closer look at g reveals why—the function is easily rewritten as $g(x) = (x - 2)^2$, producing the zero at $x = 2$ *and positive values for all other inputs!* Note that $x = 2$ was the only zero found for $g(x) = x^2 - 4x + 4$.

Figure 3.11



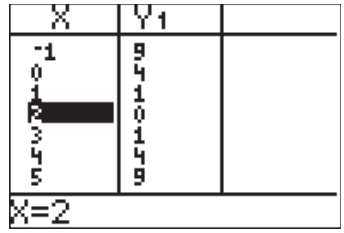


Figure 3.12

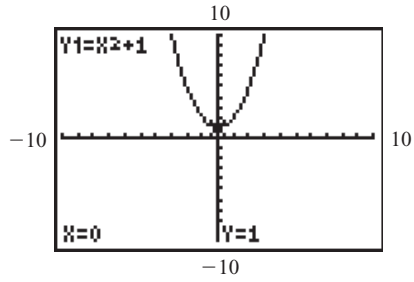
c. From parts (a) and (b), it's apparent that *the real zeroes of a function appear graphically as x-intercepts*.

Now try Exercises 7 through 20 ▶

In Section 3.1, we noted that the equation $x^2 + 1 = 0$ had no real solutions, indicating the function $f(x) = x^2 + 1$ has no real zeroes. Here we might wonder whether a graphical connection also exists for the "no real zeroes" case. The graph of $f(x) = x^2 + 1$ is given in Figure 3.13 and shows that f has no x-intercepts, further affirming the graphical connection noted in Example 1. A summary of these connections is shown in Figure 3.14 for the case where $a > 0$ (the graph opens upward). Similar statements can be made when $a < 0$ (the graph opens downward).

Figure 3.13



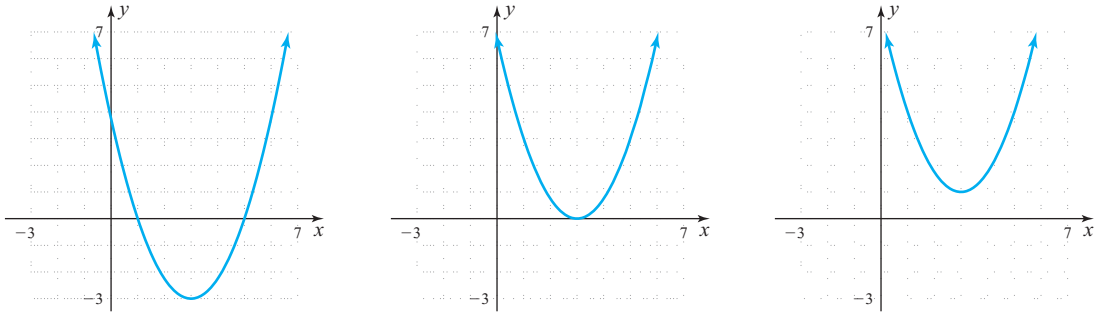


Figure 3.14

$f(x) = ax^2 + bx + c$ has two x-intercepts and two real zeroes; $ax^2 + bx + c = 0$ has two real solutions.

$g(x) = ax^2 + bx + c$ has one x-intercept and one real repeated zero; $ax^2 + bx + c = 0$ has one real repeated solution.

$h(x) = ax^2 + bx + c$ has no x-intercepts and no real zeroes; $ax^2 + bx + c = 0$ has no real solutions.

☑ **A.** You've just seen how we can establish a relationship between the zeroes of a quadratic function and the *x*-intercepts of its graph

Also from our work in Example 1, we learn that the following statements are equivalent, meaning that if any one of the statements is true, then all four statements are true.

For any real number r,

1. $x = r$ is a solution of $f(x) = 0$.
2. r is a zero of $f(x)$.
3. $(x - r)$ is a factor of $f(x)$.
4. $(r, 0)$ is an x-intercept of the graph of f.

B. Quadratic Equations and the Square Root Property of Equality

In Section 1.5 we solved the equation $ax + b = c$ for x to establish a general solution for equations of this form. In this section, we'll establish a general solution for $ax^2 + bx + c = 0$ using a process known as *completing the square*. To begin, we note that the equation $x^2 = 9$ can be solved by factoring. In standard form we have $x^2 - 9 = 0$ (note $b = 0$), then $(x + 3)(x - 3) = 0$. The solutions are $x = -3$ or $x = 3$, which are simply the *positive and negative square roots of 9*. This result suggests an alternative method for solving equations of the form $X^2 = k$, known as the **square root property of equality.**

Square Root Property of Equality

If X represents an algebraic expression and $X^2 = k$,

then $X = \sqrt{k}$ or $X = -\sqrt{k}$;

also written as $X = \pm\sqrt{k}$

EXAMPLE 2 ▶ **Solving an Equation Using the Square Root Property of Equality**

Use the square root property of equality to solve each equation. Verify solutions graphically.

a. $-4x^2 + 3 = -6$ **b.** $x^2 + 12 = 0$ **c.** $(x - 5)^2 = 7$

Solution ▶

a. $-4x^2 + 3 = -6$ original equation

$x^2 = \frac{9}{4}$ subtract 3, divide by -4

$x = \sqrt{\frac{9}{4}}$ or $x = -\sqrt{\frac{9}{4}}$ square root property of equality

$x = \frac{3}{2}$ or $x = -\frac{3}{2}$ simplify radicals

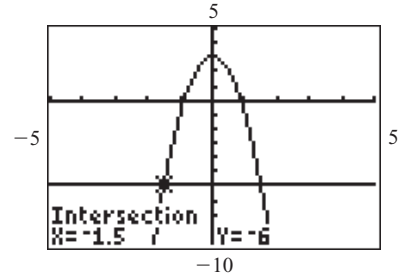
WORTHY OF NOTE

In Appendix A.6 we noted that for any real number a, $\sqrt{a^2} = |a|$. From Example 2(a), solving the equation by taking the square root of both sides produces $\sqrt{x^2} = \sqrt{\frac{9}{4}}$. This is equivalent to $|x| = \sqrt{\frac{9}{4}}$, again showing this equation must have two solutions, $x = -\sqrt{\frac{9}{4}}$ and $x = \sqrt{\frac{9}{4}}$.

This equation has two rational solutions.

Using the Intersection Method with $Y_1 = -4x^2 + 3$ and $Y_2 = -6$, we note the graphs intersect at two points. This shows there will be two real roots, which turn out to be rational (Figures 3.15 and 3.16).

Figure 3.15



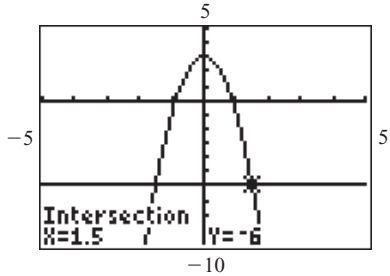


Figure 3.16

b. $x^2 + 12 = 0$ original equation

$x^2 = -12$ subtract 12

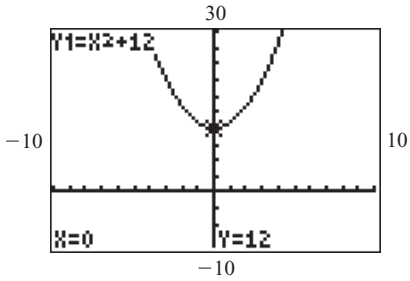
$x = \sqrt{-12}$ or $x = -\sqrt{-12}$ square root property of equality

$x = 2i\sqrt{3}$ or $x = -2i\sqrt{3}$ simplify radicals

This equation has two complex solutions.

Using the Zeroes Method with $Y_1 = x^2 + 12$ shows there are no x-intercepts, and therefore no real roots (Figure 3.17). However, the roots can still be checked on the home screen, as shown in Figure 3.18.

Figure 3.17



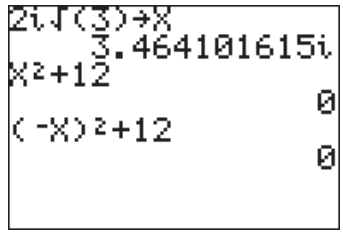


Figure 3.18

c. $(x - 5)^2 = 7$ original equation

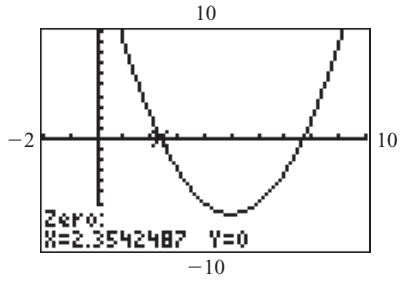
$x - 5 = \sqrt{7}$ or $x - 5 = -\sqrt{7}$ square root property of equality

$x = 5 + \sqrt{7}$ $x = 5 - \sqrt{7}$ solve for x

This equation has two irrational solutions.

Using the Zeroes Method with $Y_1 = (x - 5)^2 - 7$, we note the graph has two x-intercepts. This shows there will be two real roots, which turn out to be irrational (Figures 3.19 and 3.20).

Figure 3.19



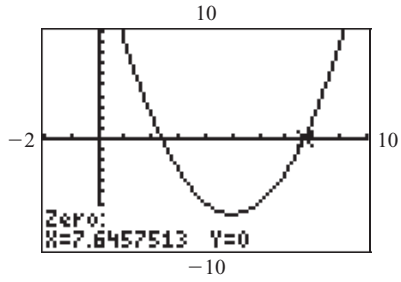


Figure 3.20

Now try Exercises 21 through 36 ▶

CAUTION ▶ For equations of the form $(x + d)^2 = k$ as in Example 2(c), you should resist the temptation to expand the binomial square in an attempt to simplify the equation and solve by factoring—many times the result is nonfactorable. *Any* equation of the form $(x + d)^2 = k$ can quickly be solved using the square root property of equality.

☑ **B.** You've just seen how we can solve quadratic equations using the square root property of equality

Answers written using radicals are called **exact** or **closed form** solutions. Actually checking the exact solutions is a nice application of fundamental skills. Let's check $x = 5 + \sqrt{7}$ from Example 2(c).

check:

$$(x - 5)^2 = 7 \quad \text{original equation}$$
$$(5 + \sqrt{7} - 5)^2 = 7 \quad \text{substitute } 5 + \sqrt{7} \text{ for } x$$
$$(\sqrt{7})^2 = 7 \quad \text{simplify}$$
$$7 = 7 \checkmark \quad (\sqrt{7})^2 = 7$$
result checks ($x = 5 - \sqrt{7}$ also checks)

C. Solving Quadratic Equations by Completing the Square

Again consider $(x - 5)^2 = 7$ from Example 2(c). If we had first expanded the binomial square, we would have obtained $x^2 - 10x + 25 = 7$, then $x^2 - 10x + 18 = 0$ in standard form. Note that this equation *cannot be solved by factoring*. Reversing this process leads us to a strategy for solving nonfactorable quadratic equations, by creating a *perfect square trinomial* from the quadratic and linear terms. This process is known as **completing the square.** To transform $x^2 - 10x + 18 = 0$ back into $x^2 - 10x + 25 = 7$ [which we would then rewrite as $(x - 5)^2 = 7$ and solve], we subtract 18 from both sides, then add 25:

$$x^2 - 10x + 18 = 0$$
$$x^2 - 10x = -18 \quad \text{subtract 18}$$
$$x^2 - 10x + 25 = -18 + 25 \quad \text{add 25}$$
$$(x - 5)^2 = 7 \quad \text{factor, simplify}$$

In general, after subtracting the constant term, the number that "completes the square" is computed as $[\frac{1}{2}$ (coefficient of linear term$)]^2$: $[\frac{1}{2}(10)]^2 = 25$. For additional practice finding this constant term, **see Exercises 37 through 42.**

EXAMPLE 3 ▶ **Solving a Quadratic Equation by Completing the Square**

Solve by completing the square: $x^2 + 13 = 6x$.

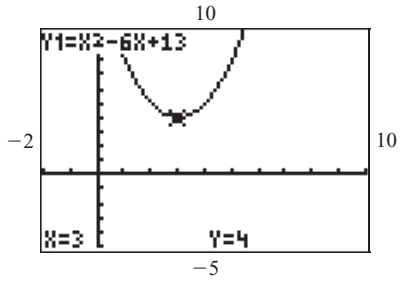
Solution ▶

$$x^2 + 13 = 6x \quad \text{original equation}$$
$$x^2 - 6x + 13 = 0 \quad \text{standard form}$$
$$x^2 - 6x + ___ = -13 + ___ \quad \text{subtract 13 to make room for new constant}$$
$$[(\tfrac{1}{2})(-6)]^2 = 9 \quad \text{compute } [(\tfrac{1}{2})(\textit{linear coefficient})]^2$$
$$x^2 - 6x + 9 = -13 + 9 \quad \text{add 9 to both sides (completing the square)}$$
$$(x - 3)^2 = -4 \quad \text{factor and simplify}$$
$$x - 3 = \sqrt{-4} \quad \text{or} \quad x - 3 = -\sqrt{-4} \quad \text{square root property of equality}$$
$$x = 3 + 2i \quad \text{or} \quad x = 3 - 2i \quad \text{simplify radicals and solve for } x$$

Now try Exercises 43 through 52 ▶

Based on our earlier work, we expect that the equation from Example 3 has no x-intercepts. Using $Y_1 = x^2 - 6x + 13$ confirms this (Figure 3.21 following), but we gain additional insight using the equation in its given form and the intersection-of-graphs method. With $Y_1 = x^2 + 13$ and $Y_2 = 6x$, we realize that if the graphs do not intersect (Figure 3.22), there can likewise be no real roots!

Figure 3.21



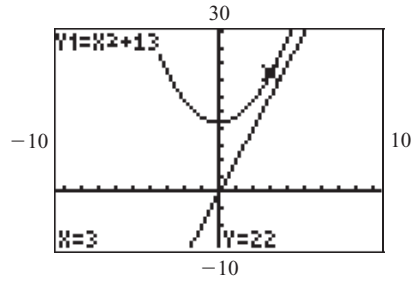


Figure 3.22

The process of completing the square can be applied to any quadratic equation with a leading coefficient of 1. If the leading coefficient is not 1, we simply divide through by a before beginning, which brings us to this summary of the process.

WORTHY OF NOTE

It's helpful to note that the number you're squaring in step three, $\left[\frac{1}{2}\cdot\frac{b}{a}\right] = \frac{b}{2a}$, turns out to be the constant term in the factored form. From Example 3, the number we squared was $(\frac{1}{2})(-6) = -3$, and the binomial square was $(x - 3)^2$.

Completing the Square to Solve a Quadratic Equation

To solve $ax^2 + bx + c = 0$ by completing the square:

1. Subtract the constant c from both sides.
2. Divide both sides by the leading coefficient a.
3. Compute $\left[\frac{1}{2}\cdot\frac{b}{a}\right]^2 = \left(\frac{b}{2a}\right)^2$ and add the result to both sides.
4. Factor left-hand side as a binomial square; simplify right-hand side.
5. Solve using the square root property of equality.

EXAMPLE 4 ▶ Solving Quadratic Equations

Find all solutions: $-3x^2 + 1 = 4x$.

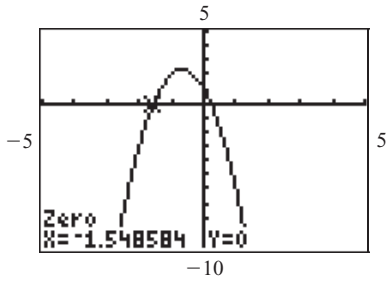
Algebraic Solution ▶ **Completing the Square**

$$-3x^2 + 1 = 4x \qquad \text{original equation}$$
$$-3x^2 - 4x + 1 = 0 \qquad \text{standard form (nonfactorable)}$$
$$-3x^2 - 4x = -1 \qquad \text{subtract 1}$$
$$x^2 + \frac{4}{3}x + \quad = \frac{1}{3} \qquad \text{divide by } -3$$
$$x^2 + \frac{4}{3}x + \frac{4}{9} = \frac{1}{3} + \frac{4}{9} \qquad \left[\left(\frac{1}{2}\right)\left(\frac{4}{3}\right)\right]^2 = \left(\frac{2}{3}\right)^2 = \frac{4}{9};\ \text{add } \frac{4}{9}$$
$$\left(x + \frac{2}{3}\right)^2 = \frac{7}{9} \qquad \text{factor and simplify } \left(\frac{1}{3} = \frac{3}{9}\right)$$
$$x + \frac{2}{3} = \sqrt{\frac{7}{9}} \quad \text{or} \quad x + \frac{2}{3} = -\sqrt{\frac{7}{9}} \qquad \text{square root property of equality}$$
$$x = -\frac{2}{3} + \frac{\sqrt{7}}{3} \quad \text{or} \quad x = -\frac{2}{3} - \frac{\sqrt{7}}{3} \qquad \text{solve for } x \text{ and simplify (exact form)}$$
$$x \approx 0.22 \quad \text{or} \quad x \approx -1.55 \qquad \text{approximate form (to hundredths)}$$

Graphical Solution ▶ **Zeroes Method**

After writing the equation in standard form, we have $-3x^2 - 4x + 1 = 0$. The graph of $Y_1 = -3x^2 - 4x + 1$ has two x-intercepts, indicating there will be two real roots. Locating the zeroes yields the decimal approximations shown and confirms our calculated results (Figures 3.23 and 3.24).

Figure 3.23



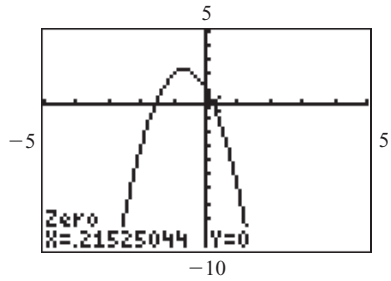


Figure 3.24

☑ **C.** You've just seen how we can solve quadratic equations by completing the square

Now try Exercises 53 through 60 ▶

CAUTION ▶ For many of the skills/processes needed in a study of algebra, it's actually easier to work with the fractional form of a number, rather than the decimal form. For example, computing $\left(\frac{2}{3}\right)^2$ is easier than computing $(0.\overline{6})^2$, and finding $\sqrt{\frac{9}{16}}$ is much easier than finding $\sqrt{0.5625}$.

D. The Quadratic Formula and the Discriminant

In Section 1.5 we found a general solution for the linear equation $ax + b = c$ by comparing it to $2x + 3 = 15$. Here we'll use a similar idea to find a general solution for quadratic equations. In a side-by-side format, we'll solve the equations $2x^2 + 5x + 3 = 0$ and $ax^2 + bx + c = 0$ by completing the square. Note the similarities.

$2x^2 + 5x + 3 = 0$	given equations	$ax^2 + bx + c = 0$
$2x^2 + 5x + \quad = -3$	subtract constant term	$ax^2 + bx + \quad = -c$
$x^2 + \frac{5}{2}x + ___ = -\frac{3}{2}$	divide by lead coefficient	$x^2 + \frac{b}{a}x + ___ = -\frac{c}{a}$
$\left[\frac{1}{2}\left(\frac{5}{2}\right)\right]^2 = \frac{25}{16}$	$\left[\frac{1}{2}(\text{linear coefficient})\right]^2$	$\left[\frac{1}{2}\left(\frac{b}{a}\right)\right]^2 = \frac{b^2}{4a^2}$
$x^2 + \frac{5}{2}x + \frac{25}{16} = \frac{25}{16} - \frac{3}{2}$	add to both sides	$x^2 + \frac{b}{a}x + \frac{b^2}{4a^2} = \frac{b^2}{4a^2} - \frac{c}{a}$
$\left(x + \frac{5}{4}\right)^2 = \frac{25}{16} - \frac{3}{2}$	left side factors as a binomial square	$\left(x + \frac{b}{2a}\right)^2 = \frac{b^2}{4a^2} - \frac{c}{a}$
$\left(x + \frac{5}{4}\right)^2 = \frac{25}{16} - \frac{24}{16}$	determine LCDs	$\left(x + \frac{b}{2a}\right)^2 = \frac{b^2}{4a^2} - \frac{4ac}{4a^2}$
$\left(x + \frac{5}{4}\right)^2 = \frac{1}{16}$	simplify right side	$\left(x + \frac{b}{2a}\right)^2 = \frac{b^2 - 4ac}{4a^2}$
$x + \frac{5}{4} = \pm\sqrt{\frac{1}{16}}$	square root property of equality	$x + \frac{b}{2a} = \pm\sqrt{\frac{b^2 - 4ac}{4a^2}}$
$x + \frac{5}{4} = \pm\frac{1}{4}$	simplify radicals	$x + \frac{b}{2a} = \pm\frac{\sqrt{b^2 - 4ac}}{2a}$
$x = -\frac{5}{4} \pm \frac{1}{4}$	solve for x	$x = -\frac{b}{2a} \pm \frac{\sqrt{b^2 - 4ac}}{2a}$
$x = \frac{-5 \pm 1}{4}$	combine terms	$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
$x = \frac{-5 + 1}{4}$ or $x = \frac{-5 - 1}{4}$	solutions	$x = \frac{-b + \sqrt{b^2 - 4ac}}{2a}$ or $x = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$

On the left, our final solutions are $x = -1$ or $x = -\frac{3}{2}$. The general solution is called the **quadratic formula,** which can be used to solve *any equation belonging to the quadratic family.*

Quadratic Formula

If $ax^2 + bx + c = 0$, with a, b, and $c \in \mathbb{R}$ and $a \neq 0$, then

$$x = \frac{-b + \sqrt{b^2 - 4ac}}{2a} \quad \text{or} \quad x = \frac{-b - \sqrt{b^2 - 4ac}}{2a};$$

$$\text{also written } x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

CAUTION ▶ It's very important to note the values of a, b, and c come from an equation *written in standard form.* For $3x^2 - 5x = -7$, $a = 3$ and $b = -5$, but $c \neq -7$! In standard form we have $3x^2 - 5x + 7 = 0$, and note the value for use in the formula is actually $c = 7$.

EXAMPLE 5 ▶ Solving Quadratic Equations Using the Quadratic Formula

Solve $4x^2 + 1 = 8x$ using the quadratic formula. State the solution(s) in both exact and approximate form. Check one of the exact solutions in the original equation.

Solution ▶ Begin by writing the equation in standard form and identifying the values of a, b, and c.

$4x^2 + 1 = 8x$ original equation

$4x^2 - 8x + 1 = 0$ standard form

$a = 4, b = -8, c = 1$

$$x = \frac{-(-8) \pm \sqrt{(-8)^2 - 4(4)(1)}}{2(4)}$$ substitute 4 for a, -8 for b, and 1 for c

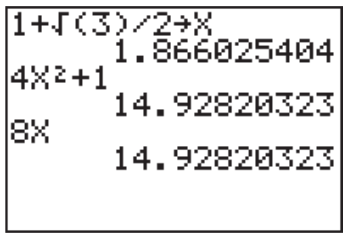
$$x = \frac{8 \pm \sqrt{64 - 16}}{8} = \frac{8 \pm \sqrt{48}}{8}$$ simplify

$$x = \frac{8 \pm 4\sqrt{3}}{8} = \frac{8}{8} \pm \frac{4\sqrt{3}}{8}$$ simplify radical (see following CAUTION)

$$x = 1 + \frac{\sqrt{3}}{2} \quad \text{or} \quad x = 1 - \frac{\sqrt{3}}{2}$$ exact solutions

$x \approx 1.87$ or $x \approx 0.13$ approximate solutions

Check ▶



$4x^2 + 1 = 8x$ original equation

$$4\left(1 + \frac{\sqrt{3}}{2}\right)^2 + 1 = 8\left(1 + \frac{\sqrt{3}}{2}\right)$$ substitute $1 + \frac{\sqrt{3}}{2}$ for x

$$4\left[1 + 2\left(\frac{\sqrt{3}}{2}\right) + \frac{3}{4}\right] + 1 = 8 + 4\sqrt{3}$$ square binomial; distribute

$4 + 4\sqrt{3} + 3 + 1 = 8 + 4\sqrt{3}$ distribute

$8 + 4\sqrt{3} = 8 + 4\sqrt{3}$ ✓ result checks

A graphing calculator check is also shown.

Now try Exercises 61 through 90 ▶

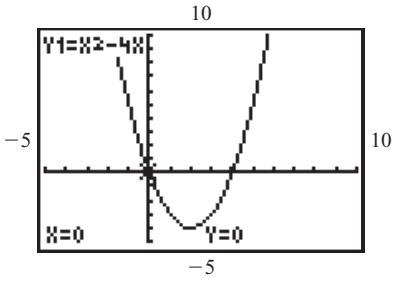
CAUTION ▶ For $\frac{8 \pm 4\sqrt{3}}{8}$, be careful not to incorrectly "cancel the eights" as in $\frac{\cancel{8}^{1} \pm 4\sqrt{3}}{\cancel{8}_{1}} \neq 1 \pm 4\sqrt{3}$.

No! Use a calculator to verify that the results are not equivalent. Both terms in the numerator are divided by 8 and we must either rewrite the expression as separate terms (as above) or factor the numerator to see if the expression simplifies further:

$\frac{8 \pm 4\sqrt{3}}{8} = \frac{\cancel{4}^{1}(2 \pm \sqrt{3})}{\cancel{8}_{2}} = \frac{2 \pm \sqrt{3}}{2}$, which is equivalent to $1 \pm \frac{\sqrt{3}}{2}$.

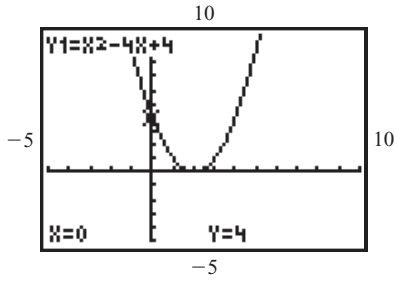
The Discriminant of the Quadratic Formula

The conclusions we reached graphically in Figure 3.14 regarding the nature of number of quadratic roots can now be seen algebraically through a closer look at the quadratic formula. For any real-valued expression X, recall that $\sqrt{X}$ represents a real number only for $X \geq 0$. Since the quadratic formula contains the radical $\sqrt{b^2 - 4ac}$, the expression $b^2 - 4ac$, called the **discriminant,** will determine the nature (real or complex) and the number of solutions to a given quadratic equation.



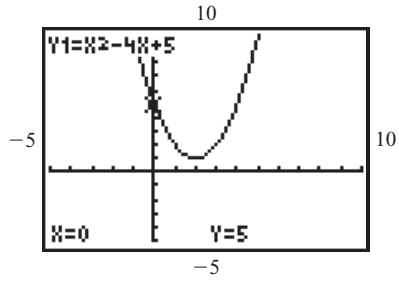
The Discriminant of the Quadratic Formula

For $f(x) = ax^2 + bx + c$, where $a, b, c \in \mathbb{R}$ and $a \neq 0$,



1. If $b^2 - 4ac > 0$, there are two real roots
2. If $b^2 - 4ac = 0$, there is one real (repeated) root
3. If $b^2 - 4ac < 0$, there are two nonreal roots

These ideas are further illustrated here, by comparing the value of the discriminant with the graph of the related function shown below each calculation.



1. $f(x) = x^2 - 4x$
$a = 1, b = -4, c = 0$
$b^2 - 4ac = (-4)^2 - 4(1)(0)$
$= 16 - 0$
$= 16$
$16 > 0$, f has two real roots

2. $g(x) = x^2 - 4x + 4$
$a = 1, b = -4, c = 4$
$b^2 - 4ac = (-4)^2 - 4(1)(4)$
$= 16 - 16$
$= 0$
$0 = 0$, g has one real root

3. $h(x) = x^2 - 4x + 5$
$a = 1, b = -4, c = 5$
$b^2 - 4ac = (-4)^2 - 4(1)(5)$
$= 16 - 20$
$= -4$
$-4 < 0$, h has two nonreal roots

Finally, we note from (3) and the structure of the quadratic formula, that the complex solutions must occur in conjugate pairs.

Complex Solutions

The complex solutions of a quadratic equation with real coefficients must occur in conjugate pairs.
If $a + bi$ is a solution, then $a - bi$ is also a solution.

Further analysis of the discriminant reveals even more concerning the nature of quadratic solutions. Namely, if a, b, and c are rational and the discriminant is

1. zero, the original equation is a perfect square trinomial.
2. a perfect square, there will be two rational roots which means the original equation can be solved by factoring.
3. not a perfect square, there will be two irrational roots.

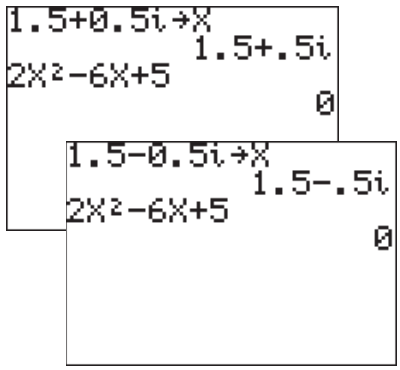
See Exercises 91 through 102.

EXAMPLE 6 ▶ Solving Quadratic Equations Using the Quadratic Formula

Solve: $2x^2 - 6x + 5 = 0$.

Solution ▶ With $a = 2$, $b = -6$, and $c = 5$, the discriminant becomes $(-6)^2 - 4(2)(5) = -4$, showing there will be two complex roots. The quadratic formula then yields

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$ quadratic formula



$$x = \frac{-(-6) \pm \sqrt{-4}}{2(2)}$$ $b^2 - 4ac = -4$, substitute 2 for a and -6 for b

$$x = \frac{6 \pm 2i}{4}$$ simplify, write in i form

$$x = \frac{3}{2} \pm \frac{1}{2}i$$ solutions are complex conjugates

A calculator check is shown in Figures 3.25 and 3.26.

Figure 3.25, 3.26

Now try Exercises 103 through 108 ▶

WORTHY OF NOTE

While it's possible to solve by completing the square if $\frac{b}{a}$ is a fraction or an odd number (see Example 4), the process is usually most efficient when $\frac{b}{a}$ is an even number. This is one observation you could use when selecting a solution method.

D. You've just seen how we can solve quadratic equations using the quadratic formula and the discriminant

Summary of Solution Methods for $ax^2 + bx + c = 0$

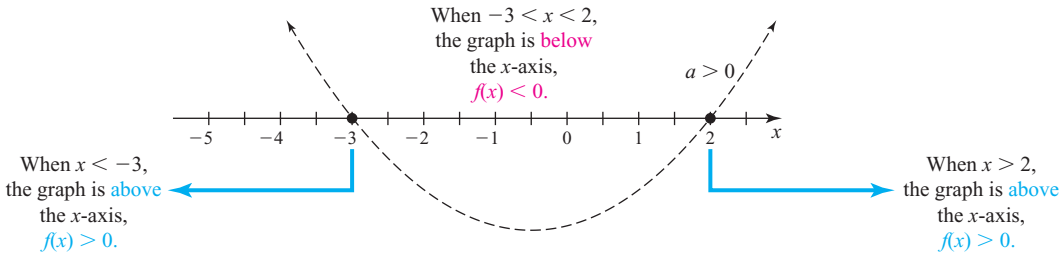
1. If $b = 0$, $ax^2 + c = 0$: isolate x^2 and use the square root property of equality.
2. If $c = 0$, $ax^2 + bx = 0$: factor out the GCF and use the zero product property.
3. If no coefficient is zero, you can attempt to solve by
   a. factoring **b.** completing the square **c.** using the quadratic formula
   d. using the intersection-of-graphs method **e.** using the zeroes method

E. Quadratic Inequalities

The study of quadratic inequalities is simply an extension of our earlier work in analyzing functions (Section 2.1). While we've developed the ability to graph a variety of new functions, the solution set for an inequality will still be determined by analyzing the behavior of the function at its zeroes. The key idea is to recognize the following statements are synonymous:

1. $f(x) > 0$. **2.** Outputs are positive. **3.** The graph is *above the x-axis*.

Similar statements can be made using the other inequality symbols.



Solving a quadratic inequality only requires that we (a) locate any real zeroes of the function and (b) determine whether the graph opens upward or downward. If there are no x-intercepts, the graph is entirely above the x-axis (output values are positive), or entirely below the x-axis (output values are negative), making the solution either all real numbers or the empty set.

EXAMPLE 7 ▶ **Solving a Quadratic Inequality**

For $f(x) = x^2 + x - 6$, solve $f(x) > 0$.

Analytical Solution ▶ The graph of f will open upward since $a > 0$. Factoring gives $f(x) = (x + 3)(x - 2)$, with zeroes at -3 and 2. Using the x-axis alone (since graphing the function is not our focus), we plot $(-3, 0)$ and $(2, 0)$ and visualize a parabola opening upward through these points (Figure 3.27).

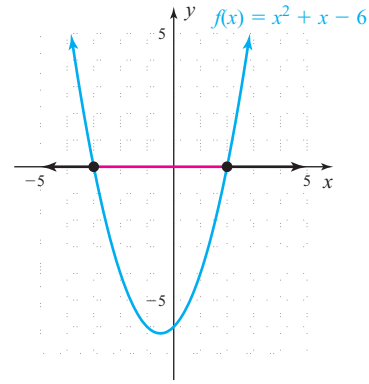


Figure 3.27

The diagram clearly shows the graph is *above* the x-axis (outputs are positive) when $x < -3$ or when $x > 2$. The solution is $x \in (-\infty, -3) \cup (2, \infty)$.

Graphical Solution ▶ The complete graph of f shown in Figure 3.28 confirms the analytical solution. For the intervals of the domain shown in **bold** $(-\infty, -3) \cup (2, \infty)$, the graph is above the x-axis ($f(x) > 0$). For the portion shown in red, the graph is below the x-axis ($f(x) < 0$).

Figure 3.28

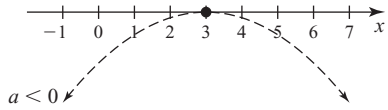
Now try Exercises 109 through 120 ▶

When solving general inequalities, zeroes of multiplicity continue to play a role. In Example 7, the zeroes of f were both of multiplicity 1, and the graph crossed the x-axis at these points. In other cases, the zeroes may have even multiplicity.

EXAMPLE 8 ▶ **Solving a Quadratic Inequality**

Solve the inequality $-x^2 + 6x \le 9$.

Analytical Solution ▶



Begin by writing the inequality in standard form: $-x^2 + 6x - 9 \le 0$. Note this is equivalent to $g(x) \le 0$ for $g(x) = -x^2 + 6x - 9$. Since $a < 0$, the graph of g will open downward. The factored form is $g(x) = -(x - 3)^2$, showing 3 is a zero and a repeated root. Using the x-axis, we plot the point (3, 0) and visualize a parabola opening downward through this point.

Figure 3.29 shows the graph is *below* the x-axis (outputs are negative) for *all values* of x except $x = 3$. But since this is a less than *or equal to* inequality, the solution is $x \in \mathbb{R}$.

WORTHY OF NOTE

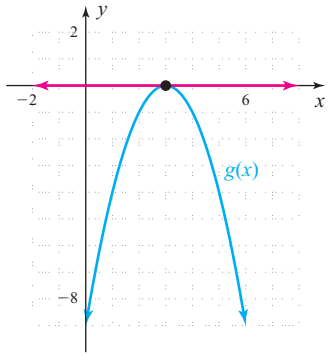
Since $x = 3$ was a zero of multiplicity 2, the graph "bounced off" the x-axis at this point, with no change of sign for g. The graph is entirely below the x-axis, except at the vertex (3, 0).

Figure 3.29

Graphical Solution ▶

The complete graph of g shown in Figure 3.30 confirms the analytical solution (using the zeroes method). For the intervals of the domain shown in red: $(-\infty, 3) \cup (3, \infty)$, the graph of g is below the x-axis $[g(x) < 0]$. The point (3, 0) is *on* the x-axis $[g(3) = 0]$. As with the analytical solution, the solution to this "less than or equal to" inequality is all real numbers. A calculator check of the original inequality is shown in Figure 3.31.

Figure 3.30



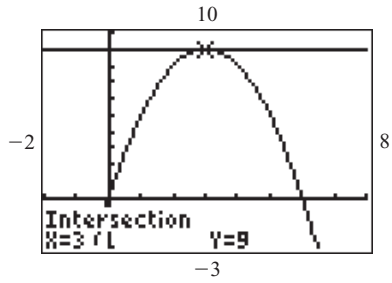


Figure 3.31

Now try Exercises 121 through 132 ▶

As an alternative to the Zeroes Method, the **Interval Test Method** can be used to solve quadratic inequalities. Using the fact that all polynomials are continuous, test values are selected from certain intervals of the domain and substituted into the original function.

Interval Test Method for Solving Inequalities

1. Find all real roots of the related equation (if they exist) and plot them on the x-axis.
2. Select any convenient test value from each interval created by the zeroes, and substitute these into the function.
3. The sign of the function at these test values will be the sign of the function for all values of x in this interval.

EXAMPLE 9 ▶ **Solving a Quadratic Inequality**

Solve the inequality $-2x^2 - 3x + 20 \le 0$ using interval tests.

Solution ▶ To begin, we find the zeroes of $f(x) = -2x^2 - 3x + 20$ by factoring.

$$\begin{aligned} -2x^2 - 3x + 20 &= 0 && \text{related equation} \\ 2x^2 + 3x - 20 &= 0 && \text{multiply by } -1 \\ (2x - 5)(x + 4) &= 0 && \text{factored form} \\ 2x - 5 = 0 \text{ or } x + 4 &= 0 && \text{zero factor property} \\ x = \frac{5}{2} \text{ or } x &= -4 && \text{solutions} \end{aligned}$$

Plotting these intercepts creates three intervals on the x-axis (Figure 3.32).

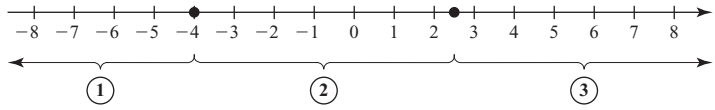

Figure 3.32

Selecting a test value from each interval (in red) gives Figure 3.33:

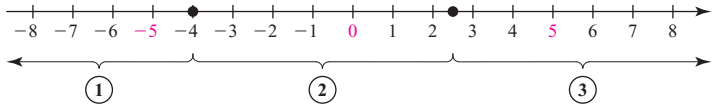

Figure 3.33

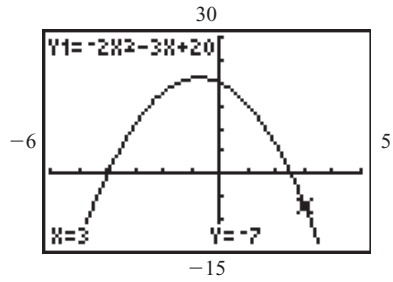


$x = -5$	$x = 0$	$x = 5$
$f(-5) = -15$	$f(0) = 20$	$f(5) = -45$
$f(x) < 0$ in ①	$f(x) > 0$ in ②	$f(x) < 0$ in ③

WORTHY OF NOTE

When evaluating a function using the interval test method, it's usually easier to use the factored form instead of the polynomial form, since all you really need is whether the result will be positive or negative. For instance, you could likely tell $f(-5) = -[2(-5) - 5](-5 + 4)$ is going to be negative, more quickly than $f(-5) = -2(-5)^2 - 3(-5) + 20$.

The interval tests show $-2x^2 - 3x + 20 \le 0$ for $x \in (-\infty, -4) \cup (\frac{5}{2}, \infty)$, which is supported by the graph shown in Figure 3.34.

Figure 3.34

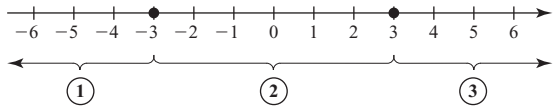
Now try Exercises 133 through 144 ▶

The need to solve a quadratic inequality occurs in a variety of contexts. Here, the solution is used to find the domain of a radical function.

EXAMPLE 10 ▶ **Solving a Quadratic Inequality to Determine the Domain**

Find the domain of $g(x) = \sqrt{9 - x^2}$.

Solution ▶ From our earlier work, the radicand must be nonnegative and we are essentially asked to solve the inequality $9 - x^2 > 0$. The related equation is $9 - x^2 = 0$ and by inspection (or factoring), the solutions are $x = -3$ and $x = 3$. Plotting these solutions creates three intervals on the x-axis (Figure 3.35).



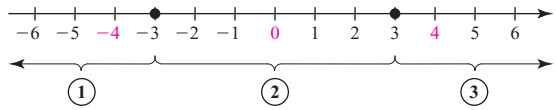


Figure 3.35

Selecting a test value from each interval (in red) gives Figure 3.36:

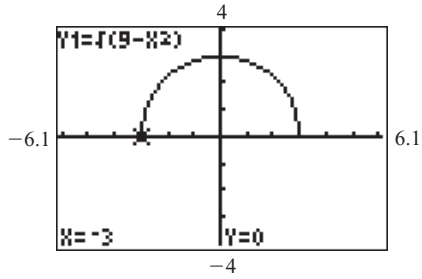

Figure 3.36

$x = -4$	$x = 0$	$x = 4$
$9 - (-4)^2 = -7$	$9 - (0)^2 = 9$	$9 - (4)^2 = -7$
$9 - x^2 < 0$ in ①	$9 - x^2 > 0$ in ②	$9 - x^2 < 0$ in ③

The interval tests show that $9 - x^2 \geq 0$ for $x \in [-3, 3]$, which is the domain of $g(x) = \sqrt{9 - x^2}$. This is the same relation we graphed in Section 1.1/Example 3, a semicircle with endpoints at $x = -3$ and 3. See Figure 3.37.

Figure 3.37

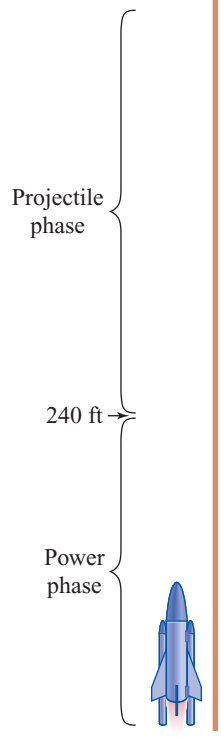
Now try Exercises 145 through 154 ▶

F. Applications of Quadratic Functions and Inequalities

A projectile is any object that is thrown, shot, or *projected* upward with no sustaining source of propulsion. The height of the projectile at time t is modeled by the equation $h = -16t^2 + vt + k$, where h is the height of the object in feet, t is the elapsed time in seconds, and v is the initial velocity in feet per second. The constant k represents the initial height of the object above ground level, as when a person releases an object 5 ft above the ground in a throwing motion ($k = 5$), or when a rocket runs out of fuel at an altitude of 240 ft ($k = 240$).

EXAMPLE 11 ▶ **Solving an Application of Quadratic Equations—Rocketry**



A model rocketry club is testing a newly developed engine. A few seconds after liftoff, at a velocity of 160 ft/sec and a height of 240 ft, it runs out of fuel and becomes a projectile (see Figure 3.38).

a. How high is the rocket 3 sec later?

b. For how many seconds was the height of the rocket greater than or equal to 496 ft?

c. How many seconds until the rocket returns to the ground?

Figure 3.38

Solution ▶

a. Using the information given, the function h modeling the rocket's height in the projectile phase, is $h(t) = -16t^2 + 160t + 240$. For its height at $t = 3$ we have

$$\begin{aligned} h(3) &= -16(3)^2 + 160(3) + 240 \\ &= -16(9) + 480 + 240 \\ &= 576 \end{aligned}$$

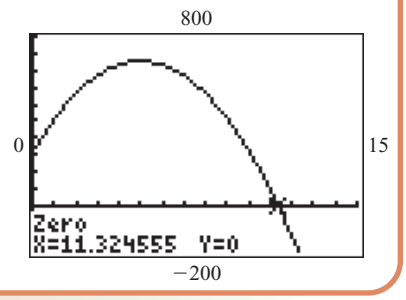
Three seconds later, the rocket was at an altitude of 576 ft.

b. Since the height $h(t)$ must be greater than or equal to 496 ft, we use the function $h(t) = -16t^2 + 160t + 240$ to write the inequality $-16t^2 + 160t + 240 \geq 496$. In standard form, we obtain $-16t^2 + 160t - 256 \geq 0$ (subtract 496 from both sides). We begin by finding the zeroes of $-16t^2 + 160t - 256 = 0$, noting the related graph opens downward since the leading coefficient is negative.

$$\begin{aligned} -16t^2 + 160t - 256 &= 0 && \text{related equation} \\ t^2 - 10t + 16 &= 0 && \text{divide by } -16 \\ (t-2)(t-8) &= 0 && \text{factor} \\ t - 2 = 0 \quad &\text{or} \quad t - 8 = 0 && \text{zero factor theorem} \\ t = 2 \quad &\text{or} \quad t = 8 && \text{result} \end{aligned}$$

This shows the rocket is at exactly 496 ft after 2 sec (on its ascent) and after 8 sec (during its descent). We conclude the rocket's height was greater than 496 ft for $8 - 2 = 6$ sec.

c. When the rocket hits the ground, its height is $h = 0$. Substituting 0 for $h(t)$ and solving gives



$$\begin{aligned} h(t) &= -16t^2 + 160t + 240 && \text{original function} \\ 0 &= -16t^2 + 160t + 240 && \text{substitute 0 for } h(t) \\ 0 &= t^2 - 10t - 15 && \text{divide by } -16 \end{aligned}$$

The equation is nonfactorable, so we use the quadratic equation to solve, with $a = 1$, $b = -10$, and $c = -15$:

$$\begin{aligned} t &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} && \text{quadratic formula} \\ &= \frac{-(-10) \pm \sqrt{(-10)^2 - 4(1)(-15)}}{2(1)} && \text{substitute 1 for } a, -10 \text{ for } b, -15 \text{ for } c \\ &= \frac{10 \pm \sqrt{160}}{2} && \text{simplify} \\ &= \frac{10}{2} \pm \frac{4\sqrt{10}}{2} && \sqrt{160} = 4\sqrt{10} \\ &= 5 \pm 2\sqrt{10} && \text{simplify} \end{aligned}$$

Since we need the time t in seconds, we use the approximate form of the answer, obtaining $t \approx -1.32$ and $t \approx 11.32$. The rocket will return to the ground in just over 11 sec (since t represents time, the solution $t = -1.32$ does not apply). A calculator check is shown in Figure 3.39 using the Zeroes Method.

Figure 3.39

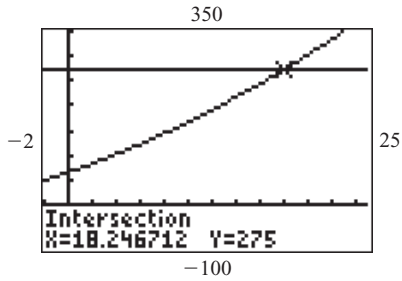
EXAMPLE 12 ▶ Solving Applications of Inequalities Using the Quadratic Formula

For the years 1995 to 2006, the amount A of annual international telephone traffic (in billions of minutes) can be modeled by $A = 0.17x^2 + 8.43x + 64.58$ where $x = 0$ represents the year 1995 [*Source:* Data from the *2009 Statistical Abstract of the United States,* Table 1344, page 846]. If this trend continues, in what year will the annual number of minutes reach or surpass 275 billion?

Analytical Solution ▶ We are essentially asked to solve the inequality $0.17x^2 + 8.43x + 64.58 \geq 275$.



$$0.17x^2 + 8.43x + 64.58 \geq 275 \quad \text{given inequality}$$
$$0.17x^2 + 8.43x - 210.42 \geq 0 \quad \text{subtract 275}$$

For $a = 0.17$, $b = 8.43$, and $c = -210.42$, the quadratic formula gives

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \quad \text{quadratic formula}$$
$$x = \frac{-8.43 \pm \sqrt{(8.43)^2 - 4(0.17)(-210.42)}}{2(0.17)} \quad \text{substitute known values}$$
$$x = \frac{-8.43 \pm \sqrt{214.1505}}{0.34} \quad \text{simplify}$$
$$x \approx 18.25 \quad \text{or} \quad x \approx -67.83 \quad \text{result}$$

We disregard the negative solution (since x represents time), and find the annual number of international telephone minutes will reach or surpass 275 billion about 18 years after 1995, or in the year 2013.

Graphical Solution ▶ After entering $0.17x^2 + 8.43x + 64.58$ as Y_1, our next task is to determine an appropriate window size. With 1995 as year $x = 0$ and the data taken from year 2006 ($x = 11$) it seems that $x = -2$ to $x = 25$ would be an appropriate start for the domain (we can later adjust the window if needed). As the primary question is the year when telephone traffic surpasses 275 billion minutes, the range must include this value and $y = -100$ to $y = 350$ would be a good start (as before, the negative values were used to create a frame around the desired window). Using the intersection-of-graphs method, the resulting graph is shown in the figure and indicates that telephone traffic surpassed 275 billion minutes in the 18th year (2013), in line with our analytical solution.

F. You've just seen how we can solve applications of quadratic functions and inequalities

Now try Exercises 167 and 168 ▶

3.2 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section, if necessary.

1. The solution $x = 2 + \sqrt{3}$ is called an _____ form of the solution. Using a calculator, we find the _____ form is $x \approx 3.732$.
2. To solve a quadratic equation by completing the square, the coefficient of the _____ term must be a _____.
3. The quantity $b^2 - 4ac$ is called the _____ of the quadratic equation. If $b^2 - 4ac > 0$, there are _____ real roots.
4. According to the summary on page 224, the equation $4x^2 - 5x$ might best be solved by _____ out the _____.
5. Discuss/Explain the relationship between solutions to $f(x) = 0$ and the x-intercepts of $y = f(x)$. Be sure to include an example.
6. Discuss/Explain why this version of the quadratic formula is incorrect:
$$x = -b \pm \frac{\sqrt{b^2 - 4ac}}{2a}$$

▶ DEVELOPING YOUR SKILLS

Six functions are shown below, along with their respective zeroes. Use these zeroes to solve the equations in Exercises 7 through 12.

$f(x) = x^2 + x - 12$, $f(-4) = f(3) = 0$;

$g(x) = x^2 - 4x - 5$, $g(-1) = g(5) = 0$;

$h(x) = -2x^2 - 4x + 6$, $h(-3) = h(1) = 0$;

$j(x) = -4x^2 + 4x + 8$, $j(-1) = j(2) = 0$;

$k(x) = 2x^2 + x - 3$, $k(\frac{-3}{2}) = k(1) = 0$;

$l(x) = 3x^2 + 8x - 3$, $l(-3) = l(\frac{1}{3}) = 0$

7. $x^2 + x - 12 = 0$

8. $x^2 - 4x - 5 = 0$

9. $2x^2 + x = 3$

10. $3x^2 + 8x = 3$

11. $4x^2 = 4x + 8$

12. $2x^2 + 4x = 6$

Solve the following equations graphically by locating the zeroes of a related quadratic function. Round to hundredths as necessary.

13. $x^2 + 3x - 5 = 0$

14. $x^2 - 7x - 2 = 0$

15. $0.4x^2 - 0.6x - 2 = 0$

16. $5x^2 + 0.2x - 1.1 = 0$

17. $2x^2 - 3x = 6$

18. $3x^2 + x = 3$

19. $2.9x^2 = 1.3x - 5.7$

20. $8.1x^2 = 5.3x - 4.2$

Solve the following equations using the square root property of equality. Write answers in exact form and approximate form rounded to hundredths. If there are no real solutions, so state. Verify solutions graphically.

21. $m^2 = 16$

22. $p^2 = 49$

23. $y^2 - 28 = 0$

24. $m^2 - 20 = 0$

25. $p^2 + 36 = 0$

26. $n^2 + 5 = 0$

27. $x^2 = \frac{21}{16}$

28. $y^2 = \frac{13}{9}$

29. $(n - 3)^2 = 36$

30. $(p + 5)^2 = 49$

31. $(w + 5)^2 = 3$

32. $(m - 4)^2 = 5$

33. $(x - 3)^2 + 7 = 2$

34. $(m + 11)^2 + 5 = 3$

35. $(m - 2)^2 = \frac{18}{49}$

36. $(x - 5)^2 = \frac{12}{25}$

Fill in the blank so the result is a perfect square trinomial, then factor into a binomial square.

37. $x^2 + 6x +$ _____

38. $y^2 + 10y +$ _____

39. $n^2 + 3n +$ _____

40. $x^2 - 5x +$ _____

41. $p^2 + \frac{2}{3}p +$ _____

42. $x^2 - \frac{3}{2}x +$ _____

Solve by completing the square. Write your answers in both exact form and approximate form rounded to the hundredths place. If there are no real solutions, so state.

43. $x^2 + 6x = -5$

44. $m^2 + 8m = -12$

45. $p^2 - 6p + 3 = 0$

46. $n^2 = 4n + 10$

47. $p^2 + 6p = -4$

48. $x^2 - 8x - 1 = 0$

49. $m^2 + 3m = 1$

50. $n^2 + 5n - 2 = 0$

51. $n^2 = 5n + 5$

52. $w^2 - 7w + 3 = 0$

Solve the following quadratic equations (a) algebraically by completing the square and (b) graphically by using a graphing calculator and the Zeroes Method. Round answers to nearest hundredth when necessary.

53. $2x^2 = -7x + 4$

54. $3w^2 - 8w + 4 = 0$

55. $2n^2 - 3n - 9 = 0$

56. $2p^2 - 5p = 1$

57. $4p^2 - 3p - 2 = 0$

58. $3x^2 + 5x - 6 = 0$

59. $m^2 = 7m - 4$

60. $a^2 - 15 = 4a$

Solve each equation using the most efficient method: factoring, square root property of equality, or the quadratic formula. Write your answer in both exact and approximate form (rounded to hundredths). Check one of the exact solutions in the original equation.

61. $x^2 - 3x = 18$

62. $w^2 + 6w - 1 = 0$

63. $4m^2 - 25 = 0$

64. $4a^2 - 4a = 1$

65. $4n^2 - 8n - 1 = 0$

66. $2x^2 - 4x + 5 = 0$

67. $6w^2 - w = 2$

68. $3a^2 - 5a + 6 = 0$

69. $4m^2 = 12m - 15$

70. $3p^2 + p = 0$

71. $4n^2 - 9 = 0$

72. $4x^2 - x = 3$

73. $5w^2 = 6w + 8$

74. $3m^2 - 7m - 6 = 0$

75. $3a^2 - a + 2 = 0$

76. $3n^2 - 2n - 3 = 0$

77. $5p^2 = 6p + 3$

78. $2x^2 + x + 3 = 0$

79. $5w^2 - w = 1$

80. $3m^2 - 2 = 5m$

81. $2a^2 + 5 = 3a$ **82.** $n^2 + 4n - 8 = 0$

83. $2p^2 - 4p + 11 = 0$ **84.** $8x^2 - 5x - 1 = 0$

85. $w^2 + \frac{2}{3}w = \frac{1}{9}$ **86.** $\frac{5}{4}m^2 - \frac{8}{3}m + \frac{1}{6} = 0$

87. $0.2a^2 + 1.2a + 0.9 = 0$

88. $-5.4n^2 + 8.1n + 9 = 0$

89. $\frac{2}{7}p^2 - 3 = \frac{8}{21}p$ **90.** $\frac{5}{9}x^2 - \frac{16}{15}x = \frac{3}{2}$

Use the discriminant to determine whether the given equation has irrational, rational, repeated, or nonreal roots. Also state whether the original equation is factorable using integers, but do not solve for *x*.

91. $-3x^2 + 2x + 1 = 0$ **92.** $2x^2 - 5x - 3 = 0$

93. $-4x + x^2 + 13 = 0$ **94.** $-10x + x^2 + 41 = 0$

95. $15x^2 - x - 6 = 0$ **96.** $10x^2 - 11x - 35 = 0$

97. $-4x^2 + 6x - 5 = 0$ **98.** $-5x^2 - 3 = 2x$

99. $2x^2 + 8 = -9x$ **100.** $x^2 + 4 = -7x$

101. $4x^2 + 12x = -9$ **102.** $9x^2 + 4 = 12x$

Solve the equations given. Simplify each result.

103. $-6x + 2x^2 + 5 = 0$ **104.** $17 + 2x^2 = 10x$

105. $5x^2 + 5 = -5x$ **106.** $x^2 = -2x - 19$

107. $-2x^2 = -5x + 11$ **108.** $4x - 3 = 5x^2$

Solve each quadratic inequality by locating the *x*-intercept(s) (if they exist), and noting the end-behavior of the graph. Begin by writing the inequality in function form as needed.

109. $f(x) = -x^2 + 4x; f(x) > 0$

110. $g(x) = x^2 - 5x; g(x) < 0$

111. $h(x) = x^2 + 4x - 5; h(x) \geq 0$

112. $p(x) = -x^2 + 3x + 10; p(x) \leq 0$

113. $q(x) = 2x^2 - 5x - 7; q(x) < 0$

114. $r(x) = -2x^2 - 3x + 5; r(x) > 0$

115. $7 \geq x^2$ **116.** $x^2 \leq 13$

117. $x^2 + 3x \leq 6$ **118.** $x^2 - 2 \leq 5x$

119. $3x^2 \geq -2x + 5$ **120.** $4x^2 \geq 3x + 7$

121. $s(x) = x^2 - 8x + 16; s(x) \geq 0$

122. $t(x) = x^2 - 6x + 9; t(x) \geq 0$

123. $r(x) = 4x^2 + 12x + 9; r(x) < 0$

124. $f(x) = 9x^2 - 6x + 1; f(x) < 0$

125. $g(x) = -x^2 + 10x - 25; g(x) < 0$

126. $h(x) = -x^2 + 14x - 49; h(x) < 0$

127. $-x^2 > 2$ **128.** $x^2 < -4$

129. $x^2 - 2x > -5$ **130.** $-x^2 + 3x < 3$

131. $2x^2 \geq 6x - 9$ **132.** $5x^2 \geq 4x - 4$

Solve each quadratic inequality using the interval test method. Write your answer in interval notation when possible.

133. $(x + 3)(x - 1) < 0$ **134.** $(x + 2)(x - 5) < 0$

135. $2x^2 - x - 6 \geq 0$ **136.** $-3x^2 + x + 4 \leq 0$

137. $(x + 1.3)^2 > 0$ **138.** $-(x - 2.2)^2 < 0$

139. $-(x - 2.9)^2 \geq 0$ **140.** $(x + 3.2)^2 \leq 0$

141. $\left(x - \frac{3}{5}\right)^2 < 0$ **142.** $-\left(x + \frac{1}{8}\right)^2 > 0$

143. $x^2 + 14x + 49 \geq 0$ **144.** $-x^2 + 6x - 9 \leq 0$

Recall that for a square root expression to represent a real number, the radicand must be greater than or equal to zero. Applying this idea results in an inequality that can be solved using the skills from this section. Determine the domain of the following radical functions.

145. $h(x) = \sqrt{x^2 - 25}$

146. $p(x) = \sqrt{25 - x^2}$

147. $q(x) = \sqrt{x^2 - 5x}$

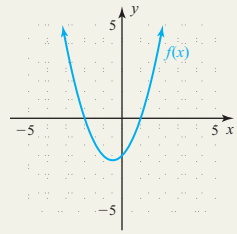
148. $r(x) = \sqrt{6x - x^2}$

149. $t(x) = \sqrt{-x^2 + 3x - 4}$

150. $Y_1 = \sqrt{x^2 - 6x + 9}$

Match the correct solution with the inequality and graph given.

151. $f(x) > 0$



a. $x \in (-\infty, -2) \cup (1, \infty)$

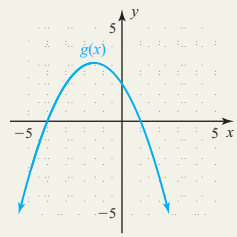
b. $x \in (-\infty, -2] \cup [1, \infty)$

c. $(-2, 1)$

d. $[-2, 1]$

e. none of these

152. $g(x) \geq 0$



a. $x \in (-\infty, -4) \cup (1, \infty)$

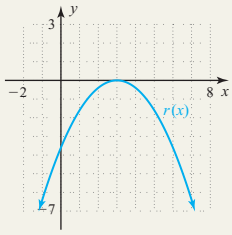
b. $x \in (-\infty, -4] \cup [1, \infty)$

c. $(-4, 1)$

d. $[-4, 1]$

e. none of these

153. $r(x) \le 0$



a. $x \in (-\infty, 3) \cup (3, \infty)$

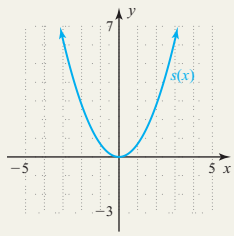
b. $x \in (-\infty, \infty)$

c. $\{3\}$

d. $\{\ \}$

e. none of these

154. $s(x) < 0$



a. $x \in (-\infty, 0) \cup (0, \infty)$

b. $x \in (-\infty, \infty)$

c. $\{0\}$

d. $\{\ \}$

e. none of these

▶ WORKING WITH FORMULAS

155. Height of a projectile: $h = -16t^2 + vt$

If an object is projected vertically upward from ground level with no continuing source of propulsion, the height of the object (in feet) is modeled by the equation shown, where v is the initial velocity, and t is the time in seconds. Use the quadratic formula to solve for t in terms of v and h. (*Hint:* Set the equation equal to zero and identify the coefficients as before.)

156. Surface area of a cylinder: $A = 2\pi r^2 + 2\pi rh$

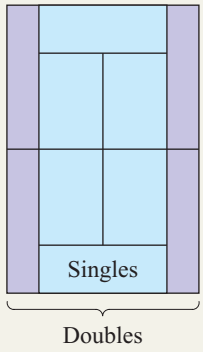
The surface area of a cylinder is given by the formula shown, where h is the height and r is the radius of the base. The equation can be considered a quadratic in the variable r. Use the quadratic formula to solve for r in terms of h and A. (*Hint:* Rewrite the equation in standard form and identify the coefficients as before.)

▶ APPLICATIONS

157. Height of a projectile: The height of an object thrown upward from the roof of a building 408 ft tall, with an initial velocity of 96 ft/sec, is given by the equation $h = -16t^2 + 96t + 408$, where h represents the height of the object after t seconds. How long will it take the object to hit the ground? Answer in exact form and decimal form rounded to the nearest hundredth.

158. Height of a projectile: The height of an object thrown upward from the floor of a canyon 106 ft deep, with an initial velocity of 120 ft/sec, is given by the equation $h = -16t^2 + 120t - 106$, where h represents the height of the object after t seconds. How long will it take the object to rise to the height of the canyon wall ($h = 0$)? Answer in exact form and decimal form rounded to hundredths.

159. Cost, revenue, and profit: The cost of raw materials to produce plastic toys is given by the cost equation $C = 2x + 35$, where x is the number of toys in hundreds. The total income (revenue) from the sale of these toys is given by $R = -x^2 + 122x - 1965$. (a) Determine the profit equation (profit = revenue − cost). (b) During the Christmas season, the owners of the company decide to manufacture and donate as many toys as they can, without taking a loss (i.e., they break even: profit or $P = 0$). How many toys will they produce for charity?



160. Cost, revenue, and profit: The cost to produce bottled spring water is given by the cost equation $C = 16x + 63$, where x is the number of bottles in thousands. The total revenue from the sale of these bottles is given by the equation $R = -x^2 + 326x - 18{,}463$. (a) Determine the profit equation (profit = revenue − cost). (b) After a bad flood contaminates the drinking water of a nearby community, the owners decide to bottle and donate as many bottles of water as they can, without taking a loss (i.e., they break even: profit or $P = 0$). Approximately how many bottles will they produce for the flood victims?

161. Height of an arrow: If an object is projected vertically upward from ground level with no continuing source of propulsion, its height (in feet) is modeled by the equation $h = -16t^2 + vt$, where v is the initial velocity and t is the time in seconds. Use the quadratic formula to solve for t, given an arrow is shot into the air with $v = 144$ ft/sec and $h = 260$ ft. See Exercise 155.

162. Surface area of a cylinder: The surface area of a cylinder is given by $A = 2\pi r^2 + 2\pi rh$, where h is the height and r is the radius of the base. The equation can be considered a quadratic in the variable r. Use the quadratic formula to solve for r, given $A = 4710$ cm^2 and $h = 35$ cm. See Exercise 156.

163. Tennis court dimensions: A regulation tennis court for a doubles match is laid out so that its length is 6 ft more than two times its width. The area of the doubles court is 2808 ft^2. What is the length and width of the doubles court?

Exercises 163 and 164

164. Tennis court dimensions: A regulation tennis court for a singles match is laid out so that its length is 3 ft less than three times its width. The area of the singles court is 2106 ft^2. What is the length and width of the singles court?

165. Cost, revenue, and profit: The revenue for a manufacturer of microwave ovens is given by the equation $R = x(40 - \frac{1}{3}x)$, where revenue is in thousands of dollars and x thousand ovens are manufactured and sold. What is the minimum number of microwave ovens that must be sold to bring in a revenue of at least \$900,000?

166. Cost, revenue, and profit: The revenue for a manufacturer of computer printers is given by the equation $R = x(30 - 0.4x)$, where revenue is in thousands of dollars and x thousand printers are manufactured and sold. What is the minimum number of printers that must be sold to bring in a revenue of at least \$440,000?

167. Cell phone subscribers: For the years 1995 to 2002, the number N of cellular phone subscribers (in millions) can be modeled by the equation $N = 17.4x^2 + 36.1x + 83.3$, where $x = 0$ represents the year 1995 [*Source:* Data from the *2005 Statistical Abstract of the United States,* Table 1372, page 870]. If this trend continued, in what year did the number of subscribers reach or surpass 3750 million?

168. U.S. international trade balance: For the years 1995 to 2003, the international trade balance B (in millions of dollars) can be approximated by the equation $B = -3.1x^2 + 4.5x - 19.9$, where $x = 0$ represents the year 1995 [*Source:* Data from the *2005 Statistical Abstract of the United States,* Table 1278, page 799]. If this trend continues, in what year will the trade balance reach a deficit of \$750 million dollars or more?

▶ EXTENDING THE CONCEPT

169. Using the discriminant: Each of the following equations can easily be solved by factoring. Using the discriminant, we can create factorable equations with identical values for b and c, but where $a \neq 1$. For instance, $x^2 - 3x - 10 = 0$ and $4x^2 - 3x - 10 = 0$ can both be solved by factoring. Find similar equations ($a \neq 1$) for the quadratics given here. (*Hint:* The discriminant $b^2 - 4ac$ must be a perfect square.)

a. $x^2 + 6x - 16 = 0$

b. $x^2 + 5x - 14 = 0$

c. $x^2 - x - 6 = 0$

170. Using the discriminant: For what values of c will the equation $9x^2 - 12x + c = 0$ have

a. no real roots

b. one rational root

c. two real roots

d. two integer roots

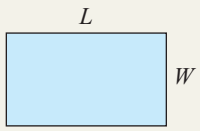
Complex polynomials: Many techniques applied to solve polynomial equations with real coefficients can be applied to solve polynomial equations with *complex coefficients*. Here we apply the idea to carefully chosen quadratic equations, as a more general application must wait until a future course, when the square root of a complex number is fully developed. Solve each equation using the quadratic formula, noting that $\frac{1}{i} = -i$.

171. $z^2 - 3iz = -10$

172. $z^2 - 9iz = -22$

173. $4iz^2 + 5z + 6i = 0$

174. $2iz^2 - 9z + 26i = 0$



175. $0.5z^2 + (7 + i)z + (6 + 7i) = 0$

176. $0.5z^2 + (4 - 3i)z + (-9 - 12i) = 0$

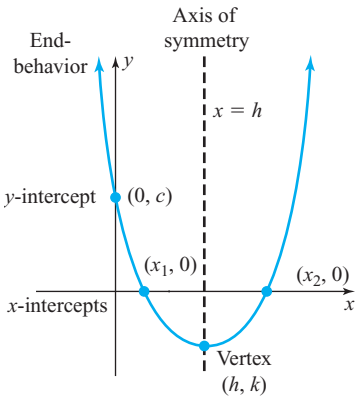
3.3 Quadratic Functions and Applications

LEARNING OBJECTIVES

In Section 3.3 you will see how we can:

- ❑ **A.** Graph quadratic functions by completing the square
- ❑ **B.** Graph quadratic functions using the vertex formula
- ❑ **C.** Find the equation of a quadratic function from its graph
- ❑ **D.** Solve applications involving extreme values



As our knowledge of functions grows, our ability to apply mathematics in new ways likewise grows. In this section, we'll build on the foundation laid in Section 3.2 and previous chapters, as we introduce additional tools used to apply quadratic functions effectively.

A. Graphing Quadratic Functions by Completing the Square

Our earlier work suggests the graph of *any* quadratic function will be a parabola. Figure 3.40 provides a summary of the graph's characteristic features. As pictured,

1. The parabola opens upward ($y = ax^2 + bx + c, a > 0$).
2. The vertex is at (h, k) and $y = k$ is a global minimum.
3. The vertex is below the x-axis, so there are two x-intercepts.
4. The axis of symmetry contains the vertex, with equation $x = h$.
5. The y-intercept is $(0, c)$, since $f(0) = c$.

Figure 3.40 $f(x) = ax^2 + bx + c$

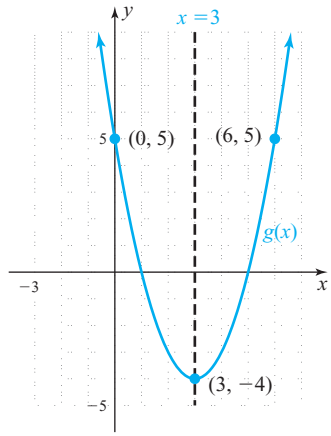
In Section 2.2, we graphed transformations of $f(x) = x^2$, using $y = a(x \pm h)^2 \pm k$. Here, we'll show that by completing the square, we can graph *any* quadratic function as a transformation of this basic graph.

When completing the square on a quadratic *equation* (Section 3.2), we applied the standard properties of equality to both sides of the equation. When completing the square on a ***quadratic function,*** the process is altered slightly, so that we operate on only one side.

The basic ideas are summarized here.

Graphing $f(x) = ax^2 + bx + c$ by Completing the Square

1. Group the variable terms apart from the constant c.
2. Factor out the leading coefficient a from this group.
3. Compute $\left[\frac{1}{2}\left(\frac{b}{a}\right)\right]^2$ and add the result to the variable terms, then subtract $a \cdot \left[\frac{1}{2}\left(\frac{b}{a}\right)\right]^2$ from c to maintain an equivalent expression.
4. Factor the grouped terms as a binomial square and combine constant terms.
5. Graph using transformations of $f(x) = x^2$.



EXAMPLE 1 ▶ **Graphing a Quadratic Function by Completing the Square**

Given $g(x) = x^2 - 6x + 5$, complete the square to rewrite g as a transformation of $f(x) = x^2$, then graph the function.

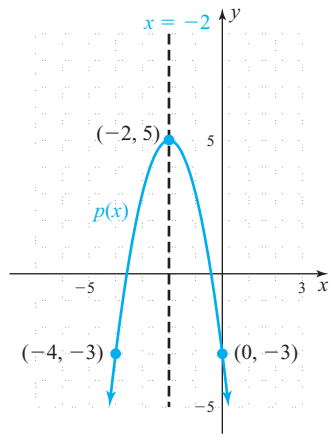
Solution ▶ To begin we note the leading coefficient is $a = 1$.

$$\begin{aligned} g(x) &= x^2 - 6x + 5 && \text{given function} \\ &= 1(x^2 - 6x + ___) + 5 && \text{group variable terms} \\ &= \underbrace{1(x^2 - 6x + 9)}_{\text{adds } 1 \cdot 9 = 9} - 9 + 5 && \left[\left(\tfrac{1}{2}\right)(-6)\right]^2 = 9 \text{ subtract 9} \\ &= (x - 3)^2 - 4 && \text{factor and simplify} \end{aligned}$$

The graph of g is the graph of f shifted 3 units right, and 4 units down. The graph opens upward ($a > 0$) with the vertex at $(3, -4)$, and axis of symmetry $x = 3$. From the original equation we find $g(0) = 5$, giving a y-intercept of $(0, 5)$. The point $(6, 5)$ was obtained using the symmetry of the graph. The graph is shown in the figure.

Now try Exercises 7 through 10 ▶

Note that by **adding 9** and simultaneously **subtracting 9** (essentially adding "0"), we changed only the *form* of the function, not its value. In other words, the resulting expression is equivalent to the original. If the leading coefficient is not 1, we factor it out from the variable terms, but take it into account when we add the constant needed to maintain an equivalent expression (steps 2 and 3).



EXAMPLE 2 ▶ **Graphing a Quadratic Function by Completing the Square**

Given $p(x) = -2x^2 - 8x - 3$, complete the square to rewrite p as a transformation of $f(x) = x^2$, then graph the function.

Solution ▶

$$\begin{aligned} p(x) &= -2x^2 - 8x - 3 && \text{given function} \\ &= (-2x^2 - 8x + ___) - 3 && \text{group variable terms} \\ &= -2(x^2 + 4x + ___) - 3 && \text{factor out } a = -2 \text{ (notice sign change)} \\ &= \underbrace{-2(x^2 + 4x + 4)}_{\text{adds } -2 \cdot 4 = -8} - (-8) - 3 && \left[\left(\tfrac{1}{2}\right)(4)\right]^2 = 4 \text{ subtract } -8 \\ &= -2(x + 2)^2 + 8 - 3 && \text{factor trinomial, simplify result} \\ &= -2(x + 2)^2 + 5 \end{aligned}$$

The graph of p is a parabola, shifted 2 units left, stretched by a factor of 2, reflected across the x-axis (opens downward), and shifted up 5 units. The vertex is $(-2, 5)$, and the axis of symmetry is $x = -2$. From the original function, the y-intercept is $(0, -3)$. The point $(-4, -3)$ was obtained using the symmetry of the graph. The graph is shown in the figure.

WORTHY OF NOTE

In cases like $f(x) = 3x^2 - 10x + 5$, where the linear coefficient has no integer factors of a, we factor out 3 and *simultaneously divide the linear coefficient by 3*. This yields $h(x) = 3\left(x^2 - \frac{10}{3}x + ___\right) + 5$, and the process continues as before: $[(\frac{1}{2})(\frac{10}{3})]^2 = (\frac{5}{3})^2 = \frac{25}{9}$, and so on. For more on this idea, **see Exercises 15 through 20.**

Now try Exercises 11 through 20 ▶

☑ **A.** You've just seen how we can graph quadratic functions by completing the square

In Example 2, note that by adding 4 to the variable terms within parentheses, we actually added $-2 \cdot 4 = -8$ to the value of the function. To adjust for this we subtracted -8.

B. Graphing Quadratic Functions Using the Vertex Formula

When the process of completing the square is applied to $f(x) = ax^2 + bx + c$, we obtain a very useful result. Notice the close similarities to Example 2.

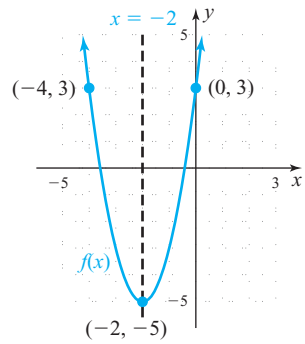
$$\begin{aligned} f(x) &= ax^2 + bx + c && \text{quadratic function} \\ &= (ax^2 + bx + ___) + c && \text{group variable terms apart from the constant } c \\ &= a\left(x^2 + \frac{b}{a}x + ___\right) + c && \text{factor out } a \\ &= a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) - a\left(\frac{b^2}{4a^2}\right) + c && \left[\left(\frac{1}{2}\right)\left(\frac{b}{a}\right)\right]^2 = \frac{b^2}{4a^2}\text{, add within group, subtract } a\left(\frac{b^2}{4a^2}\right) \\ &= a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2}{4a} + c && \text{factor the trinomial, simplify} \\ &= a\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a} && \text{result} \end{aligned}$$

By comparing this result with previous transformations, we note the x-coordinate of the vertex is $h = \dfrac{-b}{2a}$ (since the graph shifts horizontally "opposite the sign"). While we could use the expression $\dfrac{4ac - b^2}{4a}$ for k, we find it easier to substitute $\dfrac{-b}{2a}$ back into the function: $k = f\left(\dfrac{-b}{2a}\right)$. The result is called the **vertex formula.**

Vertex Formula

For the quadratic function $f(x) = ax^2 + bx + c$, the coordinates of the vertex are

$$(h, k) = \left(\frac{-b}{2a}, f\left(\frac{-b}{2a}\right)\right)$$



Since all characteristic features of the graph (end-behavior, vertex, axis of symmetry, x-intercepts, and y-intercept) can now be determined using the original equation, we'll rely on these features to sketch quadratic graphs, rather than having to complete the square.

EXAMPLE 3 ▶ Graphing a Quadratic Function Using the Vertex Formula

Graph $f(x) = 2x^2 + 8x + 3$ using the vertex formula and other features of a quadratic graph.

Solution ▶ The graph will open upward since $a > 0$.
The y-intercept is $(0, 3)$.
The vertex formula gives

$$\begin{aligned} h &= \frac{-b}{2a} && x\text{-coordinate of vertex} \\ &= \frac{-8}{2(2)} && \text{substitute 2 for } a \text{ and 8 for } b \\ &= -2 && \text{simplify} \end{aligned}$$

Computing $f(-2)$ to find the y-coordinate of the vertex yields

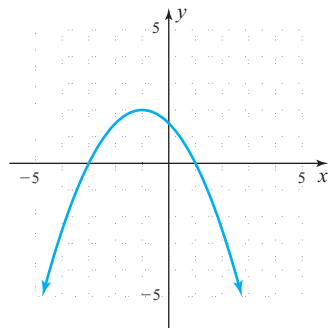
$$\begin{aligned} f(-2) &= 2(-2)^2 + 8(-2) + 3 && \text{substitute } -2 \text{ for } x \\ &= 2(4) - 16 + 3 && \text{multiply} \\ &= 8 - 13 && \text{simplify} \\ &= -5 && \text{result} \end{aligned}$$

The vertex is $(-2, -5)$. The graph is shown in the figure, with the point $(-4, 3)$ obtained using symmetry.

B. You've just seen how we can graph quadratic functions using the vertex formula

Now try Exercises 21 through 32 ▶

C. Finding the Equation of a Quadratic Function from Its Graph



While most of our emphasis so far has centered on graphing quadratic functions, it would be hard to overstate the importance of the reverse process—determining the equation of the function from its graph (as in Section 2.2). This reverse process, which began with our study of lines, will be a continuing theme each time we consider a new function.

EXAMPLE 4 ▶ **Finding the Equation of a Quadratic Function**

The graph shown is a transformation of $f(x) = x^2$. What function defines this graph?

Solution ▶ Compared to the graph of $f(x) = x^2$, the vertex has been shifted left 1 and up 2, so the function will have the form $F(x) = a(x + 1)^2 + 2$. Since the graph opens downward, we know a will be negative. As before, we select one additional point on the graph and substitute to find the value of a. Using $(x, y) \rightarrow (1, 0)$ we obtain

$$\begin{aligned} F(x) &= a(x + 1)^2 + 2 && \text{transformation} \\ 0 &= a(1 + 1)^2 + 2 && \text{substitute 1 for } x \text{ and 0 for } F(x) \\ 0 &= 4a + 2 && \text{simplify} \\ -2 &= 4a && \text{subtract 2} \\ -\frac{1}{2} &= a && \text{solve for } a \end{aligned}$$

WORTHY OF NOTE
It helps to remember that any point (x, y) on the parabola can be used. To verify this, try the calculation again using $(-3, 0)$.

The equation of this function is

$$F(x) = -\frac{1}{2}(x + 1)^2 + 2.$$

C. You've just seen how we can find the equation of a quadratic function from its graph

Now try Exercises 33 through 38 ▶

D. Quadratic Functions and Extreme Values

If $a > 0$, the parabola opens upward, and the y-coordinate of the vertex is a global minimum, the smallest value attained by the function anywhere in its domain. Conversely, if $a < 0$ the parabola opens downward and the vertex yields a global maximum. These greatest and least points are known as **extreme values** and have a number of significant applications.

Note that when graphing technology is used in a real-world context, the focus on the algebra involved is now shared with the context and meaning of the variables involved. This analysis enables us to find an appropriate viewing window, and a better interpretation of the results obtained.

EXAMPLE 5 ▶ **Applying a Quadratic Model to Manufacturing**

An airplane manufacturer can produce up to 15 planes per month. Suppose the profit made from the sale of these planes is modeled by $P(x) = -0.2x^2 + 4x - 3$, where $P(x)$ is the profit in hundred-thousands of dollars per month, and x is the number of planes sold. Based on this model,

a. Find the y-intercept and explain what it means in this context.

b. How many planes should be made and sold to maximize profit?

c. What is the maximum profit?

Analytical Solution ▶

a. $P(0) = -3$, which means the manufacturer loses \$300,000 each month if the company produces no planes.

b. Since $a < 0$, we know the graph opens downward and has a maximum value. To find the required number of sales needed to "maximize profit," we use the vertex formula with $a = -0.2$ and $b = 4$:

$$\begin{aligned} x &= \frac{-b}{2a} && \text{vertex formula} \\ &= \frac{-4}{2(-0.2)} && \text{substitute } -0.2 \text{ for } a \text{ and } 4 \text{ for } b \\ &= 10 && \text{result} \end{aligned}$$

The result shows 10 planes should be sold each month for maximum profit.

c. Evaluating $P(10)$ we find that a maximum profit of 17 "hundred-thousand dollars" will be earned (\$1,700,000).

Graphical Solution ▶

a. Regardless of the solution method (analytical or graphical), the y-intercept will be the constant term. Here $y = -3$ indicates a loss of \$300,000 if no planes are made.

b. and c. After entering $-0.2x^2 + 4x - 3$ as Y_1, we can use the 2nd (**CALC**) **4:maximum** option to locate the extreme value. Before we do, we need to set a window that will enable us to view and interpret the results. First, we know that the solution must occur in QI, since both x and $P(x)$ must be positive. We're told the manufacturer can make at most 15 planes per month, so it seems reasonable to set Xmin $= 0$ and Xmax $= 20$ (to allow for a "frame" around the window). Using Ymin $= 0$ and leaving Ymax $= 10$ for now produces the graph shown in Figure 3.41. As the "top half" of the parabola is missing, we increase the maximum y-value of our window to Ymax $= 20$, yielding the graph in Figure 3.42. The sequence 2nd (**CALC**) **4:maximum** (and then naming the appropriate bounds) shows the vertex occurs at (10, 17) (Figure 3.43), meaning a maximum profit of $17 \times \$100{,}000 = \$1{,}700{,}000$ will be earned when 10 planes are made and sold ($x = 10$).

Figure 3.41

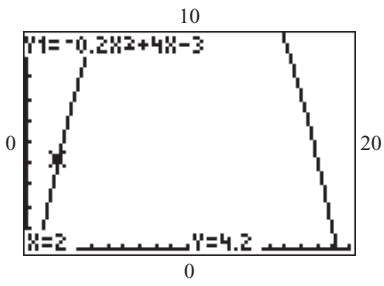


Figure 3.42

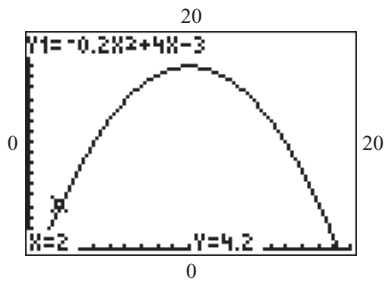

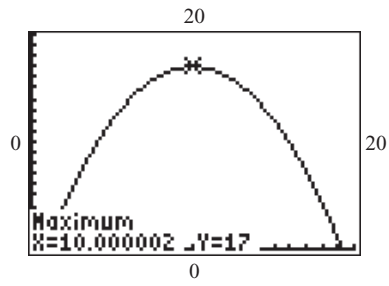

Figure 3.43

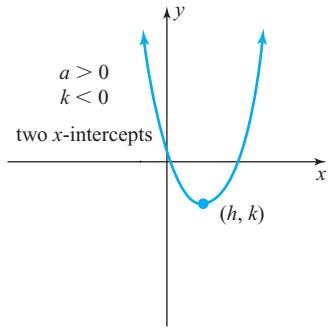
Now try Exercises 41 through 46 ▶

Recall that if the leading coefficient is positive and the vertex is below the x-axis ($k < 0$), the graph will have two x-intercepts (see Figure 3.44). If $a > 0$ and the vertex is above the x-axis ($k > 0$), the graph will not cross the x-axis (Figure 3.45). Similar statements can be made for the case where a is negative.

Figure 3.44



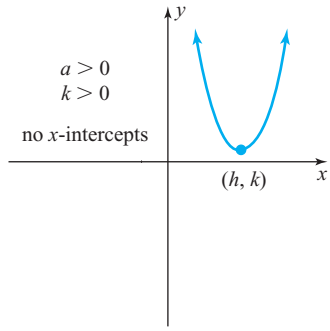


Figure 3.45

EXAMPLE 6 ▶ Modeling the Height of a Projectile—Football

In the 1976 Pro Bowl, NFL punter Ray Guy of the Oakland Raiders kicked the ball so high it hit the scoreboard hanging from the roof of the New Orleans Superdome (forcing officials to raise the scoreboard from about 90 ft to 200 ft). If we assume the ball made contact with the scoreboard near the vertex of the kick, the function $h(t) = -16t^2 + 76t + 1$ is one possible model for the height of the ball, where $h(t)$ represents the height (in feet) after t sec.

a. What does the y-intercept of this function represent?

b. After how many seconds did the football reach its maximum height?

c. What was the maximum height of this kick?

d. To the nearest hundredth of a second, how long until the ball returned to the ground (what was the hang time)?

Algebraic Solution ▶

a. $h(0) = 1$, meaning the ball was 1 ft off the ground when Ray Guy kicked it.

b. Since $a < 0$, we know the graph opens downward and has a maximum value. To find the time needed to reach the maximum height, we use the vertex formula with $a = -16$ and $b = 76$:

$$\begin{aligned} t &= \frac{-b}{2a} && \text{vertex formula} \\ &= \frac{-76}{2(-16)} && \text{substitute } -16 \text{ for } a \text{ and } 76 \text{ for } b \\ &= 2.375 && \text{result} \end{aligned}$$

The ball reached its maximum height after 2.375 sec.

c. To find the maximum height, we substitute 2.375 for t [evaluate $h(2.375)$]:

$$\begin{aligned} h(t) &= -16t^2 + 76t + 1 && \text{given function} \\ h(2.375) &= -16(2.375)^2 + 76(2.375) + 1 && \text{substitute } 2.375 \text{ for } t \\ &= 91.25 && \text{result} \end{aligned}$$

The ball reached a maximum height of 91.25 ft.

d. When the ball returns to the ground it has a height of 0 ft. Substituting 0 for $h(t)$ gives $0 = -16t^2 + 76t + 1$, which we solve using the quadratic formula.

$$t = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \qquad \text{quadratic formula}$$

$$= \frac{-76 \pm \sqrt{(76)^2 - 4(-16)(1)}}{2(-16)} \qquad \text{substitute } -16 \text{ for } a, 76 \text{ for } b, \text{ and } 1 \text{ for } c$$

$$= \frac{-76 \pm \sqrt{5840}}{-32} \qquad \text{simplify}$$

$$t \approx -0.013 \quad \text{or} \quad t \approx 4.763$$

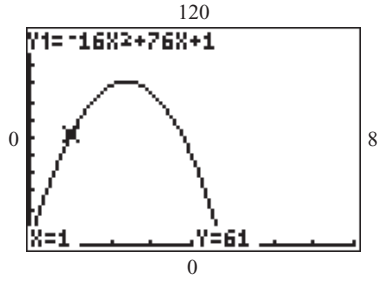
The punt had a hang time of just under 5 sec.

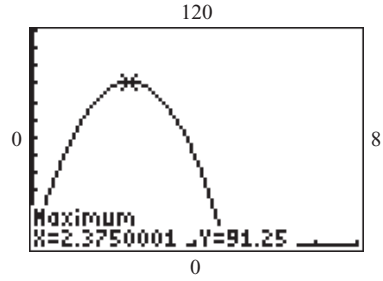
Graphical Solution ▶

a. By inspection or using the **TABLE**, $h(0) = 1$ showing the ball was 1 ft from the ground when it was kicked.

b. and c. Here we enter $-16x^2 + 76x + 1$ as Y_1, then determine an appropriate viewing window. We are once again limited to QI, since the time t and height h must both be positive. Based on common experience (participation or observation) in throwing or kicking balls in various activities, Xmin $= 0$, Xmax $= 8$ seems to be a good place to begin for time t. For the value of Ymax (having set Ymin $= 0$), we decide to just "aim high" being aware of human limitations, and adjust the window afterward (it would be impossible for a human to kick a football 250 ft high!). Using some combination of the preceding we set Ymax $= 120$, yielding the graph in Figure 3.46. Using the sequence 2nd **(CALC) 4:maximum** with appropriate bounds shows the vertex occurs at (2.375, 91.25) (Figure 3.47), meaning a maximum height of 91.25 ft ($y = 91.25$), occurred 2.375 sec after the ball was kicked ($x = 2.375$).

Figure 3.46





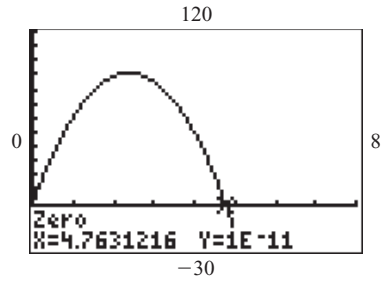


Figure 3.47

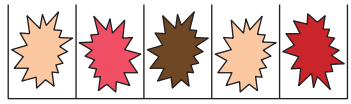
d. Before using the Zeroes Method to find the "hang time," we reset the minimum y-value to Ymin $= -30$, to obtain a frame that enables us to read the information at the bottom of the screen, without interfering with the graph (see *Worthy of Note*). Using the 2nd **(CALC) 2:zero** option for the rightmost x-intercept, we find the hang time is about 4.76 sec (Figure 3.48).

Figure 3.48

WORTHY OF NOTE



To find a frame of the kind mentioned in Example 6(d), we can use the formula Ymin $\approx$ $\frac{|\textit{current}\ \text{Ymax}| + |\textit{current}\ \text{Ymin}|}{4}$ as a rule of thumb.

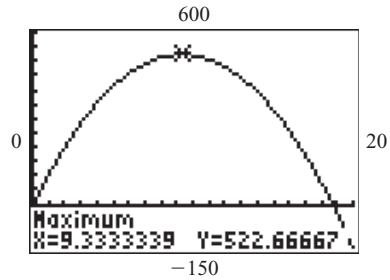
Now try Exercises 47 through 52 ▶

While the calculator is a wonderful tool for removing some computational drudgery, especially when the coefficients are large, noninteger, or not very "pretty," you are likely coming to realize that it does not (cannot) replace the analytical thought required to use it effectively. Most real-world applications still require an attentive analysis of the context and the question asked, as well as a careful development of the equation model to be used. This is particularly important in applications like those in Example 7, where the original equation has more than one independent variable, and a given or known relationship must be used to eliminate one of them.

EXAMPLE 7 ▶ Due to an increase in consumer demand, a local nursery is building new chain-link pens for holding various kinds of mulch. What is the maximum total area that can be fenced off, if five open-front pens are needed (see Figure 3.49) and 112 ft of fencing is available?

Figure 3.49

Solution ▶ We are asked to maximize the total area, an impossibility right now since the formula for area has *two independent variables*: Area $= LW$. Knowing that only 112 ft of fencing will be used, we observe that the finished pens will have *1 length and 6 identical widths,* giving the equation $112 = L + 6W$. This enables us to write L in terms of W (solve for L), and *substitute the result for* L in $A = LW$, giving an equation model with the single independent variable W.



$$\begin{aligned} 112 &= L + 6W && \text{known relationship} \\ 112 - 6W &= L && \text{solve for } L \end{aligned}$$

Using $L = 112 - 6W$, we substitute for L in the formula Area $= LW$.

$$\begin{aligned} A &= LW && \text{area formula} \\ &= (112 - 6W)W && \text{substitute } 112 - 6W \text{ for } L \\ A(W) &= 112W - 6W^2 && \text{result: a function in one variable} \end{aligned}$$

Noting the result is a quadratic function, we enter $112X - 6X^2$ as Y_1 and attempt to find an appropriate viewing window. For the maximum value at $x = -\dfrac{b}{2a}$, we substitute 112 for b and -6 for a and find this value is near 10. This shows that Xmax $= 20$ would work (with Xmin $= 0$), since the graph will be symmetric and 10 is near the "middle" (twice 10 is 20). We reason further that if the width is 10 ft, $112 - 6 \times 10 = 52$ ft is left for the length and $10 \times 52 = 520$ ft^2 would be a good estimate for Ymax (the total area). To include a frame around the viewing window, we set Ymax at 600 with Ymin $= -150$. Using the sequence 2nd (**CALC**) **4:maximum** gives the result shown in Figure 3.50, which shows a vertex of $\left(9\frac{1}{3}, 522\frac{2}{3}\right)$. This indicates that a maximum area of $522\frac{2}{3}$ ft^2 occurs when the width of each pen is $9\frac{1}{3}$ ft. Note this gives a length of $L = 112 - 6\left(9\frac{1}{3}\right) = 56$ ft.

Figure 3.50

Now try Exercises 53 through 56 ▶

In a free-market economy, it is well known that if the price of an item is decreased, more people are likely to buy it. This is why stores have sales and bargain days. But if the item is sold too cheaply, revenue starts to decline because less money is coming in—even though more sales are being made. This phenomenon is analyzed in Example 8 using the standard formula for revenue: *revenue* = *price* · *number of sales* or $R = P \cdot S$.

EXAMPLE 8 ▶ **Analyzing Retail Sales Revenue**

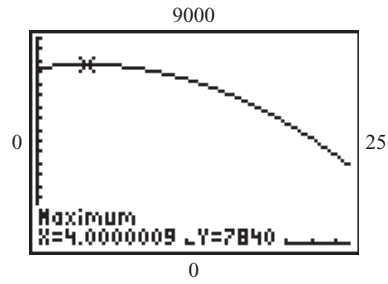
When a popular running shoe is priced at \$80, The Shoe Warehouse will sell an average of 96 pairs per week. Based on sales of similar shoes, the company believes that for each decrease of \$2.50 in price, four additional pairs will be sold.

a. Construct a function that models the store's revenue at various prices. What is the maximum possible revenue under these conditions? What price should be charged to obtain this maximum revenue?

b. What is the cheapest price the manager could charge, while still bringing in a monthly revenue of at least \$7000?

Solution ▶

a. Based on the given price and sales figures, the store has a current revenue of (\$80)(96) = \$7680. Using these figures, we can develop a general function model for the revenue, to show a decrease in price and an increase in sales based on the *number* of price decreases x.



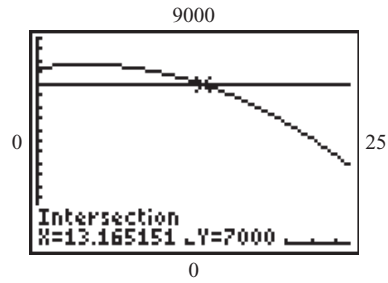
$$(\$80 - 2.5x)(96 + 4x) = R(x) \quad \text{for each price decrease of \$2.50, sales increase by 4}$$

In standard form, we have

$$7680 + 320x - 240x - 10x^2 = R(x) \quad \text{multiply binomials}$$
$$-10x^2 + 80x + 7680 = R(x) \quad \text{simplify}$$

To find the maximum revenue, we can enter the function as Y_1 on the Y= screen and set a window using the current revenue as a guide. We chose a window size of [0, 25] for x and [0, 9000] for y. The result is shown in Figure 3.51, where the 2nd TRACE **(CALC) 4:Maximum** feature was used to locate the maximum. It appears the maximum revenue will be \$7840, which occurs after $x = 4$ price decreases of \$2.50. The selling price was \$80 − 4(\$2.50) = \$70.

Figure 3.51



b. Since the desired revenue level is \$7000, we substitute 7000 for $R(x)$.

$$-10x^2 + 80x + 7680 = 7000 \quad \text{substitute 7000 for } R(x)$$

To solve for x, we'll use the Intersection-of-Graphs method with Y_1 as before and $Y_2 = 7000$. The result is shown in Figure 3.52 and indicates that to keep a revenue of at least \$7000 per week, the price must decrease by no more than about 13.2(\$2.50) = \$33. The selling price should be kept near 80 − 33 = \$47.

Figure 3.52

D. You've just seen how we can solve applications involving extreme values

Now try Exercises 57 and 58 ▶

3.3 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. Fill in the blank to complete the square, given $f(x) = -2x^2 - 10x - 7$:
$f(x) = -2(x^2 + 5x + \frac{25}{4}) - 7 + _____$.

2. The maximum and minimum values are called _____ values and can be found using the _____ formula.

3. To find the zeroes of $f(x) = ax^2 + bx + c$, we substitute _____ for _____ and solve.

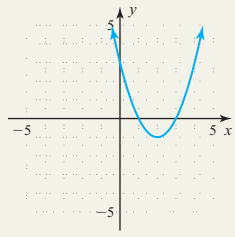
4. If the leading coefficient is positive and the vertex (h, k) is in Quadrant IV, the graph will have _____ x-intercepts.

5. Compare/Contrast how to complete the square on an *equation,* versus how to complete the square on a function. Use the equation $2x^2 + 6x - 3 = 0$ and the function $f(x) = 2x^2 + 6x - 3$ to illustrate.

6. Discuss/Explain why the graph of a quadratic function has no x-intercepts if a and k [vertex (h, k)] have like signs. Under what conditions will the function have a single real root?

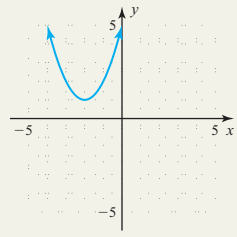
▶ DEVELOPING YOUR SKILLS

Graph each function using end-behavior, intercepts, and completing the square to write the function in shifted form. Clearly state the transformations used to obtain the graph, and label the vertex and all intercepts (if they exist). If the equation is not factorable, use the quadratic formula to find the x-intercepts.



7. $f(x) = x^2 + 4x - 5$
8. $g(x) = x^2 - 6x - 7$
9. $h(x) = -x^2 + 2x + 3$
10. $H(x) = -x^2 + 8x - 7$
11. $u(x) = 3x^2 + 6x - 5$
12. $v(x) = 4x^2 - 24x + 15$
13. $f(x) = -2x^2 + 8x + 7$
14. $g(x) = -3x^2 + 12x - 7$
15. $p(x) = 2x^2 - 7x + 3$
16. $q(x) = 4x^2 - 9x + 2$
17. $f(x) = -3x^2 - 7x + 6$
18. $g(x) = -2x^2 + 9x - 7$
19. $p(x) = x^2 - 5x + 2$
20. $q(x) = x^2 + 7x + 4$

Graph each function using the vertex formula and other features of a quadratic graph. Label all important features.



21. $f(x) = x^2 + 2x - 6$
22. $g(x) = x^2 + 8x + 11$
23. $h(x) = -x^2 + 4x + 2$
24. $H(x) = -x^2 + 10x - 19$
25. $Y_1 = 0.5x^2 + 3x + 7$
26. $Y_2 = 0.2x^2 - 2x + 8$
27. $Y_1 = -2x^2 + 10x - 7$
28. $Y_2 = -2x^2 + 8x - 3$
29. $f(x) = 4x^2 - 12x + 3$
30. $g(x) = 3x^2 + 12x + 5$
31. $p(x) = \frac{1}{2}x^2 + 3x - 5$
32. $q(x) = \frac{1}{3}x^2 - 2x - 4$

State the equation of the function whose graph is shown.

▶ WORKING WITH FORMULAS

39. Vertex/intercept formula: $x = h \pm \sqrt{-\frac{k}{a}}$

As an alternative to using the quadratic formula *prior* to completing the square, the x-intercepts can easily be found using the vertex/intercept formula *after* completing the square, when the coordinates of the vertex are known. (a) Beginning with the shifted form $y = a(x - h)^2 + k$, substitute 0 for y and solve for x to derive the formula. (b) Use the formula to find all zeroes, real or complex, of the following functions.

i. $y = (x + 3)^2 - 5$ **ii.** $y = -(x - 4)^2 + 3$ **iii.** $y = 2(x + 4)^2 - 7$

iv. $y = -3(x - 2)^2 + 6$ **v.** $s(t) = 0.2(t + 0.7)^2 - 0.8$ **vi.** $r(t) = -0.5(t - 0.6)^2 + 2$

40. Surface area of a rectangular box with square ends: $S = 2h^2 + 4Lh$

The surface area of a rectangular box with square ends is given by the formula shown, where h is the height and width of the square ends, and L is the length of the box. (a) If L is 3 ft and the box must have a surface area of 32 ft^2, find the dimensions of the square ends. (b) Solve for L, then find the length if the height is 1.5 ft and surface area is 22.5 ft^2.

▶ APPLICATIONS

41. Maximum profit: An automobile manufacturer can produce up to 300 cars per day. The profit made from the sale of these vehicles can be modeled by the function $P(x) = -10x^2 + 3500x - 66{,}000$, where $P(x)$ is the profit in dollars and x is the number of automobiles made and sold. Based on this model:

a. Find the y-intercept and explain what it means in this context.

b. Find the x-intercepts and explain what they mean in this context.

c. How many cars should be made and sold to maximize profit?

d. What is the maximum profit?

42. Maximum profit: The profit for a manufacturer of collectible grandfather clocks is given by the function $P(x) = -1.6x^2 + 240x - 375$, where $P(x)$ is the profit in dollars and x is the number of clocks made and sold.

a. Find the y-intercept and explain what it means in this context.

b. Find the x-intercepts and explain what they mean in this context.

c. How many clocks should be made and sold to maximize profit?

d. What is the maximum profit?

43. Optimal pricing strategy: The director of the Ferguson Valley drama club must decide what to charge for a ticket to the club's performance of *The Music Man.* If the price is set too low, the club will lose money; and if the price is too high, people won't come. From past experience she estimates that the profit P from sales (in hundreds) can be approximated by $P(x) = -x^2 + 46x - 88$, where x is the cost of a ticket and $0 \le x \le 50$.

a. Find the lowest cost of a ticket that would allow the club to break even.

b. What is the highest cost that the club can charge to break even?

c. If the theater were to close down before any tickets are sold, how much money would the club lose?

d. How much should the club charge to maximize their profits? What is the maximum profit?

44. Maximum profit: A kitchen appliance manufacturer can produce up to 200 appliances per day. The profit made from the sale of these machines can be modeled by the function $P(x) = -0.5x^2 + 175x - 3300$, where $P(x)$ is the profit in dollars, and x is the number of appliances made and sold. Based on this model,

- **a.** Find the y-intercept and explain what it means in this context.
- **b.** Find the x-intercepts and explain what they mean in this context.
- **c.** Determine the domain of the function and explain its significance.
- **d.** How many should be sold to maximize profit? What is the maximum profit?

45. Cost of production: The cost of producing a plastic toy is given by the function $C(x) = 2x + 35$, where x is the number of hundreds of toys. The revenue from toy sales is given by $R(x) = -x^2 + 122x - 365$. Since profit = revenue − cost, the profit function must be $P(x) = -x^2 + 120x - 400$ (verify). How many toys sold will produce the maximum profit? What is the maximum profit?

46. Cost of production: The cost to produce bottled spring water is given by $C(x) = 16x - 63$, where x is the number of thousands of bottles. The total income (revenue) from the sale of these bottles is given by the function $R(x) = -x^2 + 326x - 7463$. Since profit = revenue − cost, the profit function must be $P(x) = -x^2 + 310x - 7400$ (verify). How many bottles sold will produce the maximum profit? What is the maximum profit?

The projectile function: $h(t) = -16t^2 + vt + k$ applies to any object projected upward with an initial velocity v, from a height k but not to an object under propulsion (such as a rocket). Consider this situation and answer the questions that follow.

47. Model rocketry: A member of the local rocketry club launches her latest rocket from a large field. At the moment its fuel is exhausted, the rocket has a velocity of 240 ft/sec and an altitude of 544 ft (t is in seconds).

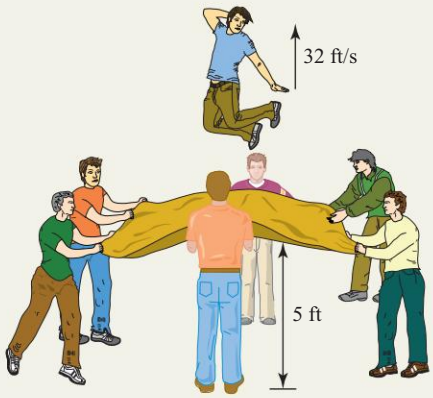
- **a.** Write the function that models the height of the rocket.
- **b.** How high is the rocket at $t = 0$? If it took off from the ground, why is it this high at $t = 0$?
- **c.** How high is the rocket 5 sec after the fuel is exhausted?
- **d.** How high is the rocket 10 sec after the fuel is exhausted?
- **e.** How could the rocket be at the same height at $t = 5$ and at $t = 10$?
- **f.** What is the maximum height attained by the rocket?
- **g.** How many seconds was the rocket airborne *after* its fuel was exhausted?

48. Height of a projectile: A projectile is thrown upward with an initial velocity of 176 ft/sec. After t sec, its height $h(t)$ above the ground is given by the function $h(t) = -16t^2 + 176t$.

- **a.** Find the projectile's height above the ground after 2 sec.
- **b.** Sketch the graph modeling the projectile's height.
- **c.** What is the projectile's maximum height? What is the value of t at this height?
- **d.** How many seconds after it is thrown will the projectile strike the ground?

49. Height of a projectile: In the movie *The Court Jester* (1956; Danny Kaye, Basil Rathbone, Angela Lansbury, and Glynis Johns), a catapult is used to toss the nefarious adviser to the king into a river. Suppose the path flown by the king's adviser is modeled by the function $h(d) = -0.02d^2 + 1.64d + 14.4$, where $h(d)$ is the height of the adviser in feet at a distance of d ft from the base of the catapult.

- **a.** How high was the release point of this catapult?
- **b.** How far from the catapult did the adviser reach a maximum altitude?
- **c.** What was this maximum altitude attained by the adviser?
- **d.** How far from the catapult did the adviser splash into the river?



50. Blanket toss competition: The fraternities at Steele Head University are participating in a blanket toss competition, an activity borrowed from the whaling villages of the Inuit Eskimos. If the person being tossed is traveling at 32 ft/sec as he is projected into the air, and the Frat members are holding the canvas blanket at a height of 5 ft,

- **a.** Write the function that models the height at time t of the person being tossed.
- **b.** How high is the person when (i) $t = 0.5$, (ii) $t = 1.5$?
- **c.** From part (b) what do you know about *when* the maximum height is reached?

d. To the nearest tenth of a second, when is the maximum height reached?

e. To the nearest one-half foot, what was the maximum height?

f. To the nearest tenth of a second, how long was this person airborne?

51. Motorcycle jumps: On December 31, 2007, Australian freestyle motocross legend Robbie Maddison set a world record by jumping his motorcycle 322 ft, 7½ in. During practice the day before, the prevailing wind conditions actually allowed him to jump farther. Suppose his height on one such jump is given by the equation $h = -16t^2 + 52t + 25$, where h represents his height (in feet) above ground level t sec after takeoff.

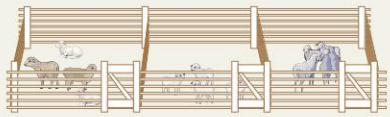
a. How high is the top of the takeoff ramp?

b. If he touched down on the landing ramp 15 ft above ground level, how long was "Maddo" in the air?

c. What would have been the daredevil's maximum height?

52. SuperPipe Finals: In the Winter X Games, one of the most exciting events to watch is the SuperPipe Final. The height of a professional snowboarder during one particularly huge jump is given by the function $h = -16t^2 + 35t + 16$, where h represents her height (in feet) above the pipe base t sec after leaving the upper edge, or lip.

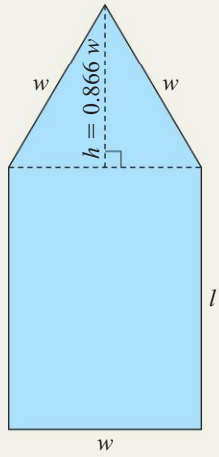
a. How high is the lip of the superpipe?



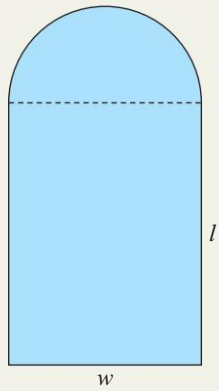
b. If the snowboarder lands her trick 11 ft above the base of the pipe, how long was she in the air?

c. What was the athlete's maximum height above the base of the pipe?

53. Fencing a backyard: Tina and Imai have just purchased a purebred German Shepherd, and need to fence in their backyard so the dog can run. What is the maximum rectangular area they can enclose with 200 ft of fencing, if (a) they use fencing material along all four sides? What are the dimensions of the rectangle? (b) What is the maximum area if they use the house as one of the sides? What are the dimensions of *this* rectangle?



54. Building sheep pens: It's time to drench the sheep again, so Chance and Chelsea-Lou are fencing off a large rectangular area to build some temporary holding pens. To prep the males, females, and kids, they are separated into three smaller and equal-size pens partitioned within the large rectangle. If 384 ft of fencing is available and the maximum area is desired, what will be (a) the dimensions of the larger, outer rectangle? (b) the dimensions of the smaller holding pens?



55. Building windows: Window World, Inc., is responsible for designing new windows for the expansion of the campus chapel. The current design is shown in the figure. The metal trim used to secure the perimeter of the frame is 126" long. If the maximum window area is desired (to let in the most sunlight), what will be (a) the dimensions of the rectangular portion of each window? (b) the total area of each window?

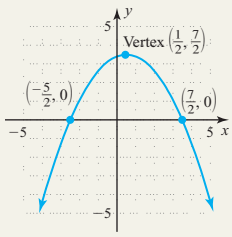
Exercise 55

56. Building windows: Before construction on the chapel expansion begins (see Exercise 55), a new design is submitted. The new design is very different (see figure), but must still have a perimeter of 126". If the maximum window area is still desired, what will be (a) the dimensions of the rectangular portion of each window? (b) the total area of each window?

Exercise 56

57. Maximizing soft drink revenue: A convenience store owner sells 20-oz soft drinks for \$1.50 each, and sells an average of 500 per week. Using a market survey, she believes that for each \$0.05 decrease in price, an additional 25 soft drinks will be sold. (a) What price should be charged to maximize revenue? What is the maximum revenue? (b) What is the lowest price the owner could charge and still bring in at least \$700 per week in revenue?

58. Maximizing restaurant revenue: At Figaro's Pizzeria, large pizzas usually sell for \$12.50 and at this price an average of 320 large pizzas are sold each weekend. Using a survey and years of experience, the manager of Figaro's believes that for each \$0.25 decrease in price, 16 additional pizzas will be sold. (a) What price should be charged to maximize revenue? What is the maximum revenue? (b) What selling price(s) will generate exactly \$4800 in revenue?



▶ EXTENDING THE CONCEPT

59. Use the general solutions from the quadratic formula to show that the average value of the x-intercepts is $\frac{-b}{2a}$. Explain/Discuss why the result is valid even if the roots are complex.

$$x_1 = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \; x_2 = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

60. Write the equation of a quadratic function whose x-intercepts are given by $x = 2 \pm 3i$.

61. Write the equation for the parabola given.

62. Referring to Exercise 39, discuss the nature (real or complex, rational or irrational) and number of zeroes (0, 1, or 2) given by the vertex/intercept formula if (a) a and k have like signs, (b) a and k have unlike signs, (c) k is zero, (d) the ratio $-\frac{k}{a}$ is positive and a perfect square, and (e) the ratio $-\frac{k}{a}$ is positive and not a perfect square.

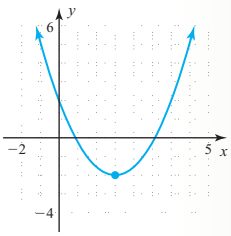
▶ MAINTAINING YOUR SKILLS

63. (1.4) Identify the slope and y-intercept for $-4x + 3y = 9$. Do not graph.

64. (Appendix A.5) Multiply:

$$\frac{x^2 - 4x + 4}{x^2 + 3x - 10} \cdot \frac{x^2 - 25}{x^2 - 10x + 25}$$

65. (2.2) Given $f(x) = \sqrt[3]{x + 3}$, find the equation of the function whose graph is that of $f(x)$, shifted right 2 units, reflected across the x-axis, and then down 3 units.



66. (3.2) Given $f(x) = 3x^2 + 7x - 6$, solve $f(x) \leq 0$ using the x-intercepts and end-behavior of f.

MID-CHAPTER CHECK

1. Find the sum and product of the complex numbers $2 + 3i$ and $2 - 3i$. Comment on what you notice.
2. Determine the quotient: $\dfrac{2 + 3i}{3 - 2i}$
3. Check by substitution: Is $x = 1 + 2i$ a solution to $x^2 - 2x + 5 = 0$?
4. Given $f(x)$ is a quadratic function whose graph has a vertex of $(1, -4)$ and an x-intercept of $(3, 0)$, find the two solutions of the equation $f(x) = 0$.

Solve the following quadratic equations using the method of your choice.

5. $3(x - 2)^2 = 5$
6. $2x^2 = 7x - 4$
7. Solve the inequality by using a graphing calculator to locate the x-intercepts and observing the graph. Round to the nearest hundredth as necessary. $f(x) = -5.1x^2 - 3.2x + 1.9; f(x) \le 0$
8. Mark Twain's 1867 book, *The Celebrated Jumping Frog of Calaveras County*, has actually spawned an annual "World Championship" frog jumping contest in Calaveras County, California. As of 2009, the record for the longest triple jump (the total of three consecutive jumps) is 21 ft $5\frac{3}{4}$ in. set by Rosie the Ribeter in 1986. In a recent competition, Count Frogula felt he had beaten the record and was awaiting the judge's decision. Suppose the longest of his three jumps was modeled by the function $h(x) = -2.3x^2 + 16.5x$, where $h(x)$ represents the height of the jump in inches, x ft from the starting point. Use this function to find (a) the maximum height of the jump and (b) the length of the jump. (c) If the Count jumped this distance three times, did he beat Rosie's record?
9. Graph $g(x) = -\frac{1}{2}x^2 - 2x$ using the vertex formula and other features of a quadratic graph. Label all important features.
10. Find the equation of the quadratic function whose graph is shown.

REINFORCING BASIC CONCEPTS

An Alternative Method for Checking Solutions to Quadratic Equations

To solve $x^2 - 2x - 15 = 0$ by factoring, students will often begin by looking for two numbers whose product is -15 (the constant term) and whose sum is -2 (the linear coefficient). The two numbers are -5 and 3 since $(-5)(3) = -15$ and $-5 + 3 = -2$. In factored form, we have $(x - 5)(x + 3) = 0$ with solutions $x_1 = 5$ and $x_2 = -3$. When these solutions are compared *to the original coefficients,* we can still see the sum/product relationship, but note that while $(5)(-3) = -15$ still gives the constant term, $5 + (-3) = 2$ gives the linear coefficient *with opposite sign.* Although more difficult to accomplish, this method can be applied to *any* factorable quadratic equation $ax^2 + bx + c = 0$ if we divide through by a, giving $x^2 + \dfrac{b}{a}x + \dfrac{c}{a} = 0$. For $2x^2 - x - 3 = 0$, we divide both sides by 2 and obtain $x^2 - \dfrac{1}{2}x - \dfrac{3}{2} = 0$, then look for two numbers whose product is $-\dfrac{3}{2}$ and whose sum is $-\dfrac{1}{2}$. The factors are $\left(x - \dfrac{3}{2}\right)$ and $(x + 1)$ since $\left(-\dfrac{3}{2}\right)(1) = -\dfrac{3}{2}$ and $-\dfrac{3}{2} + 1 = -\dfrac{1}{2}$, showing the solutions are $x_1 = \dfrac{3}{2}$ and $x_2 = -1$. We again note the product of the solutions is the constant $-\dfrac{3}{2} = \dfrac{c}{a}$, and the sum of the solutions is the linear coefficient *with opposite sign:* $\dfrac{1}{2} = -\dfrac{b}{a}$. No one actually promotes this method for solving trinomials where $a \ne 1$, but it does illustrate an important and useful concept:

If x_1 and x_2 are the two roots of $x^2 + \frac{b}{a}x + \frac{c}{a} = 0$,

then $x_1x_2 = \frac{c}{a}$ and $x_1 + x_2 = -\frac{b}{a}$

Justification for this can be found by taking the product and sum of the general solutions $x_1 = \frac{-b}{2a} + \frac{\sqrt{b^2 - 4ac}}{2a}$ and $x_2 = \frac{-b}{2a} - \frac{\sqrt{b^2 - 4ac}}{2a}$. Although the computation looks impressive, the product can be computed as a binomial times its conjugate, and the radical parts add to zero for the sum, each yielding the results as already stated.

This observation provides a useful technique for checking solutions to a quadratic equation, *even those having irrational or complex roots!* Check the solutions shown in these exercises.

Exercise 1: $2x^2 - 5x - 7 = 0$

$x_1 = \frac{7}{2}$

$x_2 = -1$

Exercise 2: $2x^2 - 4x - 7 = 0$

$x_1 = \frac{2 + 3\sqrt{2}}{2}$

$x_2 = \frac{2 - 3\sqrt{2}}{2}$

Exercise 3: $x^2 - 10x + 37 = 0$

$x_1 = 5 + 2\sqrt{3}\,i$

$x_2 = 5 - 2\sqrt{3}\,i$

Exercise 4: Verify this sum/product check by computing the sum and product of the general solutions for x_1 and x_2.

3.4 Quadratic Models; More on Rates of Change

LEARNING OBJECTIVES

In Section 3.4 you will see how we can:

- ❑ **A.** Develop quadratic function models from a set of data
- ❑ **B.** Calculate the average rate of change for nonlinear functions using points from a graph
- ❑ **C.** Calculate average rates of change using the average rate of change formula

So far in our study, we've seen real data sets that were best modeled by linear functions (Section 1.6) and power functions (Section 2.4). These models enabled us to make meaningful decisions and comparisons, as well as reasonable projections for future occurrences. In this section, we explore data relationships that are best modeled by quadratic functions, and look at how the "rate of change" concept can be applied to these and other functions.

A. Quadratic Equation Models

After a set of data is collected and organized, any patterns or relationships that exist may not be readily known or easily seen. The regression model chosen for the data will depend on a number of factors, including the context of the data, any patterns noted in the scatterplot, any foreknowledge of how the data might be related, along with a careful assessment of the correlation coefficient. Most graphing calculators have the ability to find regression models for a large number of functions, and the more we are familiar with each family of functions, the better we'll be able to use the technology. Regardless of the form of regression used, the steps for inputting the data, setting a window size, viewing the scatterplot, and so on, are identical.

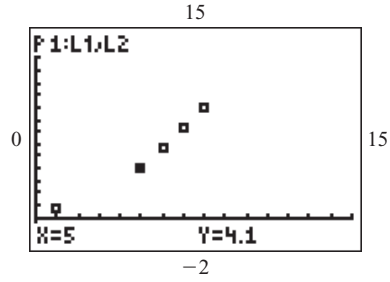
EXAMPLE 1 ▶ Growth of Online Sales of Pet Supplies

Since the year 2000, there has been a tremendous increase in the online sales of pet food, pet medications, and other pet supplies. That data shown in the table shows the amount spent (in billions of dollars) for the years indicated.

Source: 2009 Statistical Abstract of the United States, Page 646, Table 1016.

Year (2001 → 1)	Sales (billions)
1	0.8
5	4.1
6	5.6
7	7.4
8	9.1

a. Input the data into a graphing calculator, set an appropriate window and view the scatterplot, then use the context and the scatterplot to decide on an appropriate form of regression.



b. Determine the regression equation, and use it to find the amount of online sales projected for the year 2012.

c. If the predicted trends continue, in what year will online sales of pet supplies surpass $25 billion dollars?

Solution ▶

a. Begin by entering the years in L1 and the dollar amounts in L2. From the data given, a viewing window of Xmin = 0, Xmax = 15, Ymin = −2, and Ymax = 15 seems appropriate. The scatterplot in Figure 3.53 shows a definite increasing, nonlinear pattern and we opt for a quadratic regression.

Figure 3.53

b. Using STAT ▸ **(CALC) 5:QuadReg** places this option on the home screen. Pressing ENTER at this point will give us the quadratic coefficients, but we can also have the calculator paste the equation itself directly into Y_1 on the Y= screen, simply by appending Y_1 to the **QuadReg** command (Figure 3.54). The resulting equation is $y \approx 0.118x^2 + 0.136x + 0.537$ (to three decimal places), and the graph is shown in Figure 3.55. Using the home screen, we find that $Y_1(12) \approx 19.2$ (Figure 3.56), indicating that in 2012, about $19.2 billion is projected to be spent online for pet supplies.

c. To find the year when spending will surpass $25 billion, we set $Y_2 = 25$ and use the intersection-of-graphs method (be sure to increase Ymax so this graph can be seen: Ymax = 30). There result is shown in Figure 3.57 and indicates that spending will surpass $25 billion late in the year 2013.

Figure 3.54, 3.55

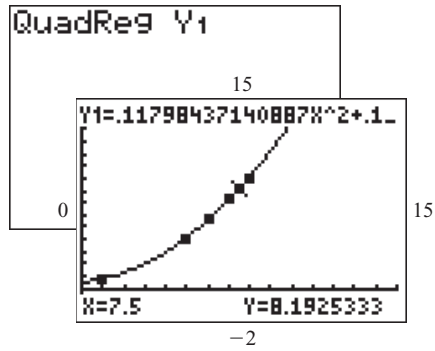


Figure 3.56

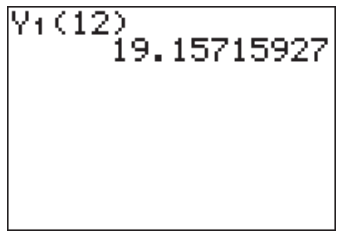

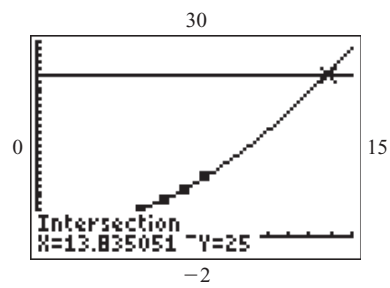

Figure 3.57

Now try Exercises 7 through 10 ▶

Applications of quadratic regression tend to focus on the defining characteristics of a quadratic graph, even if only a part of the graph is used. The data may simply indicate an increasing rate of growth beyond an initial or minimum point as in Example 1, or show values that decrease to a minimum and increase afterward. These would be data sets modeled by an equation where $a > 0$. Applications where $a < 0$ are also common.

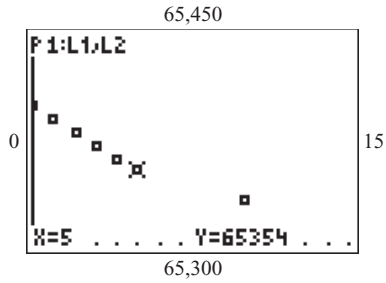
In actual practice, data sets are often very large and need not be integer-valued. In addition, as we explore additional functions and forms of regression, the decision of which form to use must be carefully evaluated as many functions exhibit similar characteristics.

EXAMPLE 2 ▶ Apollo 13, Retro-Rocket Option

About 56 hr into the mission and 65,400 km from the Moon, the oxygen tanks exploded on Apollo 13. At this point, mission control explored two options: (1) firing the retro-rockets for a direct return to Earth, or (2) the so called, "sling-shot around the Moon," the option actually chosen. The data shown in the table explore a scenario where option 1 was taken, and give the distance d from the Moon, t seconds after the retro-rockets have fired.

a. Input the data into a graphing calculator, set an appropriate window and view the scatterplot, then use the context and the scatterplot to decide on an appropriate form of regression.

b. Determine the regression equation, and use it to find how close Apollo 13 would have come to the Moon (the minimum distance). How many seconds after the retro-rockets fired would this have occurred?



c. How many seconds would it have taken for Apollo 13 to "turn around," and get back to the original distance of 65,400 km (where the accident occurred)?

Time (sec)	Distance from Moon (km)
0	65,400
1	65,389.0
2	65,378.8
3	65,369.6
4	65,361.4
5	65,354.0
10	65,331.2

Solution ▶

a. After entering the data (seconds in L1 and distance in L2), we set a viewing window of Xmin = 0, Xmax = 15, and after some trial and error, Ymin = 65,300, and Ymax = 65,450. The scatterplot shows (be sure that PLOT1 is activated on the Y= screen) a gradually decreasing, nonlinear pattern and a quadratic regression seems appropriate (Figure 3.58).

Figure 3.58

b. We find the regression equation using STAT ▸ **(CALC) 5:QuadReg** Y_1 (pasting the equation to Y_1): $Y_1 \approx 0.464X^2 - 11.519X + 65{,}400.013$. Next, press GRAPH to obtain the graph and scatterplot shown in Figure 3.59. The result indicates that we should increase the value of Xmax to see the full graph and to help locate the minimum value. Using Xmax = 30 and the 2nd TRACE **(CALC) 3:minimum** option shows that Apollo 13 would have come within 65,328.5 km of the Moon, after the retro-rockets had fired for 12.4 sec (Figure 3.60).

Figure 3.59

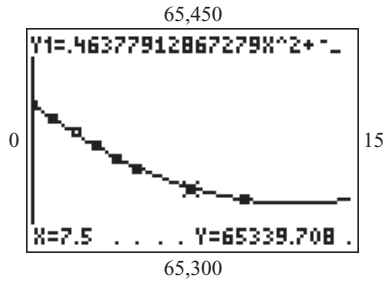


Figure 3.60

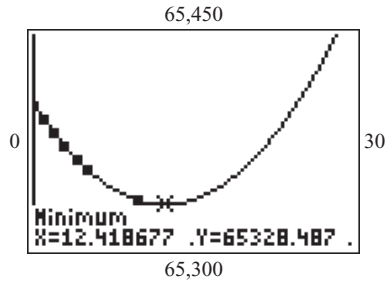

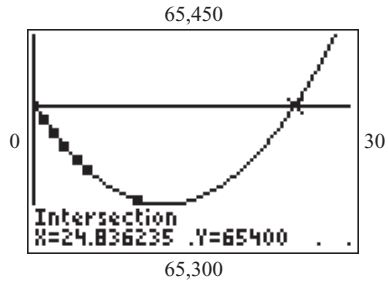

Figure 3.61

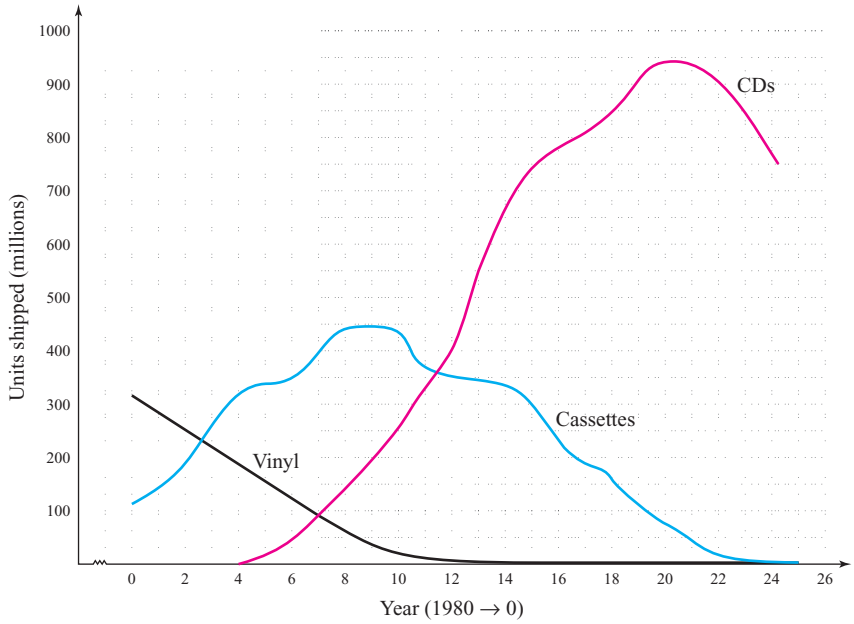
c. For the time required to return to a distance of 65,400 km, we enter $Y_2 = 65{,}400$ and use the 2nd TRACE **(CALC) 5:intersect** option. The result shown in Figure 3.61 indicates a required time of about 25 sec. Actually, we could have reasoned that if it took 12.5 sec to reach the minimum distance, we could double this time to return to the original distance.

A. You've just seen how we can develop quadratic function models from a set of data



Now try Exercises 11 through 14 and 45 through 48 ▶

B. Nonlinear Functions and Rates of Change

As noted in Section 1.2, one of the defining characteristics of linear functions is that their rate of change is constant: $\frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1} = m$. For nonlinear functions the rate of change is not constant, but to aid in their study and application, we use a related concept called the **average rate of change,** given by *the slope of a secant line* through points (x_1, y_1) and (x_2, y_2) on the graph.

EXAMPLE 3 ▶ Calculating Average Rates of Change

The graph shown displays the number of units shipped of vinyl records, cassette tapes, and CDs for the period 1980 to 2005.

Source: Swivel.com

Units shipped in millions

Year (1980 → 0)	Vinyl	Cassette	CDs
0	323	110	0
2	244	182	0
4	205	332	6
6	125	345	53
8	72	450	150
10	12	442	287
12	2	366	408
14	2	345	662
16	3	225	779
18	3	159	847
20	2	76	942
24	1	5	767
25	1	3	705

a. Find the average rate of change in CDs shipped and in cassettes shipped from 1994 to 1998. What do you notice?

b. Does it appear that the rate of increase in CDs shipped was greater from 1986 to 1992, or from 1992 to 1996? Compute the average rate of change for each period and comment on what you find.

Solution ▶ Using 1980 as year zero (1980 $\rightarrow$ 0), we have the following:

a.

CDs	**Cassettes**
1994: (14, 662), 1998: (18, 847)	1994: (14, 345), 1998: (18, 159)
$\frac{\Delta y}{\Delta x} = \frac{847 - 662}{18 - 14}$	$\frac{\Delta y}{\Delta x} = \frac{159 - 345}{18 - 14}$
$= \frac{185}{4}$	$= -\frac{186}{4}$
$= 46.25$	$= -46.5$

The decrease in the number of cassettes shipped was roughly equal to the increase in the number of CDs shipped (about 46,000,000 per year).

b. From the graph, the secant line for 1992 to 1996 appears to have a greater slope.

1986–1992 CDs	**1992–1996 CDs**
1986: (6, 53), 1992: (12, 408)	1992: (12, 408), 1996: (16, 779)
$\frac{\Delta y}{\Delta x} = \frac{408 - 53}{12 - 6}$	$\frac{\Delta y}{\Delta x} = \frac{779 - 16}{16 - 12}$
$= \frac{355}{6}$	$= \frac{371}{4}$
$= 59.1\overline{6}$	$= 92.75$

For the years 1986 to 1992, the average rate of change for CD sales was about 59.2 million per year. For the years 1992 to 1996, the average rate of change was almost 93 million per year, a significantly higher rate of growth.

Now try Exercises 15 through 26, 49 and 50 ▶

☑ **B.** You've just seen how we can calculate the average rate of change for nonlinear functions using points on a graph

C. The Average Rate of Change Formula

The importance of the rate of change concept would be hard to overstate. In many business, scientific, and economic applications, it is this attribute of a function that draws the most attention. In Example 3 we computed average rates of change by selecting two points from a graph, and computing the slope of the secant line: $m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}$. With a simple change of notation, we can use the function's *equation* rather than relying on a graph. Note that y_2 corresponds to the function evaluated at x_2: $y_2 = f(x_2)$. Likewise, $y_1 = f(x_1)$. Substituting these into the slope formula yields $\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$, giving the average rate of change between x_1 and x_2 *for any function f.*

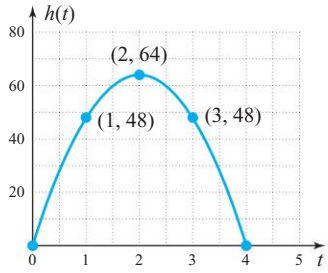
Average Rate of Change

For a function f and $[x_1, x_2]$ a subset of the domain, the average rate of change between x_1 and x_2 is

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}, x_1 \neq x_2$$

Average Rates of Change Applied to Projectile Velocity

A projectile is any object that is thrown, shot, or cast upward, with no continuing source of propulsion. The object's height (in feet) after t sec is modeled by the function $h(t) = -16t^2 + vt + k$, where v is the initial velocity of the projectile, and k is the height of the object at $t = 0$. For instance, if a soccer ball is kicked vertically upward from ground level ($k = 0$) with an initial speed of 64 ft/sec, the height of the ball t sec later is $h(t) = -16t^2 + 64t$. From Section 3.3, we recognize the graph will be a parabola and evaluating the function for $t = 0$ to 4 produces Table 3.1 and the graph shown in Figure 3.62. Experience tells us the ball is traveling at a faster rate immediately after being kicked, as compared to when it nears its maximum height where it momentarily stops, then begins its descent. In other words, the rate of change $\frac{\Delta \text{height}}{\Delta \text{time}}$ has a larger value at any time prior to reaching its maximum height. To quantify this we'll compute the average rate of change between (a) $t = 0.5$ and $t = 1$, and compare it to the average rates of change between, (b) $t = 1$ and $t = 1.5$, and (c) $t = 1.5$ and $t = 2$.



WORTHY OF NOTE

Keep in mind the graph of h represents the relationship between the soccer ball's height in feet and the elapsed time t. It does not model the actual path of the ball.

Table 3.1

Time in seconds	Height in feet
0	0
1	48
2	64
3	48
4	0

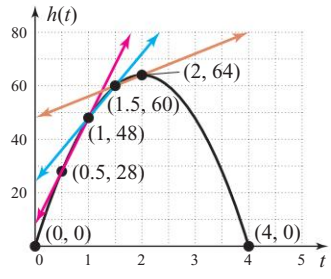
Figure 3.62

EXAMPLE 4 ▶ Average Rates of Change Applied to Projectiles

For the projectile function $h(t) = -16t^2 + 64t$, find the average rate of change for

a. $t \in [0.5, 1]$. **b.** $t \in [1, 1.5]$. **c.** $t \in [1.5, 2.0]$.

Then graph the secant lines representing these average rates of change and comment.



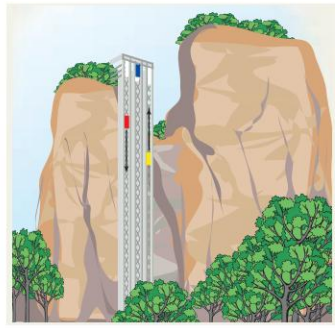
Solution ▶ Using the given intervals in the formula $\frac{\Delta h}{\Delta t} = \frac{h(t_2) - h(t_1)}{t_2 - t_1}$ yields

a. $\frac{\Delta h}{\Delta t} = \frac{h(1) - h(0.5)}{1 - (0.5)}$
$= \frac{48 - 28}{0.5}$
$= 40$

b. $\frac{\Delta h}{\Delta t} = \frac{h(1.5) - h(1)}{1.5 - 1}$
$= \frac{60 - 48}{0.5}$
$= 24$

c. $\frac{\Delta h}{\Delta t} = \frac{h(2) - h(1.5)}{2 - 1.5}$
$= \frac{64 - 60}{0.5}$
$= 8$

For $t \in [0.5, 1]$, the average rate of change is $\frac{40}{1}$, meaning the height of the ball is increasing at an average rate of 40 ft/sec. For $t \in [1, 1.5]$, the average rate of change has slowed to $\frac{24}{1}$, and the soccer ball's height is increasing at only 24 ft/sec. In the interval [1.5, 2], the average rate of change has slowed to 8 ft/sec. The secant lines representing these rates of change are shown in the figure, where we note the line from the first interval (in **red**), has a much steeper slope than the line from the third interval (in **gold**).



Now try Exercises 27 through 34 ▶

The calculation for average rates of change can be applied to any function $y = f(x)$ and will yield valuable information—particulary in an applied context. For practice with other functions, **see Exercises 35 to 42.**

You may have had the experience of riding in the external elevator of a modern building, with a superb view of the surrounding area as you rise from the bottom floor. For the first few floors, you note you can see much farther than from ground level. As you ride to the higher floors, you can see still farther, but not that much farther due to the curvature of the Earth. This is another example of a nonconstant rate of change.

EXAMPLE 5 ▶ Average Rates of Change Applied to Viewing Distance

The distance a person can see depends on their elevation above level ground. On a clear day, this viewing distance can be approximated by the function $d(h) = 1.2\sqrt{h}$, where $d(h)$ represents the viewing distance (in miles) at height h (in feet) above level ground. Find the average rate of change to the nearest 100th, for

a. $h \in [9, 16]$

b. $h \in [196, 225]$

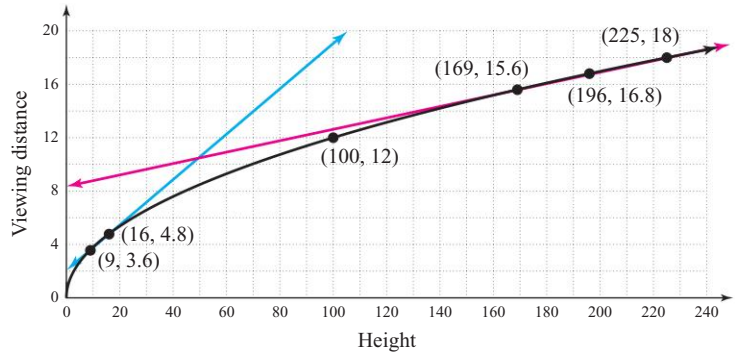
c. Graph the function along with the lines representing the average rate of change and comment on what you notice.

Solution ▶ Use the points given in the formula: $\dfrac{\Delta d}{\Delta h} = \dfrac{d(h_2) - d(h_1)}{h_2 - h_1}$

a. $\dfrac{\Delta d}{\Delta h} = \dfrac{d(16) - d(9)}{16 - 9}$

$= \dfrac{4.8 - 3.6}{7}$

≈ 0.17



b. $\dfrac{\Delta d}{\Delta h} = \dfrac{d(225) - d(196)}{225 - 196}$

$= \dfrac{18 - 16.8}{29}$

≈ 0.04

c. For $h \in [9, 16]$, $\dfrac{\Delta d}{\Delta h} \approx \dfrac{0.17}{1}$, meaning the viewing distance is increasing at an average rate of 0.17 miles (about 898 feet) for each 1 ft increase in elevation. For $h \in [196, 225]$, $\dfrac{\Delta d}{\Delta h} \approx \dfrac{0.04}{1}$ and the viewing distance is increasing at a rate of only 0.04 miles (about 211 feet) for each increase of 1 ft. We'll sketch the graph using the points (0, 0), (9, 3.6), (16, 4.8), (196, 16.8) and (225, 18), along with (100, 12) and (169, 15.6) to help round out the graph (Figure 3.63).

Figure 3.63

Note the slope of the secant line through the points (9, 3.6) and (16, 4.8), has a much steeper slope than the line through (196, 16.8) and (225, 18).

C. You've just seen how we can calculate average rates of change using the average rate of change formula

Now try Exercises 51 through 56 ▶

3.4 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. Data that indicate a gradual increase to a maximum value, matched by a like decrease, might best be modeled using _____ regression. In the case described, the coefficient of the x^2-term will be _____.

2. For linear functions, the rate of change is _____. For _____ functions, the rate of change is not constant.

3. The _____ rate of change of a function can be found by calculating the _____ of the line that passes through two points on the graph of the function. For nonlinear functions, this is called a _____.

4. The average rate of change of a function $f(x)$ between x_1 and x_2 is given by the formula _____. To avoid division by _____, x_1 cannot equal x_2.

5. Discuss/Explain the differences between the three types of regressions we have studied so far (linear, power, and quadratic). Include examples that highlight the different behavior of each of these types of models.

6. Given $f(x) = 2x^2 - 12x$, compare the average rate of change near the vertex, with $\frac{\Delta y}{\Delta x}$ on either side of the vertex. Include specific intervals and values in your discussion.

▶ DEVELOPING YOUR SKILLS

Use a graphing calculator and the tables shown to find (a) a quadratic regression equation that models the data, (b) the output of the function for $x = 3.5$, and (c) the positive value of x where $f(x) = 39$. Round to nearest thousandths as necessary.

Using the graphs shown, find the average rate of change of f and g for the intervals specified.

15. $f(x)$ for $x \in [-5, -1]$

16. $f(x)$ for $x \in [-1, 4]$

17. $f(x)$ for $x \in [2, 6]$

18. $f(x)$ for $x \in [-3, 2]$

19. $f(x)$ for $x \in [-5, -3]$

20. $f(x)$ for $x \in [-3, -1]$

21. $g(x)$ for $x \in [-3, 1]$

22. $g(x)$ for $x \in [0, 1]$

23. $g(x)$ for $x \in [-3, 4]$

24. $g(x)$ for $x \in [0, 4]$

25. $g(x)$ for $x \in [-3, 5]$

26. $g(x)$ for $x \in [0, 5]$

The functions shown are projectile equations where $h(t)$ is the height of the projectile after t sec. Calculate $\frac{\Delta h}{\Delta t}$ over the intervals indicated. Include units of measurement in your answer.

27. $h(t) = -16t^2 + 160t$, h in feet

a. [2, 5] **b.** [3, 5]

c. [4, 5] **d.** [5, 7]

28. $h(t) = -16t^2 + 32t$, h in feet

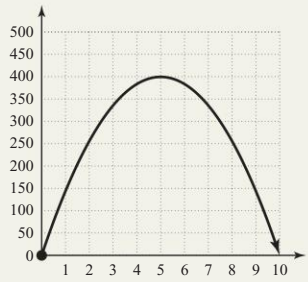
a. [0.25, 1] **b.** [0.5, 1]

c. [0.75, 1] **d.** [1, 1.5]

29. $h(t) = -4.9t^2 + 34.3t + 2.6$, h in meters

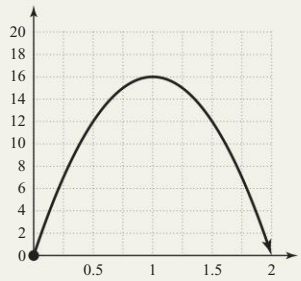
a. [1, 6] **b.** [2, 5]

c. [2.5, 3.5] **d.** [3.5, 4.5]



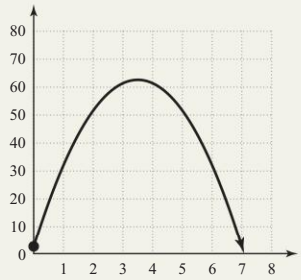
30. $h(t) = -4.9t^2 + 14.7t + 4.1$, h in meters

a. [1, 2] **b.** [0.2, 2.8]

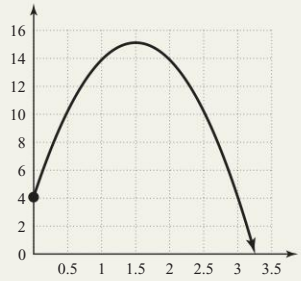


c. [0.5, 1.5] **d.** [1.5, 2.5]

Graph the function and secant lines representing the average rates of change for the exercises given. Comment on what you notice in terms of the projectile's velocity.



31. Exercise 27.



32. Exercise 28.

33. Exercise 29.

34. Exercise 30.

Graph each function in an appropriate window, then find the average rate of change for the interval specified. Round to hundredths as needed.

35. $y = x^3 - 8$; $[2, 5]$

36. $y = \sqrt[3]{x + 5}$; $[-5, 3]$

37. $y = 2|x + 3|$; $[-4, 0]$

38. $y = |3x + 1| - 2$; $[-2, 2]$

39. $F = 9.8m$; $[70, 100]$

40. $\rho = 0.2m$; $[1.3, 1.5]$

41. $A = \pi r^2$; $[5, 7]$

42. $V = \frac{4}{3}\pi r^3$; $[5, 7]$

▶ WORKING WITH FORMULAS

43. Height of a falling object: $h(t) = -16t^2 - v_0t + h_0$

Neglecting air resistance, the height of an object that is *thrown* straight downward with velocity v_0 from a height of h_0 is given by the formula shown, where $h(t)$ represents the height at time t. The Earth's longest vertical drop (on land) is the Rupal Face on Nanga Parbat (Pakistan), which rises 15,000 ft above its base. From the top of this rock face, a climber's piton hammer slips from her hand and is projected downward with an initial velocity of 6 ft/sec. Determine the hammer's height after (a) $t = 5$ sec and (b) $t = 7$ sec. (c) Use the results to calculate the average rate of change over this 2-sec interval. (d) Repeat parts (a), (b), and (c) for $t = 10$ sec and $t = 12$ sec and comment.

44. The Difference Quotient: $D(x) = \dfrac{f(x+h) - f(x)}{h}$

As we'll see in Section 3.6, the difference quotient is closely related to the average rate of change.

a. Given $f(x) = x^2$ and $h = 0.1$, evaluate $D(3)$ using the formula.

b. Calculate the average rate of change of $f(x)$ over the interval $[3, 3.1]$ and comment on what you notice.

▶ APPLICATIONS

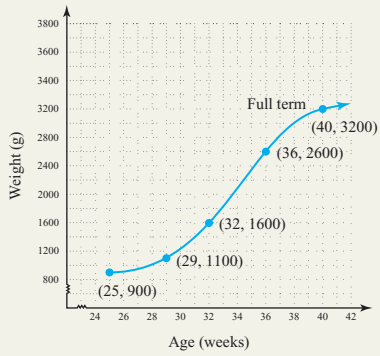
45. Registration for 5-km race: A local community hosts a popular 5-km race to raise money for breast cancer research. Due to certain legal restrictions, only the first 5000 registrants will be allowed to compete. The table shows the cumulative number of registered participants at the end of the day, for the first 5 days. (a) Use a graphing calculator to find a quadratic regression equation that models the data. Use this equation to estimate (b) the number of participants after 1 week of registration, (c) the number of days it will take for the race to fill up, and (d) the maximum number of participants that would have signed up had there been no limit. Round to the nearest hundredth when necessary.

Day	Registration Total
1	791
2	1688
3	2407
4	3067
5	3692

46. Concert tickets: In San Francisco, the *Javier Mendoza Band* has scheduled a concert at Candlestick Park. Once the tickets go on sale, the band is sure to sell out this 70,000 person venue. The table shows the cumulative number of tickets sold each week, for the first 4 weeks. (a) Use a graphing calculator to find a quadratic regression equation that models the data. Use this equation to (b) estimate the number of tickets sold after 5 weeks, (c) estimate the number of weeks it will take for the concert to sell out, and (d) estimate the number of fans that won't get to attend the show.

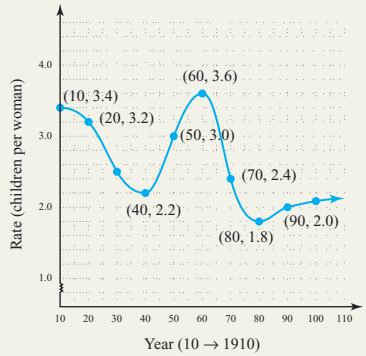
Week	Ticket Sales Total
1	17,751
2	31,266
3	45,311
4	54,986

47. Guided tours: A tour guide for Kalaniohana Tours noticed that for groups of two to seven people, the average time it took to organize them at the beginning of a tour actually *decreased* as the group size *increased*. For groups of eight or more, however, the logistics (and questions asked) actually caused a significant increase in the start time required. Using the given table and a graphing calculator, (a) find a quadratic regression equation that models the data. Use this equation to (b) estimate how long it would take to get a group of five tourists ready, (c) estimate the tour capacity if start-up time can be no longer than 10 min, and (d) estimate the fastest start time that could be expected. Round to the nearest hundredth as necessary.



No. of Tourists	Start-up Time (sec)
2	206
4	115
6	63
9	79
11	154
13	269

48. Gardening: The production of a garden can be diminished not only by lack of water, but also by *over*watering. Shay has kept diligent records of her 100-ft^2 tomato garden's weekly production, as well as the amount of water it received through watering and rain. Use the given table and a graphing calculator to (a) find a quadratic regression equation that models the data. Then use this equation to (b) estimate how many tomatoes she



Water Total (gal)	No. of Tomatoes
77	11
132	25
198	29
256	20
315	1

can expect when the garden receives 156 gal of water per week, (c) estimate how much water the garden received if there were 15 tomatoes produced per week, and (d) estimate the maximum number of tomatoes she can expect from the garden in a week. Round to the nearest ten-thousandth as necessary.

49. Weight of a fetus: The growth rate of a fetus in the mother's womb (by weight in grams) is modeled by the graph shown here, beginning with the 25th week of gestation. (a) Calculate the average rate of change (slope of the secant line) between the 25th week and the 29th week. Is the slope of the secant line positive or negative? Discuss what the slope means in this context. (b) Is the fetus gaining weight faster between the 25th and 29th week, or between the 32nd and 36th week? Compare the slopes of both secant lines and discuss.

50. Fertility rates: Over the years, fertility rates for women in the United States (average number of children per woman) have varied a great deal, though in the twenty-first century they've begun to level out. The graph shown models this fertility rate for most of the twentieth century. (a) Calculate the average rate of change from the years 1920 to 1940. Is the slope of the secant line positive or negative? Discuss what the slope means in this context. (b) Calculate the average rate of change from the year 1940 to 1950. Is the slope of the secant line positive or negative? Discuss what the slope means in this context. (c) Was the fertility rate increasing faster from 1940 to 1950, or from 1980 to 1990? Compare the slope of both secant lines and comment.

Source: Statistical History of the United States from Colonial Times to Present

For Exercises 51 to 56, use the formula for the average rate of change $\dfrac{f(x_2) - f(x_1)}{x_2 - x_1}$.

51. Average rate of change: For $f(x) = x^3$, (a) calculate the average rate of change for the interval $x = -2$ to $x = -1$ and (b) calculate the average rate of change for the interval $x = 1$ to $x = 2$. (c) What do you notice about the answers from parts (a) and (b)? (d) Sketch the graph of this function along with the lines representing these average rates of change and comment on what you notice.

52. Average rate of change: Knowing the general shape of the graph for $f(x) = \sqrt[3]{x}$, (a) is the average rate of change greater between $x = 0$ and $x = 1$ or between $x = 7$ and $x = 8$? Why? (b) Calculate the rate of change for these intervals and verify your response. (c) Approximately how many times greater is the rate of change?

53. Height of an arrow: If an arrow is shot vertically from a bow with an initial speed of 192 ft/sec, the height of the arrow can be modeled by the function $h(t) = -16t^2 + 192t$, where $h(t)$ represents the height of the arrow after t sec (assume the arrow was shot from ground level).

- **a.** What is the arrow's height at $t = 1$ sec?
- **b.** What is the arrow's height at $t = 2$ sec?
- **c.** What is the average rate of change from $t = 1$ to $t = 2$?
- **d.** What is the rate of change from $t = 10$ to $t = 11$? Why is it the same as (c) except for the sign?

54. Height of a water rocket: Although they have been around for decades, water rockets continue to be a popular toy. A plastic rocket is filled with water and then pressurized using a handheld pump. The rocket is then released and off it goes! If the rocket has an initial velocity of 96 ft/sec, the height of the rocket can be modeled by the function $h(t) = -16t^2 + 96t$, where $h(t)$ represents the height of the rocket after t sec (assume the rocket was shot from ground level).

- **a.** Find the rocket's height at $t = 1$ and $t = 2$ sec.
- **b.** Find the rocket's height at $t = 3$ sec.
- **c.** Would you expect the average rate of change to be greater between $t = 1$ and $t = 2$, or between $t = 2$ and $t = 3$? Why?
- **d.** Calculate each rate of change and discuss your answer.

55. Velocity of a falling object: The impact velocity of an object dropped from a height is modeled by $v = \sqrt{2gs}$, where v is the velocity in feet per second (ignoring air resistance), g is the acceleration due to gravity (32 ft/sec^2 near the Earth's surface), and s is the height from which the object is dropped.

a. Find the velocity at $s = 5$ ft and $s = 10$ ft.

b. Find the velocity at $s = 15$ ft and $s = 20$ ft.

c. Would you expect the average rate of change to be greater between $s = 5$ and $s = 10$, or between $s = 15$ and $s = 20$?

d. Calculate each rate of change and discuss your answer.

56. Temperature drop: One day in November, the town of Coldwater was hit by a sudden winter storm that caused temperatures to plummet. During the storm, the temperature T (in degrees Fahrenheit) could be modeled by the function $T(h) = 0.8h^2 - 16h + 60$, where h is the number of hours since the storm began. Graph the function and use this information to answer the following questions.

a. What was the temperature as the storm began?

b. How many hours until the temperature dropped below zero degrees?

c. How many hours did the temperature remain below zero?

d. What was the coldest temperature recorded during this storm?

▶ EXTENDING THE CONCEPT

57. The function $A(t) = 200t$ gives the amount of air (in cubic inches) that a compressor has pumped out after t sec. The volume of a spherical balloon being inflated by this compressor is given by $V(r) = \frac{4}{3}\pi r^3$, with the radius of the balloon modeled by $r(t) = -0.02t^2 + 0.76t + 2.26$, where $r(t)$ is the radius after t sec.

a. If the balloon pops when the radius is at its maximum, what is the maximum volume of the balloon?

b. What amount of air (the volume) was needed to pop the balloon?

c. Calculate the average rates of change $\frac{\Delta r}{\Delta t}$ and $\frac{\Delta V}{\Delta r}$ during the first second of inflation and the last second of inflation. Compare the results.

58. In Exercise 44, you were provided with a formula called the difference quotient. This formula can be derived by finding the average rate of change of a function $f(x)$ over an interval $[x, x + h]$.

a. Use the definition of average rate of change to derive the formula for the difference quotient.

b. Find and simplify the difference quotient of $f(x) = x^2 + 3x$.

59. The floor function $f(x) = \lfloor x \rfloor$ and the ceiling function $g(x) = \lceil x \rceil$ studied in Section 2.5 can produce some interesting average rates of change. The average rate of change of these two functions over any interval 1 unit or longer must lie within what range of values?

▶ MAINTAINING YOUR SKILLS

60. (1.1) Complete the squares in x and y to find the center and radius of the circle defined by $x^2 + y^2 + 6x - 8y = 0$. Then graph the circle on a graphing calculator.

61. (1.5) Solve the following inequalities graphically using the intersection-of-graphs method. Round to nearest hundredths when necessary.

a. $\frac{x - 5}{x - 2} < 2$

b. $x - \frac{2}{5}(3 - x) > 7(0.2x + 0.5)$

62. (3.3) Find an equation of the quadratic function with vertex $(-5, -3)$ and y-intercept $(0, 7)$.

63. (2.2/2.5) Given $f(x) = \begin{cases} |x + 3| & x < -2 \\ -\frac{1}{2}x & x \geq -2 \end{cases}$, find the equation of $g(x)$, given its graph is the same as $f(x)$ but translated right 3 units and reflected across the x-axis.

3.5 The Algebra of Functions

LEARNING OBJECTIVES

In Section 3.5 you will see how we can:

- ❑ **A.** Compute a sum or difference of functions and determine the domain of the result
- ❑ **B.** Compute a product or quotient of functions and determine the domain
- ❑ **C.** Interpret operations on functions graphically and numerically
- ❑ **D.** Apply the algebra of functions in context

In Section 2.2, we created new functions *graphically* by applying transformations to basic functions. In this section, we'll use two (or more) functions to create new functions *algebraically*. Previous courses often contain material on the sum, difference, product, and quotient of polynomials. Here we'll combine functions with the basic operations, noting the result is also a function that can be evaluated, graphed, and analyzed. We call these basic operations on functions the **algebra of functions.**

A. Sums and Differences of Functions

This section introduces the notation used for basic operations on functions. Here we'll note the result is also a function whose domain depends on the original functions. In general, if f and g are functions *with overlapping domains,* $f(x) + g(x) = (f + g)(x)$ and $f(x) - g(x) = (f - g)(x)$.

Sums and Differences of Functions

For functions f and g with domains P and Q respectively, the sum and difference of f and g are defined by:

	Domain of result
$(f + g)(x) = f(x) + g(x)$	$P \cap Q$
$(f - g)(x) = f(x) - g(x)$	$P \cap Q$

EXAMPLE 1A ▶ **Evaluating a Difference of Functions**

Given $f(x) = x^2 - 5x$ and $g(x) = 2x - 9$,

a. Determine the domain of $h(x) = (f - g)(x)$. **b.** Find $h(3)$ using the definition.

Solution ▶

a. Since the domain of both f and g is $\mathbb{R}$, their intersection is $\mathbb{R}$, so the domain of h is also $\mathbb{R}$.

b.

$h(x) = (f - g)(x)$	given difference
$= f(x) - g(x)$	by definition
$h(3) = f(3) - g(3)$	substitute 3 for x
$= [(3)^2 - 5(3)] - [2(3) - 9]$	evaluate
$= [9 - 15] - [6 - 9]$	multiply
$= -6 - [-3]$	subtract
$= -3$	result

If the function h is to be graphed or evaluated numerous times, it helps to compute a *new function rule* for h, rather than repeatedly apply the definition.

EXAMPLE 1B ▶ For the functions f, g, and h, as defined in Example 1A,

a. Find a new function rule for h. **b.** Use the result to find $h(3)$.

Solution ▶

a.

$h(x) = (f - g)(x)$	given difference
$= f(x) - g(x)$	by definition
$= (x^2 - 5x) - (2x - 9)$	replace $f(x)$ with $(x^2 - 5x)$ and $g(x)$ with $(2x - 9)$
$= x^2 - 7x + 9$	distribute and combine like terms

b. $h(3) = (3)^2 - 7(3) + 9$ substitute 3 for x
$= 9 - 21 + 9$ multiply
$= -3$ result

Notice the result from part (b) is identical to that in Example 1A.

Now try Exercises 7 through 10 ▶

CAUTION ▶ From Example 1A, note the importance of using grouping symbols with the algebra of functions. Without them, we could easily confuse the signs of g when computing the difference. Also, note that any operation applied to the functions f and g simply results in an *expression* representing a new function rule for h, and is not an *equation* that needs to be factored or solved.

EXAMPLE 2 ▶ **Evaluating a Sum of Functions**

For $f(x) = x^2$ and $g(x) = \sqrt{x - 2}$,

a. Determine the domain of $h(x) = (f + g)(x)$.
b. Find a new function rule for h.
c. Evaluate $h(3)$.
d. Evaluate $h(-1)$.

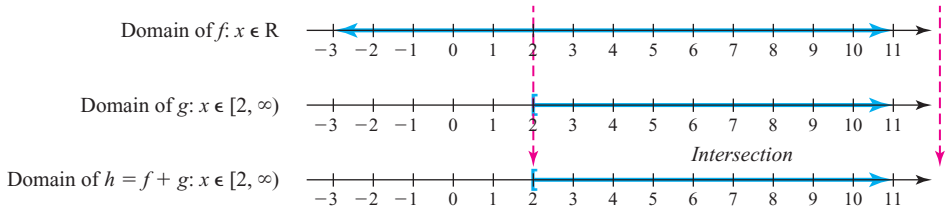
Solution ▶

a. The domain of f is $\mathbb{R}$, while the domain of g is $x \in [2, \infty)$. Since their intersection is $[2, \infty)$, this is the domain of the new function h.

b. $h(x) = (f + g)(x)$ given sum
$= f(x) + g(x)$ by definition
$= x^2 + \sqrt{x - 2}$ substitute x^2 for $f(x)$ and $\sqrt{x - 2}$ for $g(x)$ (no other simplifications possible)

c. $h(3) = (3)^2 + \sqrt{3 - 2}$ substitute 3 for x
$= 10$ result

d. $x = -1$ is outside the domain of h.



Now try Exercises 11 through 14 ▶

WORTHY OF NOTE

If we *did* try to evaluate $h(-1)$, the result would be $1 + \sqrt{-3}$, which is not a real number. While it's true we could write $1 + \sqrt{-3}$ as $1 + i\sqrt{3}$ and consider it an "answer," our study here focuses on real numbers and the graphs of functions in a coordinate system where x and y are both real.

This "intersection of domains" is illustrated in Figure 3.64.

Figure 3.64

☑ **A.** You've just seen how we can compute a sum or difference of functions and determine the domain of the result

B. Products and Quotients of Functions

The product and quotient of two functions is defined in a manner similar to that for sums and differences. For example, if f and g are functions *with overlapping domains,* $(f \cdot g)(x) = f(x) \cdot g(x)$ and $\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$. As you might expect, for quotients we must stipulate $g(x) \neq 0$.

Products and Quotients of Functions

For functions f and g with domains P and Q respectively, the product and quotient of f and g are defined by:

	Domain of result
$(f \cdot g)(x) = f(x) \cdot g(x)$	$P \cap Q$
$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$	$P \cap Q$, for all $g(x) \neq 0$

EXAMPLE 3 ▶ **Computing a Product of Functions**

Given $f(x) = \sqrt{1 + x}$ and $g(x) = \sqrt{3 - x}$,

a. Determine the domain of $h(x) = (f \cdot g)(x)$.

b. Find a new function rule for h.

c. Use the result from part (b) to evaluate $h(2)$ and $h(4)$.

Solution ▶

a. The domain of f is $x \in [-1, \infty)$ and the domain of g is $x \in (-\infty, 3]$. The intersection of these domains gives $x \in [-1, 3]$, which is the domain for h.

b.
$$\begin{aligned} h(x) &= (f \cdot g)(x) && \text{given product} \\ &= f(x) \cdot g(x) && \text{by definition} \\ &= \sqrt{1 + x} \cdot \sqrt{3 - x} && \text{substitute } \sqrt{1 + x} \text{ for } f \text{ and } \sqrt{3 - x} \text{ for } g \\ &= \sqrt{3 + 2x - x^2} && \text{combine using properties of radicals} \end{aligned}$$

c.
$$\begin{aligned} h(2) &= \sqrt{3 + 2(2) - (2)^2} && \text{substitute 2 for } x \\ &= \sqrt{3} \approx 1.732 && \text{result} \\ h(4) &= \sqrt{3 + 2(4) - (4)^2} && \text{substitute 4 for } x \\ &= \sqrt{-5} && \textit{not a real number} \end{aligned}$$

The second result of part (c) is not surprising, since $x = 4$ is not in the domain of h [meaning $h(4)$ is not defined for this function].

Now try Exercises 15 through 18 ▶

In future sections, we use polynomial division as a tool for factoring, as an aid to graphing, and to determine whether two expressions are equivalent. Understanding the notation and domain issues related to division will strengthen our ability in these areas.

EXAMPLE 4 ▶ **Computing a Quotient of Functions**

Given $f(x) = x^3 - 3x^2 + 2x - 6$ and $g(x) = x - 3$,

a. Determine the domain of $h(x) = \left(\frac{f}{g}\right)(x)$.

b. Find a new function rule for h.

c. Use the result from part (b) to evaluate $h(0)$.

Solution ▶

a. While the domain of both f and g is $\mathbb{R}$ and their intersection is also $\mathbb{R}$, we know from the definition (and past experience) *that g(x) cannot be zero*. The domain of h is $x \in (-\infty, 3) \cup (3, \infty)$.

b.
$$\begin{aligned} h(x) &= \left(\frac{f}{g}\right)(x) && \text{given quotient} \\ &= \frac{f(x)}{g(x)} && \text{by definition} \\ &= \frac{x^3 - 3x^2 + 2x - 6}{x - 3} && \text{replace } f \text{ with } x^3 - 3x^2 + 2x - 6 \text{ and } g \text{ with } x - 3 \end{aligned}$$

From our work with rational expressions in Appendix A.5, the expression that defines h can be simplified: $\dfrac{x^3 - 3x^2 + 2x - 6}{x - 3} = \dfrac{x^2(x - 3) + 2(x - 3)}{x - 3} = \dfrac{(x^2 + 2)(\cancel{x - 3})}{\cancel{x - 3}} = x^2 + 2$. But from the original expression, h is not defined if $g(x) = 3$, *even if the result for h is a polynomial*. In this case, we write the simplified form as $h(x) = x^2 + 2, x \neq 3$.

c. For $h(0)$ we have:

$h(0) = (0)^2 + 2$ replace x with 0

$h(0) = 2$

Now try Exercises 19 through 34 ▶

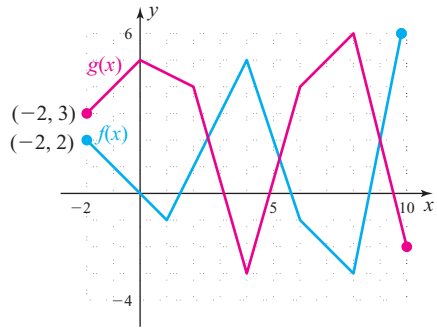
☑ **B.** You've just seen how we can compute a product or quotient of functions and determine the domain

For additional practice with the algebra of functions, **see Exercises 35 through 46.**

C. Graphical and Numerical Views of Operations on Functions

The algebra of functions also has an instructive *graphical interpretation,* in which values for $f(k)$ and $g(k)$ are read from a graph (k is a given constant), with operations like $(f + g)(k) = f(k) + g(k)$ then computed and lodged (**see Exercise 84**).

EXAMPLE 5 ▶ **Interpreting Operations on Functions Graphically**



Use the graph given to find the value of each expression:

a. $(f + g)(-2)$

b. $(g - f)(6)$

c. $\left(\dfrac{g}{f}\right)(8)$

d. $(f \cdot g)(4)$

Solution ▶ Since the needed input values for this example are $x = -2$, 4, 6, and 8, we begin by reading the value of $f(x)$ and $g(x)$ at each point. From the graph, we note that $f(-2) = 2$ and $g(-2) = 3$. The other values are likewise found and appear in the table. For $(f + g)(-2)$ we have:

x	$f(x)$	$g(x)$
−2	2	3
4	5	−3
6	−1	4
8	−3	6

a. $(f + g)(-2) = f(-2) + g(-2)$ definition

$= 2 + 3$ substitute 2 for $f(-2)$ and 3 for $g(-2)$

$= 5$ result

With some practice, the computations can be done mentally and we have

b. $(g - f)(6) = g(6) - f(6)$

$= 4 - (-1) = 5$

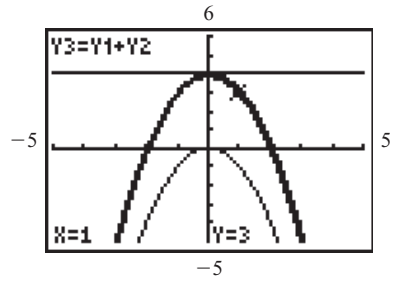
c. $\left(\dfrac{g}{f}\right)(8) = \dfrac{g(8)}{f(8)}$

$= \dfrac{6}{-3} = -2$

d. $(f \cdot g)(4) = f(4) \cdot g(4)$

$= 5(-3) = -15$

Now try Exercises 47 through 56 ▶



In addition to graphically viewing operations on functions *at specific points* as in Example 5, it is instructive to better understand what happens when functions are combined *for all possible x-values*. This will shed light on certain transformations of functions, as well as on the domain of the new function. For instance, consider the functions $f(x) = -x^2$ and $g(x) = 4$. The graph of f is a parabola opening downward with vertex $(0, 0)$, while g is a horizontal line through $y = 4$. For $h(x) = f(x) + g(x)$, the notation literally says the new function is the result of adding the outputs of f and g for all values of x in the intersection of their domains. Using $Y_1 = -x^2$, $Y_2 = 4$, and $\mathbf{Y_3 = Y_1 + Y_2}$, the result shown numerically in Table 3.2 is found by simply adding $Y_2 = 4$ to the output values in Y_1. The identical combination is shown graphically in Figure 3.65, where the outputs from Y_1 are all increased by 4. Note the result h is simply the graph f shifted up 4 units (a vertical shift).

Table 3.2

X	Y1	Y3
-3	-9	-5
-2	-4	0
-1	-1	3
0	0	4
1	-1	3
2	-4	0
3	-9	-5

X= -3

Figure 3.65

The graphical rendering also helps verify that since the domain of f and g is all real numbers, their intersection (and the domain of h) is all real numbers.

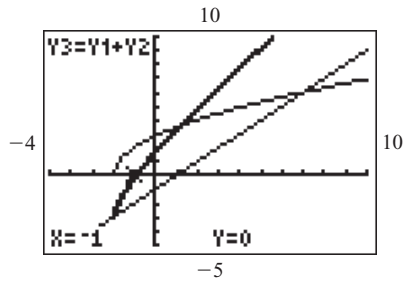
If the same analysis is performed on functions where one or both domains are restricted, the reason for the "intersection of domains" becomes clear. Using $f(x) = Y_1 = 2\sqrt{x + 2}$ and $g(x) = Y_2 = x - 1$, we note the domain of f is $x \in [-2, \infty)$ while the domain of g is $x \in \mathbb{R}$. For $h(x) = f(x) + g(x)$, we have $\mathbf{Y_3 = Y_1 + Y_2}$ with the result shown numerically Table 3.3 and graphically in Figures 3.66 and 3.67 (Y_3 is the **bold** graph). The **TABLE** feature of a graphing calculator can actually be used for all three functions by activating the functions Y_1, Y_2, and Y_3, then using the right arrow to bring the column for Y_3 into view.

Table 3.3

X	Y1	Y3
-4	ERR:	ERR:
-3	ERR:	ERR:
-2	0	-3
-1	2	0
0	2.8284	1.8284
1	3.4641	3.4641
2	4	5

X= -4

Figure 3.66



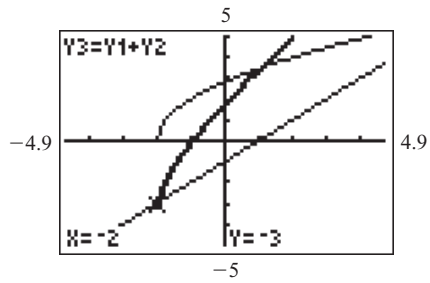


Figure 3.67

The fact that the domain of h is $[-2, \infty)$ is clearly seen from the table. Since Y_1 is not a real number for values less than -2, the combination $Y_1 + Y_2$ cannot produce real values unless $x \geq -2$. This is shown graphically in Figure 3.67, where we note the initial point of Y_3 (in **bold**) is the point $(-2, -3)$. Note that $[-2, \infty)$ is also the intersection of the domains for f and g.

EXAMPLE 6 ▶ In Example 3, we found that the product of the functions $f(x) = \sqrt{1 + x}$ and $g(x) = \sqrt{3 - x}$ was $h(x) = \sqrt{(1 + x)(3 - x)} = \sqrt{3 + 2x - x^2}$. The domain of f was stated as $[-1, \infty]$, the domain of g as $[-\infty, 3]$, and the domain of h (the intersection of domains) as $x \in [-1, 3]$. Verify these domains using a table and graph, as in Table 3.3 and Figure 3.67.

Solution ▶ Enter $\sqrt{1 + x}$ as Y_1, $\sqrt{3 - x}$ as Y_2, and $\mathbf{Y_1Y_2}$ as Y_3. The results shown in Table 3.4 (a manual table was used to show all three functions simultaneously) and the graphs in Figure 3.68 illustrate the domains of f and g stated, and show why the domain of h must be their intersection. Figure 3.69 shows the graph of Y_3 (in **bold**) on the same screen and indicates the domain of h is $[-1, 3]$.

WORTHY OF NOTE

In Section 1.1 we observed that the graph of $y = \sqrt{a^2 - x^2}$ was a semicircle with radius $r = a$ and center (0, 0). It's interesting to note that by completing the square on the radicand of function h in Example 6, we can write it as $y = \sqrt{4 - (x - 1)^2}$, which is a semicircle of radius $r = 2$, with the center shifted 1 unit right to (1, 0) as shown.

Now try Exercises 57 through 68 ▶

D. Applications of the Algebra of Functions

The algebra of functions plays an important role in the business world. For example, the cost to manufacture an item, the revenue a company brings in, and the profit a company earns are all functions of the number of items made and sold. Further, we know a company "breaks even" (making $0 profit) when the difference between their revenue R and their cost C, is zero.

EXAMPLE 7 ▶ **Applying Operations on Functions in Context**

The fixed costs to publish *Relativity Made Simple* (by N.O. Way) is $2500, and the variable cost is $4.50 per book. Marketing studies indicate the best selling price for the book is $9.50 per copy.

a. Find the cost, revenue, and profit functions for this book.

b. Determine how many copies must be sold for the company to break even.

Solution ▶ **a.** Let x represent the number of books published and sold. The cost of publishing is $4.50 per copy, plus fixed costs (labor, storage, etc.) of $2500. The cost function is $C(x) = 4.50x + 2500$. If the company charges $9.50 per book, the revenue function will be $R(x) = 9.50x$. Since profit equals revenue minus costs,

$$\begin{aligned} P(x) &= R(x) - C(x) \\ &= 9.50x - (4.50x + 2500) && \text{substitute } 9.50x \text{ for } R \text{ and } 4.50x + 2500 \text{ for } C \\ &= 9.50x - 4.50x - 2500 && \text{distribute} \\ &= 5x - 2500 && \text{result} \end{aligned}$$

The profit function is $P(x) = 5x - 2500$.

b. When a company "breaks even," the profit is zero: $P(x) = 0$.

$$\begin{aligned} P(x) &= 5x - 2500 && \text{profit function} \\ 0 &= 5x - 2500 && \text{substitute 0 for } P(x) \\ 2500 &= 5x && \text{add 2500} \\ 500 &= x && \text{divide by 5} \end{aligned}$$

In order for the company to break even, 500 copies must be sold.

D. You've just seen how we can apply the algebra of functions in context

Now try Exercises 71 through 74 ▶

There are a number of additional applications in the Exercise Set. See **Exercises 75 through 80.**

3.5 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section, if necessary.

1. Given function f with domain A and function g with domain B, the sum $f(x) + g(x)$ can also be written _____. The domain of the result is _____.
2. For the product $h(x) = f(x) \cdot g(x)$, $h(5)$ can be found by evaluating f and g then multiplying the result, or multiplying $f \cdot g$ and evaluating the result. Notationally these are written _____ and _____.
3. When combining functions f and g using basic operations, the domain of the result is the _____ of the domains of f and g. For division, we further stipulate that _____ cannot equal zero.
4. If $h(2) = 5$, $g(2) = 7$, and $f(2) = 9$, then $(f + g - h)(2) =$ ___ and $(f - g - h)(2) =$ ___.
5. For $f(x) = 2x^3 - 50x$ and $g(x) = x - 5$, discuss/explain why the domain of $h(x) = \left(\frac{f}{g}\right)(x)$ must exclude $x = 5$, even though the resulting quotient is the polynomial $2x^2 + 10x$.
6. Discuss/Explain the domain of $h(x) = (f \cdot g)(x)$, given $f(x) = \sqrt{x - 3}$ and $g(x) = \sqrt{2 - x}$.

▶ DEVELOPING YOUR SKILLS

7. Given $f(x) = 2x^2 - x - 3$ and $g(x) = x^2 + 5x$, (a) determine the domain for $h(x) = f(x) - g(x)$ and (b) find $h(-2)$ using the definition.
8. Given $f(x) = 2x^2 - 18$ and $g(x) = -3x - 7$, (a) determine the domain for $h(x) = f(x) + g(x)$ and (b) find $h(5)$ using the definition.
9. For the functions f, g, and h, as defined in Exercise 7, (a) find a new function rule for h, and (b) use the result to find $h(-2)$. (c) How does the result compare to that of Exercise 7?
10. For the functions f, g, and h as defined in Exercise 8, (a) find a new function rule for h, and (b) use the result to find $h(5)$. (c) How does the result compare to that in Exercise 8?
11. For $f(x) = \sqrt{x - 3}$ and $g(x) = 2x^3 - 54$, (a) determine the domain of $h(x) = (f + g)(x)$, (b) find a new function rule for h, and (c) evaluate $h(4)$ and $h(2)$, if possible.
12. For $f(x) = 4x^2 - 2x + 3$ and $g(x) = \sqrt{2x - 5}$, (a) determine the domain of $h(x) = (f - g)(x)$, (b) find a new function rule for h, and (c) evaluate $h(7)$ and $h(2)$, if possible.

13. For $p(x) = \sqrt{x+5}$ and $q(x) = \sqrt{3-x}$,
(a) determine the domain of $r(x) = (p+q)(x)$,
(b) find a new function rule for r, and
(c) evaluate $r(2)$ and $r(4)$, if possible.

14. For $p(x) = \sqrt{6-x}$ and $q(x) = \sqrt{x+2}$,
(a) determine the domain of $r(x) = (p-q)(x)$,
(b) find a new function rule for r, and
(c) evaluate $r(-3)$ and $r(2)$, if possible.

15. For $f(x) = \sqrt{x+4}$ and $g(x) = 2x+3$,
(a) determine the domain of $h(x) = (f \cdot g)(x)$,
(b) find a new function rule for h, and
(c) evaluate $h(-4)$ and $h(21)$, if possible.

16. For $f(x) = -3x+5$ and $g(x) = \sqrt{x-7}$,
(a) determine the domain of $h(x) = (f \cdot g)(x)$,
(b) find a new function rule for h, and
(c) evaluate $h(8)$ and $h(11)$, if possible.

17. For $p(x) = \sqrt{x+1}$ and $q(x) = \sqrt{7-x}$,
(a) determine the domain of $r(x) = (p \cdot q)(x)$,
(b) find a new function rule for r, and
(c) evaluate $r(15)$ and $r(3)$, if possible.

18. For $p(x) = \sqrt{4-x}$ and $q(x) = \sqrt{x+4}$,
(a) determine the domain of $r(x) = (p \cdot q)(x)$,
(b) find a new function rule for r, and
(c) evaluate $r(-5)$ and $r(-3)$, if possible.

For the functions f and g given, (a) determine the domain of $h(x) = \left(\frac{f}{g}\right)(x)$ and (b) find a new function rule for h in simplified form (if possible), noting the domain restrictions alongside.

19. $f(x) = x^2 - 16$ and $g(x) = x+4$

20. $f(x) = x^2 - 49$ and $g(x) = x-7$

21. $f(x) = x^3 + 4x^2 - 2x - 8$ and $g(x) = x+4$

22. $f(x) = x^3 - 5x^2 + 2x - 10$ and $g(x) = x-5$

23. $f(x) = x^3 - 7x^2 + 6x$ and $g(x) = x-1$

24. $f(x) = x^3 - 1$ and $g(x) = x-1$

25. $f(x) = x+1$ and $g(x) = x-5$

26. $f(x) = x+3$ and $g(x) = x-7$

For the functions p and q given, (a) determine the domain of $r(x) = \left(\frac{p}{q}\right)(x)$, (b) find a new function rule for r, and (c) use it to evaluate $r(6)$ and $r(-6)$, if possible.

27. $p(x) = 2x-3$ and $q(x) = \sqrt{-2-x}$

28. $p(x) = 1-x$ and $q(x) = \sqrt{3-x}$

29. $p(x) = x-5$ and $q(x) = \sqrt{x-5}$

30. $p(x) = x+2$ and $q(x) = \sqrt{x+3}$

31. $p(x) = x^2 - 36$ and $q(x) = \sqrt{2x+13}$

32. $p(x) = x^2 - 6x$ and $q(x) = \sqrt{7+3x}$

For the functions f and g given, (a) find a new function rule for $h(x) = \left(\frac{f}{g}\right)(x)$ in simplified form. (b) If $h(x)$ were the original function, what would be its domain? (c) Since we know $h(x) = \left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$, what additional restrictions exist for the domain of h?

33. $f(x) = \dfrac{6x}{x-3}$ and $g(x) = \dfrac{3x}{x+2}$

34. $f(x) = \dfrac{4x}{x+1}$ and $g(x) = \dfrac{2x}{x-2}$

For each pair of functions f and g given, determine the sum, difference, product, and quotient of f and g, and determine the domain in each case.

35. $f(x) = 2x+3$ and $g(x) = x-2$

36. $f(x) = x-5$ and $g(x) = 2x-3$

37. $f(x) = x^2 + 7$ and $g(x) = 3x-2$

38. $f(x) = x^2 - 3x$ and $g(x) = x+4$

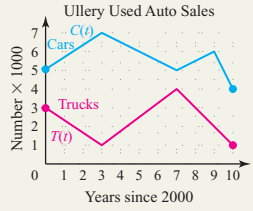
39. $f(x) = x^2 + 2x - 3$ and $g(x) = x-1$

40. $f(x) = x^2 - 2x - 15$ and $g(x) = x+3$

41. $f(x) = 3x+1$ and $g(x) = \sqrt{x-3}$

42. $f(x) = x+2$ and $g(x) = \sqrt{x+6}$

43. $f(x) = 2x^2$ and $g(x) = \sqrt{x+1}$



44. $f(x) = x^2 + 2$ and $g(x) = \sqrt{x-5}$

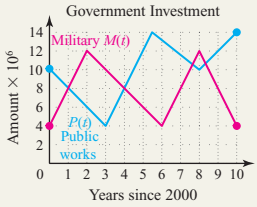
45. $f(x) = \dfrac{2}{x-3}$ and $g(x) = \dfrac{5}{x+2}$

46. $f(x) = \dfrac{4}{x-3}$ and $g(x) = \dfrac{1}{x+5}$

47. Reading a graph—Used vehicle sales: The graph given shows the number of cars $C(t)$ and trucks $T(t)$ sold by Ullery Used Autos for the years 2000 to 2010. Use the graph to estimate the number of

Exercise 47

a. cars sold in 2005: $C(5)$

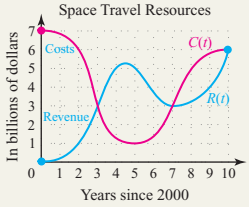


b. trucks sold in 2008: $T(8)$

c. vehicles sold in 2009: $C(9) + T(9)$

d. In function notation, how would you determine how many more cars than trucks were sold in 2009? What was the actual number?

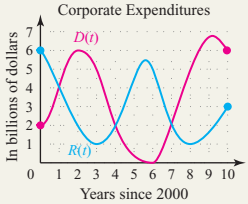
48. Reading a graph—Government investment: The graph given shows a government's investment in its military $M(t)$ over time, versus its investment in public works $P(t)$, in millions of dollars. Use the graph to estimate the amount of investment in



Exercise 48

- **a.** the military in 2002: $M(2)$
- **b.** public works in 2005: $P(5)$
- **c.** public works and the military in 2009: $M(9) + P(9)$
- **d.** In function notation, how would you determine how much more will be invested in public works than the military in 2010? What is the actual number?

49. Reading a graph—Space travel: The graph given shows the revenue $R(t)$ and operating costs $C(t)$ of Space Travel Resources (STR), for the years 2000 to 2010. Use the graph to find the

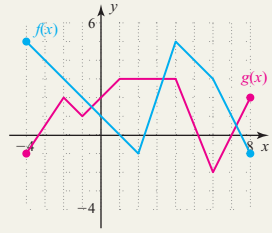


Exercise 49

- **a.** revenue in 2002: $R(2)$
- **b.** costs in 2008: $C(8)$
- **c.** years STR broke even: $R(t) = C(t)$
- **d.** years costs exceeded revenue: $C(t) > R(t)$
- **e.** years STR made a profit: $R(t) > C(t)$
- **f.** For the year 2005, use function notation to write the profit equation for STR. What was their profit?

50. Reading a graph—Corporate expenditures: The graph given shows a large corporation's investment in research and development $R(t)$ over time, and the amount paid to investors as dividends $D(t)$, in billions of dollars. Use the graph to find the

Exercise 50

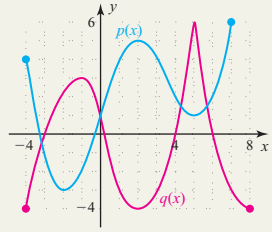


- **a.** dividend payments in 2002: $D(2)$
- **b.** investment in 2006: $R(6)$
- **c.** years where $R(t) = D(t)$
- **d.** years where $R(t) > D(t)$
- **e.** years where $R(t) < D(t)$
- **f.** Use function notation to write an equation for the total expenditures of the corporation in year t. What was the total for 2010?

51. Reading a graph—Operations on functions: Use the given graph to find the result of the operations indicated.

Note $f(-4) = 5$, $g(-4) = -1$, and so on.

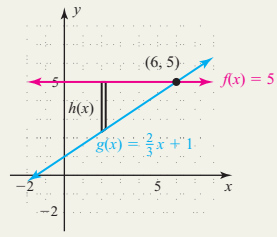
Exercise 51



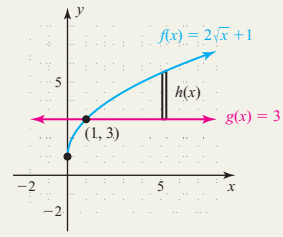
- **a.** $(f + g)(-4)$
- **b.** $(f \cdot g)(1)$
- **c.** $(f - g)(4)$
- **d.** $(f + g)(0)$
- **e.** $\left(\frac{f}{g}\right)(2)$
- **f.** $(f \cdot g)(-2)$
- **g.** $(g \cdot f)(2)$
- **h.** $(f - g)(-1)$
- **i.** $(f + g)(8)$
- **j.** $\left(\frac{f}{g}\right)(7)$

52. Reading a graph—Operations on functions: Use the given graph to find the result of the operations indicated.

Note $p(-1) = -2$, $q(5) = 6$, and so on.

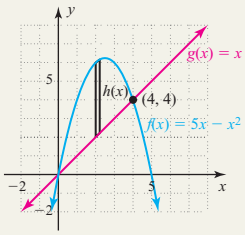


Exercise 52

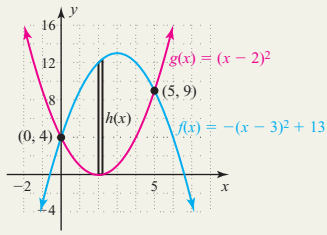


- **a.** $(p + q)(-4)$
- **b.** $(p \cdot q)(1)$
- **c.** $(p - q)(4)$
- **d.** $(p + q)(0)$
- **e.** $\left(\frac{p}{q}\right)(5)$
- **f.** $(p \cdot q)(-2)$
- **g.** $(q \cdot p)(2)$
- **h.** $(p - q)(-1)$
- **i.** $(p + q)(7)$
- **j.** $\left(\frac{p}{q}\right)(6)$

Some advanced applications require that we use the algebra of functions to find a function rule for the vertical distance between two graphs. For $f(x) = 3$ and $g(x) = -2$ (two horizontal lines), we "see" this vertical distance is 5 units, or in function form: $d(x) = f(x) - g(x) = 3 - (-2) = 5$ units. However, $d(x) = f(x) - g(x)$ also serves as a *general formula* for the vertical distance between two curves (even those that are not horizontal lines), so long as $f(x) > g(x)$ in a chosen interval. Find a function rule in simplified form, for the vertical distance $h(x)$ between the graphs of f and g shown, for the interval indicated.



53. $x \in [0, 6]$



54. $x \in [1, 7]$

55. $x \in [0, 4]$

56. $x \in [0, 5]$

Use the TABLE feature of a graphing calculator to determine the domain of each newly constructed function. Write answers in interval notation. All finite endpoints of the domain intervals are integer values between −5 and 5.

57. For $Y_1 = 6 - 3x$ and $Y_2 = x - 2$,
- **a.** $Y_1 + Y_2$
- **b.** $\dfrac{Y_1}{Y_2}$

58. For $Y_1 = 3x - 9$ and $Y_2 = x + 3$,
- **a.** $Y_1 - Y_2$
- **b.** $\dfrac{Y_1}{Y_2}$

59. For $Y_1 = x^2 - 1$ and $Y_2 = \sqrt{x + 1}$,
- **a.** $Y_1 - Y_2$
- **b.** $\dfrac{Y_1}{Y_2}$

60. For $Y_1 = 9 - x^2$ and $Y_2 = \sqrt{x - 3}$,
- **a.** $Y_1 + Y_2$
- **b.** $\dfrac{Y_1}{Y_2}$

61. For $Y_1 = \sqrt{x + 2}$ and $Y_2 = \sqrt{9 - 3x}$,
- **a.** Y_1Y_2
- **b.** $\dfrac{Y_1}{Y_2}$

62. For $Y_1 = \sqrt{2x + 8}$ and $Y_2 = \sqrt{3 - x}$,
- **a.** Y_1Y_2
- **b.** $\dfrac{Y_1}{Y_2}$

Use the GRAPH feature of a graphing calculator to determine the domain of each newly constructed function. Write answers in interval notation. All finite endpoints of the domain intervals are integer values between −5 and 5.

63. For $Y_1 = 3$ and $Y_2 = \sqrt{x + 4}$,
- **a.** $Y_1 - Y_2$
- **b.** Y_1Y_2

64. For $Y_1 = x^2 - 9$ and $Y_2 = \sqrt{4 - x}$,
- **a.** $Y_1 + Y_2$
- **b.** Y_1Y_2

65. For $Y_1 = \sqrt[3]{x - 1}$ and $Y_2 = x - 4$,
- **a.** $Y_1 + Y_2$
- **b.** $\dfrac{Y_1}{Y_2}$

66. For $Y_1 = 4$ and $Y_2 = \sqrt[3]{x + 1}$,
- **a.** $Y_1 - Y_2$
- **b.** $\dfrac{Y_1}{Y_2}$

67. For $Y_1 = \sqrt{x + 4}$ and $Y_2 = \sqrt{6 - 2x}$,
- **a.** $Y_1 - Y_2$
- **b.** $\dfrac{Y_1}{Y_2}$

68. For $Y_1 = \sqrt{5x + 10} - 2$ and $Y_2 = -\sqrt{10 - 2x} + 2$,
- **a.** $Y_1 + Y_2$
- **b.** Y_1Y_2

▶ WORKING WITH FORMULAS

69. Velocity of a falling object: $V = \dfrac{w}{k} - \dfrac{w}{k}e^{\frac{-32kt}{w}}$

When air resistance is considered, the velocity (in ft/sec) of a object weighing w lb falling for t sec can be approximated using the formula shown where k is the drag coefficient determined by the aerodynamics of the object, the density of the air, and other factors. (a) Find the velocity formula for a 16-lb bowling ball with a drag coefficient of $k = 0.04$. (b) Find two functions $f(t)$ and $g(t)$ such that $V(t) = (f - g)(t)$, and evaluate $V(1)$,$V(2)$, and $V(20)$. (c) Considering the calculations from part (b), what will be the limiting or terminal velocity of the bowling ball?

70. Surface area of a cylinder: $A = 2\pi rh + 2\pi r^2$

If the height of a cylinder is fixed at 20 cm, the formula becomes $A = 40\pi r + 2\pi r^2$. Write this formula in factored form and find two functions $f(r)$ and $g(r)$ such that $A(r) = (f \cdot g)(r)$. Then find $A(5)$ by direct calculation and also by computing the product of $f(5)$ and $g(5)$, then comment on the results.

▶ APPLICATIONS

71. Boat manufacturing: Giaro Boats manufactures a popular recreational vessel, the *Revolution*. To plan for expanded production and increased labor costs, the company carefully tracks current costs and income. The fixed cost to produce this boat is \$108,000 and the variable costs are \$28,000 per boat. If the *Revolution* sells for \$40,000, (a) find the profit function and (b) determine how many boats must be sold for the company to break even.

72. Nonprofit publications: Adobe Hope, a nonprofit agency, publishes the weekly newsletter *Community Options*. In doing so, they provide useful information to the surrounding area while giving high school dropouts valuable work experience. The fixed cost for publishing the newsletter is \$900 per week, with a variable cost of \$0.25 per newsletter. If the newsletter is sold for \$1.50 per copy, (a) find the profit function for the newsletter, (b) determine how many newsletters must be sold to break even, and (c) determine how much money will be returned to the community if 1000 newsletters are sold (to preserve their status as a nonprofit organization).

73. Cost, revenue, and profit: Suppose the total cost of manufacturing a certain computer component can be modeled by the function $C(n) = 0.1n^2$, where n is the number of components made and $C(n)$ is in dollars. If each component is sold at a price of \$11.45, the revenue is modeled by $R(n) = 11.45n$. Use this information to complete the following.

- **a.** Find the function that represents the total profit made from sales of the components.
- **b.** How much profit is earned if 12 components are made and sold?
- **c.** How much profit is earned if 60 components are made and sold?
- **d.** Explain why the company is making a "negative profit" after the 114th component is made and sold.

74. Cost, revenue, and profit: For a certain manufacturer, revenue has been increasing but so has the cost of materials and the cost of employee benefits. Suppose revenue can be modeled by $R(t) = 10\sqrt{t}$, the cost of materials by $M(t) = 2t + 1$, and the cost of benefits by $B(t) = 0.1t^2 + 2$, where t represents the number of months since operations began and outputs are in thousands of dollars. Use this information to complete the following.

- **a.** Find the function that represents the total manufacturing costs.
- **b.** Find the function that represents how much more the cost of benefits are than the cost of materials.
- **c.** What was the cost of benefits in the 10th month after operations began?
- **d.** How much less were the benefits costs than the cost of materials in the 10th month?
- **e.** Find the function that represents the profit earned by this company.
- **f.** Find the amount of profit earned in the 5th month and 10th month. Discuss each result.

Minimizing travel distance is one of the main responsibilities of a logistics manager. From delivering pizzas on a Friday night, to building distribution centers for goods and commodities, a shorter *total* travel distance translates directly into reduced costs. On a straight highway, the distance from a distribution center at milepost x to a distribution point at milepost m_1 is $d = |x - m_1|$. Using the addition of functions, the *total* distance from a distribution center to its n distribution points is $D(x) = |x - m_1| + |x - m_2| + \cdots + |x - m_n|$.

75. Minimizing CNG distribution distance: Ruta 2 in Argentina is a well-traveled corridor for residents of Buenos Aires vacationing in Mar del Plata. Many of the cars in Argentina operate on compressed natural gas (CNG). Suppose there were CNG filling stations at kilometer-posts 30, 49, 115, 199, and 280. Using a graphing calculator, at what kilometer-post should the CNG storage tanks supplying these stations be built in order to minimize total delivery distance?

76. Minimizing H_2O distribution distance: The Trans-Australian Railway links Australia's eastern states and those of Western Australia. Most of the rail line lies in the central desert (with summer temperatures of 50°C/122°F), which is home to the world's longest stretch of dead-straight track, over 478 km/297 mi. Assume rest stops are scheduled to be built at mile-posts 25, 56, 89, 145, and 229 miles from the east. At what mile-post should the water storage tanks supplying these rest stops be built in order to minimize the total delivery distance?

77. Minimizing CNG distribution distance: In addition to the five already mentioned in Exercise 75, another CNG station is being constructed at kilometer-post 233 on Ruta 2. With this station included, where should the CNG storage tanks be built? How does this result compare with that of Exercise 75?

78. Minimizing H_2O distribution distance: In addition to the five already mentioned in Exercise 76, another rest stop is scheduled to be built at mile-post 192 on the Trans-Australian Railway. With this rest stop included, where should the water storage tanks be built? How does this result compare with that of Exercise 76?

79. Measuring the depth of a well: To estimate the depth of a well, a large stone is dropped into the opening and a stop-watch is used to measure the number of seconds until a splash is heard. By solving the freefall equation $d = 16t^2$ for t, we find the function $t_1(d) = \dfrac{\sqrt{d}}{4}$ models the time it takes for the stone to hit the water. Since the speed of sound is known to be 1116 ft/sec, we use the distance = rate × time equation to obtain $t_2(d) = \dfrac{d}{1116}$ as a function modeling the time it takes the sound of the splash to reach our ears. The total time is the sum of these two functions, let's call it $T(d) = \dfrac{\sqrt{d}}{4} + \dfrac{d}{1116}$. (a) If the well is 230 ft deep, what is the total time? (b) If it takes 6 sec for the sound to be heard, how deep is the well?

80. Predator-prey concentrations: Suppose the monthly whitetip reef shark population off the coast of Manuel Antonio National Park (Costa Rica) can be modeled by the function $s(t) = -40t^2 + 500t + 1300$ (where $t = 1$ corresponds to January). One of its favorite foods is the spiny lobster, whose monthly population in these waters might be modeled by the function $l(t) = 110t^2 - 1500t + 13{,}400$. The number of lobsters per shark in any given month can then be modeled by the quotient $N(t) = \dfrac{110t^2 - 1500t + 13{,}400}{-40t^2 + 500t + 1300}$. (a) How many lobsters per shark are there in February? (b) When is the number of lobsters per shark a minimum? What is this minimum?

▶ EXTENDING THE CONCEPT

81. For a certain country, assume the function $C(x) = 0.0345x^4 - 0.8996x^3 + 7.5383x^2 - 21.7215x + 40$ approximates the number of Conservatives in the senate for the years 1995 to 2007, where $x = 0$ corresponds to 1995. The function $L(x) = -0.0345x^4 + 0.8996x^3 - 7.5383x^2 + 21.7215x + 10$ gives the number of Liberals for these years. Use this information to answer the following. (a) During what years did the Conservatives control the senate? (b) What was the greatest difference between the number of seats held by each faction in any one year? In what year did this occur? (c) What was the minimum number of seats held by the Conservatives? In what year? (d) Assuming no independent or third-party candidates are elected, what information does the function $T(x) = C(x) + L(x)$ give us? What information does $t(x) = |C(x) - L(x)|$ give us?

82. Given $f(x) = \sqrt{1 - x}$ and $g(x) = \sqrt{x - 2}$, what can you say about the domain of $(f + g)(x)$? Enter the functions as Y_1 and Y_2 on a graphing calculator, then enter $Y_3 = Y_1 + Y_2$. See if you can determine why the calculator gives an error message for Y_3, regardless of the input.

83. Use a graphing calculator to find the zeroes of each new function in Exercises 67 and 68, and describe their significance.

84. Instead of calculating the result of an operation on two functions at a *specific point* as in Exercises 47–52, we can actually *graph the function* that results from the operation. This skill, called the **addition of ordinates,** is widely applied in a study of tides and other areas. For $f(x) = (x - 3)^2 + 2$ and $g(x) = 4|x - 3| - 5$, complete a table of values like the one shown for $x \in [-2, 8]$. For the last column, remember that $(f - g)(x) = f(x) - g(x)$, and use this relation to complete the column. Finally, use the ordered pairs $(x, (f - g)(x))$ to graph the new function. Is the new function smooth? Is the new function continuous?

▶ MAINTAINING YOUR SKILLS

85. **(Appendix A.3)** Solve the equation.

$\frac{2}{7}(x - 3) - \frac{5}{3} = \frac{1}{2}x + 1$

86. **(2.2)** Given $f(x) = 3x^2 - 2x$, find $f(x - 1)$ and describe the resulting transformation.

87. **(1.1/1.2)** Given the points $(2, -5)$ and $(-3, 1)$, find (a) the standard form of the equation of the line containing these points and (b) the distance between these points.

88. **(3.4)** Find the average rate of change of the function $g(x) = x^3 - 9x + 1$ over the indicated intervals.

a. $[1, 2]$

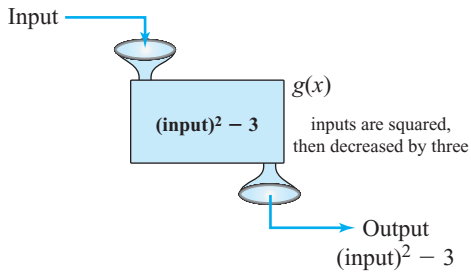
b. $[1, 3]$

c. $[1, 4]$

3.6 The Composition of Functions and the Difference Quotient

LEARNING OBJECTIVES

In Section 3.6 you will see how we can:



- ❑ **A.** Compose two functions and determine the domain; decompose a function
- ❑ **B.** Interpret the composition of functions numerically and graphically
- ❑ **C.** Apply the difference quotient to find the average rate of change for nonlinear functions
- ❑ **D.** Apply the composition of functions and the difference quotient in context

The composition of functions gives us an efficient way to study how relationships are "linked." For example, the number of wolves w in a countywide area depends on the human population x, and a simple model might be $w(x) = 600 - 0.02x$. But the number of rodents r depends on the number of wolves, say $r(w) = 10{,}000 - 9.5w$, so the human population also has a measurable effect on the rodent population. In this section, we'll show that this effect is modeled by the function $r(x) = 4300 + 0.19x$.

A. The Composition of Functions

The composition of functions is best understood by studying the "input/output" nature of a function. Consider $g(x) = x^2 - 3$. For $g(x)$ we might say, "inputs are squared, then decreased by three." In diagram form we have:

In many respects, a function box can be regarded as a very simple machine, running a simple program. It doesn't matter what the input is, this machine is going to *square the input then subtract three*.

EXAMPLE 1 ▶ **Evaluating a Function**

For $g(x) = x^2 - 3$, find

a. $g(-5)$

b. $g(5t)$

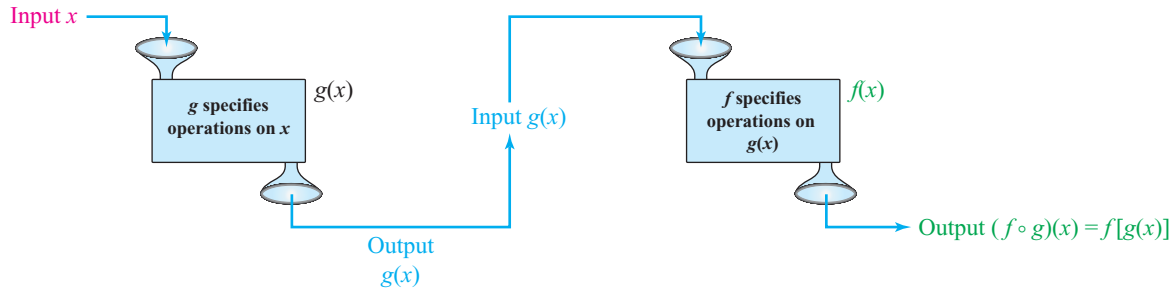
c. $g(t - 4)$

Solution ▶

a.
$$g(x) = x^2 - 3 \quad \text{original function}$$
input -5 → $g(-5) = (-5)^2 - 3$ square input, then subtract 3
$$= 25 - 3 \quad \text{simplify}$$
$$= 22 \quad \text{result}$$

b.
$$g(x) = x^2 - 3 \quad \text{original function}$$
input $5t$ → $g(5t) = (5t)^2 - 3$ square input, then subtract 3
$$= 25t^2 - 3 \quad \text{result}$$

c.
$$g(x) = x^2 - 3 \quad \text{original function}$$
input $t - 4$ → $g(t - 4) = (t - 4)^2 - 3$ square input, then subtract 3
$$= t^2 - 8t + 16 - 3 \quad \text{expand binomial}$$
$$= t^2 - 8t + 13 \quad \text{result}$$



Now try Exercises 7 and 8 ▶

WORTHY OF NOTE

It's important to note that t and $t - 4$ are two different, distinct values—the number represented by t, and a number four less than t. Examples would be 7 and 3, 12 and 8, as well as -10 and -14. There should be nothing awkward or unusual about evaluating $g(t)$ versus evaluating $g(t - 4)$ as in Example 1(c).

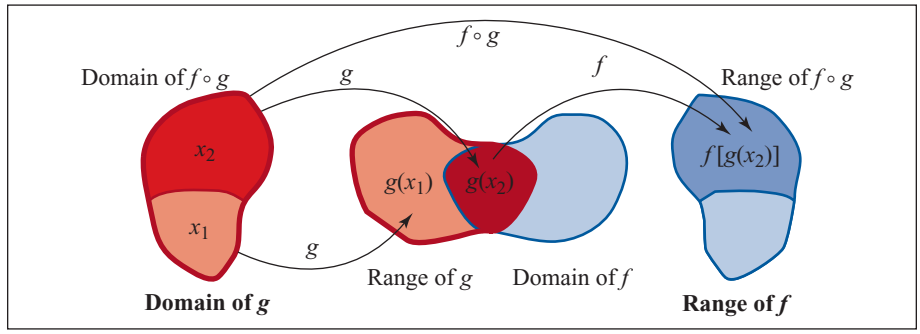
When the input value is itself a function (rather than a single number or variable), this process is called the **composition of functions.** The evaluation method is exactly the same, we are simply using a function input. Using a general function $g(x)$ and a function diagram as before, we illustrate the process in Figure 3.70.

Figure 3.70

The notation used for the composition of f with g is an open dot " $\circ$ " placed between them, and is read, "f composed with g." The notation $(f \circ g)(x)$ indicates that $g(x)$ is an input for f: $(f \circ g)(x) = f[g(x)]$. If the order is reversed, as in $(g \circ f)(x)$, $f(x)$ becomes the input for g: $(g \circ f)(x) = g[f(x)]$. Figure 3.70 also helps us determine the domain of a composite function, in that the first function g can operate only if x is a valid input for g, and the second function f can operate only if $g(x)$ is a valid input for f. In other words, $(f \circ g)(x)$ is defined for *all x in the domain of g, such that $g(x)$ is in the domain of f.*

CAUTION ▶ Try not to confuse the new "open dot" notation for the *composition* of functions, with the multiplication dot used to indicate the *product* of two functions: $(f \cdot g)(x) = (fg)(x)$ while $(f \circ g)(x) = f[g(x)]$.

The Composition of Functions



Given two functions f and g, the composition of f with g is defined by

$$(f \circ g)(x) = f[g(x)]$$

The domain of the composition is all x in the domain of g for which $g(x)$ is in the domain of f.

In Figure 3.71, these ideas are displayed using mapping notation, as we consider the simple case where $g(x) = x$ and $f(x) = \sqrt{x}$.

Figure 3.71

The domain of g (all real numbers) is shown within the red border, with g taking the negative inputs represented by x_1 (light red), to a like-colored portion of the range—the negative outputs $g(x_1)$. The nonnegative inputs represented by x_2 (dark red) are also mapped to a like-colored portion of the range—the nonnegative outputs $g(x_2)$. While the range of g is also all real numbers, function f can only use the nonnegative inputs represented by $g(x_2)$. This restricts the domain of $(f \circ g)(x)$ to only the inputs from g, where $g(x)$ is in the domain of f.

EXAMPLE 2 ▶ **Finding a Composition of Functions**

Given $f(x) = \sqrt{x - 4}$ and $g(x) = 3x + 2$, find

a. $(f \circ g)(x)$

b. $(g \circ f)(x)$

Also determine the domain for each.

Solution ▶

a. $f(x) = \sqrt{x - 4}$ says "decrease inputs by 4, and take the square root of the result."

$$\begin{aligned}(f \circ g)(x) &= f[g(x)] && g(x) \text{ is an input for } f\\ &= \sqrt{g(x) - 4} && \text{decrease input by 4, and take the square root of the result}\\ &= \sqrt{(3x + 2) - 4} && \text{substitute } 3x + 2 \text{ for } g(x)\\ &= \sqrt{3x - 2} && \text{result}\end{aligned}$$

While g is defined for all real numbers, $f(x)$ represents a real number only when $x \geq 4$. For $f[g(x)]$, this means we need $g(x) \geq 4$, giving $3x + 2 \geq 4$, $x \geq \frac{2}{3}$. In interval notation, the domain of $(f \circ g)(x)$ is $x \in [\frac{2}{3}, \infty)$.

b. The function g says "inputs are multiplied by 3, then increased by 2."

$$\begin{aligned}(g \circ f)(x) &= g[f(x)] && f(x) \text{ is an input for } g\\ &= 3f(x) + 2 && \text{multiply input by 3, then increase by 2}\\ &= 3\sqrt{x - 4} + 2 && \text{substitute } \sqrt{x - 4} \text{ for } f(x)\end{aligned}$$

For $g[f(x)]$, g can accept any real number input, but f can supply only those where $x \geq 4$. The domain of $(g \circ f)(x)$ is $x \in [4, \infty)$.

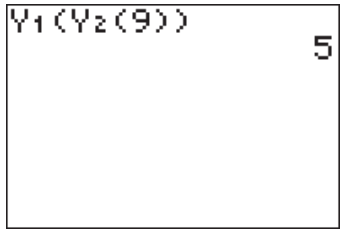
WORTHY OF NOTE

Example 2 shows that $(f \circ g)(x)$ is generally not equal to $(g \circ f)(x)$. On those occasions when they *are* equal, the functions have a unique relationship that we'll study in Section 5.1.

Now try Exercises 9 through 18 ▶

Most graphing calculators have the ability to evaluate a composition of functions at a given point. From Example 2, enter $f(x)$ as $Y_1 = \sqrt{x - 4}$ and $g(x)$ as $Y_2 = 3x + 2$. To evaluate the composition $(f \circ g)(9)$ (since we know $x = 9$ is in the domain), we can (1) return to the home screen, enter $Y_1(Y_2(9))$ and press ENTER (Figure 3.72), or (2) enter $Y_3 = Y_1(Y_2(X))$ on the Y= screen and use the **TABLE** feature (Figure 3.73). **See Exercises 19 through 24.**

Figure 3.72



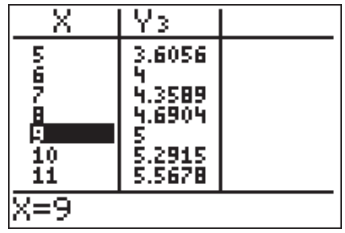


Figure 3.73

EXAMPLE 3 ▶ Finding a Composition of Functions

For $f(x) = \dfrac{3x}{x - 1}$ and $g(x) = \dfrac{2}{x}$, analyze the domain of

a. $(f \circ g)(x)$ **b.** $(g \circ f)(x)$ **c.** Find the actual compositions and comment.

Solution ▶

a. $(f \circ g)(x)$: For g to be defined, $x \neq 0$ is our first restriction. Once $g(x)$ is used as the input, we have $f[g(x)] = \dfrac{3g(x)}{g(x) - 1}$, and additionally note that $g(x)$ cannot equal 1. This means $\dfrac{2}{x} \neq 1$, so $x \neq 2$. The domain of $f \circ g$ is all real numbers except $x = 0$ and $x = 2$.

b. $(g \circ f)(x)$: For f to be defined, $x \neq 1$ is our first restriction. Once $f(x)$ is used as the input, we have $g[f(x)] = \dfrac{2}{f(x)}$, and additionally note that $f(x)$ cannot be 0. This means $\dfrac{3x}{x - 1} \neq 0$, so $x \neq 0$. The domain of $(g \circ f)(x)$ is all real numbers except $x = 0$ and $x = 1$.

c. For $(f \circ g)(x)$:

$$f[g(x)] = \frac{3g(x)}{g(x) - 1} \qquad \text{composition of } f \text{ with } g$$

$$= \frac{\left(\frac{3}{1}\right)\left(\frac{2}{x}\right)}{\left(\frac{2}{x}\right) - 1} \qquad \text{substitute } \frac{2}{x} \text{ for } g(x)$$

$$= \frac{\frac{6}{x}}{\frac{2 - x}{x}} = \frac{6}{x} \cdot \frac{x}{2 - x} \qquad \text{simplify denominator; invert and multiply}$$

$$= \frac{6}{2 - x} \qquad \text{result}$$

Notice the function rule for $(f \circ g)(x)$ has an implied domain of $x \neq 2$, but does not show that g (the inner function) is undefined when $x = 0$ (see part a). The domain of $(f \circ g)(x)$ is actually all real numbers except $x = 0$ and $x = 2$.

For $(g \circ f)(x)$ we have:

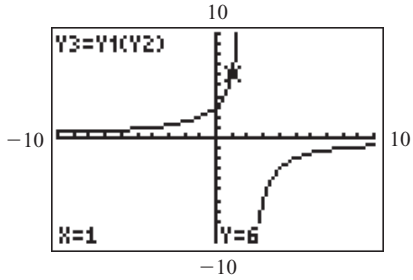
$$\begin{aligned} g[f(x)] &= \frac{2}{f(x)} && \text{composition of } g \text{ with } f \\ &= \frac{2}{\frac{3x}{x-1}} && \text{substitute } \frac{3x}{x-1} \text{ for } f(x) \\ &= \frac{2}{1} \cdot \frac{x-1}{3x} && \text{invert and multiply} \\ &= \frac{2(x-1)}{3x} && \text{result} \end{aligned}$$

Similarly, the function rule for $(g \circ f)(x)$ has an implied domain of $x \neq 0$, but does not show that f (the inner function) is undefined when $x = 1$ (see part b). The domain of $(g \circ f)(x)$ is actually all real numbers except $x = 0$ and $x = 1$.

Now try Exercises 25 through 30 ▶

As Example 3 illustrates, the domain of $h(x) = (f \circ g)(x)$ *cannot simply be taken from the new function rule for* h. It *must* be determined from the functions composed to obtain h. The graph of $(f \circ g)(x)$ is shown in Figure 3.74. We can easily see $x = 2$ is not in the domain as there a vertical asymptote at $x = 2$. The fact that $x = 0$ is also excluded is obscured by the y-axis, but the table shown in Figure 3.75 confirms that $x = 0$ is likewise not in the domain.

Figure 3.74



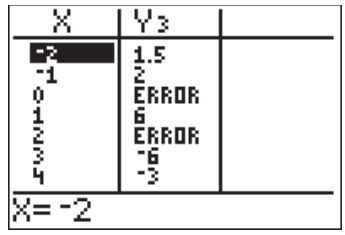


Figure 3.75

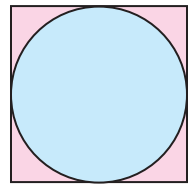


To further explore concepts related to the domain of a composition, **see Exercises 69 and 70.**

Decomposing a Composite Function

Based on Figure 3.76, would you say that the circle is inside the square or the square is inside the circle? The decomposition of a composite function is related to a similar question, as we ask ourselves what function (of the composition) is on the "inside"—the input quantity—and what function is on the "outside." For instance, consider $h(x) = \sqrt{x-4}$, where we see that $x - 4$ is "inside" the radical. Letting $g(x) = x - 4$ and $f(x) = \sqrt{x}$, we have $h(x) = (f \circ g)(x)$ or $f[g(x)]$.

Figure 3.76

WORTHY OF NOTE

The decomposition of a function is not unique and can often be done in many different ways.

EXAMPLE 4 ▶ **Decomposing a Composite Function**

Given $h(x) = (\sqrt[3]{x} + 1)^2 - 3$, identify two functions f and g so that $(f \circ g)(x) = h(x)$, then check by composing the functions to obtain $h(x)$.

Solution ▶ Noting that $\sqrt[3]{x} + 1$ is inside the squaring function, we assign $g(x)$ as this inner function: $g(x) = \sqrt[3]{x} + 1$. The outer function is the squaring function decreased by 3, so $f(x) = x^2 - 3$.

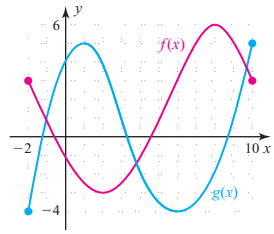
Check: $(f \circ g)(x) = f[g(x)]$ — $g(x)$ is an input for f

$= [g(x)]^2 - 3$ — f squares inputs, then decreases the result by 3

$= [\sqrt[3]{x} + 1]^2 - 3$ — substitute $\sqrt[3]{x} + 1$ for $g(x)$

$= h(x)$ ✓

Now try Exercises 31 through 34 ▶



☑ **A.** You've just seen how we can compose two functions and determine the domain, and decompose a function

B. A Numerical and Graphical View of the Composition of Functions

Just as with the sum, difference, product, and quotient of functions, the composition of functions can also be interpreted and understood graphically. For $(f \circ g)(x)$, once the value of $g(x)$ is known (read from the graph), the value of $(f \circ g)(x) = f[g(x)]$, can also be determined.

EXAMPLE 5 ▶ **Interpreting the Composition of Functions Numerically**

For $f(x)$ and $g(x)$ as shown, use the graph given to determine the value of each expression.

a. $f(4)$, $g(2)$, and $(f \circ g)(2)$

b. $g(6)$, $f(8)$, and $(g \circ f)(8)$

c. $(f \circ g)(8)$ and $(g \circ f)(0)$

d. $(f \circ f)(9)$ and $(g \circ g)(0)$

Solution ▶

a. For $f(4)$, we go to $x = 4$ and note that $(4, -1)$ is a point on the red graph: $f(4) = -1$. For $g(2)$, go to $x = 2$ and note that $(2, 4)$ is a point on the blue graph: $g(2) = 4$. Since $g(2) = 4$ and $f(4) = -1$, $(f \circ g)(2) = f[g(2)] = f(4) = -1$: $(f \circ g)(2) = -1$.

b. For $g(6)$, $x = 6$ and we find that $(6, -4)$ is a point on the blue graph: $g(6) = -4$. For $f(8)$, $x = 8$ and note that that $(8, 6)$ is a point on the red graph: $f(8) = 6$. Since $f(8) = 6$ and $g(6) = -4$, $(g \circ f)(8) = g[f(8)] = g(6) = -4$: $(g \circ f)(8) = -4$.

c. As illustrated in parts (a) and (b), for $(f \circ g)(8) = f[g(8)]$ we first determine $g(8)$, then substitute this value into f. From the blue graph $g(8) = -2$, and $f(-2) = 3$. For $(g \circ f)(0) = g[f(0)]$ we first determine $f(0)$, then substitute this value into g. From the red graph $f(0) = -1$, and $g(-1) = 1$.

d. To evaluate $(f \circ f)(9) = f[f(9)]$ we follow the same sequence as before. From the graph of f, $f(9) = 5$ and $f(5) = 1$, showing $(f \circ f)(9) = 1$. The same ideas are applied to $(g \circ g)(0) = g[g(0)]$. Since $g(0) = 4$ and $g(4) = -2$, $(g \circ g)(0) = -2$.

Now try Exercises 35 and 36 ▶

As with other operations on functions, a composition can be understood graphically *at specific points,* as in Example 5, or *for all allowable x-values*. Exploring the second option will help us understand certain transformations of functions, and why

the domain of a composition is defined so carefully. For instance, consider the functions $f(x) = -x^2 + 3$ and $g(x) = (x - 2)$. The graph of f is a parabola opening downward with vertex (0, 3). For $h(x) = (f \circ g)(x)$ we have $h(x) = -(x - 2)^2 + 3$, which we recognize as the graph of f *shifted 2 units to the right*. Using $Y_1 = -X^2 + 3$, $Y_2 = X - 2$, and $Y_3 = Y_1(Y_2(X))$, we can deactivate Y_2 so the only the graphs of Y_1 and Y_3 (in **bold**) are shown (see Figure 3.77). Here the domain of the composition was not a concern, as both f and g have domain $x \in \mathbb{R}$. But now consider $f(x) = 4\sqrt{x + 1}$, $g(x) = \dfrac{3}{2 - x}$, and $h(x) = (f \circ g)(x)$. The domain of g must exclude $x = 2$ (which is also excluded from the domain of h), while the domain of f is $x \geq -1$. But after assigning $Y_1 = 4\sqrt{X + 1}$, $Y_2 = \dfrac{3}{2 - X}$, and $Y_3 = Y_1(Y_2(X))$, the graph of Y_3 shows a noticeable gap between $x = 2$ and $x = 5$ (Figure 3.78). The reason is that $(f \circ g)(x) = f[g(x)]$ uses $g(x)$ *as the input for* f, meaning for the domain, $x \geq -1$ becomes $g(x) \geq -1 \rightarrow \dfrac{3}{2 - x} \geq -1$. Solving this inequality graphically (Figure 3.79) shows $g(x) \geq -1$ only for the intervals $x \in (-\infty, 2) \cup [5, \infty)$, leaving the gap seen in Y_3 for the interval (2, 5]. The domain of h is $x \in (-\infty, 2) \cup [5, \infty)$.

Figure 3.77

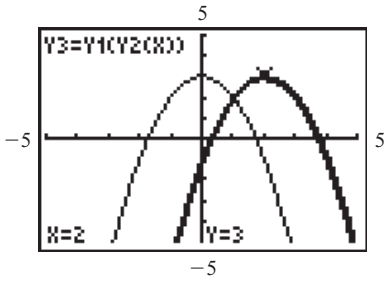


Figure 3.78

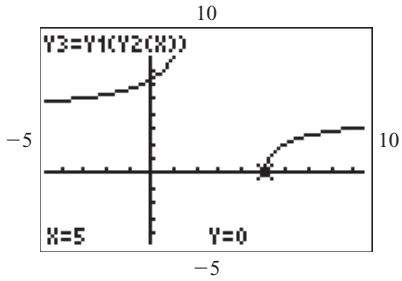

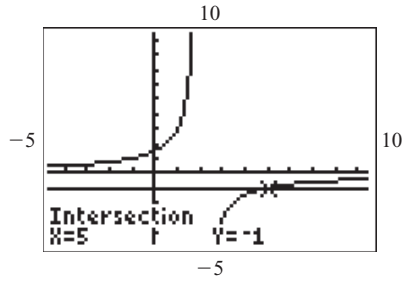

Figure 3.79

EXAMPLE 6 ▶ **Interpreting a Composition Graphically and Understanding the Domain**

Given $f(x) = 3\sqrt{1 - x}$, $g(x) = \dfrac{4}{x + 3}$,

a. State the domains of f and g.

b. Use a graphing calculator to study the graph of $h(x) = (f \circ g)(x)$.

c. Algebraically determine the domain of h, and reconcile it with the graph.

Solution ▶

a. The domain of g must exclude $x = -3$, and for the domain of f we must have $x \leq 1$.

b. For the graph of h, enter $Y_1 = 3\sqrt{1 - x}$, $Y_2 = \dfrac{4}{x + 3}$, and $Y_3 = Y_1(Y_2(X))$. Graphing Y_3 on the ZOOM **6:ZStandard** screen shows a gap between $x = -3$ and $x = 1$ (Figure 3.80).

c. Since the composition $(f \circ g)(x) = f[g(x)]$ uses $g(x)$ as the input for f, $x \leq 1$ (the domain for f) becomes $g(x) \leq 1 \rightarrow \dfrac{4}{x + 3} \leq 1$. Figure 3.81 shows a graphical solution to this inequality, which indicates $g(x) \leq 1$ for $x \in (-\infty, -3) \cup [1, \infty)$. The domain of h is $x \in (-\infty, -3) \cup [1, \infty)$.

Figure 3.80

Now try Exercises 37 and 38 ▶

C. Average Rates of Change and the Difference Quotient

We now return to our discussion of average rates of change, seeking to make the calculation more efficient due to (1) the large number of times the concept is applied, and (2) its value to virtually all fields of study. Our current calculation $\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$ works very well, but requires us to recalculate $\frac{\Delta y}{\Delta x}$ for each new interval chosen. Using a slightly different approach, we can develop a *formula* for a given function, and use it to calculate various rates of change with greater efficiency. This is done by selecting a point $x = x_1$ in the domain, and a point $x_2 = x + h$, where h is assumed to be some very small, arbitrary number. Making these substitutions in our current formula gives

$$\begin{aligned} \frac{\Delta y}{\Delta x} &= \frac{f(x_2) - f(x_1)}{x_2 - x_1} && \text{average rate of change} \\ &= \frac{f(x + h) - f(x)}{(x + h) - x} && \text{substitute } x + h \text{ for } x_2, x \text{ for } x_1 \\ &= \frac{f(x + h) - f(x)}{h} && \text{simplify} \end{aligned}$$

The advantage of this new formula, called the **difference quotient,** is that the result is a new function that can be evaluated repeatedly for any interval.

The Difference Quotient

For a given function $f(x)$ and constant $h \neq 0$,

$$\frac{f(x + h) - f(x)}{h}$$

is the difference quotient for f.

Note that the formula has three parts: (1) the function evaluated at $x + h$: $f(x + h)$, (2) the function f itself: $f(x)$, and (3) the constant h. The expression for $f(x + h)$ is actually a *composition of functions,* which can be evaluated and simplified prior to its use in the difference quotient.

$$\frac{\overset{(1)}{f(x + h)} - \overset{(2)}{f(x)}}{\underset{(3)}{h}}$$

EXAMPLE 7 ▶ Computing a Difference Quotient and Average Rates of Change

For $f(x) = x^2 - 4x$,

a. Compute the difference quotient.

b. Find the average rates of change in the intervals [1.9, 2.0] and [3.6, 3.7].

c. Sketch the graph of f along with the secant lines and comment on what you notice.

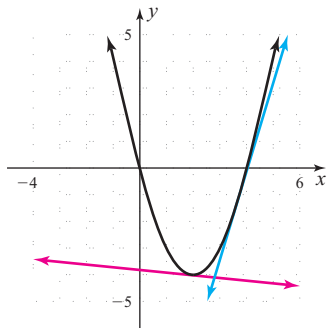
Solution ▶

a. For $f(x) = x^2 - 4x$, $f(x + h) = (x + h)^2 - 4(x + h)$
$= x^2 + 2xh + h^2 - 4x - 4h$

Using this result in the difference quotient yields,

$$\frac{f(x + h) - f(x)}{h} = \frac{(x^2 + 2xh + h^2 - 4x - 4h) - (x^2 - 4x)}{h}$$ substitute into the difference quotient

$$= \frac{x^2 + 2xh + h^2 - 4x - 4h - x^2 + 4x}{h}$$ eliminate parentheses



$$= \frac{2xh + h^2 - 4h}{h}$$ combine like terms

$$= \frac{h(2x + h - 4)}{h}$$ factor out h

$$= 2x - 4 + h$$ result

b. For the interval [1.9, 2.0], $x = 1.9$ and $h = 0.1$. The slope of the secant line is $\frac{\Delta y}{\Delta x} = 2(1.9) - 4 + 0.1 = -0.1$. For the interval [3.6, 3.7], $x = 3.6$ and $h = 0.1$. The slope of this secant line is $\frac{\Delta y}{\Delta x} = 2(3.6) - 4 + 0.1 = 3.3$.

c. After sketching the graph of f and the secant lines from each interval (see the figure), we note the slope of the first line (in red) is negative and very near zero, while the slope of the second (in blue) is positive and very steep.

Now try Exercises 39 through 50 ▶

It is important that you see these calculations as much more than just an algebraic exercise. If the parabola were modeling the distance a rocket has traveled after the retro-rockets fired, the difference quotient could provide us with valuable information regarding the decreasing velocity of the rocket, and even help pinpoint the moment the velocity was zero.

EXAMPLE 8 ▶ Use the difference quotient to find an *average rate of change* formula for the reciprocal function $f(x) = \frac{1}{x}$. Then use the formula to find the average rate of change on the intervals [0.5, 0.51] and [3, 3.01]. Note $h = 0.01$ for both intervals.

Solution ▶ For $f(x) = \frac{1}{x}$ we have $f(x + h) = \frac{1}{x + h}$ and we compute as follows:

$$\frac{\Delta y}{\Delta x} = \frac{f(x + h) - f(x)}{h} \quad \text{difference quotient}$$

$$= \frac{\frac{1}{(x + h)} - \frac{1}{x}}{h} \quad \text{substitute } \tfrac{1}{x+h} \text{ for } f(x+h) \text{ and } \tfrac{1}{x} \text{ for } f(x)$$

$$= \frac{\frac{x - (x + h)}{(x + h)x}}{h} \quad \text{common denominator}$$

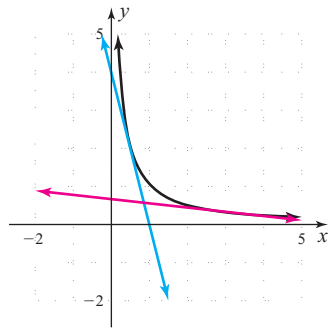
$$= \frac{\frac{-h}{(x + h)x}}{h} \quad \text{simplify numerator}$$

$$= \frac{-1}{(x + h)x} \quad \text{invert and multiply}$$

This is the formula for computing rates of change given $f(x) = \frac{1}{x}$.

To find $\frac{\Delta y}{\Delta x}$ on the interval [0.5, 0.51] we have:

$$\frac{\Delta y}{\Delta x} = \frac{-1}{(0.5 + 0.01)(0.5)} \quad \text{substitute 0.5 for } x, \text{ 0.01 for } h$$



$$\approx \frac{-4}{1} \quad \text{result (approximate)}$$

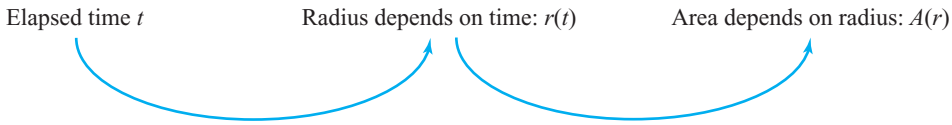
On this interval y is decreasing by about 4 units for every 1 unit x is increasing. The slope of the secant line (in blue) through these points is $m \approx -4$. For the interval [3, 3.01] we have

$$\frac{\Delta y}{\Delta x} = \frac{-1}{(3 + 0.01)(3)} \quad \text{substitute 3 for } x, \text{ 0.01 for } h$$

$$\approx -\frac{1}{9} \quad \text{result (approximate)}$$

On this interval, y is decreasing 1 unit for every 9 units x is increasing. The slope of the secant line (in red) through these points is $m \approx -\frac{1}{9}$.

Now try Exercises 51 through 54 ▶



☑ **C.** You've just seen how we can apply the difference quotient to find average rates of change for nonlinear functions

In context, suppose the graph of f were modeling the declining area of the rainforest over time. The difference quotient would give us information on just how fast the destruction was taking place (and give us plenty of cause for alarm).

D. Applications of Composition and the Difference Quotient

Suppose that due to a collision, an oil tanker is spewing oil into the open ocean. The oil is spreading outward in a shape that is roughly circular, with the radius of the circle modeled by the function $r(t) = 2\sqrt{t}$, where t is the time in minutes and r is measured in feet. How could we determine the *area* of the oil slick in terms of t? As you can see, the radius depends on the time and the area depends on the radius. In diagram form we have:

It is possible to create a direct relationship between the elapsed time and the area of the circular spill using a composition of functions.

EXAMPLE 9 ▶ **Composition and the Area of an Oil Spill**

Given $r(t) = 2\sqrt{t}$ and $A(r) = \pi r^2$,

a. Write A directly as a function of t by computing $(A \circ r)(t)$.

b. Find the area of the oil spill after 30 min.

Solution ▶

a. The function A squares inputs, then multiplies by π.

$$\begin{aligned}(A \circ r)(t) &= A[r(t)] && r(t) \text{ is the input for } A\\ &= [r(t)]^2 \cdot \pi && \text{square input, multiply by } \pi\\ &= [2\sqrt{t}]^2 \cdot \pi && \text{substitute } 2\sqrt{t} \text{ for } r(t)\\ &= 4\pi t && \text{result}\end{aligned}$$

Since the result contains no variable r, we can now compute the area of the spill directly, given the elapsed time t (in minutes): $A(t) = 4\pi t$.

b. To find the area after 30 min, use $t = 30$.

$$\begin{aligned}A(t) &= 4\pi t && \text{composite function}\\ A(30) &= 4\pi(30) && \text{substitute 30 for } t\\ &= 120\pi && \text{simplify}\\ &\approx 377 && \text{result (rounded to the nearest unit)}\end{aligned}$$

After 30 min, the area of the spill is approximately 377 ft^2.

Now try Exercises 57 through 62 ▶

EXAMPLE 10 ▶ **Composition and Related Populations**

Using a statistical study, environmentalists find a current population of 600 wolves in the county, and believe the wolf population w will decrease as the human population x grows, according to the formula $w(x) = 600 - 0.02x$. Further, the population of rodents and small animals r depends on the number of wolves w, with the rodent population estimated by $r(w) = 10{,}000 - 9.5w$.

a. Evaluate $r(w)$ for $w = 600$ to find the current rodent population, then use a composition to find a function modeling how the human population relates directly to the number of rodents.

b. Use the function to estimate the number of rodents in the county, if the human population grows by 35,000.

Solution ▶

a. Since $r(600) = 4300$, there are currently 4300 rodents in the county. The number of rodents and small animals is a function of w: $r(w) = 10{,}000 - 9.5w$, and the number of wolves w is a function of human population x: $w(x) = 600 - 0.02x$. To find a function for r in terms of x, we use the composition $(r \circ w)(x) = r[w(x)]$.

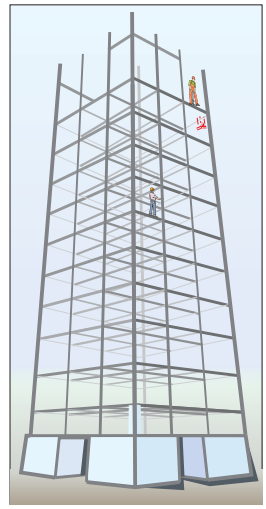
$$\begin{aligned} r(w) &= 10{,}000 - 9.5w && r \text{ depends on } w \\ r[w(x)] &= 10{,}000 - 9.5[600 - 0.02x] && \text{compose } r \text{ with } w(x) \\ &= 10{,}000 - 5700 + 0.19x && \text{distribute} \\ r(x) &= 4300 + 0.19x && \text{simplify, } r \text{ depends on } x \end{aligned}$$

b. Evaluating $r(35{,}000)$ gives 10,950 rodents, showing a decline in the wolf population will eventually cause the rodent population to flourish, with an adverse effect on humans. In cases like these, a careful balance should be the goal.

Now try Exercises 63 and 64 ▶

You might be familiar with Galileo Galilei and his studies of gravity. According to popular history, he demonstrated that unequal weights will fall equal distances in equal time periods, by dropping cannonballs from the upper floors of the Leaning Tower of Pisa. Neglecting air resistance, the distance an object falls is modeled by the function $d(t) = 16t^2$, where $d(t)$ represents the distance fallen after t sec. Due to the effects of gravity, the velocity of the object increases as it falls. In other words, the velocity or the average rate of change $\dfrac{\Delta\text{distance}}{\Delta\text{time}}$ is a nonconstant (increasing) quantity. We can analyze this rate of change using the difference quotient.

EXAMPLE 11 ▶ Applying the Difference Quotient in Context



A construction worker drops a heavy wrench from atop a girder of a new skyscraper. Use the function $d(t) = 16t^2$ to

a. Compute the distance the wrench has fallen after 2 sec and after 7 sec.

b. Find a formula for the velocity of the wrench (average rate of change in distance per unit time).

c. Use the formula to find the rate of change in the intervals [2, 2.01] and [7, 7.01].

d. Graph the function and the secant lines representing the average rate of change. Comment on what you notice.

Solution ▶

a. Substituting $t = 2$ and $t = 7$ in the given function yields

$$\begin{aligned} d(2) &= 16(2)^2 & d(7) &= 16(7)^2 && \text{evaluate } d(t) = 16t^2 \\ &= 16(4) & &= 16(49) && \text{square input} \\ &= 64 & &= 784 && \text{multiply} \end{aligned}$$

After 2 sec, the wrench has fallen 64 ft; after 7 sec, the wrench has fallen 784 ft.

b. For $d(t) = 16t^2$, $d(t + h) = 16(t + h)^2$, which we compute separately.

$$\begin{aligned} d(t + h) &= 16(t + h)^2 && \text{substitute } t + h \text{ for } t \\ &= 16(t^2 + 2th + h^2) && \text{square binomial} \\ &= 16t^2 + 32th + 16h^2 && \text{distribute 16} \end{aligned}$$

Using this result in the difference quotient yields

$$\frac{d(t+h)-d(t)}{h} = \frac{(16t^2+32th+16h^2)-16t^2}{h} \quad \text{substitute into the difference quotient}$$

$$= \frac{16t^2+32th+16h^2-16t^2}{h} \quad \text{eliminate parentheses}$$

$$= \frac{32th+16h^2}{h} \quad \text{combine like terms}$$

$$= \frac{h(32t+16h)}{h} \quad \text{factor out } h \text{ and simplify}$$

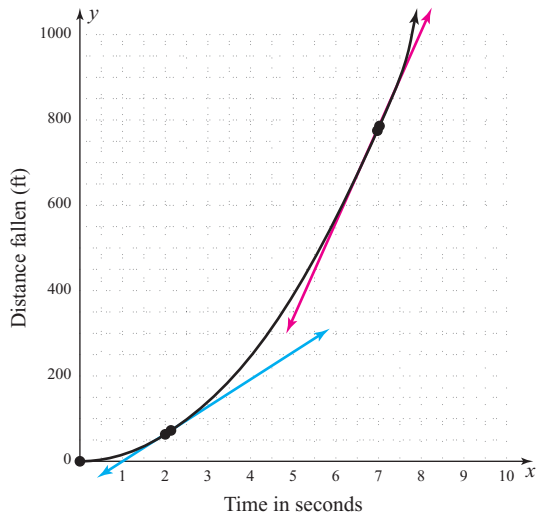
$$= 32t+16h \quad \text{result}$$

For any number of seconds t and h a small increment of time thereafter, the velocity of the wrench is modeled by $\dfrac{\Delta\text{distance}}{\Delta\text{time}} = \dfrac{\mathbf{32t+16h}}{\mathbf{1}}$.

c. For the interval $[t, t+h] = [2, 2.01]$, $t = 2$ and $h = 0.01$:

$$\frac{\Delta\text{distance}}{\Delta\text{time}} = \frac{32(2)+16(0.01)}{1} \quad \text{substitute 2 for } t \text{ and 0.01 for } h$$

$$= 64 + 0.16 = 64.16$$



Two seconds after being dropped, the velocity of the wrench is close to 64.16 ft/sec (44 mph). For the interval $[t, t+h] = [7, 7.01]$, $t = 7$ and $h = 0.01$:

$$\frac{\Delta\text{distance}}{\Delta\text{time}} = \frac{32(7)+16(0.01)}{1} \quad \text{substitute 7 for } t \text{ and 0.01 for } h$$

$$= 224 + 0.16 = 224.16$$

Seven seconds after being dropped, the velocity of the wrench is approximately 224.16 ft/sec (about 153 mph).

d.

The velocity increases with time, as indicated by the steepness of each secant line.

D. You've just seen how we can apply the composition of functions and the difference quotient in context

1. When evaluating functions, if the input value is a function itself, the process is called a _____ of functions.
2. The notation $(f \circ g)(x)$ indicates that $g(x)$ is the input value for $f(x)$, which is written _____.
3. For functions f and g, the domain of $(f \circ g)(x)$ is the set of all x in the _____ of g, such that _____ is in the domain of f.
4. The average rate of change formula becomes the _____ quotient by substituting _____ for x_2 and _____ for x_1.
5. Discuss/Explain how and why using the the difference quotient differs from using the average rate of change formula.
6. Discuss/Explain how the domain of $(f \circ g)(x)$ is determined, given $f(x) = \sqrt{2x + 7}$ and $g(x) = \dfrac{2x}{x - 1}$.

▶ DEVELOPING YOUR SKILLS

7. Given $f(x) = x^2 - 5x - 14$, find $f(-2), f(7)$, $f(2a)$, and $f(a - 2)$.
8. Given $g(x) = x^3 - 9x$, find $g(-3), g(2), g(3t)$, and $g(t + 1)$.

For each pair of functions below, find (a) $h(x) = (f \circ g)(x)$ and (b) $H(x) = (g \circ f)(x)$, and (c) determine the domain of each result.

9. $f(x) = \sqrt{x + 3}$ and $g(x) = 2x - 5$
10. $f(x) = x + 3$ and $g(x) = \sqrt{9 - x}$
11. $f(x) = \sqrt{x - 3}$ and $g(x) = 3x + 4$
12. $f(x) = \sqrt{x + 5}$ and $g(x) = 4x - 1$
13. $f(x) = x^2 - 3x$ and $g(x) = x + 2$
14. $f(x) = 2x^2 - 1$ and $g(x) = 3x + 2$
15. $f(x) = x^2 + x - 4$ and $g(x) = x + 3$
16. $f(x) = x^2 - 4x + 2$ and $g(x) = x - 2$
17. $f(x) = |x| - 5$ and $g(x) = -3x + 1$
18. $f(x) = |x - 2|$ and $g(x) = 3x - 5$

For the functions f and g given, $h(x) = (f \circ g)(x)$. Use a calculator to evaluate $h(-3)$, $h(\sqrt{2})$, $h\left(\frac{1}{2}\right)$, and $h(5)$. If an error message is received, explain why.

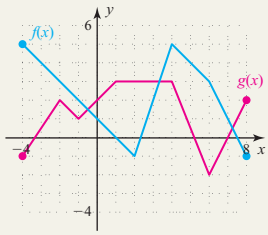
19. $f(x) = x^2 + 3x - 4, g(x) = x + 1$
20. $f(x) = -x^2 - 15x, g(x) = x - 2$
21. $f(x) = (x + 8)^2, g(x) = \dfrac{72}{x - 5}$
22. $f(x) = \dfrac{1}{x^2}, g(x) = \dfrac{1}{2x - 1}$
23. $f(x) = \sqrt{4 - 3x}, g(x) = x^2 - 9$
24. $f(x) = \dfrac{7}{x + 2}, g(x) = x^2 - 11$

For the functions $f(x)$ and $g(x)$ given, analyze the domain of (a) $(f \circ g)(x)$ and (b) $(g \circ f)(x)$, then (c) find the actual compositions and comment.

25. $f(x) = \dfrac{2x}{x + 3}$ and $g(x) = \dfrac{5}{x}$
26. $f(x) = \dfrac{-3}{x}$ and $g(x) = \dfrac{x}{x - 2}$
27. $f(x) = \dfrac{4}{x}$ and $g(x) = \dfrac{1}{x - 5}$
28. $f(x) = \dfrac{3}{x}$ and $g(x) = \dfrac{1}{x - 2}$
29. For $f(x) = x^2 - 8$, $g(x) = x + 2$, and $h(x) = (f \circ g)(x)$, find $h(5)$ in two ways:
    a. $(f \circ g)(5)$ **b.** $f[g(5)]$
30. For $p(x) = x^2 - 8$, $q(x) = x + 2$, and $H(x) = (p \circ q)(x)$, find $H(-2)$ in two ways:
    a. $(p \circ q)(-2)$ **b.** $p[q(-2)]$

31. For $h(x) = (\sqrt{x-2}+1)^3 - 5$, find two functions f and g such that $(f \circ g)(x) = h(x)$.

32. For $H(x) = \sqrt[3]{x^2-5} + 2$, find two functions p and q such that $(p \circ q)(x) = H(x)$.



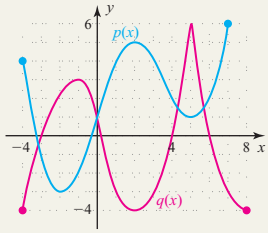
33. Given $f(x) = 2x - 1$, $g(x) = x^2 - 1$, and $h(x) = x + 4$, find $p(x) = f[g([h(x)])]$ and $q(x) = g[f([h(x)])]$.

34. Given $f(x) = 2x + 3$ and $g(x) = \dfrac{x-3}{2}$, find (a) $(f \circ f)(x)$, (b) $(g \circ g)(x)$, (c) $(f \circ g)(x)$, and (d) $(g \circ f)(x)$.

35. Reading a graph: Use the given graph to find the result of the operations indicated.

Note $f(-4) = 5$, $g(-4) = -1$, and so on.

Exercise 35



a. $(f \circ g)(-4)$
b. $(f \circ g)(1)$
c. $(f \circ g)(4)$
d. $(f \circ g)(0)$
e. $(f \circ g)(-2)$
f. $(g \circ f)(2)$
g. $(f \circ g)(6)$
h. $(g \circ f)(4)$

36. Reading a graph: Use the given graph to find the result of the operations indicated.

Note $p(-1) = -2$, $q(5) = 6$, and so on.

Exercise 36

a. $(p \circ q)(-4)$
b. $(p \circ q)(1)$
c. $(p \circ q)(4)$
d. $(p \circ q)(0)$
e. $(p \circ q)(-2)$
f. $(q \circ p)(2)$
g. $(q \circ q)(-1)$
h. $(p \circ p)(7)$

37. Given $f(x) = 3\sqrt{x+1}$, $g(x) = \dfrac{-3}{x+2}$, (a) state the domain of f and g, then (b) use a graphing calculator to study the graph of $h(x) = (f \circ g)(x)$. Finally, (c) algebraically determine the domain of h, and reconcile it with the graph.

38. Given $f(x) = \sqrt{x}$, $g(x) = \dfrac{1}{x^2-2x-3}$, (a) state the domain of f and g, then (b) use a graphing calculator to study the graph of $h(x) = (f \circ g)(x)$. Finally, (c) algebraically determine the domain of h, and reconcile it with the graph.

Compute and simplify the difference quotient $\dfrac{f(x+h)-f(x)}{h}$ for each function given.

39. $f(x) = 2x - 3$
40. $g(x) = 4x + 1$
41. $j(x) = x^2 + 3$
42. $p(x) = x^2 - 2$
43. $q(x) = x^2 + 2x - 3$
44. $r(x) = x^2 - 5x + 2$
45. $f(x) = \dfrac{2}{x}$
46. $g(x) = \dfrac{-3}{x}$

Use the difference quotient to find: (a) a rate of change formula for the functions given and (b)/(c) calculate the rate of change in the intervals shown. Then (d) sketch the graph of each function along with the secant lines and comment on what you notice.

47. $g(x) = x^2 + 2x$
$[-3.0, -2.9]$, $[0.50, 0.51]$

48. $j(x) = x^2 - 6x$
$[1.9, 2.0]$, $[5.0, 5.01]$

49. $g(x) = x^3 + 1$
$[-2.1, -2]$, $[0.40, 0.41]$

50. $v(x) = \sqrt{x}$ (*Hint*: Rationalize the numerator.)
$[1, 1.1]$, $[4, 4.1]$

Use the difference quotient to find a rate of change formula for the functions given, then calculate the rate of change for the intervals indicated. Comment on how the rate of change in each interval corresponds to the graph of the function.

51. $j(x) = \dfrac{1}{x^2}$
$[0.50, 0.51]$, $[1.50, 1.51]$

52. $f(x) = x^2 - 4x$
$[0.00, 0.01]$, $[3.00, 3.01]$

53. $g(x) = x^3 + 1$
$[-2.01, -2.00]$, $[0.40, 0.41]$

54. $r(x) = \sqrt{x}$
$[1.00, 1.01]$, $[4.00, 4.01]$

▶ WORKING WITH FORMULAS

55. Transformations via composition: For $f(x) = x^2 + 4x + 3$ and $g(x) = x - 2$, (a) show that $h(x) = (f \circ g)(x) = x^2 - 1$, then (b) verify the graph of h is the same as that of f, shifted 2 units to the right.

56. Compound annual growth: $A(r) = P(1+r)^t$
The amount of money A in a savings account t yr after an initial investment of P dollars depends on the interest rate r. If \$1000 is invested for 5 yr, find $f(r)$ and $g(r)$ such that $A(r) = (f \circ g)(r)$.

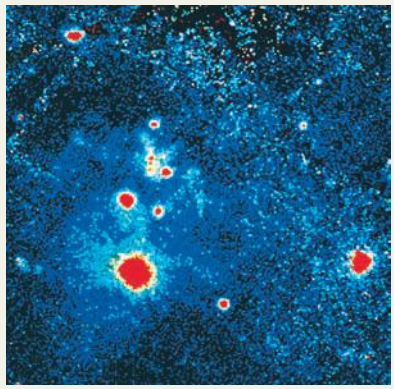
▶ APPLICATIONS

57. International shoe sizes: Peering inside her athletic shoes, Morgan notes the following shoe sizes: *US 8.5, UK 6, EUR 40*. The function that relates the U.S. sizes to the European (EUR) sizes is $g(x) = 2x + 23$, where x represents the U.S. size and $g(x)$ represents the EUR size. The function that relates European sizes to sizes in the United Kingdom (UK) is $f(x) = 0.5x - 14$, where x represents the EUR size and $f(x)$ represents the UK size. Find the function $h(x)$ that relates the U.S. measurement directly to the UK measurement by finding $h(x) = (f \circ g)(x)$. Find the UK size for a shoe that has a U.S. size of 13.

58. Currency conversion: On a trip to Europe, Megan had to convert American dollars to euros using the function $E(x) = 1.12x$, where x represents the number of dollars and $E(x)$ is the equivalent number of euros. Later, she converts her euros to Japanese yen using the function $Y(x) = 1061x$, where x represents the number of euros and $Y(x)$ represents the equivalent number of yen. (a) Convert 100 U.S. dollars to euros. (b) Convert the answer from part (a) into Japanese yen. (c) Express yen as a function of dollars by finding $M(x) = (Y \circ E)(x)$, then use $M(x)$ to convert \$100 directly to yen. Do parts (b) and (c) agree?

Source: 2005 *World Almanac,* p. 231

59. Currency conversion: While traveling in the Far East, Timi must convert U.S. dollars to Thai baht using the function $T(x) = 41.6x$, where x represents the number of dollars and $T(x)$ is the equivalent number of baht. Later she needs to convert her baht to Malaysian ringgit using the function $R(x) = 10.9x$. (a) Convert \$100 to baht. (b) Convert the result from part (a) to ringgit. (c) Express ringgit as a function of dollars using $M(x) = (R \circ T)(x)$, then use $M(x)$ to convert \$100 to ringgit directly. Do parts (b) and (c) agree?



Source: 2005 *World Almanac,* p. 231

60. Spread of a fire: Due to a lightning strike, a forest fire begins to burn and is spreading outward in a shape that is roughly circular. The radius of the circle is modeled by the function $r(t) = 2t$, where t is the time in minutes and r is measured in meters. (a) Write a function for the area burned by the fire directly as a function of t by computing $(A \circ r)(t)$. (b) Find the area of the circular burn after 60 min.

61. Radius of a ripple: As Mark drops firecrackers into a lake one 4th of July, each "pop" caused a circular ripple that expanded with time. The radius of the circle is a function of time t. Suppose the function is $r(t) = 3t$, where t is in seconds and r is in feet. (a) Find the radius of the circle after 2 sec. (b) Find the area of the circle after 2 sec. (c) Express the area as a function of time by finding $A(t) = (A \circ r)(t)$ and use $A(t)$ to find the area of the circle after 2 sec. Do the answers agree?

62. Expanding supernova: The surface area of a star goes through an expansion phase prior to going *supernova*. As the star begins expanding, the radius becomes a function of time. Suppose this function is $r(t) = 1.05t$, where t is in days and $r(t)$ is in gigameters (Gm). (a) Find the radius of the star two days after the expansion phase begins. (b) Find the surface area after two days. (c) Express the surface area as a function of time by finding $h(t) = (S \circ r)(t)$, then use $h(t)$ to compute the surface area after two days directly. Do the answers agree?

63. Composition and dependent relationships: In the wild, the balance of nature is often very fragile, with any sudden changes causing dramatic and unforeseen changes. With a huge increase in population and tourism near an African wildlife preserve, the number of lions is decreasing due to loss of habitat and a disruption in normal daily movements. This is causing a related increase in the hyena population, as the lion is one of the hyena's only natural predators. If this increase remains unchecked, animals lower in the food chain will suffer. If the lion population L depends on the increase in human population x according to the formula $L(x) = 500 - 0.015x$, and the hyena population depends on the lion population as modeled by the formula $H(L) = 650 - 0.5L$, (a) what is the current lion population $(x = 0)$ and hyena population? (b) Use a composition to find a function modeling how the hyena population relates directly to the number of humans, and use the function to estimate the number of hyenas in the area if the human population grows by 16,000. (c) If the administrators of the preserve consider a population of 625 hyenas as "extremely detrimental," at what point should the human population be capped?

64. Composition and dependent relationships: The recent opening of a landfill in the area has caused the raccoon population to flourish, with an adverse effect on the number of purple martins. Wildlife specialists believe the population of martins p will decrease as the raccoon population r grows. Further, since mosquitoes are the primary diet of purple martins, the mosquito population m is likewise affected. If the first relationship is modeled by the function $p(r) = 750 - 3.75r$ and the second by $m(p) = 50{,}000 - 45p$, (a) what is the current number of purple martins $(r = 0)$ and mosquitoes? (b) Use a composition to find a function modeling how the raccoon population relates directly to the number of mosquitoes, and use the function to estimate the number of mosquitoes in the area if the raccoon population grows by 50. (c) If the health department considers 36,500 mosquitoes to be a "dangerous level," what increase in the raccoon population will bring this about?

65. Distance to the horizon: The distance that a person can see depends on how high they're standing above level ground. On a clear day, the distance is approximated by the function $d(h) = 1.2\sqrt{h}$, where $d(h)$ represents the viewing distance (in miles) at height h (in feet). Use the difference quotient to find the average rate of change in the intervals (a) [9, 9.01] and (b) [225, 225.01]. Then (c) graph the function along with the lines representing the average rates of change and comment on what you notice.

66. Projector lenses: A special magnifying lens is crafted and installed in an overhead projector. When the projector is x ft from the screen, the size $P(x)$ of the projected image is x^2. Use the difference quotient to find the average rate of change for $P(x) = x^2$ in the intervals (a) [1, 1.01] and (b) [4, 4.01]. Then (c) graph the function along with the lines representing the average rates of change and comment on what you notice.

67. Fortune and fame: Over the years there have been a large number of what we know as "one hit wonders," persons or groups that published a memorable or timeless song, but who were unable to repeat the feat. In some cases, their fame might be modeled by a quadratic function as their popularity rose to a maximum, then faded with time. Suppose the song *She's on Her Way* by Helyn Wheels rode to the top of the charts in January of 1988, with demand for the song modeled by $d(t) = -2t^2 + 27t$. Here, $d(t)$ represents the demand in 1000s for month $t(t = 1 \rightarrow \text{Jan})$. (a) How many times faster was the demand growing in March (shortly after the release) than in June? Use the difference quotient and the intervals [3, 3.01] for March

and [6, 6.01] for June. (b) Determine the month that demand reached its peak using a graphing calculator. (c) Was the demand increasing or decreasing in the month of August? At what rate?

68. Velocity and fuel economy: It has long been known that cars and trucks are more fuel efficient at certain speeds, which is why President Richard Nixon lowered the speed limit on all federal highways to 55 mph during the oil embargo of 1974. For heavier and less fuel-efficient vehicles, the miles per gallon for certain speeds can be modeled by the function $m(s) = -0.01s^2 + s$, where $m(s)$ represents the mileage (in miles per gallon) at speed s $(0 < s \leq 80)$. (a) Use the difference quotient to find how many times faster fuel efficiency is growing near $s = 30$ mph than near $s = 45$ mph. Use the intervals [30, 30.1] and [45, 45.1]. (b) Use a graphing calculator to determine the speed(s) that maximizes fuel efficiency for this vehicle. How many miles per gallon are achieved? (c) Is fuel efficiency increasing or decreasing at 70 mph? At what rate?

▶ EXTENDING THE CONCEPT

69. Given $f(x) = x^3 + 2$ and $g(x) = \sqrt[3]{x - 2}$, graph each function on the same axes by plotting the points that correspond to integer inputs for $x \in [-3, 3]$. Do you notice anything? Next, find $h(x) = (f \circ g)(x)$ and $H(x) = (g \circ f)(x)$. What happened? Look closely at the functions f and g to see how they are related. Can you come up with two additional functions where the same thing occurs?

70. Given $f(x) = \dfrac{1}{x^2 - 4}$, $g(x) = \sqrt{x + 1}$, and $h(x) = (f \circ g)(x)$, (a) find the new function rule for h and (b) determine the implied domain of h. Does this *implied* domain include $x = 2$, $x = -2$, and $x = -3$ as valid inputs? (c) Determine the actual domain for $h(x) = (f \circ g)(x)$ and discuss the result.

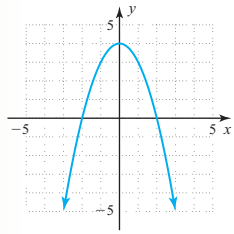
71. Consider the functions $f(x) = \dfrac{k}{x}$ and $g(x) = \dfrac{k}{x^2}$. Both graphs appear similar in Quadrant I and both may "fit" a scatterplot fairly well, but there is a big difference between them—they decrease as x gets larger, but *they decrease at very different rates*. (a) Assume $k = 1$ and use the ideas from this section to compute the rates of change for f and g for the interval from $x = 0.5$ to $x = 0.51$. Were you surprised? (b) In the interval $x = 0.8$ to $x = 0.81$, will the rate of decrease for each function be greater or less than in the interval $x = 0.5$ to $x = 0.51$? Why?

▶ MAINTAINING YOUR SKILLS

72. **(3.1)** Find the sum and product of the complex numbers $2 + 3i$ and $2 - 3i$.

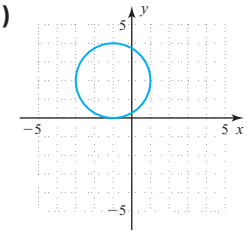
73. **(2.2)** Draw a sketch of the functions *from memory*.
(a) $f(x) = \sqrt{x}$, (b) $g(x) = \sqrt[3]{x}$, and
(c) $h(x) = |x|$

74. **(3.2)** Use the quadratic formula to solve $2x^2 - 3x + 4 = 0$.



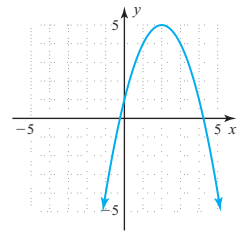
75. **(1.4)** Find an equation of the line perpendicular to $-2x + 3y = 9$, that also goes through the origin.

MAKING CONNECTIONS

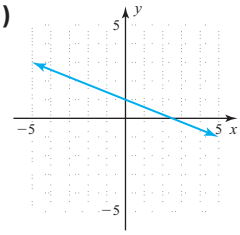


Making Connections: Graphically, Symbolically, Numerically, and Verbally

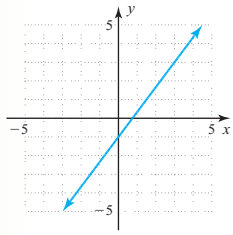
Eight graphs (a) through (h) are given. Match the characteristics shown in 1 through 16 to one of the eight graphs.



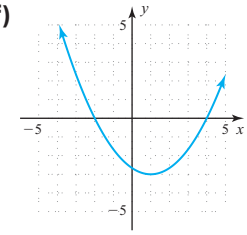
(a)



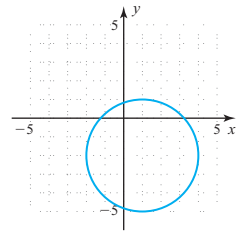
(b)



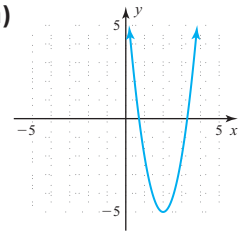
(c)



(d)



(e)



(f)

(g)

(h)

1. ____ $(x + 1)^2 + (y - 2)^2 = 4$

2. ____ $y = -\frac{2}{5}x + 1$

3. ____ $f(x)\downarrow$ for $x \in (-\infty, 2)$, $f(x)\uparrow$ for $x \in (2, \infty)$

4. ____ $f(x)\uparrow$ for $x \in (-\infty, 2)$, $f(x)\downarrow$ for $x \in (2, \infty)$

5. ____ $m < 0, b > 0$

6. ____ $m > 0, b < 0$

7. ____ $y = -x^2 + 4$

8. ____ $y = 3(x - 2)^2 - 5$

9. ____ center $(1, -2)$, radius $= 3$

10. ____ vertex $(2, 5)$, y-intercept $(0, 1)$

11. ____ $y = \frac{1}{3}(x - 1)^2 - 3$

12. ____ $(x - 1)^2 + (y + 2)^2 = 9$

13. ____ axis of symmetry $x = 2$, opens downward

14. ____ $4x - 3y = 3$

15. ____ $f(x) < 0$ for $x \in (-\infty, -2) \cup (2, \infty)$, $f(x) \geq 0$ for $x \in [-2, 2]$

16. ____ $f(-2) = 0, f(1) = -3$

SUMMARY AND CONCEPT REVIEW

SECTION 3.1 Complex Numbers

KEY CONCEPTS

- The italicized i represents the number whose square is -1. This means $i^2 = -1$ and $i = \sqrt{-1}$.
- Larger powers of i can be simplified using $i^4 = 1$.
- For $k > 0$, $\sqrt{-k} = i\sqrt{k}$ and we say the expression has been *written in terms of i.*
- The standard form of a *complex number* is $a + bi$, where a is the *real number part* and bi is the *imaginary part.*
- To add or subtract complex numbers, combine the like terms.
- For any complex number $a + bi$, its *complex conjugate* is $a - bi$.
- The *product* of a complex number and its conjugate is a real number.

- The commutative, associative, and distributive properties also apply to complex numbers and are used to perform basic operations.
- To multiply complex numbers, use the F-O-I-L method and simplify.
- To find a *quotient* of complex numbers, multiply the numerator and denominator by the conjugate of the denominator.

EXERCISES

Simplify each expression and write the result in standard form.

1. $\sqrt{-72}$ **2.** $6\sqrt{-48}$ **3.** $\dfrac{-10 + \sqrt{-50}}{5}$

4. $\sqrt{3}\sqrt{-6}$ **5.** i^{57}

Perform the operation indicated and write the result in standard form.

6. $(5 + 2i)^2$ **7.** $\dfrac{5i}{1 - 2i}$ **8.** $(-3 + 5i) - (2 - 2i)$

9. $(2 + 3i)(2 - 3i)$ **10.** $4i(-3 + 5i)$

Use substitution to show the given complex number and its conjugate are solutions to the equation shown.

11. $x^2 - 9 = -34; x = 5i$ **12.** $x^2 - 4x + 9 = 0; x = 2 + i\sqrt{5}$

SECTION 3.2 Solving Quadratic Equations and Inequalities

KEY CONCEPTS

- The standard form of a quadratic equation is $ax^2 + bx + c = 0$, where a, b, and c are real numbers and $a \neq 0$. In words, we say the equation is written in decreasing order of degree and set equal to zero.
- A quadratic function is one that can be written as $f(x) = ax^2 + bx + c$, where a, b, and c are real numbers and $a \neq 0$.
- The following four statements are equivalent: (1) $x = r$ is a solution of $f(x) = 0$, (2) r is a zero of $f(x)$, (3) $(r, 0)$ is an x-intercept of $y = f(x)$, and (4) $(x - r)$ is a factor of $f(x)$.
- The square root property of equality states that if $X^2 = k$, where $k \geq 0$, then $X = \sqrt{k}$ or $X = -\sqrt{k}$.
- Quadratic equations can also be solved by *completing the square,* or using the *quadratic formula*.
- If the discriminant $b^2 - 4ac = 0$, the equation has one real (repeated) root. If $b^2 - 4ac > 0$, the equation has two real roots; and if $b^2 - 4ac < 0$, the equation has two nonreal roots.
- Quadratic inequalities can be solved using the zeroes of the function and either an understanding of quadratic graphs or mid-interval test values.

EXERCISES

13. Solve by factoring.

a. $x^2 - 3x - 10 = 0$ **b.** $2x^2 - 50 = 0$ **c.** $3x^2 - 15 = 4x$ **d.** $x^3 - 3x^2 = 4x - 12$

14. Solve using the square root property of equality.

a. $x^2 - 9 = 0$ **b.** $2(x - 2)^2 + 1 = 11$ **c.** $3x^2 + 15 = 0$ **d.** $-2x^2 + 4 = -46$

15. Solve by completing the square. Give real number solutions in exact and approximate form.

a. $x^2 + 2x = 15$ **b.** $x^2 + 6x = 16$ **c.** $-4x + 2x^2 = 3$ **d.** $3x^2 - 7x = -2$

16. Solve using the quadratic formula. Give solutions in both exact and approximate form.

a. $x^2 - 4x = -9$ **b.** $4x^2 + 7 = 12x$ **c.** $2x^2 - 6x + 5 = 0$

17. Solve by locating the x-intercepts and noting the end-behavior of the graph.

a. $x^2 - x - 6 > 0$ **b.** $-x^2 + 1 \geq 0$ **c.** $x^2 - 2x + 2 > 0$

18. Solve using the interval test method.

a. $x^2 + 3x \leq 4$ **b.** $x^2 > 20 - x$ **c.** $x^2 + 4x + 4 \leq 0$

Solve the following quadratic applications. For 19 and 20, recall the height of a projectile is modeled by $h = -16t^2 + v_0t + k$.

19. A projectile is fired upward from ground level with an initial velocity of 96 ft/sec. (a) To the nearest tenth of a second, how long until the object first reaches a height of 100 ft? (b) How long until the object is again at 100 ft? (c) How many seconds until it returns to the ground?

20. A person throws a rock upward from the top of an 80-ft cliff with an initial velocity of 64 ft/sec. (a) To the nearest tenth of a second, how long until the object is 120 ft high? (b) How long until the object is again at 120 ft? (c) How many seconds until the object hits the ground at the base of the cliff?

SECTION 3.3 Quadratic Functions and Applications

KEY CONCEPTS

- The graph of a quadratic function is a parabola. Parabolas have three distinctive features: (1) like end-behavior on the left and right, (2) an axis of symmetry, (3) a highest or lowest point called the vertex.
- By completing the square, $f(x) = ax^2 + bx + c$ can be written as the transformation $f(x) = a(x + h)^2 \pm k$, and graphed using transformations of $y = x^2$.
- For a quadratic function in the standard form $y = ax^2 + bx + c$,
  - End-behavior: graph opens upward if $a > 0$, opens downward if $a < 0$
  - Zeroes/x-intercepts (if they exist): substitute 0 for y and solve for x
  - y-intercept: substitute 0 for $x \rightarrow (0, c)$
  - Vertex: (h, k), where $h = \dfrac{-b}{2a}$, $k = f\left(\dfrac{-b}{2a}\right)$
  - Maximum value: If the parabola opens downward, $y = k$ is the maximum value of f.
  - Minimum value: If the parabola opens upward, $y = k$ is the minimum value of f.
  - Line of symmetry: $x = h$ is the line of symmetry. If $(h + c, y)$ is on the graph, then $(h - c, y)$ is also on the graph.

EXERCISES

Graph $p(x)$ and $f(x)$ by completing the square and using transformations of the parent function. Graph $g(x)$ and $h(x)$ using the vertex formula and y-intercept. Find the x-intercepts (if they exist) for all functions.

21. $p(x) = x^2 - 6x$ **22.** $f(x) = x^2 + 8x + 15$ **23.** $g(x) = -x^2 + 4x - 5$ **24.** $h(x) = 4x^2 - 12x + 3$

25. Height of a superball: A teenager tries to see how high she can bounce her superball by throwing it downward on her driveway. The height of the ball (in feet) at time t (in seconds) is given by $h(t) = -16t^2 + 96t$. (a) How high is the ball at $t = 0$? (b) How high is the ball after 1.5 sec? (c) How long until the ball is 135 ft high? (d) What is the maximum height attained by the ball? At what time t did this occur?

26. Theater Revenue: The manager of a large, 14-screen movie theater finds that if he charges \$2.50 per person for the matinee, the average daily attendance is 4000 people. With every increase of 25 cents the attendance drops an average of 200 people. (a) What admission price will bring in a revenue of \$11,250? (b) How many people will purchase tickets at this price?

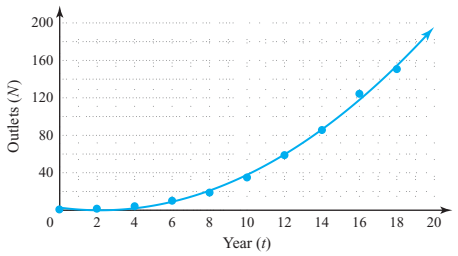
SECTION 3.4 Quadratic Models; More on Rates of Change

KEY CONCEPTS

- Regardless of the form of regression chosen, obtaining a regression equation uses these five steps: (1) clear out old data, (2) enter new data, (3) set an appropriate window and display the data, (4) calculate the regression equation, and (5) display the data and equation, and once satisfied the model is appropriate, apply the result.
- The choice of a nonlinear regression model often depends on many factors, particularly the context of the data, any patterns formed by the scatterplot, some foreknowledge on how the data might be related, and/or a careful assessment of the correlation coefficient.
- Applications of quadratic regression are generally applied when a set of data indicates a gradual decrease to some minimum value, with a matching increase afterward, or a gradual increase to some maximum, with a matching decrease afterward.

- For nonlinear functions, the *average rate of change* gives an average value for how changes in the independent variable cause a change in the dependent variable within a specified interval.
- The average rate of change is given by the slope of a secant line through two points (x_1, y_1) and (x_2, y_2) on the graph, and is computed as: $\dfrac{\Delta y}{\Delta x} = \dfrac{f(x_2) - f(x_1)}{x_2 - x_1}, x_2 \neq x_1$.

EXERCISES



27. While the Internet has been with us for over 20 years, its use continues to grow at a rapid pace. The data in the table gives the amount of money (in billions of dollars) consumers spent online for retail items in selected years (amounts for 2010 through 2012 are projections). Use the data and a graphing calculator to (a) draw a scatterplot and decide on an appropriate form of regression, then (b) find the regression equation and use it to estimate the amount spent by consumers in 2003, (c) the projected amount that will be spent in 2014 if this rate of growth continues, and (d) the year that \$591 billion is the projected amount of retail spending over the Internet.

Year (2000 → 0)	Amount (billions)
1	31
5	84
6	108
7	128
10	267
11	301
12	335

28. The drag force on a compact car driving along the highway on a windless day, depends on a constant $\frac{k}{2}$ and the velocity of the car, where k is determined using the density of the air, the cross-sectional area of the car, and the drag coefficient of the vehicle. The data shown in the table gives the magnitude of the drag force F_d, at given velocity v. Use the data and a graphing calculator to (a) draw a scatterplot and decide on an appropriate form of regression, then (b) find a regression equation and use it to estimate the magnitude of the drag force for this car at 60 mph. Finally, (c) estimate the speed of the car if the drag force has a magnitude of 2329 units.

Velocity (mph)	F_d
10	32
30	306
50	860
70	1694

29. The graph and accompanying table show the number N of active Starbucks outlets for selected years t from 1990 to 2008. Use the graph and table to (a) find the average rate of change for the years 1994 to 1996 (the interval [4, 6]). (b) Verify that the rate of growth between the years 2000 and 2002 (the interval [10, 12]) was about 4 times greater than from 1994 to 1996. (c) Show that the average rate of change for the years 2002 to 2004 was very close to the rate of change for the years 2006 to 2008.

Year t (1990 → 0)	Outlets N (100s)	Year t (1990 → 0)	Outlets N (100s)
0	0.84	10	35.01
2	1.65	12	58.86
4	4.25	14	85.69
6	10.15	16	124.40
8	18.86	18	150.79

30. According to Torricelli's law for tank draining, the volume (in ft^3) of a full 5 ft × 2 ft × 2 ft bathtub t sec after the plug is pulled can be modeled by the function $V(t) = (-0.2t + \sqrt{20})^2$. (a) What is the volume of the bathtub at $t = 0$ sec? (b) What is the volume of the bathtub at $t = 1$ sec? (c) What is the average rate of change from $t = 0$ to $t = 1$? (d) What is the average rate of change from $t = 20$ to $t = 21$? (e) When is the bathtub empty?

SECTION 3.5 The Algebra of Functions

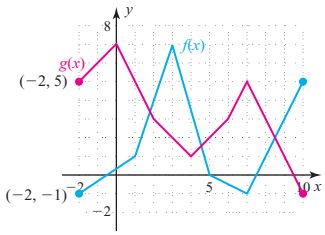
KEY CONCEPTS

- The notation used to represent the basic operations on two functions is
  - $(f + g)(x) = f(x) + g(x)$
  - $(f - g)(x) = f(x) - g(x)$
  - $(f \cdot g)(x) = f(x) \cdot g(x)$
  - $\left(\dfrac{f}{g}\right)(x) = \dfrac{f(x)}{g(x)}; g(x) \neq 0$
- The result of these operations is a new function $h(x)$. The domain of h is the intersection of domains for f and g, excluding values that make $g(x) = 0$ for $h(x) = \left(\dfrac{f}{g}\right)(x)$.

EXERCISES

For $f(x) = x^2 + 4x$ and $g(x) = 3x - 2$, find the following:

31. $(f + g)(a)$ **32.** $(f \cdot g)(3)$ **33.** the domain of $\left(\frac{f}{g}\right)(x)$



34. Use the graph given to find the value of each expression:

a. $(f + g)(-2)$

b. $(g - f)(7)$

c. $\left(\frac{g}{f}\right)(10)$

d. $(f \cdot g)(3)$

35. As the availability of free, public Wi-Fi has increased, so has the number of devices that can utilize this protocol. A new company has just released a Wi-Fi phone that provides free phone service anywhere it has access to a wireless network. The total cost for manufacturing these phones can be modeled by the function $C(n) = -0.002n^2 + 20n + 30{,}000$, where n is the number of phones made and $C(n)$ is in dollars. If each phone is sold at a price of \$84.95, the revenue is modeled by $R(n) = 84.95n$.

a. Find the function that represents the total profit made from sales of the phones.

b. How much profit is earned if 400 phones are sold?

c. How much profit is earned if 5000 phones (the production limit) are sold?

d. How many phone sales are necessary for the company to break even?

SECTION 3.6 The Composition of Functions and the Difference Quotient

KEY CONCEPTS

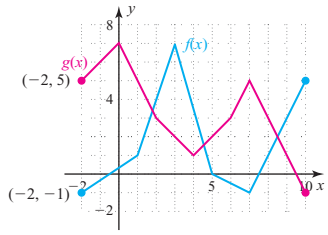
- The composition of two functions is written $(f \circ g)(x) = f[g(x)]$ (g is an input for f).
- The domain of $f \circ g$ is all x in the domain of g, such that $g(x)$ is in the domain of f.
- To evaluate $(f \circ g)(2)$, we find $(f \circ g)(x)$ then substitute $x = 2$. Alternatively, we can find $g(2) = k$, then find $f(k)$.
- A composite function $h(x) = (f \circ g)(x)$ can be "decomposed" into individual functions by identifying functions f and g such that $(f \circ g)(x) = h(x)$. The decomposition is not unique.
- The difference quotient for a function $f(x)$ is $\dfrac{f(x + h) - f(x)}{h}$.

EXERCISES

Given $p(x) = 4x - 3$, $q(x) = x^2 + 2x$, and $r(x) = \dfrac{x + 3}{4}$ find:

36. $(p \circ q)(x)$ **37.** $(q \circ p)(3)$ **38.** $(p \circ r)(x)$ and $(r \circ p)(x)$

For each function here, find functions $f(x)$ and $g(x)$ such that $h(x) = f[g(x)]$:



39. $h(x) = \sqrt{3x - 2} + 1$

40. $h(x) = x^{\frac{2}{3}} - 3x^{\frac{1}{3}} - 10$

41. A stone is thrown into a pond causing a circular ripple to move outward from the point of entry. The radius of the circle is modeled by $r(t) = 2t + 3$, where t is the time in seconds. Find a function that will give the area of the circle directly as a function of time. In other words, find $A(t)$.

42. Use the graph given to find the value of each expression:

a. $(f \circ g)(-2)$
b. $(g \circ f)(5)$
c. $(g \circ f)(7)$
d. $(g \circ f)(10)$
e. $(f \circ g)(3)$

43. Use the difference quotient to find a rate of change formula for the function given, then calculate the rate of change for the interval indicated: $j(x) = x^2 - x$; $[2.00, 2.01]$.

PRACTICE TEST

1. Solve each equation or inequality.
a. $11x - 2x^2 > 0$
b. $x^2 + 1 > 2x$
c. $3x^2 \geq 2x + 21$
d. $-x^2 - 2.2x \geq 3.8$

2. $x^2 + 25 = 0$

3. $(x - 1)^2 + 3 = 0$

4. $3x^2 - 20x = -12$

5. Due to the seasonal nature of the business, the revenue of Wet Willey's Water World can be modeled by the equation $r = -3t^2 + 42t - 135$, where t is the time in months ($t = 1$ corresponds to January) and r is the dollar revenue in thousands. (a) What month does Wet Willey's open? (b) What month does Wet Willey's close? (c) Does Wet Willey's bring in more revenue in July or August? How much more?

6. Simplify each expression.
a. $\dfrac{-8 + \sqrt{-20}}{6}$ **b.** i^{39}

7. Given $x = \dfrac{1}{2} + \dfrac{\sqrt{3}}{2}i$ and $y = \dfrac{1}{2} - \dfrac{\sqrt{3}}{2}i$ find
a. $x + y$ **b.** $x - y$ **c.** xy

8. Compute the quotient: $\dfrac{3i}{1 - i}$.

9. Find the product: $(3i + 5)(5 - 3i)$.

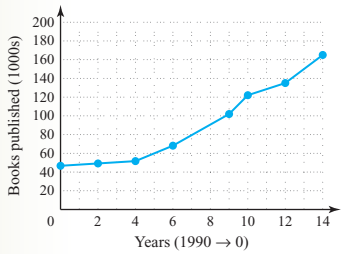
10. Show $x = 2 - 3i$ is a solution of $x^2 - 4x + 13 = 0$.

11. Solve by completing the square.
a. $2x^2 - 20x + 49 = 0$
b. $2x^2 - 5x = -4$

12. Solve using the quadratic formula.
a. $3x^2 + 2 = 6x$
b. $x^2 = 2x - 10$

13. Complete the square to write each function as a transformation. Then graph each function and label the vertex and x-intercepts (if they exist).
a. $f(x) = -x^2 + 10x - 16$
b. $g(x) = \dfrac{1}{2}x^2 + 4x + 16$

14. The graph of a quadratic function has a vertex of $(-1, -2)$, and passes through the origin. Find the other intercept, and the equation of the graph in standard form.



15. Suppose the function $d(t) = t^2 - 14t$ models the depth of a scuba diver at time t, as she dives underwater from a steep shoreline, reaches a certain depth, and swims back to the surface.
a. What is her depth after 4 sec? After 6 sec?
b. What was the maximum depth of the dive?
c. How many seconds was the diver beneath the surface?

16. Homeschool education: Since the early 1980s the number of parents electing to homeschool their children has been steadily increasing. Estimates for the number of children homeschooled (in 1000s) are given in the table for selected years. (a) Use a graphing calculator to draw a scatterplot of the data and decide on an appropriate form of regression. (b) Calculate a regression equation with $x = 0$ corresponding to 1985 and display the scatterplot and graph on the same screen. (c) According to the equation model, how many children were homeschooled in 1991? If growth continues at the same rate, how many children will be homeschooled in 2010?

Year (1985 → 0)	Children (1000s)
0	183
3	225
5	301
7	470
8	588
9	735
10	800
11	920
12	1100

Source: National Home Education Research Institute

17. The graph and accompanying table show the number N of *new* books published in the United States for selected years t from 1990 to 2004. Find the average rate of change for the years (a) 1992 to 1996 and (b) 1996 to 1999. (c) In 1997, the number of new books published actually fell to 65.8 (1000s). Using this information, find the average rate of change for the years 1996 to 1997, and 1997 to 1999.

Year (1990 → 0)	Books (1000s)
0	46.7
2	49.2
4	51.7
6	68.2
9	102.0
10	122.1
12	135.1
14	165.8

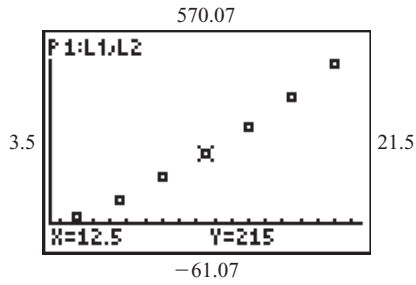
18. Given $f(x) = x^2 + 2$ and $g(x) = \sqrt{3x - 1}$, determine $(f \circ g)(x)$ and its domain.

19. Monthly sales volume for a successful new company is modeled by $S(t) = 2t^2 - 3t$, where $S(t)$ represents sales volume in thousands in month t ($t = 0$ corresponds to January 1). (a) Would you expect the average rate of change from May to June to be greater than that from June to July? Why? (b) Calculate the rates of change in these intervals to verify your answer. (c) Calculate the difference quotient for $S(t)$ and use it to estimate the sales volume rate of change after 10, 18, and 24 months.

20. A snowball increases in size as it rolls downhill. The snowball is roughly spherical with a radius that can be modeled by the function $r(t) = \sqrt{t}$, where t is time in seconds and r is measured in inches. The volume of the snowball is given by the function $V(r) = \frac{4}{3}\pi r^3$. Use a composition to (a) write V directly as a function of t and (b) find the volume of the snowball after 9 sec.

CALCULATOR EXPLORATION AND DISCOVERY

Residuals, Correlation Coefficients, and Goodness of Fit



When using technology to calculate a regression equation, we must avoid relying on the correlation coefficient as the sole indicator of how well a model fits the data. It is actually possible for a regression to have a high r-value (correlation coefficient) but fit the data very poorly. In addition, regression models are often used to predict future values, extrapolating well beyond the given set of data. Sometimes the model fails miserably when extended—even when it fits the data on the specified interval very well. This fact highlights (1) the importance of studying the behavior of the toolbox functions and other graphs, as we often need to choose between two models that seem to fit the given data; (2) the need to consider the context of the data; and (3) the need for an additional means to evaluate the "goodness of fit." For the third item, we investigate something called a **residual.** As the name implies, we are interested in the difference between the outputs generated by the equation model, and the actual data: equation value − data value = residual. Residuals that are fairly random and scattered indicate the equation model has done a good job of capturing the curvature of the data. If the residuals exhibit a detectable pattern of some sort, this often indicates trends in the data that the equation model did not account for.

Table 3.5

x	y
5	19
7.5	75
10	140
12.5	215
15	297
17.5	387
20	490

As a simplistic illustration, enter the data from Table 3.5 in L1 and L2, then graph the scatterplot. Most graphing calculators offer a window option specifically designed for scatterplots that will plot the points in an "ideal" window: ZOOM **9:ZoomStat** (Figure 3.82). Upon inspection, it appears the data could be linear with positive slope, quadratic with $a > 0$, or some other toolbox function with increasing behavior. Many of these forms of regression will *give a correlation coefficient in the high 90s*. This is where an awareness of the context is important. (1) Do we expect the data to increase steadily over time (linear data)? (2) Do we expect the rate of change (the growth rate) to increase over time (quadratic data)? At what rate will values increase? (3) Do we expect the growth to increase dramatically with time (power or exponential regression)?

Figure 3.82

Running a linear regression **(LinReg L1, L2, Y_1)** gives the equation in Figure 3.83, with a very high r-value. This model appears to fit the data very well, and will reasonably approximate the data points within the interval. But could we use this model to accurately predict future values (do we expect the outputs to grow indefinitely at a linear rate)?

In some cases, the answer will be clear from the context. Other times the decision is more difficult and a study of the residuals can help. Most graphing calculators provide a residual function [2nd STAT **(LIST)**(›)**(OPS)** 7: **ΔList**], but to help you understand more exactly what residuals are, for now we'll calculate them via function values. For this calculation, we go to the STAT ENTER (**EDIT**) screen. In the header of L3 (List3), input **Y_1(L1) − L2** ENTER (Figure 3.84), which will evaluate the function at the input values listed in L1, compute the difference between these outputs and the data in L2, and place the results in L3. Scrolling through the residuals reveals a distinct lack of randomness, as there is a large interval where outputs are continuously positive (Figure 3.85).

Figure 3.83

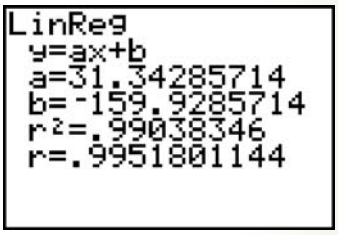


Figure 3.84

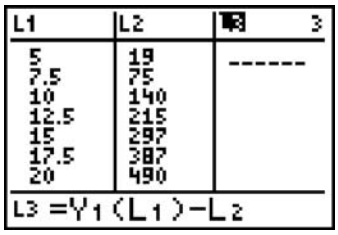

Figure 3.85

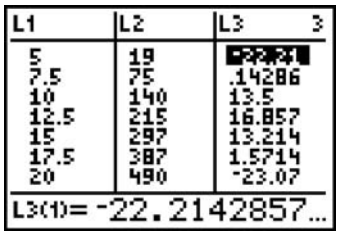

Figure 3.86

We can also analyze the residuals *graphically* by going to the 2nd Y= (**STATPLOT**) screen to activate **2:PLOT2,** setting it up to recognize L1 and L3 as the **XList** and **YList** respectively (Figure 3.86). After deactivating all other plots and functions, pressing ZOOM 9:**ZoomStat** gives Figure 3.87 shown, with the residuals following a definite (quadratic) pattern. Performing the same sequence of steps using quadratic regression results in a higher correlation coefficient and an increased randomness in residuals (Figures 3.88 and 3.89), with the residuals appearing to increase over time.

Figure 3.87

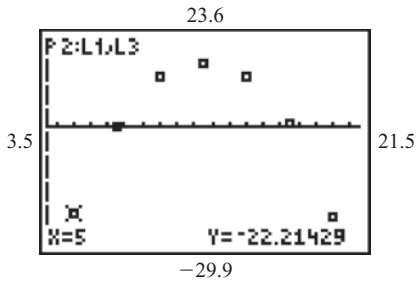

Figure 3.88

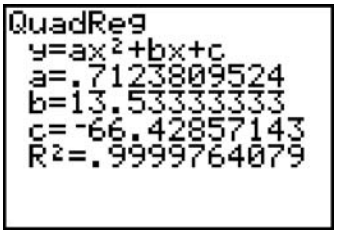

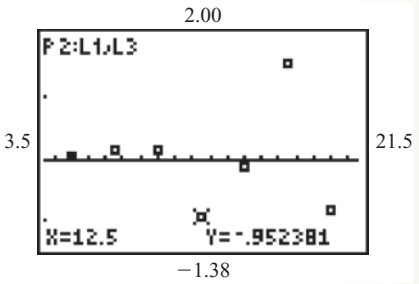

Figure 3.89

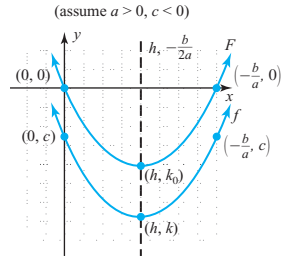
Exercise 1: As part of a science lab, students are asked to determine the relationship between the length of a pendulum and the time it takes to complete one back-and-forth cycle, called its *period*. They tie a 500-g weight to 10 different lengths of string, suspend them from a doorway, and collect the data shown in Table 3.6.

a. Use a combination of the context, the correlation coefficient, and an analysis of the residuals to determine whether a linear, quadratic, or power model is most appropriate for the data. State the *r*-value of each regression and justify your final choice of equation model.

b. According to the data, what would be the period of a pendulum with a 90-cm length? A 150-cm length?



c. If the period was 1.6 sec, how long was the pendulum? If the period were 2 sec, how long was the pendulum?

Table 3.6

Length (cm)	Time (sec)
12	0.7
20	0.9
28	1.09
36	1.24
44	1.35
52	1.55
60	1.64
68	1.73
76	1.80
84	1.95

STRENGTHENING CORE SKILLS

Base Functions and Quadratic Graphs

Certain transformations of quadratic graphs offer an intriguing alternative to graphing these functions by completing the square. In many cases, the process is less time consuming and ties together a number of basic concepts. To begin, we note that for $f(x) = ax^2 + bx + c$, $F(x) = ax^2 + bx$ is called the **base function** or *the original function less the constant term.* By comparing $f(x)$ with $F(x)$, four things are immediately apparent: (1) F and f share the same axis of symmetry since one is a vertical shift of the other; (2) the x-intercepts of F can be found by factoring; (3) the axis of symmetry is simply the average value of the x-intercepts; $h = \dfrac{x_1 + x_2}{2}$; and (4) the vertices of F and f differ only by the constant c. Consider these vertices to be (h, k_0) and (h, k), respectively, with $k = k_0 + c$. Knowing the vertex of *any* parabola is $\left(\dfrac{-b}{2a}, f\left(\dfrac{-b}{2b}\right)\right)$, we evaluate the base function at $h = \dfrac{x_1 + x_2}{2} = \dfrac{-b}{2a}$ and find that for the base function, $F\left(\dfrac{-b}{2a}\right) = -ah^2$:

$$F(x) = ax^2 + bx \qquad \text{original function}$$

$$F\left(-\frac{b}{2a}\right) = a\left(-\frac{b}{2a}\right)^2 + b\left(-\frac{b}{2a}\right) \qquad \text{substitute } -\frac{b}{2a} \text{ for } x$$

$$= \frac{b^2}{4a} - \frac{b^2}{2a} = \frac{b^2 - 2b^2}{4a} \text{ or } \frac{-b^2}{4a} \qquad \text{multiply and combine terms}$$

$$= \frac{-b^2}{4a} \cdot \frac{a}{a} \qquad \text{multiply by } \frac{a}{a}$$

$$= -a\left(\frac{b}{2a}\right)^2 \qquad \text{rearrange factors}$$

From $h = -\dfrac{b}{2a}$, we have $-h = \dfrac{b}{2a}$ and it follows that

$$F\left(-\frac{b}{2a}\right) = -a(-h)^2 \qquad \text{substitute } -h \text{ for } \frac{b}{2a}$$

$$= -ah^2 \qquad (-h)^2 = h^2$$

This verifies the vertex of F is (h, k_0), where $k_0 = -ah^2$.

It's significant to note that the vertex of both $F(x)$ and $f(x)$ can now be determined *using only elementary operations on the single value* h, since $k_0 = -ah^2$ and $k = k_0 + c$. By setting $y = 0$ in the quadratic equation $y = a(x - h)^2 + k$ and solving for x_1 we get the vertex/intercept formula, which can be used to find the roots of f with no further calculations: $x = h \pm \sqrt{-\dfrac{k}{a}}$. Finally, this approach enables easy access to the exact form of the roots, even when they happen to be irrational or complex (no quadratic formula needed). Several examples follow, with the actual graphs left to the student—only the process is illustrated here.

Illustration 1 ▶ Graph $f(x) = x^2 - 10x + 17$ and locate its zeroes (if they exist).

Solution ▶ For $F(x) = x^2 - 10x$, the zeroes/x-intercepts are $(0, 0)$ and $(10, 0)$ by inspection, with $h = 5$ (halfway point) as the axis of symmetry. Noting $a = 1$ and $c = 17$, the vertex of F is at $(h, -ah^2)$ or $(5, -25)$. After adding 17 units to the y-coordinates of the points from F, we find the y-intercept for f is $(0, 17)$, its "symmetric point" is $(10, 17)$, and the vertex is at $(5, -8)$. The x-intercepts of f are $(h \pm \sqrt{-k}, 0)$ or $(5 \pm \sqrt{8}, 0)$.✓

Illustration 2 ▶ Graph $f(x) = x^2 + 7x - 15$ and locate its zeroes (if they exist).

Solution ▶ For $F(x) = x^2 + 7x$, the zeroes are (0, 0) and (−7, 0) by inspection, with $h = \frac{-7}{2}$ as the axis of symmetry. Noting $a = 1, c = -15$, and $(\frac{-7}{2})^2 = \frac{49}{4}$ or 12.25, the vertex of F is (−3.5, −12.25). After subtracting 15 units from the y-coordinates of the points from F, we find the y-intercept for f is (0, −15), its "symmetric point" is (−7, −15), and the vertex is at (−3.5, −27.25). The x-intercepts of f are $(-3.5 \pm \sqrt{27.25}, 0)$.✓

Even when $a \neq 1$ the method lends a measure of efficiency to graphing quadratic functions, as shown in Illustration 3.

Illustration 3 ▶ Graph $f(x) = -2x^2 + 5x - 4$ and locate its zeroes (if they exist).

Solution ▶ For $F(x) = -2x^2 + 5x$, the zeroes are (0, 0) and $(\frac{5}{2}, 0)$ by inspection, with $h = \frac{5}{4}$ as the halfway point and axis of symmetry. Noting $a = -2$ and $c = -4$, the vertex of F is at $(\frac{5}{4}, \frac{25}{8})$. After subtracting $4 = \frac{32}{8}$ units from the y-coordinates of the points from F, we find the y-intercept for f is (0, −4), its "symmetric point" is $(\frac{5}{2}, -4)$, and the vertex is at $(\frac{5}{4}, \frac{-7}{8})$. The roots of f are $x = \frac{5}{4} \pm \sqrt{\frac{-7}{16}} = \frac{5}{4} \pm \frac{\sqrt{7}}{4}i$✓, showing the graph has no x-intercepts.

Use this method for graphing quadratic functions to sketch a complete graph of the following functions. Find and clearly indicate the axis of symmetry, vertex, x-intercept(s), and the y-intercept along with its "symmetric point."

Exercise 1: $f(x) = x^2 + 2x - 7$

Exercise 2: $g(x) = x^2 + 5x + 9$

Exercise 3: $h(x) = x^2 - 6x + 11$

Exercise 4: $H(x) = -x^2 + 10x - 17$

Exercise 5: $p(x) = 2x^2 + 12x + 21$

Exercise 6: $q(x) = 2x^2 - 7x + 8$

CUMULATIVE REVIEW CHAPTERS 1–3

1. Solve for R: $\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$

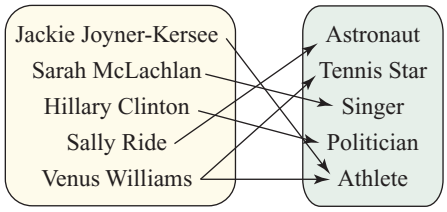
2. Solve for x: $\frac{2}{x+1} + 1 = \frac{5}{x^2 - 1}$

3. Factor the expressions:

a. $x^3 - 1$ **b.** $x^3 - 3x^2 - 4x + 12$

4. Solve using the quadratic formula. Write answers in both exact and approximate form: $2x^2 + 4x + 1 = 0$.

5. Solve the following inequality: $x + 3 < 5$ *or* $5 - x < 4$.



6. Name the eight toolbox functions, give their equations, then draw a sketch of each.

7. Use substitution to verify that $x = 2 - 3i$ is a solution to $x^2 - 4x + 13 = 0$.

8. Given $f(x) = 3x^2 - 6x$ and $g(x) = x - 2$ find: $(f \cdot g)(x)$, $(f \div g)(x)$, and $(g \circ f)(-2)$.

9. As part of a study on traffic conditions, the mayor of a small city tracks her driving time to work each day for six months and finds a linear and increasing relationship. On day 1, her drive time was 17 min. By day 61 the drive time had increased to 28 min. Find a linear function that models the drive time and use it to estimate the drive time on day 121, if the trend continues. Explain what the slope of the line means in this context.

10. Does the relation shown represent a function? If not, discuss/explain why not.

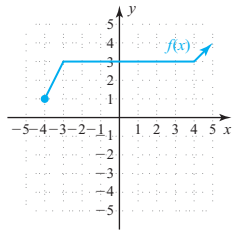
11. The data given shows the profit of a new company for the first 6 months of business, and is closely modeled by the function $p(m) = 1.18x^2 - 10.99x + 4.6$, where $p(m)$ is the profit earned in month m. Assuming this trend continues, use this function to find the first month a profit will be earned ($p > 0$).

Exercise 11

Month	Profit (1000s)
1	−5
2	−13
3	−18
4	−20
5	−21
6	−19

12. Graph the function $g(x) = \dfrac{-1}{(x+2)^2} + 3$ using transformations of a basic function.

13. Given $f(x) = x^2$ and $g(x) = x^3$, use the formula for average rate of change to determine which of these functions is increasing faster in the intervals:



a. [0.5, 0.6] **b.** [1.5, 1.6].

14. Graph $f(x) = x^2 - 4x + 7$ by completing the square, then state intervals where:

a. $f(x) \geq 0$ **b.** $f(x)\uparrow$

15. Given the graph of the general function $f(x)$ shown, graph $F(x) = -f(x+1) + 2$.

Exercise 15

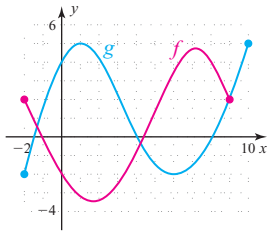
16. Graph the piecewise-defined function given:

$$f(x) = \begin{cases} -3 & x < -1 \\ x & -1 \leq x \leq 1 \\ 3x & x > 1 \end{cases}$$

17. Y varies directly with X and inversely with the square of Z. If $Y = 10$ when $X = 32$ and $Z = 4$, find X when $Z = 15$ and $Y = 1.4$.

18. Compute as indicated:

a. $(2 + 5i)^2$ **b.** $\dfrac{1 - 2i}{1 + 2i}$



19. For $f(x)$ and $g(x)$ as shown, use the graph given to determine the value of each expression. Assume each grid line represents 1 unit.

a. $f(4)$, $g(2)$, $(f \circ g)(2)$

b. $g(4)$, $f(8)$, and $(g \circ f)(8)$

c. $(fg)(0)$ and $\left(\dfrac{g}{f}\right)(0)$

d. $(f + g)(1)$ and $(g - f)(9)$

20. Solve using the quadratic formula. If solutions are complex, write them in $a + bi$ form.

$2x^2 + 20x = -51$

Exercises 21 through 25 require the use of a graphing calculator.

21. The value $x = 2.3 - 1.4i$ is a solution to one or more of the following quadratic equations. Use your calculator to determine which one(s).

$2x^2 - 9.2x + 14.5 = 0$ $1.1x^2 + 4.6x - 3.7 = 0$

$1.2x^2 = 5.52x - 8.7$ $11.2x = 3.7x^2 - 2.05$

22. Use a graphing calculator to find any local maximum and minimum values of the function $g(x) = -0.2x^3 + 2.5x - 4$. Round to the nearest hundredth if necessary.

23. Use the quadratic regression feature of a graphing calculator to find the equation that contains the points $(-0.5, 8.5)$, $(1, 8.5)$, and $(1.5, 11.5)$.

24. Use a graphing calculator to find the zeroes of the function $h(x) = 4.3x - 0.9x^2$. Round to the nearest hundredth if necessary.

25. State the domain of $y = \dfrac{10x + 1}{x^2 - 0.04}$ using interval notation. Use the **TABLE** feature to verify your answer.

CONNECTIONS TO CALCULUS

In Section 3.6, we noted the difference quotient $\frac{f(x+h)-f(x)}{h}$ was actually a formula for the *average rate of change* of a function f. In calculus, a study of very small differences investigates what happens to this quotient as the difference between h and 0 becomes very small (as h approaches 0: $h \to 0$). This investigation is closely linked to the concept of instantaneous rates of change. Also, from our work in Chapter 2, we'll briefly look at how transformations of basic functions and the area under a curve will play significant roles in our future studies.

Rates of Change and the Difference Quotient

In Exercise 53 of Section 3.4, the height of an arrow shot vertically into the air was modeled by the function $f(t) = -16t^2 + 192t$ (the general function notation is used here). Calculating the average rate of change using $\frac{f(t_2)-f(t_1)}{t_2-t_1}$, we can find the average velocity of the arrow for any specified interval of time [see Exercise 53(c)]. To consider the velocity of the arrow at a *precise instant*, we apply the difference quotient $\frac{f(t+h)-f(t)}{h}$ to this function, and investigate what happens as h becomes very small ($h \to 0$). In this process, we note that while h may become infinitely *close* to zero, it never takes on a value of 0.

EXAMPLE 1 ▶ **Applying the Difference Quotient to a Polynomial Function**

For the function $f(t) = -16t^2 + 192t$ modeling the height of an arrow, apply the difference quotient to $f(t)$ and simplify the result. Then approximate the velocity of the arrow at the moment $t = 2$, by investigating what happens as $h \to 0$.

Solution ▶ For $f(t) = -16t^2 + 192t$, $f(t+h) = -16(t+h)^2 + 192(t+h)$.

$$= -16(t^2 + 2th + h^2) + 192t + 192h$$
$$= -16t^2 - 32th - 16h^2 + 192t + 192h.$$

The resulting difference quotient is

$$\frac{f(t+h)-f(t)}{h} = \frac{(-16t^2 - 32th - 16h^2 + 192t + 192h) - (-16t^2 + 192t)}{h}$$
$$= \frac{-16t^2 - 32th - 16h^2 + 192t + 192h + 16t^2 - 192t}{h}$$
$$= \frac{-32th - 16h^2 + 192h}{h}$$
$$= \frac{h(-32t - 16h + 192)}{h}$$

For any value of $h \neq 0$, however small, $\frac{h}{h} = 1$ and we obtain

$$= -32t - 16h + 192$$

When $t = 2$, the expression becomes $-32(2) - 16h + 192 = \mathbf{128 - 16h}$, and our investigation shows that as $h \to 0$, the velocity of the arrow approaches 128 ft/sec.

Now try Exercises 1 through 4 ▶

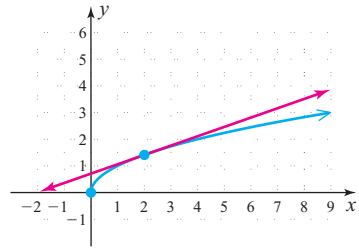
Other real-world applications rely heavily on the ability to apply the difference quotient to a variety of functions, and simplify the result. In all cases, remember that the difference quotient represents a *rate of change,* which appears graphically as the slope of a secant line.

EXAMPLE 2 ▶ Applying the Difference Quotient to a Radical Function

Apply the difference quotient to $f(x) = \sqrt{x}$ and simplify the result. Then consider the slope of a line drawn tangent to the graph of f at $x = 2$, by investigating what happens as $h \to 0$.

Solution ▶ For $f(x) = \sqrt{x}$, $f(x + h) = \sqrt{x + h}$, giving the difference quotient $\dfrac{\sqrt{x + h} - \sqrt{x}}{h}$.

Note that multiplying the numerator and denominator by $\sqrt{x + h} + \sqrt{x}$ will eliminate the radicals in the numerator, since $(A + B)(A - B) = A^2 - B^2$. This will "free up" the terms in the numerator and we then have



$$\frac{(\sqrt{x + h} - \sqrt{x})}{h}\frac{(\sqrt{x + h} + \sqrt{x})}{(\sqrt{x + h} + \sqrt{x})} = \frac{(x + h) - x}{h(\sqrt{x + h} + \sqrt{x})} \qquad (A - B)(A + B) = A^2 - B^2$$

$$= \frac{h}{h(\sqrt{x + h} + \sqrt{x})} \qquad \text{simplify}$$

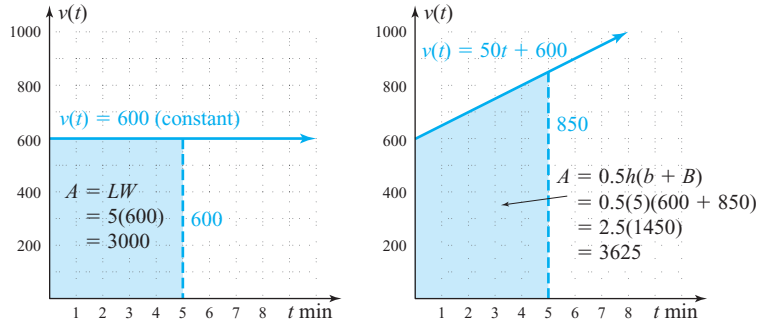
For any value of $h \neq 0$, however small, $\dfrac{h}{h} = 1$ and we obtain

$$= \frac{1}{\sqrt{x + h} + \sqrt{x}} \qquad \frac{h}{h} = 1,\ h \neq 0$$

When $x = 2$, the expression becomes $\dfrac{1}{\sqrt{2 + h} + \sqrt{2}}$ and our investigation shows that as $h \to 0$, the slope of the tangent line approaches $\dfrac{1}{2\sqrt{2}} \approx 0.35$. The graph of $y = \sqrt{x}$ along with an approximation for the tangent line at $x = 2$ are shown in the figure. Note that for values of x close to zero, the tangent line will be much steeper. Verify this using $x = 1$, $x = 0.1$, and $x = 0.01$.

Now try Exercises 5 through 8 ▶

In Example 1, we simplified the difference quotient using a binomial square and the distributive property. In Example 2, the needed skills involved working with radicals and rationalizing the numerator. In other cases, the algebra needed may involve complex fractions, binomial powers, trigonometric identities, or other skills.



Transformations and the Area Under a Curve

The transformations of basic graphs studied in Chapter 2 can help to illustrate some important topics in calculus. One of these involves a simple computing of the area between the graph of a function and the x-axis, between stipulated boundaries.

EXAMPLE 3 ▶ Using the Area Under a Graph to Determine Distance Covered

Consider a jogger who is running at a steady pace of 600 ft/min (about 7 mph). Represent this graphically and use the result to determine the distance run if she continues this pace for 5 min.

Solution ▶ Graphically her running speed is given by the horizontal line $v(t) = 600$, where $v(t)$ represents the velocity at time t in minutes, with minutes scaled on the horizontal axis. Note this creates a rectangular shape with an area that is numerically the same as the distance run ($A = LW$ corresponds to $D = RT$), which turns out to be 3000 ft. This is not a coincidence, and in fact, this area represents the total distance run *even when the velocity is not constant*. If these were the last 5 min of the race, she might increase her speed (begin her final kick) in order to overtake the runners ahead of her. If she increases her velocity at a rate of 50 ft/min, the equation becomes $v(t) = 50t + 600$, and the graphical model for her velocity is a line with slope 50 and y-intercept (0, 600). Since her velocity is increasing, it seems reasonable that she covers a greater distance in 5 min, and sure enough we find she covers a distance of 3625 ft (the area of the trapezoid is numerically the same as the distance run).

Now try Exercises 9 through 12 ▶

This very simple idea has a number of powerful real-world applications, because the principle holds *even when the velocity function is nonlinear*. Even more important, this principle holds for other rate of change relationships as well. For example, power consumption is the rate of change of energy, and if we have a graph representing the power consumption in an office building, the area under this curve will represent the total amount of energy consumed!

Connections to Calculus Exercises

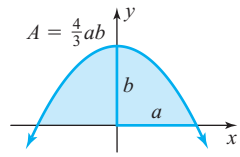
For Exercises 1 through 8, (a) apply the difference quotient to the functions given and simplify the result, then (b) find the value that the slope of the tangent line approaches when $x = 2$, by investigating what happens as $h \to 0$.

1. $f(x) = -3x + 5$

2. $g(x) = \frac{2}{3}x - 7$

3. $d(x) = x^2 - 3x$

4. $r(x) = -2x^2 + 3x + 7$



5. $f(x) = \frac{1}{x}$

6. $g(x) = \frac{3}{x + 1}$

7. $d(x) = \frac{1}{2x^2}$

8. $r(x) = x^3 - 2x - 2$

To elude a hungry bird, a crawling insect may vary its speed. Suppose the velocity of the insect (in ft/sec) for an 8-sec time period ($t = 0$ to $t = 8$) is modeled by the following functions. Draw an accurate graph (use transformations of a basic graph as needed) in each case, and use the graph and basic geometry to determine the total distance traveled by the insect. For Exercise 12, the area of a right parabolic region is required, and the formula is given here.

9. $v(t) = 3$

10. $v(t) = t + 3$

11. $v(t) = -|t - 4| + 7$

12. $v(t) = -\frac{1}{2}(t - 4)^2 + 11$

CHAPTER CONNECTIONS

In a study of demographics, the population density of a city and its surrounding area is measured using a unit called *people per square mile*. The population density is much greater near the city's center, and tends to decrease as you move out into suburban and rural areas. The density can be modeled using the formula $D(x) = \dfrac{ax}{x^2 + b}$, where $D(x)$ represents the density at a distance of x mi from the center of a city, and a and b are constants related to a particular city and its sprawl. Using this equation, city planners can determine how far from the city's center the population drops below a certain level, and answer other important questions to help plan for future growth.

▶ This application appears as Exercise 63 in Section 4.4.

Connections to Calculus

In Chapters 2 and 3, we were able to find the maximum or minimum value of a parabola and other elementary functions. In a calculus course, certain techniques are developed that enable us to find these extreme values for almost any function. The ability to graph functions will play an important role in this development, as well as the skills necessary to solve a variety of equation types. These are explored in the *Connections to Calculus* feature for Chapter 4.

4.1 Synthetic Division; the Remainder and Factor Theorems

LEARNING OBJECTIVES

In Section 4.1 you will see how we can:

- ❑ **A.** Divide polynomials using long division and synthetic division
- ❑ **B.** Use the remainder theorem to evaluate polynomials
- ❑ **C.** Use the factor theorem to factor and build polynomials
- ❑ **D.** Solve applications using the remainder theorem

To find the zero of a linear function, we can use properties of equality to isolate x. To find the zeroes of a quadratic function, we can factor or use the quadratic formula. To find the zeroes of higher degree polynomials, we must first develop additional tools, including synthetic division and the remainder and factor theorems. These will help us write a higher degree polynomial in terms of linear and quadratic polynomials, whose zeroes can easily be found.

A. Long Division and Synthetic Division

To help understand **synthetic division** and its use as a mathematical tool, we first review the process of **long division.**

Long Division

Polynomial long division closely resembles the division of whole numbers, with the main difference being that *we group each partial product* in parentheses to prevent errors in subtraction.

EXAMPLE 1 ▶ **Dividing Polynomials Using Long Division**

Divide $x^3 - 4x^2 + x + 6$ by $x - 1$.

Solution ▶ The divisor is $(x - 1)$ and the dividend is $(x^3 - 4x^2 + x + 6)$. To find the first multiplier, we compute *the ratio of leading terms* from each expression. Here the ratio $\frac{x^3}{x}$ (from dividend / from divisor) shows our first multiplier will be "x^2," with $x^2(x - 1) = x^3 - x^2$.

$$x - 1\overline{)x^3 - 4x^2 + x + 6} \qquad x - 1\overline{)x^3 - 4x^2 + x + 6}$$

$$\underline{-(x^3 - x^2)} \text{ subtraction} \longrightarrow \underline{-x^3 + x^2} \text{ algebraic addition}$$

$$-3x^2 + x$$

At each stage, after writing the subtraction as algebraic addition (distributing the negative) we compute the sum in each column and "bring down" the next term. Each following multiplier is found as before, using the ratio $\frac{ax^k}{x}$ (next leading term / from divisor).

$$\begin{array}{rl}
 & x^2 - 3x - 2 \\
x - 1\overline{)x^3 - 4x^2 + x + 6} & \\
\underline{-(x^3 - x^2)} & \\
-3x^2 + x & \\
\text{next multiplier: } \frac{-3x^2}{x} = -3x \quad \underline{-(-3x^2 + 3x)} & -3x(x-1) = -3x^2 + 3x, \text{ subtract } -3x^2 + 3x \\
-2x + 6 & \text{algebraic addition, bring down next term} \\
\text{next multiplier: } \frac{-2x}{x} = -2 \quad \underline{-(-2x + 2)} & -2(x-1) = -2x + 2, \text{ subtract } -2x + 2 \\
4 & \text{algebraic addition, remainder is 4}
\end{array}$$

The result shows $\frac{x^3 - 4x^2 + x + 6}{x - 1} = x^2 - 3x - 2 + \frac{4}{x - 1}$, or after multiplying both sides by $x - 1$, $x^3 - 4x^2 + x + 6 = (x - 1)(x^2 - 3x - 2) + 4$.

Now try Exercises 7 through 12 ▶

The process illustrated is called the **division algorithm,** and like the division of whole numbers, the final result can be checked by multiplication.

dividend divisor quotient remainder

check: $x^3 - 4x^2 + x + 6 = (x - 1)(x^2 - 3x - 2) + 4$

$= (x^3 - 3x^2 - 2x - x^2 + 3x + 2) + 4$ divisor · quotient

$= (x^3 - 4x^2 + x + 2) + 4$ combine like terms

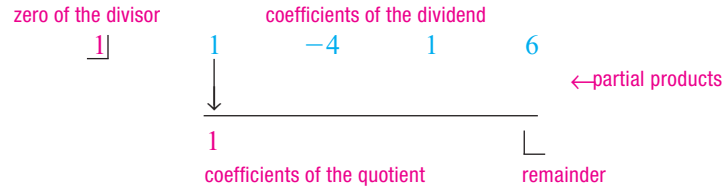
$= x^3 - 4x^2 + x + 6$ ✓ add remainder

In general, the division algorithm for polynomials says

Division of Polynomials

Given polynomials $p(x)$ and $d(x) \neq 0$, there exist unique polynomials $q(x)$ and $r(x)$ such that

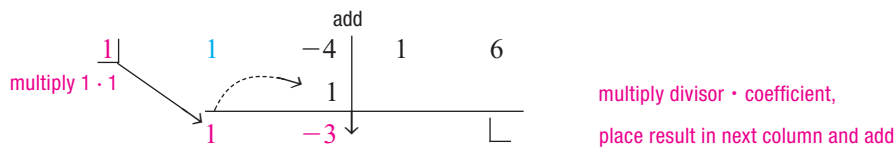
$$p(x) = d(x)q(x) + r(x),$$



where $r(x) = 0$ or the degree of $r(x)$ is less than the degree of $d(x)$.
Here, $d(x)$ is called the *divisor,* $q(x)$ is the *quotient,* and $r(x)$ is the *remainder.*

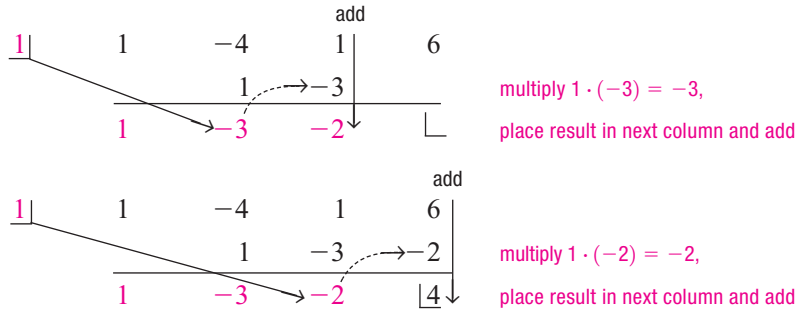
In other words, "a polynomial of greater degree can be divided by a polynomial of equal or lesser degree to obtain a quotient and a remainder." As with whole numbers, if the remainder is zero, the divisor is a factor of the dividend.

Synthetic Division

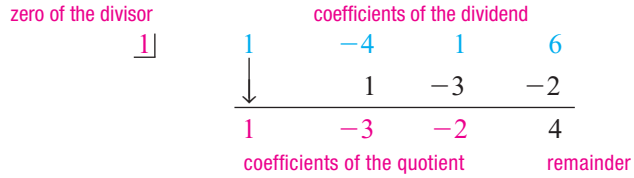


As the word "synthetic" implies, synthetic division not only *simulates* the long division process, but also condenses it and makes it more efficient *when the divisor is linear.* The process works by capitalizing on the repetition found in the division algorithm. First, the polynomials involved are written in decreasing order of degree, so the variable part of each term is unnecessary as we can let the *position of each coefficient* indicate the degree of the term. For the dividend from Example 1, 1 −4 1 6 would represent the polynomial $1x^3 - 4x^2 + 1x + 6$. Also, each stage of the algorithm involves a product of the divisor with the next multiplier, followed by a subtraction. These can likewise be computed using the coefficients only, as the degree of each term is still determined by its position. Here is the division from Example 1 in the synthetic division format. Note that we must use the *zero of the divisor* (as in $x = \frac{3}{2}$ for a divisor of $2x - 3$, or in this case, "1" from $x - 1 = 0$) and the coefficients of the dividend in the following format:

WORTHY OF NOTE
The process of synthetic division is only summarized here. For a complete discussion, see Appendix C.

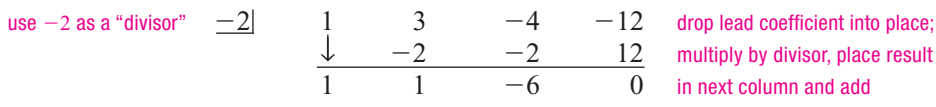


As this template indicates, the quotient and remainder will be read from the last row.



The arrow indicates we begin by "dropping the leading coefficient into place." We then multiply this coefficient by the "divisor," then place the result in the next column and add. Note that using the zero of the divisor enables us to *add in each column directly,* rather than subtracting then changing to algebraic addition as before.

In a sense, we "multiply in the diagonal direction," and "add in the vertical direction." Repeat the process until the division is complete.



The quotient is read from the last row by noting the remainder is 4, leaving the coefficients $1\ -3\ -2$, which translate back into the polynomial $x^2 - 3x - 2$. The final result is identical to that in Example 1, but the new process is more efficient, since all stages are actually computed on a single template as shown here:

EXAMPLE 2 ▶ Dividing Polynomials Using Synthetic Division

Compute the quotient of $(x^3 + 3x^2 - 4x - 12)$ and $(x + 2)$, then check your answer.

Solution ▶ Using -2 as our "divisor" (from $x + 2 = 0$), we set up the synthetic division template and begin.

The result shows $\dfrac{x^3 + 3x^2 - 4x - 12}{x + 2} = x^2 + x - 6$, with no remainder.

Check ▶

$$\begin{aligned} x^3 + 3x^2 - 4x - 12 &= (x + 2)(x^2 + x - 6) \\ &= (x^3 + x^2 - 6x + 2x^2 + 2x - 12) \\ &= x^3 + 3x^2 - 4x - 12 \checkmark \end{aligned}$$

Now try Exercises 13 through 20 ▶

Note that in synthetic division, the degree of $q(x)$ will always be one less than $p(x)$, since the process requires a linear divisor (degree 1).

Since the division process is so dependent on the place value (degree) of each term, polynomials such as $2x^3 + 3x + 7$, which has no term of degree 2, must be written using a zero *placeholder:* $2x^3 + \mathbf{0x^2} + 3x + 7$. This ensures that like place values "line up" as we carry out the division.

EXAMPLE 3 ▶ **Dividing Polynomials Using a Zero Placeholder**

Compute the quotient $\dfrac{2x^3 + 3x + 7}{x - 3}$ and check your answer.

Solution ▶ use 3 as a "divisor"

$$\begin{array}{r|cccc} 3 & 2 & 0 & 3 & 7 \\ & \downarrow & 6 & 18 & 63 \\ \hline & 2 & 6 & 21 & 70 \end{array}$$

note place holder **0** for "x^2" term

The result shows $\dfrac{2x^3 + 3x + 7}{x - 3} = 2x^2 + 6x + 21 + \dfrac{70}{x - 3}$. Multiplying by $x - 3$ gives

$$2x^3 + 3x + 7 = (2x^2 + 6x + 21)(x - 3) + 70$$

Check ▶

$$\begin{aligned} 2x^3 + 3x + 7 &= (x - 3)(2x^2 + 6x + 21) + 70 \\ &= (2x^3 + 6x^2 + 21x - 6x^2 - 18x - 63) + 70 \\ &= 2x^3 + 3x + 7 \checkmark \end{aligned}$$

Now try Exercises 21 through 30 ▶

WORTHY OF NOTE

Many corporations now pay their employees monthly to save on payroll costs. If your monthly salary was \$2037/mo, but you received a check for only \$237, would you complain? Just as placeholder zeroes ensure the correct value of each digit, they also ensure the correct valuation of each term in the division process.

As noted earlier, for synthetic division the divisor must be a linear polynomial and the zero of this divisor is used. This means for the quotient $\dfrac{2x^3 - 3x^2 - 8x + 12}{2x - 3}$, we have $2x - 3 = 0$, and $x = \dfrac{3}{2}$ would be used for synthetic division **[see Example 6(c)].** Finally, if the divisor is nonlinear, long division must be used.

EXAMPLE 4 ▶ **Division with a Nonlinear Divisor**

Compute the quotient: $\dfrac{2x^4 + x^3 - 7x^2 + 3}{x^2 - 2}$.

Solution ▶ Write the dividend as $2x^4 + x^3 - 7x^2 + \mathbf{0}x + 3$, and the divisor as $x^2 + \mathbf{0}x - 2$.

The quotient of leading terms gives $\dfrac{2x^4 \text{ from dividend}}{x^2 \text{ from divisor}} = 2x^2$ as our first multiplier.

$$\begin{array}{rl} & 2x^2 + x - 3 \\ x^2 + 0x - 2 \;\overline{)} & 2x^4 + x^3 - 7x^2 + 0x + 3 \\ \text{Multiply } 2x^2(x^2 + 0x - 2) & -(2x^4 + 0x^3 - 4x^2) \qquad \text{subtract (algebraic addition)} \\ & x^3 - 3x^2 + 0x \qquad \text{bring down next term} \\ \text{Multiply } x(x^2 + 0x - 2) & -(x^3 + 0x^2 - 2x) \qquad \text{subtract (algebraic addition)} \\ & -3x^2 + 2x + 3 \qquad \text{bring down next term} \\ \text{Multiply } -3(x^2 + 0x - 2) & -(-3x^2 + 0x + 6) \qquad \text{subtract (algebraic addition)} \\ & 2x - 3 \qquad \text{remainder is } 2x - 3 \end{array}$$

Since the degree of $2x - 3$ (degree 1) is less than the degree of the divisor (degree 2), the process is complete.

$$\frac{2x^4 + x^3 - 7x^2 + 3}{x^2 - 2} = (2x^2 + x - 3) + \frac{2x - 3}{x^2 - 2}$$

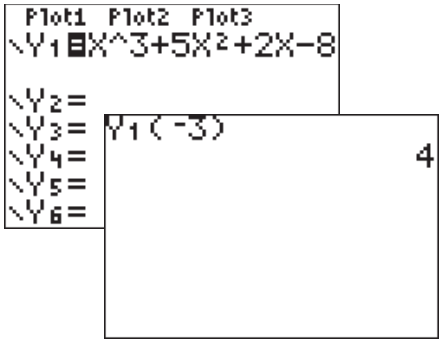
Now try Exercises 31 through 34 ▶

☑ **A.** You've just seen how we can divide polynomials using long division and synthetic division

Note that we elected to keep the solution to Example 4 in the form $\frac{p(x)}{d(x)} = q(x) + \frac{r(x)}{d(x)}$, instead of multiplying both sides by $d(x)$.

B. The Remainder Theorem

In Example 2, we saw that $(x^3 + 3x^2 - 4x - 12) \div (x + 2) = x^2 + x - 6$, with remainder zero. Similar to whole number division, this means $x + 2$ must be a factor of $x^3 + 3x^2 - 4x - 12$, a fact made clear as we checked our answer: $x^3 + 3x^2 - 4x - 12 = (x + 2)(x^2 + x - 6)$. Now consider the functions $p(x) = x^3 + 5x^2 + 2x - 8$, $d(x) = x + 3$, and their quotient $\frac{p(x)}{d(x)} = \frac{x^3 + 5x^2 + 2x - 8}{x + 3}$. Using -3 as the divisor in synthetic division gives



use -3 as a "divisor" -3

	1	5	2	−8
	↓	−3	−6	12
	1	2	−4	4

This shows $x + 3$ is *not* a factor of $p(x)$, since it didn't divide evenly (the remainder is not zero). However, from the result $p(x) = (x + 3)(x^2 + 2x - 4) + 4$, we make a remarkable observation—if we evaluate $p(-3)$, *the quotient portion becomes zero,* showing $p(-3) = 4$ (the remainder).

$$\begin{aligned} p(-3) &= (-3 + 3)[(-3)^2 + 2(-3) - 4] + 4 \\ &= (\mathbf{0})(-1) + 4 \\ &= 4 \end{aligned}$$

Figure 4.1

This result can be verified by evaluating $p(-3)$ in its original form (also see Figure 4.1):

$$\begin{aligned} p(x) &= x^3 + 5x^2 + 2x - 8 \\ p(-3) &= (-3)^3 + 5(-3)^2 + 2(-3) - 8 \\ &= -27 + 45 + (-6) - 8 \\ &= 4 \end{aligned}$$

The result is no coincidence, and illustrates the conclusion of the **remainder theorem.**

The Remainder Theorem

If a polynomial $p(x)$ is divided by $(x - c)$ using synthetic division, the remainder is equal to $p(c)$.

This gives us a powerful tool for evaluating polynomials. Where a direct evaluation involves powers of numbers and a long series of calculations, synthetic division reduces the process to simple products and sums.

EXAMPLE 5 ▶ **Using the Remainder Theorem to Evaluate Polynomials**

Use the remainder theorem to find $p(-5)$ for $p(x) = x^4 + 3x^3 - 8x^2 + 5x - 6$. Verify the result using a substitution.

Solution ▶

use -5 as a "divisor" -5

	1	3	−8	5	−6
		−5	10	−10	25
	1	−2	2	−5	19

The result shows $p(-5) = 19$.

Verification using algebra

$$\begin{aligned} p(-5) &= (-5)^4 + 3(-5)^3 - 8(-5)^2 + 5(-5) - 6 \\ &= 625 - 375 - 200 - 25 - 6 \\ &= 625 - 606 \\ &= 19 \end{aligned}$$

Verification using technology

Now try Exercises 35 through 44 ▶

B. You've just seen how we can use the remainder theorem to evaluate polynomials

Since $p(-5) = 19$, we know $(-5, 19)$ must be a point of the graph of $p(x)$. The ability to quickly evaluate polynomial functions using the remainder theorem will be used extensively in the sections that follow.

C. The Factor Theorem

As a consequence of the remainder theorem, when $p(x)$ is divided by $x - c$ and the remainder is 0, $p(c) = 0$ and c is a zero of the polynomial. The relationship between $x - c$, c, and $p(c) = 0$ are given in the **factor theorem.**

The Factor Theorem

For a polynomial $p(x)$,

1. If $p(c) = 0$, then $x - c$ is a factor of $p(x)$.
2. If $x - c$ is a factor of $p(x)$, then $p(c) = 0$.

The remainder and factor theorems often work together to help us find factors of higher degree polynomials.

EXAMPLE 6 ▶ Using the Factor Theorem to Find Factors of a Polynomial

Use the factor theorem to determine if

a. $x - 2$ **b.** $x + 1$ **c.** $3x - 2$

are factors of $p(x) = 3x^4 - 2x^3 - 21x^2 + 32x - 12$.

Solution ▶

a. If $x - 2$ is a factor, then $p(2)$ must be 0. Using the remainder theorem we have

$$\begin{array}{r|rrrrr} 2 & 3 & -2 & -21 & 32 & -12 \\ & \downarrow & 6 & 8 & -26 & 12 \\ \hline & 3 & 4 & -13 & 6 & \boxed{0} \end{array}$$

Since the remainder is zero, we know $p(2) = 0$ (remainder theorem) and $(x - 2)$ is a factor (factor theorem).

b. Similarly, if $x + 1$ is a factor, then $p(-1)$ must be 0.

$$\begin{array}{r|rrrrr} -1 & 3 & -2 & -21 & 32 & -12 \\ & \downarrow & -3 & 5 & 16 & -48 \\ \hline & 3 & -5 & -16 & 48 & \boxed{-60} \end{array}$$

Since the remainder is not zero, $(x + 1)$ is not a factor of p.

c. The zero of the divisor $3x - 2 = 0$ is $x = \frac{2}{3}$, and this value is used in the synthetic division.

$$\begin{array}{c|cccc} \frac{2}{3} & 3 & -2 & -21 & 32 & -12 \\ & \downarrow & 2 & 0 & -14 & 12 \\ \hline & 3 & 0 & -21 & 18 & \boxed{0} \end{array}$$

Since the remainder is zero, $p\left(\frac{2}{3}\right) = 0$ (remainder theorem) and $\left(x - \frac{2}{3}\right)$ is the related factor (factor theorem). The original factor $3x - 2$ is found by noting that the quotient polynomial $q(x) = 3x^3 - 21x + 18$ has a common factor of three, which will be factored out and applied to $x - \frac{2}{3}$. Starting with the partially factored form we have

$$\begin{aligned} p(x) &= \left(x - \frac{2}{3}\right)(3x^3 - 21x + 18) && \text{partially factored form} \\ &= \left(x - \frac{2}{3}\right)(3)(x^3 - 7x + 6) && \text{factor out 3} \\ &= (3x - 2)(x^3 - 7x + 6) && \text{multiply 3}\left(x - \frac{2}{3}\right) \end{aligned}$$

This form of simplification will always take place when the zero found using synthetic division is a fraction and the coefficients of the polynomial are integers.

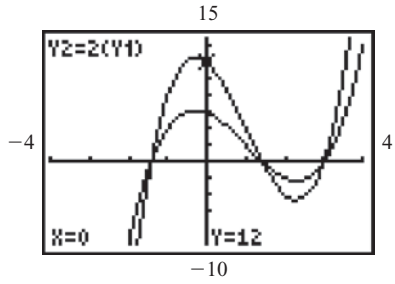
Now try Exercises 45 through 56 ▶

As a final note on Example 6, there should be no hesitation to use fractions in the synthetic division process if the given polynomial has integer coefficients. The fraction will be a zero only if all values in the quotient line are integers (i.e., all of the products and sums must be integers).

EXAMPLE 7 ▶ Building a Polynomial Using the Factor Theorem

A polynomial $p(x)$ has three zeroes at $x = 3$, $\sqrt{2}$, and $-\sqrt{2}$. Use the factor theorem to find the polynomial.

Solution ▶ Using the factor theorem, the factors of $p(x)$ must be $(x - 3)$, $(x - \sqrt{2})$, and $(x + \sqrt{2})$. Computing the product will yield the polynomial.



$$\begin{aligned} p(x) &= (x - 3)(x - \sqrt{2})(x + \sqrt{2}) \\ &= (x - 3)(x^2 - 2) \\ &= x^3 - 3x^2 - 2x + 6 \end{aligned}$$

Now try Exercises 57 through 64 ▶

Actually, the result obtained in Example 7 is not unique, since any polynomial of the form $a(x^3 - 3x^2 - 2x + 6)$ will also have the same three zeroes for $a \in \mathbb{R}$.

Figure 4.2 shows the graph of $Y_1 = p(x)$, as well as graph of $Y_2 = 2p(x)$. The only difference is $2p(x)$ has been vertically stretched. Likewise, the graph of $-1p(x)$ would be a vertical reflection, *but still with the same zeroes.* As in previous graph-to-equation exercises, finding a unique value for the leading coefficient a requires that we use a point (x, y) on the graph of p and substitute these values to solve for a. For Example 7, assume you were also told the graph contains the point $(1, 2)$, or $x = 1$, $p(1) = 2$. This would yield:

Figure 4.2

$$\begin{aligned} p(x) &= a(x^3 - 3x^2 - 2x + 6) && \text{original function} \\ p(1) &= a[1^3 - 3(1)^2 - 2(1) + 6] && \text{substitute 1 for } x \\ 2 &= 2a && \text{substitute 2 for } p(1), \text{ simplify} \\ 1 &= a && \text{result} \end{aligned}$$

Consistent with the graph shown, if the point $(1, 4)$ were specified instead, a like calculation would show $a = 2$.

EXAMPLE 8 ▶ **Finding Zeroes Using the Factor Theorem**

Given that 2 is a zero of $p(x) = x^4 + x^3 - 10x^2 - 4x + 24$, use the factor theorem to help find all other zeroes.

Solution ▶ Using synthetic division gives:

use 2 as a "divisor"

$$\begin{array}{c|ccccc} 2 & 1 & 1 & -10 & -4 & 24 \\ & \downarrow & 2 & 6 & -8 & -24 \\ \hline & 1 & 3 & -4 & -12 & 0 \end{array}$$

Since the remainder is zero, $(x - 2)$ is a factor and p can be written:

$$x^4 + x^3 - 10x^2 - 4x + 24 = (x - 2)(x^3 + 3x^2 - 4x - 12)$$

WORTHY OF NOTE

In Appendix A.4 we noted a third degree polynomial $ax^3 + bx^2 + cx + d$ is factorable if $ad = bc$. In Example 8, $1(-12) = 3(-4)$ and the polynomial is factorable.

Note the quotient polynomial can be factored by grouping to find the remaining factors of p.

$$\begin{aligned} x^4 + x^3 - 10x^2 - 4x + 24 &= (x - 2)(x^3 + 3x^2 - 4x - 12) && \text{group terms (in color)} \\ &= (x - 2)[x^2(x + 3) - 4(x + 3)] && \text{remove common factors from each group} \\ &= (x - 2)[(x + 3)(x^2 - 4)] && \text{factor common binomial} \\ &= (x - 2)(x + 3)(x + 2)(x - 2) && \text{factor difference of squares} \\ &= (x + 3)(x + 2)(x - 2)^2 && \text{completely factored form} \end{aligned}$$

The final result shows $(x - 2)$ is actually a repeated factor, and the remaining zeroes of p are -3 and -2.

C. You've just seen how we can use the factor theorem to factor and build polynomials

Now try Exercises 65 through 78 ▶

D. Applications

While the factor and remainder theorems are valuable tools for factoring higher degree polynomials, each has applications that extend beyond this use.

EXAMPLE 9 ▶ **Using the Remainder Theorem to Solve a Discharge Rate Application**

The *discharge rate* of a river is a measure of the river's water flow as it empties into a lake, sea, or ocean. The rate depends on many factors, but is primarily influenced by the precipitation in the surrounding area and is often seasonal. Suppose the discharge rate of the Shimote River was modeled by $D(m) = -m^4 + 22m^3 - 147m^2 + 317m + 150$, where $D(m)$ represents the discharge rate in thousands of cubic meters of water per second in month m ($m = 1 \rightarrow$ Jan).

a. What was the discharge rate in June (summer heat)?

b. Is the discharge rate higher in February (winter runoff) or October (fall rains)?

Solution ▶

a. To find the discharge rate in June, we evaluate D at $m = 6$.
Using the remainder theorem gives

6	−1	22	−147	317	150
	↓	−6	96	−306	66
	−1	16	−51	11	216

In June, the discharge rate is 216,000 m^3/sec.

b. For the discharge rates in February ($m = 2$) and October ($m = 10$), we have

2	−1	22	−147	317	150
	↓	−2	40	−214	206
	−1	20	−107	103	356

10	−1	22	−147	317	150
	↓	−10	120	−270	470
	−1	12	−27	47	620

The discharge rate during the fall rains in October is much higher: $620 > 356$.

D. You've just seen how we can solve applications using the remainder theorem

Now try Exercises 81 through 84 ▶

4.1 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. For _____ division, we use the _____ of the divisor to begin.

2. If the _____ is zero after division, then the _____ is a factor of the dividend.

3. If polynomial $P(x)$ is divided by a linear divisor of the form $x - c$, the remainder is identical to _____. This is a statement of the _____ theorem.

4. If $P(c) = 0$, then _____ must be a factor of $P(x)$. Conversely, if _____ is a factor of $P(x)$, then $P(c) = 0$. These are statements from the _____ theorem.

5. Discuss/Explain how to write the quotient and remainder using the last line from a synthetic division.

6. Discuss/Explain why (a, b) is a point on the graph of P, given b was the remainder after P was divided by $x - a$ using synthetic division.

▶ DEVELOPING YOUR SKILLS

Divide using long division. Write the result as dividend = (divisor)(quotient) + remainder.

7. $\dfrac{x^3 - 5x^2 - 4x + 23}{x - 2}$

8. $\dfrac{x^3 + 5x^2 - 17x - 26}{x + 7}$

9. $(2x^3 + 5x^2 + 4x + 17) \div (x + 3)$

10. $(3x^3 + 14x^2 - 2x - 37) \div (x + 4)$

11. $(x^3 - 8x^2 + 11x + 20) \div (x - 5)$

12. $(x^3 - 5x^2 - 22x - 16) \div (x + 2)$

Divide using synthetic division. Write answers in two ways: (a) $\frac{\text{dividend}}{\text{divisor}}$ = quotient + $\frac{\text{remainder}}{\text{divisor}}$, and (b) dividend = (divisor)(quotient) + remainder. For Exercises 13–18, check answers using multiplication.

13. $\dfrac{2x^2 - 5x - 3}{x - 3}$ **14.** $\dfrac{3x^2 + 13x - 10}{x + 5}$

15. $(x^3 - 3x^2 - 14x - 8) \div (x + 2)$

16. $(x^3 - 6x^2 - 24x - 17) \div (x + 1)$

17. $\dfrac{x^3 - 5x^2 - 4x + 23}{x - 2}$ **18.** $\dfrac{x^3 + 12x^2 + 34x - 9}{x + 7}$

19. $(2x^3 - 5x^2 - 11x - 17) \div (x - 4)$

20. $(3x^3 - x^2 - 7x + 27) \div (x - 1)$

Divide using synthetic division. Note that some terms of a polynomial may be "missing." Write answers as dividend = (divisor)(quotient) + remainder.

21. $(x^3 + 5x^2 + 7) \div (x + 1)$

22. $(x^3 - 3x^2 - 37) \div (x - 5)$

23. $(x^3 - 13x - 12) \div (x - 4)$

24. $(x^3 - 7x + 6) \div (x + 3)$

25. $\dfrac{3x^3 - 8x + 12}{x - 1}$ **26.** $\dfrac{2x^3 + 7x - 81}{x - 3}$

27. $(n^3 + 27) \div (n + 3)$

28. $(m^3 - 8) \div (m - 2)$

29. $(x^4 + 3x^3 - 16x - 8) \div (x - 2)$

30. $(x^4 + 3x^2 + 29x - 21) \div (x + 3)$

Compute each indicated quotient. Write answers in the form $\frac{\text{dividend}}{\text{divisor}}$ = quotient + $\frac{\text{remainder}}{\text{divisor}}$.

31. $\dfrac{2x^3 + 7x^2 - x + 26}{x^2 + 3}$ **32.** $\dfrac{x^4 + 3x^3 + 2x^2 - x - 5}{x^2 - 2}$

33. $\dfrac{x^4 - 5x^2 - 4x + 7}{x^2 - 1}$ **34.** $\dfrac{x^4 + 2x^3 - 8x - 16}{x^2 + 5}$

Use the remainder theorem to evaluate $P(x)$ as given.

35. $P(x) = x^3 - 6x^2 + 5x + 12$
a. $P(-2)$ **b.** $P(5)$

36. $P(x) = x^3 + 4x^2 - 8x - 15$
a. $P(-2)$ **b.** $P(3)$

37. $P(x) = 2x^3 - x^2 - 19x + 4$
a. $P(-3)$ **b.** $P(2)$

38. $P(x) = 3x^3 - 8x^2 - 14x + 9$
a. $P(-2)$ **b.** $P(4)$

39. $P(x) = x^4 - 4x^2 + x + 1$
a. $P(-2)$ **b.** $P(2)$

40. $P(x) = x^4 + 3x^3 - 2x - 4$
a. $P(-2)$ **b.** $P(2)$

41. $P(x) = 2x^3 - 7x + 33$
a. $P(-2)$ **b.** $P(-3)$

42. $P(x) = -2x^3 + 9x^2 - 11$
a. $P(-2)$ **b.** $P(-1)$

43. $P(x) = 2x^3 + 3x^2 - 9x - 10$
a. $P(\frac{3}{2})$ **b.** $P(-\frac{5}{2})$

44. $P(x) = 3x^3 + 11x^2 + 2x - 16$
a. $P(\frac{1}{3})$ **b.** $P(-\frac{8}{3})$

Use the factor theorem to determine if the factors given are factors of $f(x)$.

45. $f(x) = x^3 - 3x^2 - 13x + 15$
a. $(x + 3)$ **b.** $(x - 5)$

46. $f(x) = x^3 + 2x^2 - 11x - 12$
a. $(x + 4)$ **b.** $(x - 3)$

47. $f(x) = x^3 - 6x^2 + 3x + 10$
a. $(x + 2)$ **b.** $(x - 5)$

48. $f(x) = x^3 + 2x^2 - 5x - 6$

a. $(x - 2)$ **b.** $(x + 4)$

49. $f(x) = -2x^3 - x^2 + 12x - 9$

a. $(x + 3)$ **b.** $(2x - 3)$

50. $f(x) = 3x^3 - 19x^2 + 30x - 8$

a. $(3x - 1)$ **b.** $(x + 4)$

Use the factor theorem to show the given value is a zero of $P(x)$.

51. $P(x) = x^3 + 2x^2 - 5x - 6; x = -3$

52. $P(x) = x^3 + 3x^2 - 16x + 12; x = -6$

53. $P(x) = x^3 - 7x + 6; x = 2$

54. $P(x) = x^3 - 13x + 12; x = -4$

55. $P(x) = 9x^3 + 18x^2 - 4x - 8; x = \frac{2}{3}$

56. $P(x) = 5x^3 + 13x^2 - 9x - 9; x = -\frac{3}{5}$

A polynomial P with integer coefficients has the zeroes and degree indicated. Use the factor theorem to write the function in factored form and standard form.

57. $-2, 3, -5$; degree 3

58. $1, -4, 2$; degree 3

59. $-2, \sqrt{3}, -\sqrt{3}$; degree 3

60. $\sqrt{5}, -\sqrt{5}, 4$; degree 3

61. $-5, 2\sqrt{3}, -2\sqrt{3}$; degree 3

62. $4, 3\sqrt{2}, -3\sqrt{2}$; degree 3

63. $1, -2, \sqrt{10}, -\sqrt{10}$; degree 4

64. $\sqrt{7}, -\sqrt{7}, 3, -1$; degree 4

In Exercises 65 through 70, a known zero of the polynomial is given. Use the factor theorem to write the polynomial in completely factored form.

65. $P(x) = x^3 - 5x^2 - 2x + 24; x = -2$

66. $Q(x) = x^3 - 7x^2 + 7x + 15; x = 3$

67. $p(x) = x^4 + 2x^3 - 12x^2 - 18x + 27; x = -3$

68. $q(x) = x^4 + 4x^3 - 6x^2 - 4x + 5; x = 1$

69. $f(x) = 2x^3 + 11x^2 - x - 30; x = \frac{3}{2}$

70. $g(x) = 3x^3 + 2x^2 - 75x - 50; x = -\frac{2}{3}$

If $p(x)$ is a polynomial with rational coefficients and a leading coefficient of $a = 1$, the rational zeroes of p (if they exist) *must be factors of the constant term*. Use this property of polynomials with the factor and remainder theorems to factor each polynomial completely.

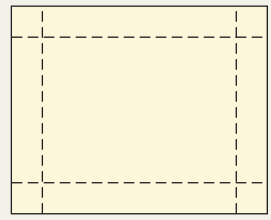
71. $p(x) = x^3 - 3x^2 - 9x + 27$

72. $p(x) = x^3 - 4x^2 - 16x + 64$

73. $p(x) = x^3 - 6x^2 + 12x - 8$

74. $p(x) = x^3 - 15x^2 + 75x - 125$

75. $p(x) = (x^2 - 6x + 9)(x^2 - 9)$



76. $p(x) = (x^2 - 1)(x^2 - 2x + 1)$

77. $p(x) = (x^3 + 4x^2 - 9x - 36)(x^2 + x - 12)$

78. $p(x) = (x^3 - 3x^2 + 3x - 1)(x^2 - 3x + 2)$

▶ WORKING WITH FORMULAS

Volume of an open box: $V(x) = 4x^3 - 84x^2 + 432x$

An open box is constructed by cutting square corners from a 24 in. by 18 in. sheet of cardboard and folding up the sides. Its volume is given by the formula shown, where x represents the length of the square cuts.

79. Given a volume of 640 in^3, use synthetic division and the remainder theorem to determine if the squares were 2-, 3-, 4-, or 5-in. squares and state the dimensions of the box. (*Hint:* Write as a function $V(x)$ and use synthetic division.)

80. Given the volume is 357.5 in^3, use synthetic division and the remainder theorem to determine if the squares were 5.5-, 6.5-, or 7.5-in. squares and state the dimensions of the box. (*Hint:* Write as a function $V(x)$ and use synthetic division.)

▶ APPLICATIONS

81. Tourist population: During the 12 weeks of summer, the population of tourists at a popular beach resort is modeled by the polynomial $P(w) = -0.1w^4 + 2w^3 - 14w^2 + 52w + 5$, where $P(w)$ is the tourist population (in 1000s) during week w. Use the remainder theorem to help answer the following questions.

a. Were there more tourists at the resort in week 5 ($w = 5$) or week 10? How many more tourists?

b. Were more tourists at the resort one week after opening ($w = 1$) or one week before closing ($w = 11$). How many more tourists?

c. The tourist population peaked (reached its highest) between weeks 7 and 10. Use the remainder theorem to determine the peak week.

82. Debt load: Due to a fluctuation in tax revenues, a county government is projecting a deficit for the next 12 months, followed by a quick recovery and the repayment of all debt near the end of this period. The projected debt can be modeled by the polynomial $D(m) = 0.1m^4 - 2m^3 + 15m^2 - 64m - 3$, where $D(m)$ represents the amount of debt (in millions of dollars) in month m. Use the remainder theorem to help answer the following questions.

a. Was the debt higher in month 5 ($m = 5$) or month 10 of this period? How much higher?

b. Was the debt higher in the first month of this period (one month into the deficit) or after the eleventh month (one month before the expected recovery)? How much higher?

c. The total debt reached its maximum between months 7 and 10. Use the remainder theorem to determine which month.

83. Volume of water: The volume of water in a rectangular, inground, swimming pool is given by $V(x) = x^3 + 11x^2 + 24x$, where $V(x)$ is the volume in cubic feet when the water is x ft high. (a) Use the remainder theorem to find the volume when $x = 3$ ft. (b) If the volume is 100 ft^3 of water, what is the height x? (c) If the maximum capacity of the pool is 1000 ft^3, what is the maximum depth (to the nearest integer)?

84. Amusement park attendance: Attendance at an amusement park depends on the weather. After opening in spring, attendance rises quickly, slows during the summer, soars in the fall, then quickly falls with the approach of winter when the park closes. The model for attendance is given by $A(m) = -\frac{1}{4}m^4 + 6m^3 - 52m^2 + 196m - 260$, where $A(m)$ represents the number of people attending in month m (in thousands). (a) Did more people go to the park in April ($m = 4$) or June ($m = 6$)? (b) In what month did maximum attendance occur? (c) When did the park close?

In these applications, synthetic division is applied in the usual way, treating k as an unknown constant.

85. Find a value of k that will make $x + 2$ a factor of $f(x) = x^3 - 3x^2 - 5x + k$.

86. Find a value of k that will make $x - 3$ a factor of $g(x) = x^3 + 2x^2 - 7x + k$.

87. For what value(s) of k will $x - 2$ be a factor of $p(x) = x^3 - 3x^2 + kx + 10$?

88. For what value(s) of k will $x + 5$ be a factor of $q(x) = x^3 + 6x^2 + kx + 50$?

▶ EXTENDING THE CONCEPT

89. To investigate whether the remainder and factor theorems can be applied when the coefficients or zeroes of a polynomial are complex, try using the factor theorem to find a polynomial with degree 3, whose zeroes are $x = 2i$, $x = -2i$, and $x = 3$. Then see if the result can be verified using the remainder theorem and these zeroes. What does the result suggest? **Also see Exercise 92.**

90. Since we use a base-10 number system, numbers like 1196 can be written in polynomial form as $p(x) = 1x^3 + 1x^2 + 9x + 6$, where $x = 10$. Divide $p(x)$ by $x + 3$ using synthetic division and write your answer as $\frac{x^3 + x^2 + 9x + 6}{x + 3} = \text{quotient} + \frac{\text{remainder}}{\text{divisor}}$. For $x = 10$, what is the value of quotient $+ \frac{\text{remainder}}{\text{divisor}}$? What is the result of dividing 1196 by $10 + 3 = 13$? What can you conclude?

91. The sum of the first n perfect cubes is given by the formula $S = \frac{1}{4}(n^4 + 2n^3 + n^2)$. Use the remainder theorem on S to find the sum of (a) the first three perfect cubes (divide by $n - 3$) and (b) the first five perfect cubes (divide by $n - 5$). Check results by adding the perfect cubes manually. To avoid working with fractions you can initially ignore the $\frac{1}{4}$ (use $n^4 + 2n^3 + n^2 + 0n + 0$), as long as you divide the remainder by 4.

92. Though not a direct focus of this course, the remainder and factor theorems, as well as synthetic division, *can also be applied using complex numbers*. Use the remainder theorem to show the value given is a zero of $P(x)$.

a. $P(x) = x^3 - 4x^2 + 9x - 36; x = 3i$

b. $P(x) = x^4 + x^3 + 2x^2 + 4x - 8; x = -2i$

c. $P(x) = -x^3 + x^2 - 3x - 5; x = 1 + 2i$

d. $P(x) = x^3 + 2x^2 + 16x + 32; x = -4i$

e. $P(x) = x^4 + x^3 - 5x^2 + x - 6; x = i$

f. $P(x) = -x^3 + x^2 - 8x - 10; x = 1 + 3i$

95. **(1.4)** The profit of a small business increased linearly from \$5000 in 2005 to \$12,000 in 2010. Find a linear function $G(t)$ modeling the growth of the company's profit (let $t = 0$ correspond to 2005).

96. **(3.4)** Given $f(x) = x^2 - 4x$, use the average rate of change formula to find $\frac{\Delta y}{\Delta x}$ in the interval $x \in [1.0, 1.1]$.

4.2 The Zeroes of Polynomial Functions

LEARNING OBJECTIVES

In Section 4.2 you will see how we can:

- ❑ **A.** Apply the fundamental theorem of algebra and the linear factorization theorem
- ❑ **B.** Use the intermediate value theorem to identify intervals containing a polynomial zero
- ❑ **C.** Find rational zeroes of a real polynomial function using the rational zeroes theorem
- ❑ **D.** Obtain more information on the zeroes of real polynomials using Descartes' rule of signs and the upper/lower bounds theorem
- ❑ **E.** Solve applications of polynomial functions

This section represents one of the highlights in the college algebra curriculum, because it offers a look at what many call *the big picture*. The ideas presented are the result of a cumulative knowledge base developed over a long period of time, and give a fairly comprehensive view of the study of polynomial functions.

A. The Fundamental Theorem of Algebra

From Section 3.1, we know the set of real numbers is a subset of the complex numbers. Because complex numbers are the "larger" set (containing all other number sets), properties and theorems about complex numbers are more powerful and far reaching than theorems about real numbers. In the same way, real polynomials are a subset of the complex polynomials, and the same principle applies.

Complex Polynomial Functions

A complex polynomial of degree n has the form

$$P(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_1 x^1 + a_0,$$

where $a_n, a_{n-1}, \cdots, a_1, a_0$ are complex numbers and $a_n \neq 0$.

Notice that real polynomials have the same form, but here $a_n, a_{n-1}, \ldots, a_1, a_0$ *represent complex numbers*. In 1799, Carl Friedrich Gauss (1777–1855) proved that *all* polynomial functions have zeroes, and that the number of zeroes is equal to the degree of the polynomial. The proof of this statement is based on a theorem that is the bedrock

WORTHY OF NOTE

Quadratic functions also belong to the larger family of **complex polynomial functions.** Since quadratics have a known number of terms, it is common to write the general form using the early letters of the alphabet: $P(x) = \boldsymbol{a}x^2 + \boldsymbol{b}x + \boldsymbol{c}$. For higher degree polynomials, the number of terms is unknown or unspecified, and the general form is written using subscripts on a single letter.

for a complete study of polynomial functions, and has come to be known as the **fundamental theorem of algebra.**

The Fundamental Theorem of Algebra

Every complex polynomial of degree $n \geq 1$ has at least one complex zero.

Although the statement may seem trivial, it allows us to draw two important conclusions. The first is that our search for a solution will not be fruitless or wasted—zeroes for *all* polynomial equations exist. Second, the fundamental theorem combined with the factor theorem enables us to state the **linear factorization theorem.**

The Linear Factorization Theorem

If $p(x)$ is a polynomial function of degree $n \geq 1$, then p has exactly n linear factors and can be written in the form,

$$p(x) = a(x - c_1)(x - c_2) \cdot \cdots \cdot (x - c_n)$$

where $a \neq 0$ and $c_1, c_2, \ldots, c_n$ are (not necessarily distinct) complex numbers.

In other words, every complex polynomial of degree n can be rewritten as the product of a nonzero constant and exactly n linear factors (for a proof of this theorem, see Appendix B).

EXAMPLE 1 ▶ **Writing a Polynomial as a Product of Linear Factors**

Rewrite $P(x) = x^4 - 8x^2 - 9$ as a product of linear factors, and find its zeroes.

Solution ▶ From its given form, we know $a = 1$. Since P has degree 4, the factored form must be $P(x) = (x - c_1)(x - c_2)(x - c_3)(x - c_4)$. Noting that P is in quadratic form, we substitute u for x^2 and u^2 for x^4 and attempt to factor:

$$\begin{aligned} x^4 - 8x^2 - 9 &\rightarrow u^2 - 8u - 9 && \text{substitute } u \text{ for } x^2;\ u^2 \text{ for } x^4 \\ &= (u - 9)(u + 1) && \text{factor in terms of } u \\ &= (x^2 - 9)(x^2 + 1) && \text{rewrite in terms of } x \text{ (substitute } x^2 \text{ for } u) \end{aligned}$$

WORTHY OF NOTE

While polynomials with complex coefficients are not the focus of this course, interested students can investigate the wider application of these theorems by completing **Exercise 115.**

We know $x^2 - 9$ will factor since it is a difference of squares. From our work with complex numbers (Section 3.1), we know $(a + bi)(a - bi) = a^2 + b^2$, and the factored form of $x^2 + 1$ must be $(x + i)(x - i)$. The completely factored form is

$$P(x) = (x + 3)(x - 3)(x + i)(x - i), \text{ and}$$

the zeroes of P are -3, 3, $-i$, and i.

Now try Exercises 7 through 10 ▶

EXAMPLE 2 ▶ **Writing a Polynomial as a Product of Linear Factors**

Rewrite $P(x) = x^3 + 2x^2 - 4x - 8$ as a product of linear factors and find its zeroes.

Solution ▶ We observe that $a = 1$ and P has degree 3, so the factored form must be $P(x) = (x - c_1)(x - c_2)(x - c_3)$. Noting that $ad = bc$ (Appendix A.4, page A-38), we start with factoring by grouping.

$$\begin{aligned} P(x) &= x^3 + 2x^2 - 4x - 8 && \text{group terms (in color)} \\ &= x^2(x + 2) - 4(x + 2) && \text{remove common factors (note sign change)} \\ &= (x + 2)(x^2 - 4) && \text{factor common binomial} \\ &= (x + 2)(x + 2)(x - 2) && \text{factor difference of squares} \end{aligned}$$

The zeroes of P are -2, -2, and 2.

Now try Exercises 11 through 14 ▶

Note the polynomial in Example 2 has three zeroes, but the zero -2 was repeated two times. In this case we say -2 is a zero of multiplicity two, and a zero of **even multiplicity.** It is also possible for a zero to be repeated three or more times, with those repeated an odd number of times called zeroes of **odd multiplicity** [the factor $(x - 2) = (x - 2)^1$ also gives a zero of odd multiplicity]. In general, repeated factors are written in exponential form and we have

Zeroes of Multiplicity

If p is a polynomial function with degree $n \geq 1$, and $(x - c)$ occurs as a factor of p exactly m times, then c is a zero of multiplicity m.

EXAMPLE 3 ▶ Identifying the Multiplicity of a Zero

Factor the given function completely, writing repeated factors in exponential form. Then state the multiplicity of each zero: $P(x) = (x^2 + 8x + 16)(x^2 - x - 20)(x - 5)$

Solution ▶

$$\begin{aligned} P(x) &= (x^2 + 8x + 16)(x^2 - x - 20)(x - 5) && \text{given polynomial} \\ &= (x + 4)(x + 4)(x - 5)(x + 4)(x - 5) && \text{trinomial factoring} \\ &= (x + 4)^3(x - 5)^2 && \text{exponential form} \end{aligned}$$

For function P, -4 is a zero of multiplicity 3 (odd multiplicity), and 5 is a zero of multiplicity 2 (even multiplicity).

Now try Exercises 15 through 18 ▶

These examples help illustrate three important consequences of the linear factorization theorem. From Example 1, if the coefficients of P are real, the polynomial can be factored into linear and quadratic factors using real numbers only $[(x + 3)(x - 3)(x^2 + 1)]$, where the quadratic factors have no real zeroes. Quadratic factors of this type are said to be **irreducible.**

Corollary I: Irreducible Quadratic Factors

If p is a polynomial with real coefficients, p can be factored into a product of linear factors (which are not necessarily distinct) and irreducible quadratic factors having real coefficients.

Closely related to this corollary and our previous study of quadratic functions, complex zeroes of the irreducible factors must occur in conjugate pairs.

Corollary II: Complex Conjugates

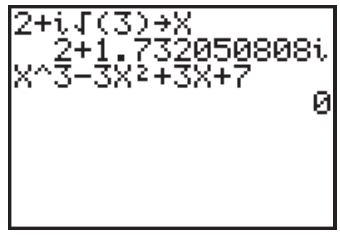
If p is a polynomial with real coefficients, complex zeroes must occur in conjugate pairs. If $a + bi$, $b \neq 0$ is a zero, then $a - bi$ will also be a zero.

Finally, the polynomial in Example 1 has degree 4 with 4 zeroes (two real, two complex), and the polynomial in Example 2 has degree 3 with 3 zeroes (three real, one of these is a repeated root). While not shown explicitly, the polynomial in Example 3 has degree 5, and there were 5 zeroes (one repeated twice, one repeated three times). This suggests our final corollary.

Corollary III: Number of Zeroes

If p is a polynomial function with degree $n \geq 1$, then p has exactly n zeroes (real or complex), where zeroes of multiplicity m are counted m times.

These corollaries help us gain valuable information about a polynomial, when only partial information is given or known.



EXAMPLE 4 ▶ **Constructing a Polynomial from Its Zeroes**

A polynomial P of degree 3 with real coefficients has zeroes of -1 and $2 + i\sqrt{3}$. Find the polynomial (assume $a = 1$).

Solution ▶ Using the factor theorem, two of the factors are $(x + 1)$ and $x - (2 + i\sqrt{3})$. From Corollary II, $2 - i\sqrt{3}$ must also be a zero and $x - (2 - i\sqrt{3})$ is also a factor of P. This gives

$$\begin{aligned} P(x) &= (x + 1)[x - (2 + i\sqrt{3})][x - (2 - i\sqrt{3})] \\ &= (x + 1)[(x - 2) - i\sqrt{3}][(x - 2) + i\sqrt{3}] && \text{associative property} \\ &= (x + 1)[(x^2 - 4x + 4) + 3] && (a + bi)(a - bi) = a^2 + b^2 \\ &= (x + 1)(x^2 - 4x + 7) && \text{simplify} \\ &= x^3 - 3x^2 + 3x + 7 && \text{result} \end{aligned}$$

The polynomial is $P(x) = x^3 - 3x^2 + 3x + 7$, which can be verified using the remainder theorem and any of the original zeroes. A calculator check using the zero $x = 2 + i\sqrt{3}$ is shown here.

WORTHY OF NOTE

When reconstructing a polynomial P having complex zeroes, it is often more efficient to determine the irreducible quadratic factors of P separately, as shown here. For the zeroes $2 \pm i\sqrt{3}$ we have

$$\begin{aligned} x &= 2 \pm i\sqrt{3} \\ x - 2 &= \pm i\sqrt{3} \\ (x - 2)^2 &= (\pm i\sqrt{3})^2 \\ x^2 - 4x + 4 &= -3 \\ x^2 - 4x + 7 &= 0. \end{aligned}$$

The quadratic factor is $(x^2 - 4x + 7)$.

Now try Exercises 19 through 22 ▶

EXAMPLE 5 ▶ **Building a Polynomial from Its Zeroes**

Find a fourth degree polynomial P with real coefficients, if 3 is the only real zero and $2i$ is also a zero of P.

Solution ▶ Since complex zeroes must occur in conjugate pairs, $-2i$ is also a zero, but this accounts for only three zeroes. Since P has degree 4, 3 must be a *repeated* zero, and the factors of P are $(x - 3)(x - 3)(x - 2i)(x + 2i)$.

$$\begin{aligned} P(x) &= (x - 3)(x - 3)(x - 2i)(x + 2i) && \text{factored form} \\ &= (x^2 - 6x + 9)(x^2 + 4) && \text{multiply binomials, } (a + bi)(a - bi) = a^2 + b^2 \\ &= x^4 - 6x^3 + 13x^2 - 24x + 36 && \text{result} \end{aligned}$$

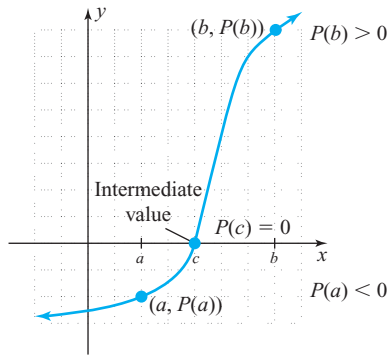
The polynomial is $P(x) = x^4 - 6x^3 + 13x^2 - 24x + 36$, which can be verified using a calculator or the remainder theorem and any of the original zeroes.

Now try Exercises 23 through 28 ▶

☑ **A.** You've just seen how we can apply the fundamental theorem of algebra and the linear factorization theorem

B. Real Polynomials and the Intermediate Value Theorem

The fundamental theorem of algebra is called an **existence theorem,** as it affirms the *existence* of the zeroes but does not tell us where or how to find them. Because polynomial graphs are continuous (there are no holes or breaks in the graph), the **intermediate value theorem (IVT)** can be used for this purpose.



The Intermediate Value Theorem

Given P is a polynomial with real coefficients, if $P(a)$ and $P(b)$ have opposite signs, there is *at least* one number c between a and b such that $P(c) = 0$ (see Figure 4.3).

WORTHY OF NOTE

You might recall a similar idea was used in Section 2.1, where we noted the graph of $P(x)$ crosses the x-axis at the zeroes determined by linear factors, with a corresponding change of sign in the function values.

Figure 4.3

EXAMPLE 6 ▶ **Finding Zeroes Using the Intermediate Value Theorem**

Use the intermediate value theorem to show $P(x) = x^3 - 9x + 6$ has at least one zero in the interval given:

a. $[-4, -3]$ **b.** $[0, 1]$ **c.** $[-4, 3]$

Solution ▶

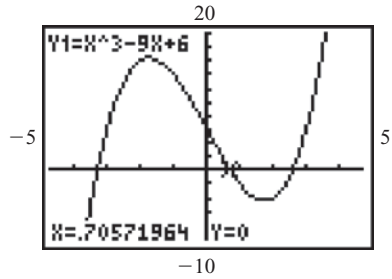
a. Begin by evaluating P at $x = -4$ and $x = -3$.

$$\begin{aligned} P(-4) &= (-4)^3 - 9(-4) + 6 \\ &= -64 + 36 + 6 \\ &= -22 \end{aligned} \qquad \begin{aligned} P(-3) &= (-3)^3 - 9(-3) + 6 \\ &= -27 + 27 + 6 \\ &= 6 \end{aligned}$$

Since $P(-4) < 0$ and $P(-3) > 0$, there must be at least one number c_1 between -4 and -3 where $P(c_1) = 0$. The graph must cross the x-axis at least once in this interval.

b. Evaluate P at $x = 0$ and $x = 1$.

$$\begin{aligned} P(0) &= (0)^3 - 9(0) + 6 \\ &= 0 - 0 + 6 \\ &= 6 \end{aligned} \qquad \begin{aligned} P(1) &= (1)^3 - 9(1) + 6 \\ &= 1 - 9 + 6 \\ &= -2 \end{aligned}$$



Since $P(0) > 0$ and $P(1) < 0$, there must be at least one number c_2 between 0 and 1 where $P(c_2) = 0$.

c. In part (a) we found that $P(-4) < 0$. For $P(3)$ we have

$$\begin{aligned} P(3) &= (3)^3 - 9(3) + 6 \\ &= 27 - 27 + 6 \\ &= 6 \end{aligned}$$

Since $P(-4) < 0$ and $P(3) > 0$, there must be at least one number c_3 between -4 and 3 where $P(c_3) = 0$. In fact, from parts (a) and (b) we know of two that exist, and the graph of P shown in Figure 4.4 reveals there are actually three real roots in this interval. This illustrates why the intermediate value theorem uses the phrase, "there is *at least* one number c."

Figure 4.4

Now try Exercises 29 and 30 ▶

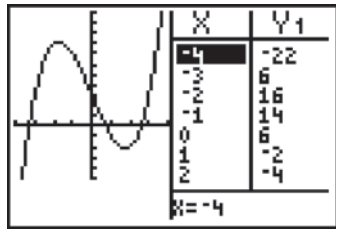
Figure 4.4A

To help illustrate the Intermediate Value Theorem, many graphing calculators offer a useful feature called *split screen viewing,* that enables us to view a table of values and the graph of a function at the same time. To illustrate, enter the function $y = x^3 - 9x + 6$ (from Example 6) as Y_1 on the Y= screen, then set the viewing window as shown in Figure 4.4. Set your table in **AUTO** mode with ΔTbl $= 1$, then press the MODE key (see Figure 4.4A) and notice the second-to-last entry on this screen reads: **Full** for full screen viewing, **Horiz** for splitting the screen horizontally with the graph above a reduced home screen, and **G-T,** which represents **Graph-Table** and splits the screen vertically. In the **G-T** mode, the graph appears on the left and the table of values on the right. Navigate the cursor to the **G-T** mode and press ENTER. Pressing the GRAPH key at this point should give you a screen similar to Figure 4.5. Scrolling downward shows the function also changes sign between $x = 2$ and $x = 3$. For more on this idea, **see Exercises 31 and 32.**

As a final note, while the intermediate value theorem is a powerful yet simple tool, it must be used with care. For example, given $p(x) = -x^4 + 10x^2 - 5$, $p(-1) > 0$ and $p(1) > 0$, seeming to indicate that no zeroes exist in the interval $(-1, 1)$. Actually, there are two zeroes, as seen in Figure 4.6.

B. You've just seen how we can use the intermediate value theorem to identify intervals containing a polynomial zero

Figure 4.5



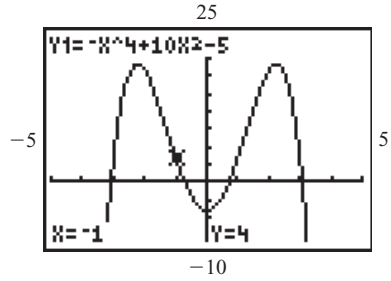


Figure 4.6

C. The Rational Zeroes Theorem

The fundamental theorem of algebra tells us that zeroes of a polynomial function *exist*. The intermediate value theorem tells us how to *locate* intervals that contain zeroes. Our next theorem gives us the information we need to actually *find* certain zeroes of a polynomial. Recall that if c is a zero of P, then $P(c) = 0$, and when $P(x)$ is divided by $x - c$ using synthetic division, the remainder is zero (from the remainder and factor theorems).

To find *divisors that give a remainder of zero,* we make the following observations. To solve $3x^2 - 11x - 20 = 0$ by factoring, a beginner might write out all possible binomial pairs where the **F**irst term in the F-O-I-L process multiplies to $3x^2$ and the **L**ast term multiplies to 20. The six possibilities are shown here:

$$(3x \quad 1)(x \quad 20) \qquad (3x \quad 20)(x \quad 1) \qquad (3x \quad 2)(x \quad 10) \qquad (3x \quad 10)(x \quad 2)$$
$$(3x \quad 4)(x \quad 5) \qquad (3x \quad 5)(x \quad 4)$$

If $3x^2 - 11x - 20$ is factorable using integers, the factors *must be somewhere in this list*. Also, the first coefficient in each binomial must be a factor of the leading coefficient, and the second coefficient must be a factor of the constant term. This means that regardless of which factored form is correct, the solution will be a rational number whose numerator comes from the factors of 20, and whose denominator comes from the factors of 3. The correct factored form is shown here, along with the solution:

$$3x^2 - 11x - 20 = 0$$
$$(3x + 4)(x - 5) = 0$$
$$3x + 4 = 0 \qquad x - 5 = 0$$
$$x = \frac{-4}{3} \quad \begin{matrix}\leftarrow \text{from the factors of 20} \\ \leftarrow \text{from the factors of 3}\end{matrix} \qquad x = \frac{5}{1} \quad \begin{matrix}\leftarrow \text{from the factors of 20} \\ \leftarrow \text{from the factors of 3}\end{matrix}$$

This same principle also applies to polynomials of higher degree, and these observations suggest the following theorem.

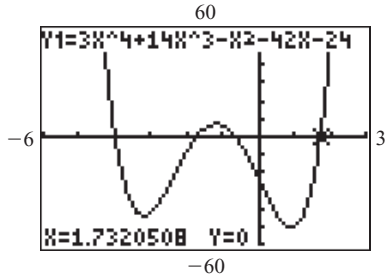
The Rational Zeroes Theorem

Given polynomial P with integer coefficients, and $\frac{p}{q}$ a rational number in lowest terms, the rational zeroes of P (if they exist) must be of the form $\frac{p}{q}$, where p is a factor of the constant term, and q is a factor of the leading coefficient.

Note that if the leading coefficient is 1, the possible rational zeroes are limited to factors of the constant term: $\frac{p}{1} = p$. If the leading coefficient is not "1" and the constant term has a large number of factors, the set of possible rational zeroes becomes rather large. To list these possibilities, it helps to begin with all factor *pairs* of the constant a_0, then divide each of these by the factors of a_n as shown in Example 7.

EXAMPLE 7 ▶ Identifying the Possible Rational Zeroes of a Polynomial

List all possible rational zeroes for the function $P(x) = 3x^4 + 14x^3 - x^2 - 42x - 24$.



Solution ▶ All rational zeroes must be of the form $\frac{p}{q}$, where p is a factor of $a_0 = -24$ and q is a factor of $a_n = 3$. The factor pairs of -24 are: ± 1, ± 24, ± 2, ± 12, ± 3, ± 8, ± 4 and ± 6. Dividing each by ± 1 and ± 3 (the factor pairs of 3), we note division by ± 1 will not change any of the previous values, while division by ± 3 gives $\pm\frac{1}{3}$, $\pm\frac{2}{3}$, $\pm\frac{8}{3}$, $\pm\frac{4}{3}$ as additional possibilities. Any rational zeroes must be from the set

$$\{\pm 1, \pm 24, \pm 2, \pm 12, \pm 3, \pm 8, \pm 4, \pm 6, \pm\tfrac{1}{3}, \pm\tfrac{2}{3}, \pm\tfrac{8}{3}, \pm\tfrac{4}{3}\}.$$

Now try Exercises 33 through 40 ▶

The actual zeroes of the function in Example 7 are $x = \sqrt{3}, x = -\sqrt{3}, x = -\frac{2}{3}$, and $x = -4$ and the graph of $P(x) = 3x^4 + 14x^3 - x^2 - 42x - 24$ is shown in Figure 4.7. Although the *rational* zeroes are indeed in the set noted, it's apparent we need a way to narrow down the number of possibilities (we don't want to try all 24 possible zeroes). If we're able to find even one factor easily, we can rewrite the polynomial using this factor and the quotient polynomial, with the hope of factoring further using trinomial factoring or factoring by grouping. Many times testing to see if 1 or -1 are zeroes will help.

Figure 4.7

Tests to Determine If 1 or −1 is a Zero of *P*

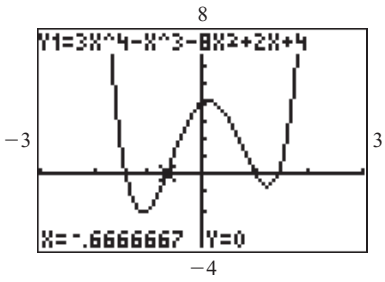
For any polynomial P with real coefficients,

1. If the sum of all coefficients is zero, then 1 is a root and $(x - 1)$ is a factor.
2. After changing the sign of all terms with odd degree, if the sum of the coefficients is zero, then -1 is a root and $(x + 1)$ is a factor.

EXAMPLE 8 ▶ **Finding the Rational Zeroes of a Polynomial**

Find all rational zeroes of $P(x) = 3x^4 - x^3 - 8x^2 + 2x + 4$, and use them to write the function in completely factored form. Then use the factored form to name all zeroes of P.

Solution ▶ Instead of listing all possibilities using the rational zeroes theorem, we first test for 1 and -1, then see if we're able to complete the factorization using other means. The sum of the coefficients is: $3 - 1 - 8 + 2 + 4 = 0$, which means 1 is a zero and $x - 1$ is a factor. By changing the sign on terms of odd degree, we have $3x^4 + x^3 - 8x^2 - 2x + 4$ and $3 + 1 - 8 - 2 + 4 = -2$, showing -1 is *not* a zero. Using $x = 1$ and the factor theorem, we have



use 1 as a "divisor"

1	3	−1	−8	2	4
		3	2	−6	−4
	3	2	−6	−4	0

and we write P as $P(x) = (x - 1)(3x^3 + 2x^2 - 6x - 4)$. Noting the quotient polynomial can be factored by grouping ($ad = bc$), we need not continue with synthetic division or the factor theorem.

$$\begin{aligned} P(x) &= (x - 1)(3x^3 + 2x^2 - 6x - 4) && \text{group terms} \\ &= (x - 1)[x^2(3x + 2) - 2(3x + 2)] && \text{factor common terms} \\ &= (x - 1)(3x + 2)(x^2 - 2) && \text{factor common binomial} \\ &= (x - 1)(3x + 2)(x + \sqrt{2})(x - \sqrt{2}) && \text{completely factored form} \end{aligned}$$

The zeroes of P are 1, $\frac{-2}{3}$, and $\pm\sqrt{2}$. The graph of P is shown in the figure.

WORTHY OF NOTE

In the second to last line of Example 8, we factored $x^2 - 2$ as $(x + \sqrt{2})(x - \sqrt{2})$. As discussed in Appendix A.6, this is an application of factoring the difference of two squares: $a^2 - b^2 = (a + b)(a - b)$. By mentally rewriting $x^2 - 2$ as $x^2 - (\sqrt{2})^2$, we obtain the result shown. Also **see Exercise 113.**

Now try Exercises 41 through 62 ▶

In cases where the quotient polynomial is not easily factored, we continue with synthetic division and other possible zeroes, until the remaining zeroes can be determined.

EXAMPLE 9 ▶ **Finding the Zeroes of a Polynomial**

Find all zeroes of $P(x) = x^5 - 3x^4 + 3x^3 - 5x^2 + 12$.

Solution ▶ Using the rational zeroes theorem, the possibilities are: $\{\pm1, \pm12, \pm2, \pm6, \pm3, \pm4\}$. The test for 1 shows 1 is not a zero. After changing the signs of all terms with odd degree, we have $-1 - 3 - 3 - 5 + 12 = 0$, and find -1 *is* a zero. Using -1 with the factor theorem, we continue our search for additional factors. Noting that P is missing a linear term, we include a placeholder zero:

use -1 as a "divisor"

−1	1	−3	3	−5	0	12	coefficients of P
		−1	4	−7	12	−12	
	1	−4	7	−12	12	0	coefficients of $q_1(x)$

Here the quotient polynomial $q_1(x) = x^4 - 4x^3 + 7x^2 - 12x + 12$ is not easily factored, so we next try 2, *using the quotient polynomial:*

use 2 as a "divisor" on $q_1(x)$

2	1	−4	7	−12	12	coefficients of $q_1(x)$
		2	−4	6	−12	
	1	−2	3	−6	0	coefficients of $q_2(x)$

If you miss the fact that $q_2(x)$ is actually factorable ($ad = bc$), the process would continue using -2 and the current quotient.

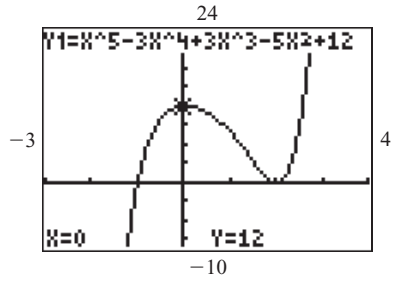
use -2 as a "divisor" $-2|$ 1 -2 3 -6 coefficients of $q_2(x)$

-2 8 -22

1 -4 11 $|-28$ -2 is not a zero

We find -2 is not a zero, and in fact, trying *all other* possibilities will show that *none* of them are zeroes. As there must be five zeroes, we are reminded of three things:

1. This process can only find *rational zeros* (the remaining zeroes may be irrational or complex),
2. This process cannot find irreducible quadratic factors (unless they appear as the quotient polynomial), and
3. Some of the zeroes *may have multiplicities greater than 1!*



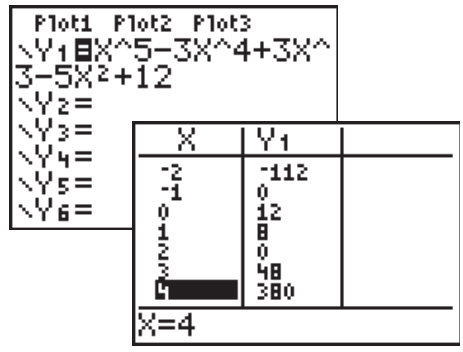
Testing the zero 2 for a second time using $q_2(x)$ gives

use 2 as a "divisor" 2| 1 -2 3 -6 coefficients of $q_2(x)$

2 0 6

1 0 3 |0 2 is a *repeated* zero

and we see that 2 is actually a zero of multiplicity two, and the final quotient is the irreducible quadratic factor $x^2 + 3$. Using this information produces the factored form $P(x) = (x + 1)(x - 2)^2(x^2 + 3) = (x + 1)(x - 2)^2(x + i\sqrt{3})(x - i\sqrt{3})$, and the zeroes of P are $-i\sqrt{3}$, $i\sqrt{3}$, -1, and 2 with multiplicity two. The graph of P is shown in the figure.



Now try Exercises 63 through 82 ▶

C. You've just seen how we can find rational zeroes of a real polynomial function using the rational zeroes theorem

In Example 9, note that since the leading coefficient is 1, all possible rational zeroes will be integers. This means our initial search can easily be performed using the **TABLE** feature of a graphing calculator. But note that while Figure 4.8 indeed shows that $x = -1$ and $x = 2$ are zeroes, it cannot show that $x = 2$ is a repeated zero until we begin working with the quotient polynomial. In the next section, we'll learn how to locate repeated zeroes from a polynomial's graph.

Figure 4.8

D. Descartes' Rule of Signs and Upper/Lower Bounds

Testing $x = 1$ and $x = -1$ is one way to reduce the number of possible rational zeroes, but unless we're very lucky, factoring the polynomial can still be a challenge. **Descartes' rule of signs** and the **upper and lower bounds property** offer additional assistance.

Descartes' Rule of Signs

Given the real polynomial equation $P(x) = 0$,

1. The number of positive real zeroes is equal to the number of variations in sign for $P(x)$, or an even number less.
2. The number of negative real zeroes is equal to the number of variations in sign for $P(-x)$, or an even number less.

EXAMPLE 10 ▶ **Finding the Zeroes of a Polynomial**

For $P(x) = 2x^5 - 5x^4 + x^3 + x^2 - x + 6$,

a. Use the rational zeroes theorem to list all possible rational zeroes.

b. Apply Descartes' rule to count the number of possible positive, negative, and complex zeroes.

c. Use this information and the tools of this section to find all zeroes of P.

Solution ▶

a. The factors of 2 are $\{\pm 1, \pm 2\}$ and the factors of 6 are $\{\pm 1, \pm 6, \pm 2, \pm 3\}$. The possible rational zeroes for P are $\{\pm 1, \pm 6, \pm 2, \pm 3, \pm\frac{1}{2}, \pm\frac{3}{2}\}$.

b. For Descartes' rule, we organize our work in a table. Since P has degree 5, there must be a total of five zeroes. For this illustration, positive terms are in **blue** and negative terms in **red**: $P(x) = 2x^5 - 5x^4 + x^3 + x^2 - x + 6$. The terms change sign a total of four times, meaning there are four, two, or zero positive roots. For the negative roots, recall that $P(-x)$ will change the sign of *all odd-degree terms,* giving $P(-x) = -2x^5 - 5x^4 - x^3 + x^2 + x + 6$. This time there is only one sign change (from negative to positive) showing there will be exactly one negative root, a fact that is highlighted in the following table. Since there must be 5 zeroes, the number of possible complex zeroes is: none, two, or four, as shown.

possible **positive zeroes**	*known* **negative zeroes**	*possibilities for* **complex roots**	**total number** ***must be 5***
4	**1**	0	5
2	**1**	2	5
0	**1**	4	5

c. Testing 1 and -1 shows $x = 1$ is not a root, but $x = -1$ *is,* and using -1 in synthetic division gives:

use -1 as a "divisor" $-1\big|$ 2 -5 1 1 -1 6 coefficients of $P(x)$

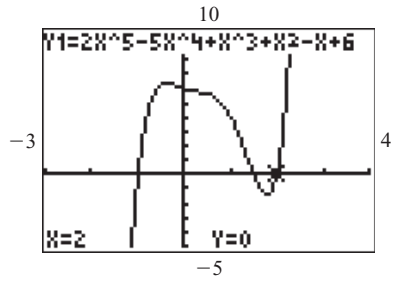
-2 7 -8 7 -6

2 -7 8 -7 6 $\big|0$ $q_1(x)$ is not easily factored

Since there is *only one* negative root, we need only check the remaining positive zeroes. The quotient $q_1(x)$ is not easily factored, so we continue with synthetic division using the next larger positive root, $x = 2$.

use 2 as a "divisor" $2\big|$ 2 -7 8 -7 6 coefficients of $q_1(x)$

4 -6 4 -6



2 -3 2 -3 $\big|0$ $q_2(x)$

The partially factored form is $P(x) = (x + 1)(x - 2)(2x^3 - 3x^2 + 2x - 3)$.

WORTHY OF NOTE

As you recall from our study of quadratics, it's entirely possible for a polynomial function to have no real zeroes. Also, if the zeroes are irrational, complex, or a combination of these, they cannot be found using the rational zeroes theorem. For a look at ways to determine these zeroes, see the *Reinforcing Basic Skills* feature that follows Section 4.3.

Graphing $P(x)$ at this point (see the figure) verifies that -1 and 2 are zeroes, but also indicates there is an additional zero between 1 and 2. If it's a *rational* zero, it must be $x = \frac{3}{2}$ from our list of possible zeroes.

Checking $\frac{3}{2}$ using synthetic division and $q_2(x)$ we have

$$\begin{array}{r|rrrr} \frac{3}{2} & 2 & -3 & 2 & -3 \\ & \downarrow & 3 & 0 & 3 \\ \hline & 2 & 0 & 2 & \boxed{0} \end{array}$$

Since the remainder is zero, $P\left(\frac{3}{2}\right) = 0$ (remainder theorem) and $\left(x - \frac{3}{2}\right)$ is a factor (factor theorem). Since the zero is a fraction, we'll use the ideas discussed in Section 4.1 to help write $P(x)$ in completely factored form:

$$\begin{aligned} P(x) &= (x+1)(x-2)\left(x-\frac{3}{2}\right)(2x^2+2) && \text{partially factored form} \\ &= (x+1)(x-2)\left(x-\frac{3}{2}\right)(2)(x^2+1) && \text{factor out 2} \\ &= (x+1)(x-2)(2x-3)(x^2+1) && \text{multiply } 2\left(x-\tfrac{3}{2}\right) \\ &= (x+1)(x-2)(2x-3)(x+i)(x-i) && \text{completely factored form} \end{aligned}$$

The zeroes of P are -1, 2, $\frac{3}{2}$, $-i$ and i, with two positive, one negative, and two complex zeroes (row two of the table).

Now try Exercises 83 through 96 ▶

One final idea that helps reduce the number of possible zeroes is the **upper and lower bounds property.** A number b is an **upper bound** on the positive zeroes of a function if no positive zero is greater than b. In the same way, a number a is a **lower bound** on the negative zeroes if no negative zero is less than a.

Upper and Lower Bounds Property

Given $P(x)$ is a polynomial with real coefficients.

1. If $P(x)$ is divided by $x - b$ $(b > 0)$ using synthetic division and all coefficients in the quotient row are either positive or zero, then b is an upper bound on the zeroes of P.
2. If $P(x)$ is divided by $x - a$ $(a < 0)$ using synthetic division and all coefficients in the quotient row alternate in sign, then a is a lower bound on the zeroes of P.

For both 1 and 2, zero coefficients can be either positive or negative as needed.

D. You've just seen how we can obtain more information on the zeroes of real polynomials using Descartes' rule of signs and upper/lower bounds theorem

While this test certainly helps narrow the possibilities, we gain the additional benefit of knowing the property actually places boundaries on *all* real zeroes of the polynomial, both rational and irrational. In part (c) of Example 10, the quotient row of the first division alternates in sign, showing $x = -1$ is both a zero and a lower bound on the real zeroes of P. For more on the upper and lower bounds property, **see Exercise 111.**

E. Applications of Polynomial Functions

Polynomial functions can be very accurate models of real-world phenomena, though we often must restrict their domain, as illustrated in Example 11.

EXAMPLE 11 ▶ Using the Remainder Theorem to Solve an Oceanography Application

As part of an environmental study, scientists use radar to map the ocean floor from the coastline to a distance 12 mi from shore. In this study, ocean trenches appear as negative values and underwater mountains as positive values, as measured from the surrounding ocean floor. The terrain due west of a particular island can be modeled by $h(x) = x^4 - 25x^3 + 200x^2 - 560x + 384$, where $h(x)$ represents the height in feet, x mi from shore $(0 < x \leq 12)$.

a. Use the remainder theorem to find the "height of the ocean floor" 10 mi out.

b. Use the tools developed in this section to find the number of times the ocean floor has height $h(x) = 0$ in this interval, given this occurs 12 mi out.

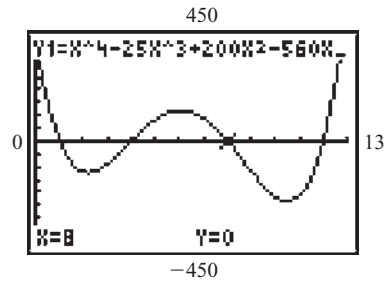
Solution ▶

a. For part (a) we simply evaluate $h(10)$ using the remainder theorem.

use 10 as a "divisor"	10	1	−25	200	−560	384	coefficients of $h(x)$
		10	−150	500	−600
	1	−15	50	−60	−216	remainder is −216

Ten miles from shore, there is an ocean trench 216 ft deep.

b. For part (b), we're given 12 is zero, so we again use the remainder theorem and work with the quotient polynomial.



use 12 as a "divisor"	12	1	−25	200	−560	384	coefficients of $h(x)$
		12	−156	528	−384
	1	−13	44	−32	0	$q_1(x)$

The quotient is $q_1(x) = x^3 - 13x^2 + 44x - 32$. Since $a = 1$, we know the remaining rational zeroes must be factors of -32: $\{\pm 1, \pm 32, \pm 2, \pm 16, \pm 4, \pm 8\}$. Using $x = 1$ gives

use 1 as a "divisor"	1	1	−13	44	−32	coefficients of $q_1(x)$
		1	−12	32
	1	−12	32	0	$q_2(x)$

The function can now be written as $h(x) = (x - 12)(x - 1)(x^2 - 12x + 32)$ and in completely factored form $h(x) = (x - 12)(x - 1)(x - 4)(x - 8)$. The ocean floor has height zero at distances of 1, 4, 8, and 12 mi from shore.

The graph of $h(x)$ is shown in the figure. The graph shows a great deal of variation in the ocean floor, but the zeroes occurring at 1, 4, 8, and 12 mi out are clearly evident.

Now try Exercises 99 through 110 ▶

E. You've just seen how we can solve an application of polynomial functions

4.2 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. A complex polynomial is one where one or more _____ are complex numbers.

2. A polynomial function of degree n will have exactly _____ zeroes, real or _____, where zeroes of multiplicity m are counted m times.

3. If $a + bi$ is a complex zero of polynomial P with real coefficients, then _____ is also a zero.

4. According to Descartes' rule of signs, there are as many _____ real roots as changes in sign from term to term, or an _____ number less.

5. Which of the following values is *not* a possible root of $f(x) = 6x^3 - 2x^2 + 5x - 12$:

a. $x = \frac{4}{3}$ **b.** $x = \frac{3}{4}$ **c.** $x = \frac{1}{2}$

Discuss/Explain why.

6. Discuss/Explain each of the following: (a) irreducible quadratic factors, (b) factors that are complex conjugates, (c) zeroes of multiplicity m, and (d) upper bounds on the zeroes of a polynomial.

▶ DEVELOPING YOUR SKILLS

Rewrite each polynomial as a product of linear factors, and find the zeroes of the polynomial.

7. $P(x) = x^4 + 5x^2 - 36$

8. $Q(x) = x^4 + 21x^2 - 100$

9. $Q(x) = x^4 - 16$

10. $P(x) = x^4 - 81$

11. $P(x) = x^3 + x^2 - x - 1$

12. $Q(x) = x^3 - 3x^2 - 9x + 27$

13. $Q(x) = x^3 - 5x^2 - 25x + 125$

14. $P(x) = x^3 + 4x^2 - 16x - 64$

Factor each polynomial completely. Write any repeated factors in exponential form, then name all zeroes and their multiplicity.

15. $p(x) = (x^2 - 10x + 25)(x^2 + 4x - 45)(x + 9)$

16. $q(x) = (x^2 + 12x + 36)(x^2 + 2x - 24)(x - 4)$

17. $P(x) = (x^2 - 5x - 14)(x^2 - 49)(x + 2)$

18. $Q(x) = (x^2 - 9x + 18)(x^2 - 36)(x - 3)$

Find a polynomial $P(x)$ having real coefficients, with the degree and zeroes indicated. All real zeroes are given. Assume the lead coefficient is 1. Recall $(a + bi)(a - bi) = a^2 + b^2$.

19. degree 3, $x = 3, x = 2i$

20. degree 3, $x = -5, x = -3i$

21. degree 4, $x = -1, x = 2, x = i$

22. degree 4, $x = -1, x = 3, x = -2i$

23. degree 4, $x = 3, x = 2i$

24. degree 4, $x = -2, x = -3i$

25. degree 4, $x = -1, x = 1 + 2i$

26. degree 4, $x = -1, x = 1 - 3i$

27. degree 4, $x = -3, x = 1 + i\sqrt{2}$

28. degree 4, $x = -2, x = 1 + i\sqrt{3}$

Use the intermediate value theorem to verify the given polynomial has at least one zero "c_i" in the intervals specified. Do not find the zeroes.

29. $f(x) = x^3 + 2x^2 - 8x - 5$

a. $[-4, -3]$ **b.** $[2, 3]$

30. $g(x) = x^4 - 2x^2 + 6x - 3$

a. $[-3, -2]$ **b.** $[0, 1]$

For Exercises 31 and 32, enter each function on the Y= screen. Then place your graphing calculator in G-T MODE and set up a **TABLE** using **TblStart = −5** and ΔTBL = 0.1. Use the intermediate value theorem and the resulting GRAPH and **TABLE** to locate intervals $[x_1, x_2]$, where $x_2 - x_1 = 0.1$, that contain zeroes of the function. Assume all real zeroes are between −5 and 5.

31. $f(x) = x^3 + 6x^2 + 4x - 10$

32. $g(x) = 2x^4 + 3x^3 - 7x^2 - 5x + 4$

List all possible rational zeroes for the polynomials given, but do not solve.

33. $f(x) = 4x^3 - 19x - 15$

34. $g(x) = 3x^3 - 2x + 20$

35. $h(x) = 2x^3 - 5x^2 - 28x + 15$

36. $H(x) = 2x^3 - 19x^2 + 37x - 14$

37. $p(x) = 6x^4 - 2x^3 + 5x^2 - 28$

38. $q(x) = 7x^4 + 6x^3 - 49x^2 + 36$

39. $Y_1 = 32t^3 - 52t^2 + 17t + 3$

40. $Y_2 = 24t^3 + 17t^2 - 13t - 6$

Use the rational zeroes theorem to write each function in factored form and find all zeroes. Note $a = 1$.

41. $f(x) = x^3 - 13x + 12$

42. $g(x) = x^3 - 21x + 20$

43. $h(x) = x^3 - 19x - 30$

44. $H(x) = x^3 - 28x - 48$

45. $p(x) = x^3 - 2x^2 - 11x + 12$

46. $q(x) = x^3 - 4x^2 - 7x + 10$

47. $Y_1 = x^3 - 6x^2 - x + 30$

48. $Y_2 = x^3 - 4x^2 - 20x + 48$

49. $Y_3 = x^4 - 15x^2 + 10x + 24$

50. $Y_4 = x^4 - 23x^2 - 18x + 40$

51. $f(x) = x^4 + 7x^3 - 7x^2 - 55x - 42$

52. $g(x) = x^4 + 4x^3 - 17x^2 - 24x + 36$

Find all rational zeroes of the functions given and use them to write the function in factored form. Use the factored form to state *all* zeroes of *f*. Begin by applying the tests for 1 and −1.

53. $f(x) = 4x^3 - 7x + 3$

54. $g(x) = 9x^3 - 7x - 2$

55. $h(x) = 4x^3 + 8x^2 - 3x - 9$

56. $H(x) = 9x^3 + 3x^2 - 8x - 4$

57. $Y_1 = 2x^3 - 3x^2 - 9x + 10$

58. $Y_2 = 3x^3 - 14x^2 + 17x - 6$

59. $p(x) = 2x^4 + 3x^3 - 9x^2 - 15x - 5$

60. $q(x) = 3x^4 + x^3 - 11x^2 - 3x + 6$

61. $r(x) = 3x^4 + 4x^3 + 8x^2 + 16x - 16$

62. $s(x) = 2x^4 - 7x^3 + 14x^2 - 63x - 36$

Find the zeroes of the polynomials given using any combination of the rational zeroes theorem, testing for 1 and −1, and/or the remainder and factor theorems.

63. $f(x) = 2x^4 - 9x^3 + 4x^2 + 21x - 18$

64. $g(x) = 3x^4 + 4x^3 - 21x^2 - 10x + 24$

65. $h(x) = 3x^4 + 2x^3 - 9x^2 + 4$

66. $H(x) = 7x^4 + 6x^3 - 49x^2 + 36$

67. $p(x) = 2x^4 + 3x^3 - 24x^2 - 68x - 48$

68. $q(x) = 3x^4 - 19x^3 + 6x^2 + 96x - 32$

69. $r(x) = 3x^4 - 20x^3 + 34x^2 + 12x - 45$

70. $s(x) = 4x^4 - 15x^3 + 9x^2 + 16x - 12$

71. $Y_1 = x^5 + 6x^2 - 49x + 42$

72. $Y_2 = x^5 + 2x^2 - 9x + 6$

73. $P(x) = 3x^5 + x^4 + x^3 + 7x^2 - 24x + 12$

74. $P(x) = 2x^5 - x^4 - 3x^3 + 4x^2 - 14x + 12$

75. $Y_1 = x^4 - 5x^3 + 20x - 16$

76. $Y_2 = x^4 - 10x^3 + 90x - 81$

77. $r(x) = x^4 - x^3 - 14x^2 + 2x + 24$

78. $s(x) = x^4 - 3x^3 - 13x^2 + 9x + 30$

79. $p(x) = 2x^4 - x^3 + 3x^2 - 3x - 9$

80. $q(x) = 3x^4 + x^3 + 13x^2 + 5x - 10$

81. $f(x) = 2x^5 - 7x^4 + 13x^3 - 23x^2 + 21x - 6$

82. $g(x) = 4x^5 + 3x^4 + 3x^3 + 11x^2 - 27x + 6$

Gather information on each polynomial using (a) the rational zeroes theorem, (b) testing for 1 and −1, (c) applying Descartes' rule of signs, and (d) using the upper and lower bounds property. Respond explicitly to each.

83. $f(x) = x^4 - 2x^3 + 4x - 8$

84. $g(x) = x^4 + 3x^3 - 7x - 6$

85. $h(x) = x^5 + x^4 - 3x^3 + 5x + 2$

86. $H(x) = x^5 + x^4 - 2x^3 + 4x - 4$

87. $p(x) = x^5 - 3x^4 + 3x^3 - 9x^2 - 4x + 12$

88. $q(x) = x^5 - 2x^4 - 8x^3 + 16x^2 + 7x - 14$

89. $r(x) = 2x^4 + 7x^2 + 11x - 20$

90. $s(x) = 3x^4 - 8x^3 - 13x - 24$

Use Descartes' rule of signs to determine the possible combinations of real and complex zeroes for each polynomial. Then graph the function on the standard window of a graphing calculator and adjust it as needed until you're certain all real zeroes are in clear view. Use this screen and a list of the possible rational zeroes to factor the polynomial and find all zeroes (real and complex).

91. $f(x) = 4x^3 - 16x^2 - 9x + 36$

92. $g(x) = 6x^3 - 41x^2 + 26x + 24$

93. $h(x) = 6x^3 - 73x^2 + 10x + 24$

94. $H(x) = 4x^3 + 60x^2 + 53x - 42$

95. $p(x) = 4x^4 + 40x^3 - 93x^2 + 30x - 72$

96. $q(x) = 4x^4 - 42x^3 - 70x^2 - 21x - 36$

▶ WORKING WITH FORMULAS

97. The absolute value of a complex number $z = a + bi$: $|z| = \sqrt{a^2 + b^2}$

The absolute value of a complex number z, denoted $|z|$, represents the distance between the origin and the point (a, b) in the complex plane. Use the formula to find $|z|$ for the complex numbers given (also see Section 3.1, Exercise 69): (a) $3 + 4i$, (b) $-5 + 12i$, and (c) $1 + i\sqrt{3}$.

98. The square root of $z = a + bi$:

$$\sqrt{z} = \tfrac{\sqrt{2}}{2}\left(\sqrt{|z| + a} \pm i\sqrt{|z| - a}\right)$$

The principal square root of a complex number is given by the relation shown, where $|z|$ represents the absolute value of z and the sign for the "$\pm$" is chosen to match the sign of b. Use the formula to find the square root of each complex number from Exercise 97, then check your answer by squaring the result (also see Section 3.1, Exercise 82).

▶ APPLICATIONS

99. Maximum and minimum values: To locate the maximum and minimum values of $F(x) = x^4 - 4x^3 - 12x^2 + 32x + 15$ requires finding the zeroes of $f(x) = 4x^3 - 12x^2 - 24x + 32$. Use the rational zeroes theorem and synthetic division to find the zeroes of f, then graph $F(x)$ on a calculator and see if the graph tends to support your calculations—do the maximum and minimum values occur at the zeroes of f?

100. Graphical analysis: Use the rational zeroes theorem and synthetic division to find the zeroes of $F(x) = x^4 - 4x^3 - 12x^2 + 32x + 15$ (see Exercise 99 to verify graphically).

101. Maximum and minimum values: To locate the maximum and minimum values of $G(x) = x^4 - 6x^3 + x^2 + 24x - 20$ requires finding the zeroes of $g(x) = 4x^3 - 18x^2 + 2x + 24$. Use the rational zeroes theorem and synthetic division to find the zeroes of g, then graph $G(x)$ on a calculator and see if the graph tends to support your calculations—do the maximum and minimum values occur at the zeroes of g?

102. Graphical analysis: Use the rational zeroes theorem and synthetic division to find the zeroes of $G(x) = x^4 - 6x^3 + x^2 + 24x - 20$ (see Exercise 101 to verify graphically).

Geometry: The volume of a cube is $V = x \cdot x \cdot x = x^3$, where x represents the length of the edges. If a slice 1 unit thick is removed from the cube, the remaining volume is $v = x \cdot x \cdot (x - 1) = x^3 - x^2$. Use this information for Exercises 103 and 104.

103. A slice 1 unit in thickness is removed from one side of a cube. Use the rational zeroes theorem and synthetic division to find the original dimensions of the cube, if the remaining volume is (a) 48 cm^3 and (b) 100 cm^3.

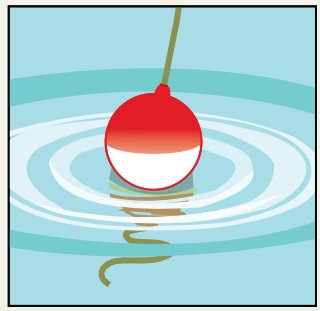
104. A slice 1 unit in thickness is removed from one side of a cube, then a second slice of the same thickness is removed from a different side (not the opposite side). Use the rational zeroes theorem and synthetic division to find the original dimensions of the cube, if the remaining volume is (a) 36 cm^3 and (b) 80 cm^3.

Geometry: The volume of a rectangular box is $V = LWH$. For the box to satisfy certain requirements, its length must be twice the width, and its height must be two inches less than the width. Use this information for Exercises 105 and 106.

105. Use the rational zeroes theorem and synthetic division to find the dimensions of the box if it must have a volume of 150 in^3.

106. Suppose the box must have a volume of 64 in^3. Use the rational zeroes theorem and synthetic division to find the dimensions required.

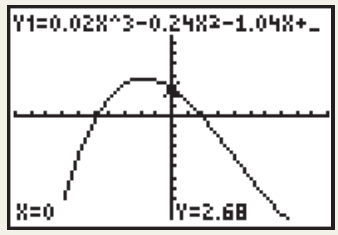
Government deficits: Over a 14-yr period, the balance of payments (deficit versus surplus) for a certain county government was modeled by the function $f(x) = \frac{1}{4}x^4 - 6x^3 + 42x^2 - 72x - 64$, where $x = 0$ corresponds to 1990 and $f(x)$ is the deficit or surplus in tens of thousands of dollars. Use this information for Exercises 107 and 108.



107. Use the rational zeroes theorem and synthetic division to find the years when the county "broke even" (debt = surplus = 0) from 1990 to 2004. How many years did the county run a surplus during this period?

108. The deficit was at the \$84,000 level $[f(x) = -84]$, four times from 1990 to 2004. Given this occurred in 1992 and 2000 ($x = 2$ and $x = 10$), use the rational zeroes theorem, synthetic division, and the remainder theorem to find the other two years the deficit was at \$84,000.

109. Drag resistance on a boat: In a scientific study on the effects of drag against the hull of a sculling boat, some of the factors to consider are displacement, draft, speed, hull shape, and length, among others. If the first four are held constant and we assume a flat, calm water surface, length becomes the sole variable (as length changes, we adjust the beam by a uniform scaling to keep a constant displacement). For a fixed sculling speed of 5.5 knots, the relationship between drag and length can be modeled by $f(x) = -0.4192x^4 + 18.9663x^3 - 319.9714x^2 + 2384.2x - 6615.8$, where $f(x)$ is the efficiency rating of a boat with length x ($8.7 < x < 13.6$). Here, $f(x) = 0$ represents an *average* efficiency rating. (a) Under these conditions, what lengths (to the nearest hundredth) will give the boat an average rating? (b) What length will maximize the efficiency of the boat? What is this rating?



110. Comparing densities: Why is it that when you throw a rock into a lake, it sinks, while a wooden ball will float half submerged, but the bobber on your fishing line floats on the surface? It all depends on the density of the object compared to the density of water ($d = 1$). For uniformity, we'll consider spherical objects of various densities, each with a radius of 5 cm. When placed into water, the depth that the sphere will sink beneath the surface (while still floating) is modeled by the polynomial $p(x) = \frac{\pi}{3}x^3 - 5\pi x^2 + \frac{500\pi}{3}d$, where d is the density of the object and the smallest positive zero of p is the depth of the sphere below the surface (in centimeters). How far submerged is the sphere if it's made of (a) balsa wood, $d = 0.17$; (b) pine wood, $d = 0.55$; (c) ebony wood, $d = 1.12$; (d) a large bobber made of lightweight plastic, $d = 0.05$ (see figure)?

▶ EXTENDING THE CONCEPT

111. In the figure, $P(x) = 0.02x^3 - 0.24x^2 - 1.04x + 2.68$ is graphed on the standard screen ($-10 \le x \le 10$), which shows two real zeroes. Since P has degree 3, there must be one more real zero but is it negative or positive? Use the upper/lower bounds property (a) to see if -10 is a lower bound and (b) to see if 10 is an upper bound. (c) Then use your calculator to find the remaining zero.

112. From Example 11, (a) what is the significance of the y-intercept? (b) If the domain were extended to include $0 < x \le 13$, what happens when x is approximately 12.8?

113A. It is often said that while the difference of two squares is factorable, $a^2 - b^2 = (a + b)(a - b)$, the sum of two squares is prime. To be 100% correct, we should say the sum of two squares cannot be factored *using real numbers*. If complex numbers are used, $(a^2 + b^2) = (a + bi)(a - bi)$. Use this idea to factor the following binomials.

a. $p(x) = x^2 + 25$ **b.** $q(x) = x^2 + 9$

c. $r(x) = x^2 + 7$

113B. It is often said that while $x^2 - 16$ is factorable as a difference of squares, $a^2 - b^2 = (a + b)(a - b)$, $x^2 - 17$ is not. To be 100% correct, we should say that $x^2 - 17$ is not factorable *using integers*. Since $(\sqrt{17})^2 = 17$, it can actually be factored in the same way: $x^2 - 17 = (x + \sqrt{17})(x - \sqrt{17})$. Use this idea to solve the following equations.

a. $x^2 - 7 = 0$ **b.** $x^2 - 12 = 0$

c. $x^2 - 18 = 0$

114. Every general cubic equation $aw^3 + bw^2 + cw + d = 0$ can be written in the form $x^3 + px + q = 0$ (where the squared term has been "depressed"), using the transformation $w = x - \dfrac{b}{3a}$. Use this transformation to solve the following equations.

a. $w^3 - 3w^2 + 6w - 4 = 0$

b. $w^3 - 6w^2 + 21w - 26 = 0$

Note: It is actually very rare that the transformation produces a value of $q = 0$ for the "depressed" cubic $x^3 + px + q = 0$, and general solutions must be found using what has become known as *Cardano's formula.* For a complete treatment of cubic equations and their solutions, visit our website at www.mhhe.com/coburn.

115. For each of the following complex polynomials, one of its zeroes is given. Use this zero to help write the polynomial in completely factored form. (*Hint:* Synthetic division and the quadratic formula can be applied to *all polynomials,* even those with complex coefficients.)

a. $C(z) = z^3 + (1 - 4i)z^2 + (-6 - 4i)z + 24i$; $z = 4i$

b. $C(z) = z^3 + (5 - 9i)z^2 + (4 - 45i)z - 36i$; $z = 9i$

c. $C(z) = z^3 + (-2 - 3i)z^2 + (5 + 6i)z - 15i$; $z = 3i$

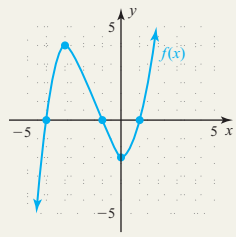
d. $C(z) = z^3 + (-4 - i)z^2 + (29 + 4i)z - 29i$; $z = i$

e. $C(z) = z^3 + (-2 - 6i)z^2 + (4 + 12i)z - 24i$; $z = 6i$

f. $C(z) = z^3 + (-6 + 4i)z^2 + (11 - 24i)z + 44i$; $z = -4i$

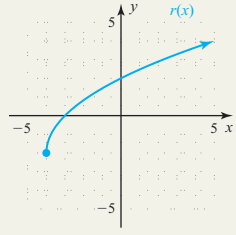
g. $C(z) = z^3 + (-2 - i)z^2 + (5 + 4i)z + (-6 + 3i)$; $z = 2 - i$

h. $C(z) = z^3 - 2z^2 + (19 + 6i)z + (-20 + 30i)$; $z = 2 - 3i$



▶ MAINTAINING YOUR SKILLS

116. **(2.5)** Graph the piecewise-defined function and find the values of $f(-3)$, $f(2)$, and $f(5)$.



$$f(x) = \begin{cases} 2 & x \le -1 \\ |x - 1| & -1 < x < 5 \\ 4 & x \ge 5 \end{cases}$$

117. **(3.4)** For a county fair, officials need to fence off a large rectangular area, then subdivide it into three equal (rectangular) areas. If the county provides 1200 ft of fencing, (a) what dimensions will maximize the area of the larger (outer) rectangle? (b) What is the area of each smaller rectangle?

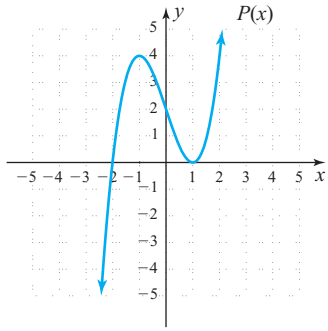
118. **(2.1)** Use the graph given to (a) state intervals where $f(x) \ge 0$, (b) locate local maximum and minimum values, and (c) state intervals where $f(x)\uparrow$ and $f(x)\downarrow$.

119. **(2.2)** Write the equation of the function shown.

4.3 Graphing Polynomial Functions

LEARNING OBJECTIVES

In Section 4.3 you will see how we can:



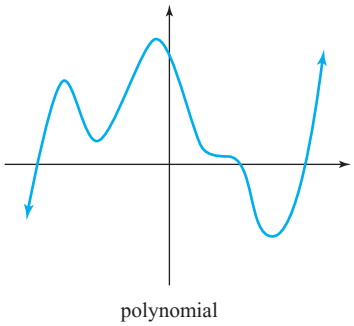
- ❑ **A.** Identify the graph of a polynomial function and determine its degree
- ❑ **B.** Describe the end-behavior of a polynomial graph
- ❑ **C.** Discuss the attributes of a polynomial graph with zeroes of multiplicity
- ❑ **D.** Graph polynomial functions in standard form
- ❑ **E.** Solve applications of polynomials and polynomial modeling

As with linear and quadratic functions, understanding graphs of *polynomial* functions will help us apply them more effectively as mathematical models. Since all real polynomials can be written in terms of their linear and quadratic factors (Section 4.2), these functions provide the basis for our continuing study.

A. Identifying the Graph of a Polynomial Function

Consider the graphs of $f(x) = x + 2$ and $g(x) = (x - 1)^2$, which we know are smooth, continuous curves. The graph of f is a straight line with positive slope, that crosses the x-axis at -2. The graph of g is a parabola, opening upward, shifted 1 unit to the right, and touching the x-axis at $x = 1$. When f and g are "combined" into the single function $P(x) = (x + 2)(x - 1)^2$, the behavior of the graph at these zeroes is still evident. In Figure 4.9, the graph of P crosses the x-axis at $x = -2$, "bounces" off the x-axis at $x = 1$, and is still a smooth, continuous curve. This observation could be extended to include additional linear or quadratic factors, and helps affirm that the graph of a polynomial function is a *smooth, continuous curve*.

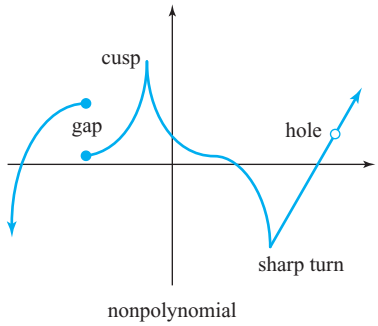
Figure 4.9



Further, after the graph of P crosses the axis at $x = -2$, it must "turn around" at some point to reach the zero at $x = 1$, then turn again as it touches the x-axis without crossing. By combining this observation with our work in Section 4.2, we can state the following:

Polynomial Graphs and Turning Points

1. If $P(x)$ is a polynomial function of degree n, then the graph of P has at most $n - 1$ turning points.
2. If the graph of a function P has $n - 1$ turning points, then the degree of $P(x)$ is at least n.

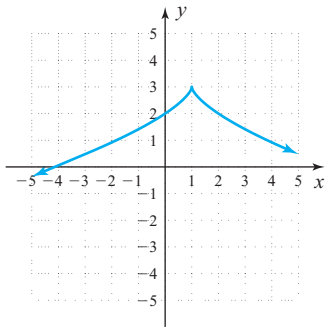


While defined more precisely in a future course, we will take "smooth" to mean the graph has no sharp turns or jagged edges, and "continuous" to mean the entire graph can be drawn without lifting your pencil (Figure 4.10). In other words, a polynomial graph has none of the attributes shown in Figure 4.11.

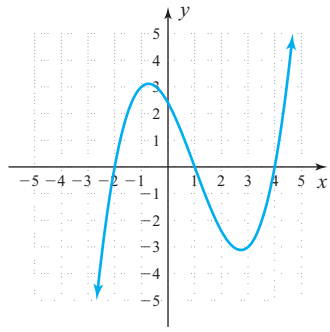
Figure 4.10

polynomial

Figure 4.11

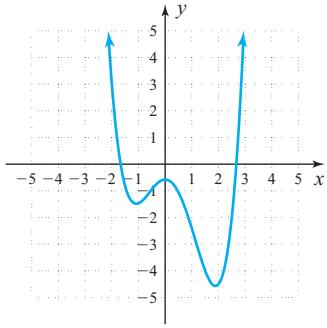


nonpolynomial

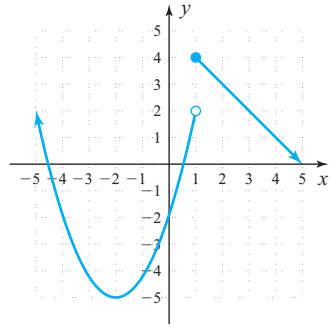


EXAMPLE 1 ▶ **Identifying Polynomial Graphs**

Determine whether each graph could be the graph of a polynomial. If not, discuss why. If so, use the number of turning points and zeroes to identify the least possible degree of the function.



a.



b.

c.

d.

Solution ▶

a. This is not a polynomial graph, as it has a cusp at (1, 3).
A polynomial graph is always smooth.

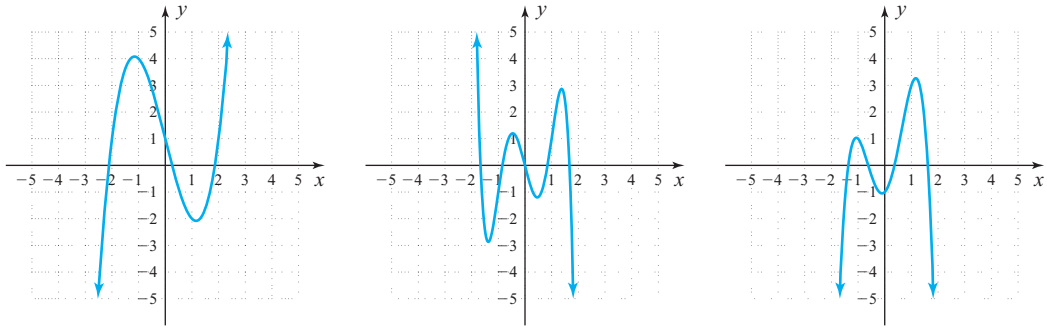
b. This graph is smooth and continuous, and could be that of a polynomial. With two turning points and three zeroes, the function is at least degree 3.

c. This graph is smooth and continuous, and could be that of a polynomial. With three turning points and two zeroes, the function is at least degree 4.

d. This is not a polynomial graph, as it has a gap (discontinuity) at $x = 1$.
A polynomial graph is always continuous.

Now try Exercises 7 through 12 ▶

☑ **A.** You've just seen how we can identify the graph of a polynomial function and determine its degree



B. The End-Behavior of a Polynomial Graph

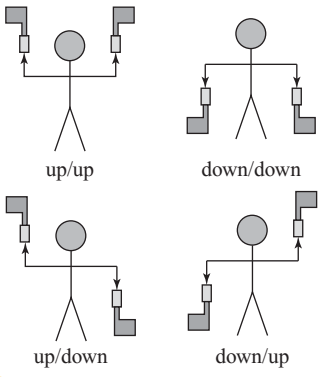
Once the graph of a function has "made its last turn" and crossed or touched its last real zero, it will continue to increase or decrease without bound as $|x|$ becomes large. As before, we refer to this as the **end-behavior** of the graph. In previous sections, we noted that quadratic functions (degree 2) with a positive leading coefficient ($a > 0$), had the end-behavior "up on the left" and "up on the right (up/up)." If the leading coefficient was negative ($a < 0$), end-behavior was "down on the left" and "down on the right (down/down)." These descriptions were also applied to the graph of a linear function $y = mx + b$ (degree 1). A positive leading coefficient ($m > 0$) indicates the graph will be down on the left, up on the right (down/up), and so on. All polynomial graphs exhibit some form of end-behavior, which can be likewise described.

EXAMPLE 2 ▶ Identifying the End-Behavior of a Graph

State the end-behavior of each graph shown:

a. $f(x) = x^3 - 4x + 1$ **b.** $g(x) = -2x^5 + 7x^3 - 4x$ **c.** $h(x) = -2x^4 + 5x^2 + x - 1$

Solution ▶



a. down on the left, up on the right **b.** up on the left, down on the right

c. down on the left, down on the right

Now try Exercises 13 through 16 ▶

WORTHY OF NOTE

As a visual aid to end-behavior, it might help to picture a signalman using semaphore code as illustrated here. As you view the end-behavior of a polynomial graph, there is a striking resemblance.

The leading term ax^n of a polynomial function is said to be the **dominant term,** because for large values of $|x|$, the value of ax^n is much larger than all other terms combined. Figure 4.12 shows a table of values for $Y_1 = 0.4x^5 - 3x^4 - 9x^3 - 15x^2 - 30$, where the leading coefficient is positive and very small, with all other coefficients negative and much larger. Initially, all outputs are negative as these terms overpower the leading term. But eventually (in this case for any integer greater than 10), the leading term will dominate all others since it becomes much more "powerful" for larger values. See Figure 4.13.

Figure 4.12

$Y_1 = 0.4x^5 - 3x^4 - 9x^3 - 15x^2 - 30$

X	Y1
0	-30
1	-56.6
2	-197.2
3	-553.8
4	-1204
5	-2155
6	-3292

X=0

Figure 4.13

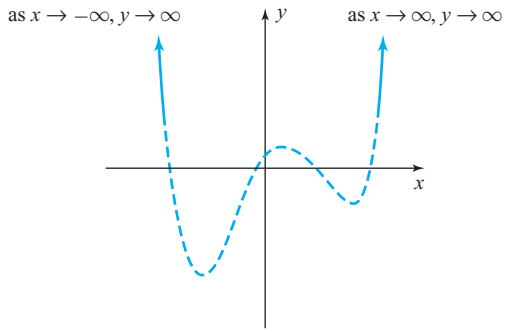
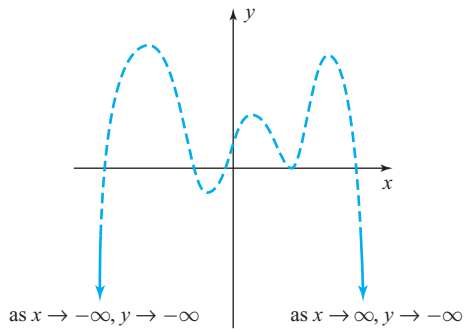
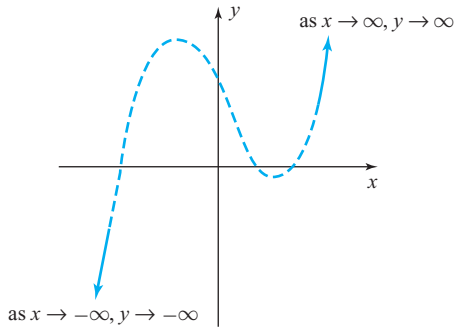
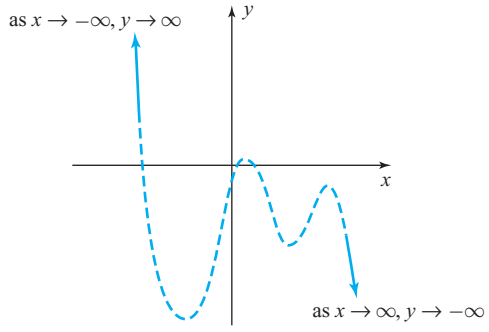
13	40496

X=13









This means that like linear and quadratic graphs, polynomial end-behavior can be predicted in advance by analyzing this term alone.

1. For ax^n when n is even, any nonzero number raised to an even power is positive, so the ends of the graph must point in the same direction. If $a > 0$, both point upward. If $a < 0$, both point downward.
2. For ax^n when n is odd, any number raised to an odd power has the same sign as the input value, so the ends of the graph must point in opposite directions. If $a > 0$, end-behavior is down on the left, up on the right. If $a < 0$, end-behavior is up on the left, down on the right.

From this we find that end-behavior depends on two things: *the degree of the function* (even or odd) and the *sign of the leading coefficient* (positive or negative). In more formal terms, this is described in terms of how the graph "behaves" for large values of x. For end-behavior that is "up on the right," we mean that as x becomes a large positive number, y becomes a large positive number. This is indicated using the notation: as $x \to \infty$, $y \to \infty$. Similar notation is used for the other possibilities. These facts are summarized in Table 4.1. The interior portion of each graph is dashed since the actual number of turning

points may vary, although a polynomial of odd degree will have an even number of turning points, and a polynomial of even degree will have an odd number of turning points.

Table 4.1
Polynomial End-Behavior

Even Degree: $a > 0$	$a < 0$
 up on the left, up on the right (similar to $y = x^2$)	 down on the left, down on the right (similar to $y = -x^2$)
Odd Degree: $a > 0$	$a < 0$
 down on the left, up on the right (similar to $y = x$)	 up on the left, down on the right (similar to $y = -x$)

Note the end-behavior of $y = mx$ can be used as a representative of all odd degree functions, and the end-behavior of $y = ax^2$ as a representative of all even degree functions.

The End-Behavior of a Polynomial Graph

Given a polynomial $P(x)$ with leading term ax^n and $n \geq 1$.
If n is **even,** ends will point in the **same direction,**

1. for $a > 0$: up on the left, up on the right (*as with* $y = x^2$);
   as $x \to -\infty, y \to \infty$; as $x \to \infty, y \to \infty$
2. for $a < 0$: down on the left, down on the right (*as with* $y = -x^2$);
   as $x \to -\infty, y \to -\infty$; as $x \to \infty, y \to -\infty$

If n is **odd,** the ends will point in **opposite directions,**

1. for $a > 0$: down on the left, up on the right (*as with* $y = x$);
   as $x \to -\infty, y \to -\infty$; as $x \to \infty, y \to \infty$
2. for $a < 0$: up on the left, down on the right (*as with* $y = -x$);
   as $x \to -\infty, y \to \infty$; as $x \to \infty, y \to -\infty$

EXAMPLE 3 ▶ **Identifying the End-Behavior of a Function**

State the end-behavior of each function.

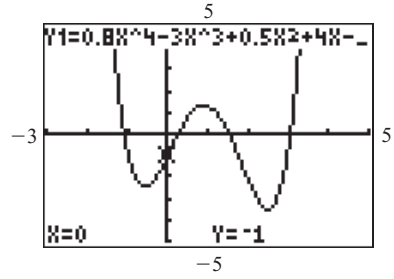
a. $f(x) = 0.8x^4 - 3x^3 + 0.5x^2 + 4x - 1$ **b.** $g(x) = -2x^5 + 6x^3 - 1$

Solution ▶

a. The function has degree 4 (even), so the ends will point in the same direction. The leading coefficient is positive, so end-behavior is up/up. See Figure 4.14.

b. The function has degree 5 (odd), so the ends will point in opposite directions. The leading coefficient is negative, so the end-behavior is up/down. See Figure 4.15.

Figure 4.14



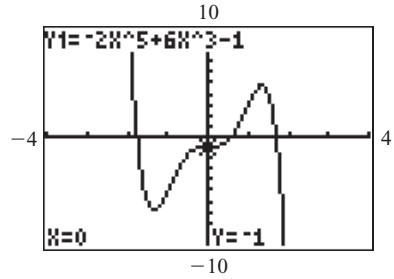


Figure 4.15

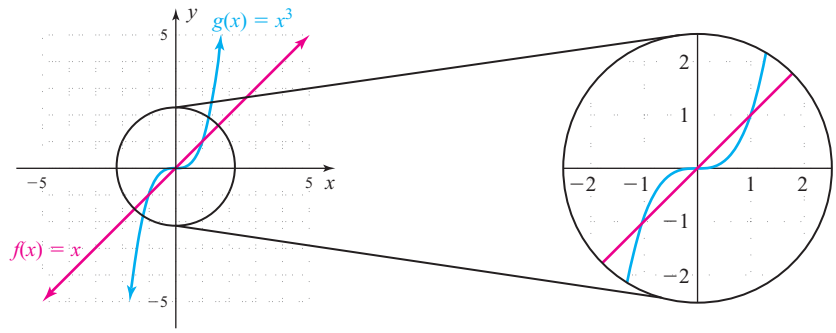
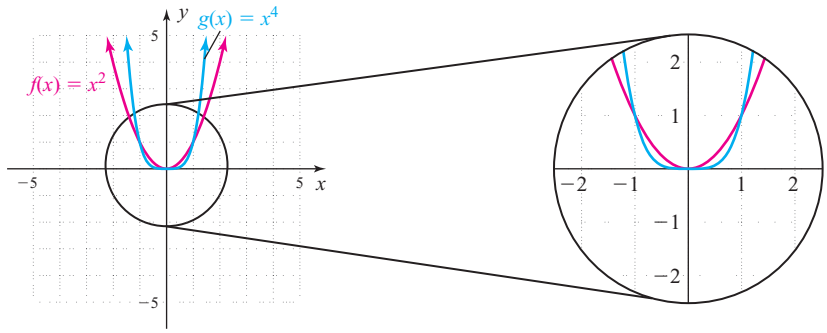


☑ **B.** You've just seen how we can describe the end-behavior of a polynomial graph

Now try Exercises 17 through 22 ▶

C. Attributes of Polynomial Graphs with Zeroes of Multiplicity



Another important aspect of polynomial functions is the behavior of a graph near its zeroes. In the simplest case, consider the functions $f(x) = x$ and $g(x) = x^3$ in Figure 4.16. Both have odd degree, like end-behavior (down/up), and a zero at $x = 0$. But the zero of f has multiplicity 1, while the zero from g has multiplicity 3. Notice the graph of g is vertically compressed near $x = 0$ and flattens out on its approach and departure from this zero.

Figure 4.16

This behavior can be explained by noting that for $x = -1$ and 1, $f(x) = g(x)$. But for $|x| < 1$, the graph of g *will be closer to the x-axis* (g decreases faster than f) since the cube of a fractional number is smaller than the fraction itself. We further note that for $|x| > 1$, g increases much faster than f, and $|g(x)| > |f(x)|$. Similar observations can be made regarding $f(x) = x^2$ and $g(x) = x^4$ in Figure 4.17. Both functions have even degree, a zero at $x = 0$, and $f(x) = g(x)$ for $x = -1$ and 1. But for $|x| < 1$, the function with higher degree is once again closer to the x-axis.

Figure 4.17

These observations can be generalized and applied to all real zeroes of a function.

Polynomial Graphs and Zeroes of Multiplicity

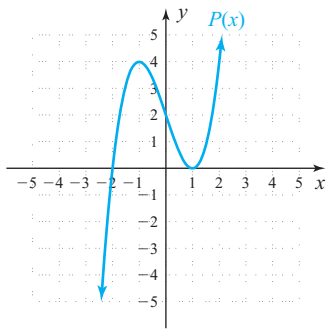
Given $P(x)$ is a polynomial with factors of the form $(x - c)^m$, with c a real number,

- If m is odd, the graph will cross through the x-axis.
- If m is even, the graph will "bounce" off the x-*axis* (touching at just one point).

In each case, the graph will be more compressed (flatter) near c for larger values of m.

To illustrate, compare the graph of $P(x) = (x + 2)(x - 1)^2$ (Figure 4.18), with the graph of $p(x) = (x + 2)^3(x - 1)^4$ shown in Figure 4.19, noting the increased multiplicity of each zero.

Figure 4.18



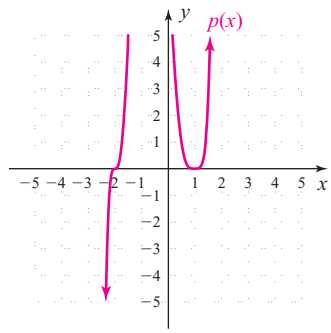


Figure 4.19

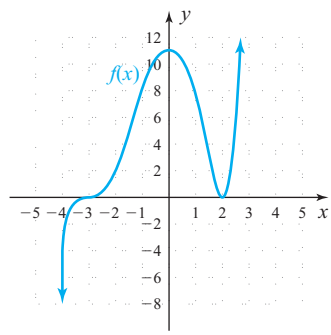
Both graphs show the expected zeroes at $x = -2$ and $x = 1$, but the graph of $p(x)$ is flatter near $x = -2$ and $x = 1$, due to the increased multiplicity of each zero. We also lose sight of the graph of $p(x)$ between $x = -2$ and $x = 0$, since the increased multiplicities produce larger values than the original grid could display.

EXAMPLE 4 ▶ **Naming Attributes of a Function from Its Graph**



The graph of a polynomial $f(x)$ is shown.

a. State whether the degree of f is even or odd.

b. Use the graph to name the zeroes of f, then state whether their multiplicity is even or odd.

c. State the minimum possible degree of f.

d. State the domain and range of f.

Solution ▶

a. Since the ends of the graph point in opposite directions, the degree of the function must be odd.

b. The graph crosses the x-axis at $x = -3$ and is compressed near -3, meaning it must have odd multiplicity with $m > 1$. The graph "bounces" off the x-axis at $x = 2$ and 2 must be a zero of even multiplicity.

c. The minimum possible degree of f is 5, as in $f(x) = a(x - 2)^2(x + 3)^3$.

d. $x \in \mathbb{R}, y \in \mathbb{R}$.

Now try Exercises 23 through 28 ▶

To find the degree of a polynomial from its factored form, add the exponents on all linear factors, then add 2 for each irreducible quadratic factor (the degree of any quadratic factor is 2). The sum gives the degree of the polynomial, from which end-behavior can be determined. To find the y-intercept, substitute 0 for x as before, noting this is equivalent to applying the exponent to the constant from each factor.

EXAMPLE 5 ▶ Naming Attributes of a Function from Its Factored Form

State the degree of each function, then describe the end-behavior and name the y-intercept of each graph.

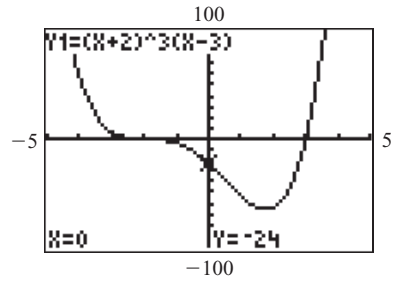
a. $f(x) = (x + 2)^3(x - 3)$ **b.** $g(x) = -(x + 2)^2(x^2 + 5)(x - 5)$

Solution ▶

a. The degree of f is $3 + 1 = 4$. With even degree and positive leading coefficient, end-behavior is up/up. For $f(0) = (2)^3(-3) = -24$, the y-intercept is $(0, -24)$. See Figure 4.20.

b. The degree of g is $2 + 2 + 1 = 5$. With odd degree and negative leading coefficient, end-behavior is up/down. For $g(0) = -1(2)^2(5)(-5) = 100$, the y-intercept is $(0, 100)$. See Figure 4.21.

Figure 4.20



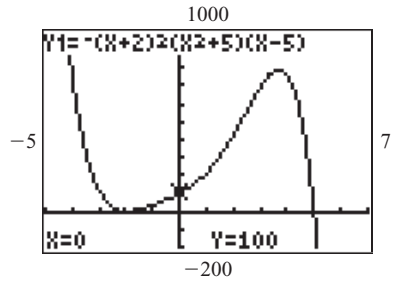


Figure 4.21

Now try Exercises 29 through 36 ▶

EXAMPLE 6 ▶ Matching Graphs to Functions Using Zeroes of Multiplicity

The following functions all have zeroes at $x = -2, -1$, and 1. Match each function to the corresponding graph *using its degree and the multiplicity of each zero.*

a. $y = (x + 2)(x + 1)^2(x - 1)^3$ **b.** $y = (x + 2)(x + 1)(x - 1)^3$

c. $y = (x + 2)^2(x + 1)^2(x - 1)^3$ **d.** $y = (x + 2)^2(x + 1)(x - 1)^3$

Solution ▶

The functions in Figures 4.22 and 4.24 must have even degree due to end-behavior, so each corresponds to (a) or (d). At $x = -1$ the graph in Figure 4.22 "crosses," while the graph in Figure 4.24 "bounces." This indicates Figure 4.22 matches equation (d), while Figure 4.24 matches equation (a).

The graphs in Figures 4.23 and 4.25 must have odd degree due to end-behavior, so each corresponds to (b) or (c). Here, one graph "bounces" at $x = -2$, while the other "crosses." The graph in Figure 4.23 matches equation (c), the graph in Figure 4.25 matches equation (b).

Figure 4.22

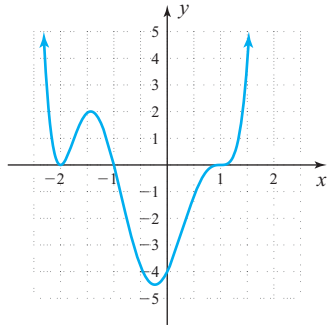

Figure 4.23

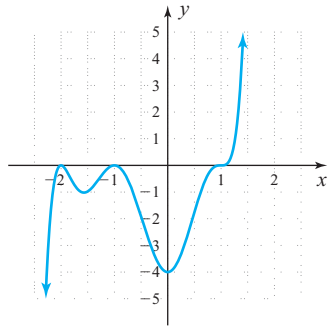

Figure 4.24

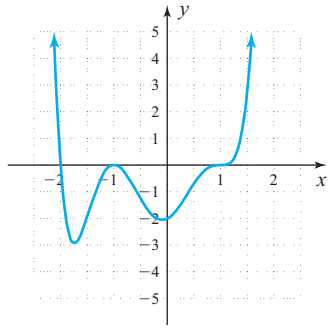

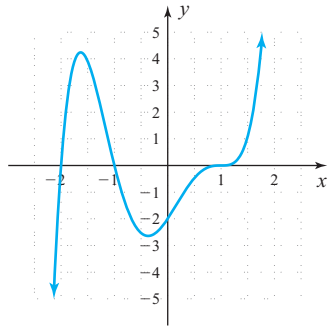

Figure 4.25

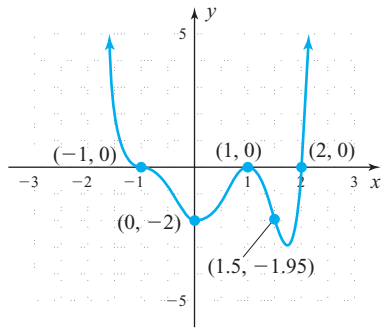
Now try Exercises 37 through 42 ▶



Using the ideas from Examples 5 and 6, we're able to draw a fairly accurate graph given the factored form of a polynomial. Convenient values between two zeroes, called **midinterval points,** should be used to help complete the graph.

EXAMPLE 7 ▶ Graphing a Function Given the Factored Form

Sketch the graph of $f(x) = (x - 2)(x - 1)^2(x + 1)^3$ using end-behavior; the x- and y-intercepts, and zeroes of multiplicity.

Solution ▶

Adding the exponents of each factor, we find that f is a function of degree 6 with a positive lead coefficient, so end-behavior will be up/up. Since $f(0) = -2$, the y-intercept is $(0, -2)$. The graph will bounce off the x-axis at $x = 1$ (even multiplicity), and cross the axis at $x = -1$ and 2 (odd multiplicities). The graph will "flatten out" near $x = -1$ because of its higher multiplicity. To help "round-out" the graph we evaluate f at $x = 1.5$, giving $(-0.5)(0.5)^2(2.5)^3 \approx -1.95$ (note scaling of the x- and y-axes).

C. You've just seen how we can discuss the attributes of a polynomial graph with zeroes of multiplicity

Now try Exercises 43 through 56 ▶

D. The Graph of a Polynomial Function

Using the cumulative observations from this and previous sections, a general strategy emerges for the graphing of polynomial functions.

Guidelines for Graphing Polynomial Functions

1. Determine the end-behavior of the graph.
2. Find the y-intercept $(0, a_0)$
3. Find the zeroes using any combination of the rational zeroes theorem, the factor and remainder theorems, tests for 1 and -1, factoring, and the quadratic formula.
4. Use the y-intercept, end-behavior, the multiplicity of each zero, and midinterval points as needed to sketch a smooth, continuous curve.

Additional tools include (a) polynomial zeroes theorem, (b) complex conjugates theorem, (c) number of turning points, (d) Descartes' rule of signs, (e) upper and lower bounds, and (f) symmetry.

WORTHY OF NOTE

Although of somewhat limited value, symmetry (item f in the guidelines) can sometimes aid in the graphing of polynomial functions. If all terms of the function have even degree, the graph will be symmetric to the y-axis (even). If all terms have odd degree, the graph will be symmetric to the origin. Recall that a constant term has degree zero, an even number.

EXAMPLE 8 ▶ Graphing a Polynomial Function

Sketch the graph of $g(x) = -x^4 + 9x^2 - 4x - 12$.

Solution ▶

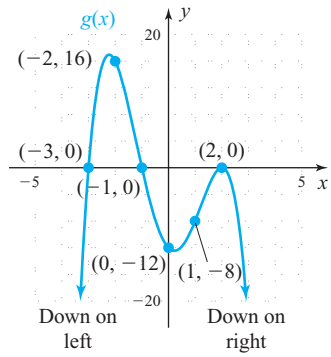
1. End-behavior: The function has degree 4 (even) with a negative leading coefficient, so end-behavior is *down on the left, down on the right.*
2. Since $g(0) = -12$, the y-intercept is $(0, -12)$.
3. Zeroes: Using the test for $x = 1$ gives $-1 + 9 - 4 - 12 = -8$, showing $x = 1$ is not a zero but $(1, -8)$ is a point on the graph. Using the test for $x = -1$ gives $-1 + 9 + 4 - 12 = 0$, so -1 is a zero and $(x + 1)$ is a factor. Using $x = -1$ with the factor theorem yields

$$\begin{array}{r|rrrrr} -1 & -1 & 0 & 9 & -4 & -12 \\ & & 1 & -1 & -8 & 12 \\ \hline & -1 & 1 & 8 & -12 & 0 \end{array}$$

The quotient polynomial is not easily factorable so we continue with synthetic division. Using the rational zeroes theorem, the possible rational zeroes are $\{\pm 1, \pm 12, \pm 2, \pm 6, \pm 3, \pm 4\}$, so we try $x = 2$.

use 2 as a "divisor" on the quotient polynomial

$$\begin{array}{r|rrrr} 2 & -1 & 1 & 8 & -12 \\ & & -2 & -2 & 12 \\ \hline & -1 & -1 & 6 & 0 \end{array}$$



This shows $x = 2$ is a zero, $x - 2$ is a factor, and the function can now be written as

$$g(x) = (x + 1)(x - 2)(-x^2 - x + 6).$$

Factoring -1 from the trinomial gives

$$\begin{aligned} g(x) &= -1(x + 1)(x - 2)(x^2 + x - 6) \\ &= -1(x + 1)(x - 2)(x + 3)(x - 2) \\ &= -1(x + 1)(x - 2)^2(x + 3) \end{aligned}$$

The zeroes of g are $x = -1$ and -3, both with multiplicity 1, and $x = 2$ with multiplicity 2.

4. To help "round-out" the graph we evaluate the midinterval point $x = -2$ using the remainder theorem or the factored form of $g(x)$, which shows that $(-2, 16)$ is also a point on the graph.

use -2 as a "divisor"

$$\begin{array}{r|rrrrr} -2 & -1 & 0 & 9 & -4 & -12 \\ & & 2 & -4 & -10 & 28 \\ \hline & -1 & 2 & 5 & -14 & 16 \end{array}$$

The final result is the graph shown.

Now try Exercises 57 through 72 ▶

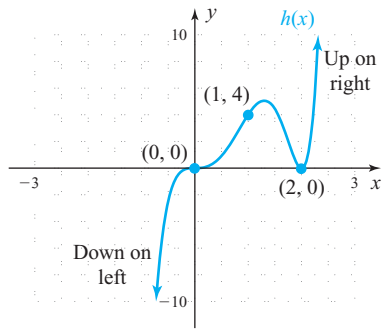
CAUTION ▶ Sometimes using a midinterval point to help draw a graph will give the illusion that a maximum or minimum value has been located. This is rarely the case, as demonstrated in the figure in Example 8, where the maximum value in Quadrant II is actually closer to $(-2.22, 16.95)$.

EXAMPLE 9 ▶ **Using the Guidelines to Sketch a Polynomial Graph**

Sketch the graph of $h(x) = x^7 - 4x^6 + 7x^5 - 12x^4 + 12x^3$.

Solution ▶

1. End-behavior: The function has degree 7 (odd) so the ends will point in opposite directions. The leading coefficient is positive and the end-behavior will be *down on the left* and *up on the right*.
2. y-intercept: Since $h(0) = 0$, the y-intercept is $(0, 0)$.
3. Zeroes: Testing 1 and -1 shows neither are zeroes but $(1, 4)$ and $(-1, -36)$ are points on the graph. Factoring out x^3 produces $h(x) = x^3(x^4 - 4x^3 + 7x^2 - 12x + 12)$, and we see that $x = 0$ is a zero of multiplicity 3. We next use synthetic division with $x = 2$ on the fourth-degree polynomial:



use 2 as a "divisor"

$$\begin{array}{r|rrrrr} 2 & 1 & -4 & 7 & -12 & 12 \\ & & 2 & -4 & 6 & -12 \\ \hline & 1 & -2 & 3 & -6 & 0 \end{array}$$

This shows $x = 2$ is a zero and $x - 2$ is a factor. At this stage, it appears the quotient can be factored by grouping. From $h(x) = x^3(x - 2)(x^3 - 2x^2 + 3x - 6)$, we obtain $h(x) = x^3(x - 2)(x^2 + 3)(x - 2)$ after factoring and

$$h(x) = x^3(x - 2)^2(x^2 + 3)$$

as the completely factored form. We find that $x = 2$ is a zero of multiplicity 2, and the remaining two zeroes are complex.

4. Using this information produces the graph shown in the figure.

Now try Exercises 73 through 76 ▶

D. You've just seen how we can graph polynomial functions in standard form

For practice with these ideas using a graphing calculator, **see Exercises 77 through 80.** Similar to our work in previous sections, **Exercises 81 and 82** ask you to reconstruct the complete equation of a polynomial from its given graph.

E. Applications of Polynomials and Polynomial Modeling

EXAMPLE 10 ▶ **Modeling the Value of an Investment**

In the year 2000, Marc and his wife Maria decided to invest some money in precious metals. As expected, the value of the investment fluctuated over the years, sometimes being worth more than they paid, other times less. Suppose that through 2010, the gain or loss on the investment was modeled by $v(t) = t^4 - 11t^3 + 38t^2 - 40t$, where $v(t)$ represents the gain or loss (in hundreds of dollars) in year t ($t = 0 \rightarrow 2000$).

a. Use the rational zeroes theorem to find the years when their gain/loss was zero.

b. Sketch the graph of the function.

c. In what years was the investment worth less than they paid?

d. What was their gain or loss in 2010?

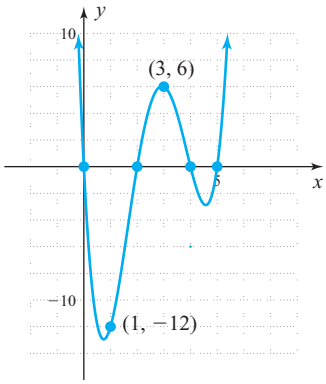
Solution ▶

a. Writing the function as $v(t) = t(t^3 - 11t^2 + 38t - 40)$, we note $t = 0$ shows no gain or loss on purchase, and attempt to find the remaining zeroes. Testing for 1 and -1 shows neither is a zero, but $(1, -12)$ and $(-1, 90)$ are points on the graph of v. Next we try $t = 2$ with the factor theorem and the cubic polynomial.

2	1	−11	38	−40
		2	−18	40
	1	−9	20	0

We find that 2 is a zero and write $v(t) = t(t - 2)(t^2 - 9t + 20)$, then factor to obtain $v(t) = t(t - 2)(t - 4)(t - 5)$. Since $v(t) = 0$ for $t = 0, 2, 4$, and 5, they "broke even" in years 2000, 2002, 2004, and 2005.

WORTHY OF NOTE



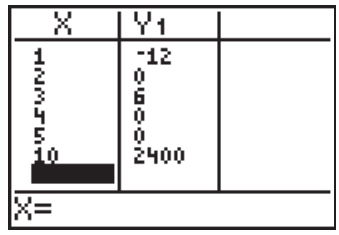
Due to the context, the domain of $v(t)$ in Example 10 actually begins at $t = 0$, which we could designate with a point at (0, 0). In addition, note there are three sign changes in the terms of $v(t)$, indicating there will be 3 or 1 positive roots (we found 3).

b. With even degree and a positive leading coefficient, the end-behavior is up/up. All zeroes have multiplicity 1. As an additional midinterval point we find $v(3) = 6$:

3	1	−11	38	−40	0
		3	−24	42	6
	1	−8	14	2	6

The graph is shown in Figure 4.26.

Figure 4.26



c. The investment was worth less than what they paid (outputs are negative) from 2000 to 2002 and 2004 to 2005.

d. In 2010, they were "sitting pretty," as their investment had gained $2,400.

10	1	−11	38	−40	0
		10	−10	280	2400
	1	−1	28	240	2400

These values can also be calculated or confirmed using a graphing calculator. See Figure 4.27.

Figure 4.27

Now try Exercises 85 through 88 ▶

As with linear and quadratic regression models, applications of other polynomial models begins with a scatterplot and a decision as to which form of regression might be appropriate. This can depend on a number of factors, such as any end-behavior that is

evident, the number of apparent turning points, any anticipated behavior, and so on. However, due to the end-behavior of polynomial models, great care must be exercised when these models are used to make projections beyond the limits of the given data.

EXAMPLE 11 ▶ The Earth's atmosphere consists of several layers that are defined in terms of altitude and the characteristics of the air in each layer. In order, these are the Troposphere (0–12 km), Stratosphere (12–50 km), Mesosphere (50–80 km), and Thermosphere (80–100 km). Due to their chemical and physical characteristics, the air temperature within each layer and from layer to layer varies a great deal. The data in the table gives the temperature in °C at an altitude of h kilometers (km). Use the data to:

a. Draw a scatterplot and decide on an appropriate form of regression, then find the regression equation.

b. Use the regression equation to find the temperature at altitudes of 32.6 km and 63.6 km.

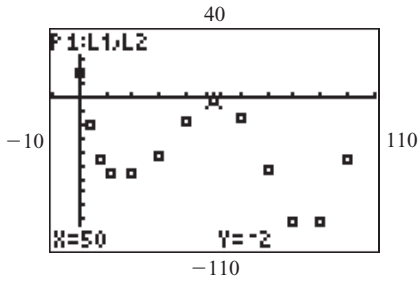
c. As the space shuttle rockets into orbit, a temperature reading of −75°C is taken. What are the possible altitudes for the shuttle at this point?

Altitude (km)	Temperature (°C)
0	20
4	−20
8	−45
12	−55
20	−57
30	−43
40	−16
50	−2
60	−14
70	−54
80	−91
90	−93
100	−45

Solution ▶

a. The scatterplot is shown in Figure 4.28. Using the characteristics exhibited (end-behavior, three turning points), it appears a quartic regression (degree 4) is appropriate and the equation is shown in Figure 4.29.

Figure 4.28



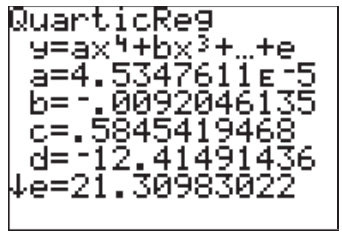


Figure 4.29

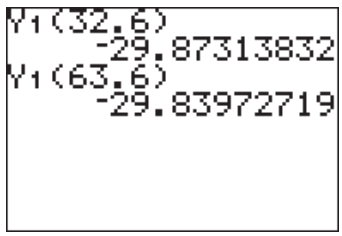
b. At altitudes of 32.6 km and 63.6 km, the temperature is very near −30.0°C (Figure 4.30).

c. Setting $Y_2 = -75$, we note the line intersects the graph in two places, one indicating an altitude of about 76.4 km, and the other an altitude of about 96.1 km (Figure 4.31).

Figure 4.30



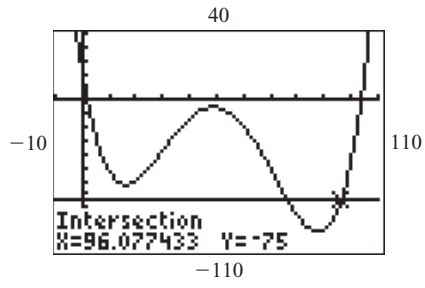


Figure 4.31

E. You've just seen how to solve applications of polynomials and polynomial modeling

Now try Exercises 89 through 92 ▶

4.3 EXERCISES

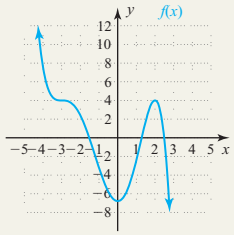
▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

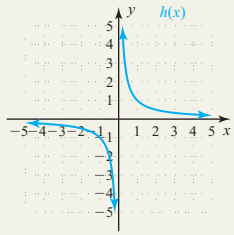
1. For a polynomial with factors of the form $(x - c)^m$, c is called a _____ of multiplicity _____.

2. A polynomial function of degree n has _____ zeroes and at most _____ "turning points."

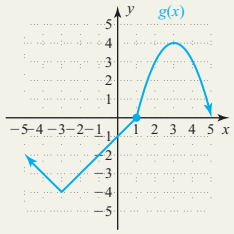
3. The graphs of $Y_1 = (x - 2)^2$ and $Y_2 = (x - 2)^4$ both _____ at $x = 2$, but the graph of Y_2 is _____ than the graph of Y_1 at this point.



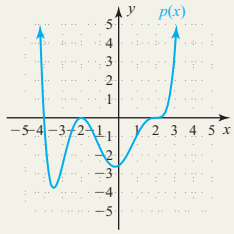
4. Since $x^4 > 0$ for all x, the ends of its graph will always point in the _____ direction. Since $x^3 > 0$ when $x > 0$ and $x^3 < 0$ when $x < 0$, the ends of its graph will always point in the _____ direction.



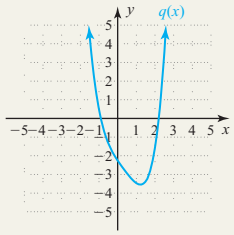
5. In your own words, explain/discuss how to find the degree and y-intercept of a function that is given in factored form. Use $f(x) = (x + 1)^3(x - 2)(x + 4)^2$ to illustrate.



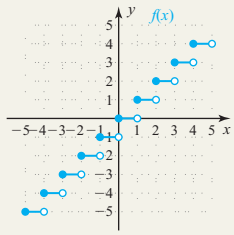
6. Name all of the "tools" at your disposal that play a role in the graphing of polynomial functions. Which tools are indispensable and always used? Which tools are used only as the situation merits?



▶ DEVELOPING YOUR SKILLS

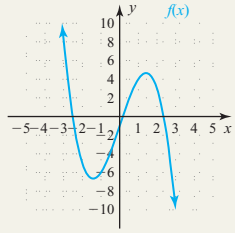


Determine whether each graph is the graph of a polynomial function. If yes, state the least possible degree of the function. If no, state why.

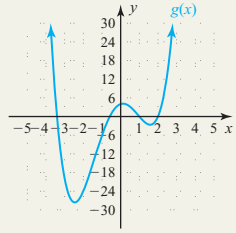


7.

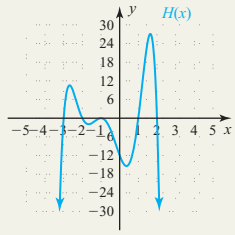
8.



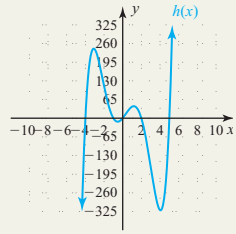
9.



10.



11.



12.

State the end-behavior of the functions shown.

13. $f(x)$

14. $g(x)$

15. $H(x)$

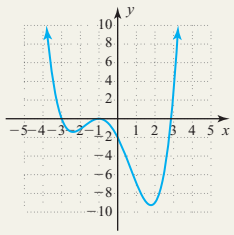
16. $h(x)$

State the end-behavior and y-intercept of the functions given. Do not graph.

17. $f(x) = x^3 + 6x^2 - 5x - 2$

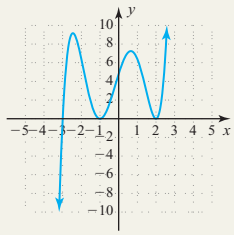
18. $g(x) = x^4 - 4x^3 - 2x^2 + 16x - 12$

19. $p(x) = -2x^4 + x^3 + 7x^2 - x - 6$



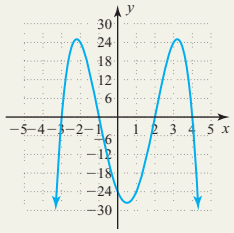
20. $q(x) = -2x^3 - 18x^2 + 7x + 3$

21. $Y_1 = -3x^5 + x^3 + 7x^2 - 6$

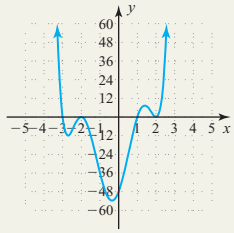


22. $Y_2 = -x^6 - 4x^5 + 4x^3 + 16x - 12$

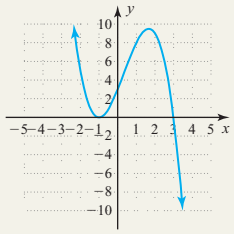
For each polynomial graph, (a) state whether the degree of the function is even or odd; (b) use the graph to name the zeroes of *f*, then state whether their multiplicity is even or odd; (c) state the minimum possible degree of *f* and write one possible function for *f* in factored form; and (d) estimate the domain and range. Assume all zeroes are real.



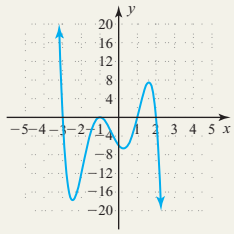
23.



24.



25.



26.

27.

28.

State the degree of each function, the end-behavior, and *y*-intercept of its graph.

29. $f(x) = (x - 3)(x + 1)^3(x - 2)^2$

30. $g(x) = (x + 2)^2(x - 4)(x + 1)$

31. $Y_1 = -(x + 1)^2(x - 2)(2x - 3)(x + 4)$

32. $Y_2 = -(x + 1)(x - 2)^3(5x - 3)$

33. $r(x) = (x^2 + 3)(x + 4)^3(x - 1)$

34. $s(x) = (x + 2)^2(x - 1)^2(x^2 + 5)$

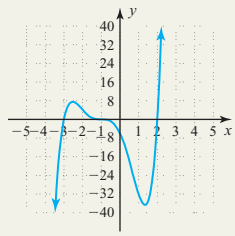
35. $h(x) = (x^2 + 2)(x - 1)^2(1 - x)$

36. $H(x) = (x + 2)^2(2 - x)(x^2 + 4)$

Every function in Exercises 37 through 42 has the zeroes $x = -1$, $x = -3$, and $x = 2$. Match each to its corresponding graph using degree, end-behavior, and the multiplicity of each zero.

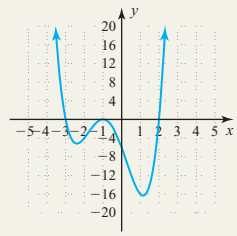
37. $f(x) = (x + 1)^2(x + 3)(x - 2)$

38. $F(x) = (x + 1)(x + 3)^2(x - 2)$



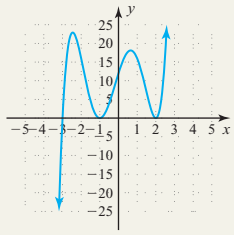
39. $g(x) = (x + 1)(x + 3)(x - 2)^3$

40. $G(x) = (x + 1)^3(x + 3)(x - 2)$

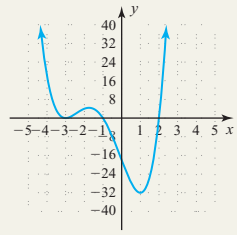


41. $Y_1 = (x + 1)^2(x + 3)(x - 2)^2$

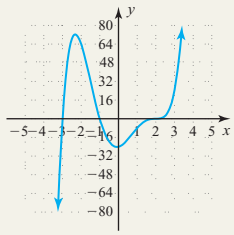
42. $Y_2 = (x + 1)^3(x + 3)(x - 2)^2$



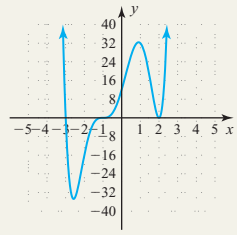
a.



b.



c.



d.

e.

f.

Sketch the graph of each function using the degree, end-behavior, *x*- and *y*-intercepts, zeroes of multiplicity, and a few midinterval points to round-out the graph. Connect all points with a smooth, continuous curve.

43. $f(x) = (x + 3)(x + 1)(x - 2)$

44. $g(x) = (x + 2)(x - 4)(x - 1)$

45. $p(x) = -(x + 1)^2(x - 3)$

46. $q(x) = -(x + 2)(x - 2)^2$

47. $Y_1 = (x + 1)^2(3x - 2)(x + 3)$

48. $Y_2 = (x + 2)(x - 1)^2(5x - 2)$

49. $r(x) = -(x + 1)^2(x - 2)^2(x - 1)$

50. $s(x) = -(x - 3)(x - 1)^2(x + 1)^2$

51. $f(x) = (2x + 3)(x - 1)^3$

52. $g(x) = (3x - 4)(x + 1)^3$

53. $h(x) = (x + 1)^3(x - 3)(x - 2)$

54. $H(x) = (x + 3)(x + 1)^2(x - 2)^2$

55. $Y_3 = (x + 1)^3(x - 1)^2(x - 2)$

56. $Y_4 = (x - 3)(x - 1)^3(x + 1)^2$

Use the *Guidelines for Graphing Polynomial Functions* to graph the polynomials.

57. $y = x^3 + 3x^2 - 4$

58. $y = x^3 - 13x + 12$

59. $f(x) = x^3 - 3x^2 - 6x + 8$

60. $g(x) = x^3 + 2x^2 - 5x - 6$

61. $h(x) = -x^3 - x^2 + 5x - 3$

62. $H(x) = -x^3 - x^2 + 8x + 12$

63. $p(x) = -x^4 + 10x^2 - 9$

64. $q(x) = -x^4 + 13x^2 - 36$

65. $r(x) = x^4 - 9x^2 - 4x + 12$

66. $s(x) = x^4 - 5x^3 + 20x - 16$

67. $Y_1 = x^4 - 6x^3 + 8x^2 + 6x - 9$

68. $Y_2 = x^4 - 4x^3 - 3x^2 + 10x + 8$

69. $Y_3 = 3x^4 + 2x^3 - 36x^2 + 24x + 32$

70. $Y_4 = 2x^4 - 3x^3 - 15x^2 + 32x - 12$

71. $F(x) = 2x^4 + 3x^3 - 9x^2$

72. $G(x) = 3x^4 + 2x^3 - 8x^2$

73. $f(x) = x^5 + 4x^4 - 16x^2 - 16x$

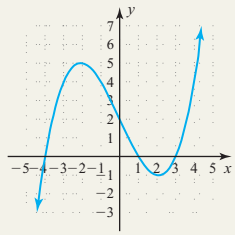
74. $g(x) = x^5 - 3x^4 + x^3 - 3x^2$

75. $h(x) = x^6 - 2x^5 - 4x^4 + 8x^3$

76. $H(x) = x^6 + 3x^5 - 4x^4$

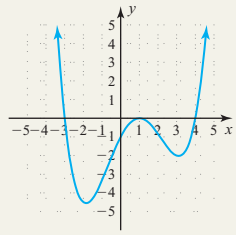
In preparation for future course work, it becomes helpful to recognize the most common square roots in mathematics: $\sqrt{2} \approx 1.414$, $\sqrt{3} \approx 1.732$, and $\sqrt{6} \approx 2.449$. Graph the following polynomials *on a graphing calculator,* and use the calculator to locate the maximum/minimum values and all zeroes. Use the zeroes to write the polynomial in factored form, then verify the *y*-intercept from the factored form and polynomial form.

77. $h(x) = x^5 + 4x^4 - 9x - 36$



78. $H(x) = x^5 + 5x^4 - 4x - 20$

79. $f(x) = 2x^5 + 5x^4 - 10x^3 - 25x^2 + 12x + 30$



80. $g(x) = 3x^5 + 2x^4 - 24x^3 - 16x^2 + 36x + 24$

Use the graph of each function to construct its equation in factored form and in polynomial form. Be sure to check the *y*-intercept and adjust the lead coefficient if necessary.

81.

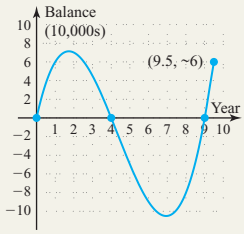
82.

▶ WORKING WITH FORMULAS

83. Roots tests for a quartic polynomial $ax^4 + bx^3 + cx^2 + dx + e$:

$$(r_1)^2 + (r_2)^2 + (r_3)^2 + (r_4)^2 = \frac{b^2 - 2ac}{a^2}$$

In the Chapter 3 *Reinforcing Basic Concepts* feature, we used relationships between the roots of a quadratic equation and its coefficients to verify the roots without having to substitute. Similar root/coefficient relationships exist for cubic and quartic polynomials, but the method soon becomes too time consuming (see Exercise 94). There is actually a little known formula for checking the roots of a quartic polynomial (and others) that is much more efficient. Given that r_1, r_2, r_3, and r_4 are the roots of the polynomial, the sum of the squares of the roots must be equal to $\frac{b^2 - 2ac}{a^2}$. Note that if $a = 1$, the formula reduces to $b^2 - 2c$. (a) Use this test to verify that $x = -3, -1, 2$, and 4 are the roots of $x^4 - 2x^3 - 13x^2 + 14x + 24 = 0$, then (b) use these roots and the factored form to write the equation in polynomial form to confirm results.



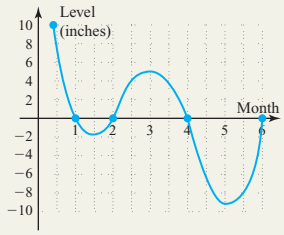
84. It is worth noting that the root test in Exercise 83 still applies when the roots are irrational and/or complex. Use this test to verify that $x = -\sqrt{3}, \sqrt{3}, 1 + 2i$, and $1 - 2i$ are the solutions to $x^4 - 2x^3 + 2x^2 + 6x - 15 = 0$, then use these zeroes and the factored form to write the equation in polynomial form to confirm results.

▶ APPLICATIONS

85. Traffic volume: Between the hours of 6:00 A.M. and 6.00 P.M., the volume of traffic at a busy intersection can be modeled by the polynomial $v(t) = -t^4 + 25t^3 - 192t^2 + 432t$, where $v(t)$ represents the number of vehicles above/below average, and t is number of hours past 6:00 A.M. (6:00 A.M. $\rightarrow 0$). (a) Use the remainder theorem to find the volume of traffic during rush hour (8:00 A.M.), lunch time (12 noon), and the trip home (5:00 P.M.). (b) Use the rational zeroes theorem to find the times when the volume of traffic is at its average $[v(t) = 0]$. (c) Use this information to graph $v(t)$, then use the graph to estimate the maximum and minimum flow of traffic and the time at which each occurs.

86. Insect population: The population of a certain insect varies dramatically with the weather, with springlike temperatures causing a population boom and extreme weather (summer heat and winter cold) adversely affecting the population. This phenomena can be modeled by the polynomial $p(m) = -m^4 + 26m^3 - 217m^2 + 588m$, where $p(m)$ represents the number of live insects (in hundreds of thousands) in month m ($m \in (0, 1] \rightarrow$ Jan). (a) Use the remainder theorem to find the population of insects during the cool of spring (March) and the fair weather of fall (October). (b) Use the rational zeroes theorem to find the times when the population of insects becomes dormant $[p(m) = 0]$. (c) Use this information to graph $p(m)$, then use the graph to estimate the maximum and minimum population of insects, and the month at which each occurs.

87. Balance of payments: The graph shown represents the balance of payments (surplus versus deficit) for a large county over a 9-yr period. Use it to answer the following:



a. What is the minimum possible degree polynomial that can model this graph?

b. How many years did this county run a deficit?

c. Construct an equation model in factored form and in polynomial form, adjusting the lead coefficient as needed. How large was the deficit in year 8?

88. Water supply: The graph shown represents the water level in a reservoir (above and below normal) that supplies water to a metropolitan area, over a 6-month period. Use it to answer the following:

a. What is the minimum possible degree polynomial that can model this graph?

b. How many months was the water level below normal in this 6-month period?

c. At the beginning of this period ($m = 0$), the water level was 36 in. above normal, due to a long period of rain. Use this fact to help construct an equation model in factored form and in polynomial form, adjusting the lead coefficient as needed. Use the equation to determine the water level in months three and five.

89. In order to determine if the number of lanes on a certain highway should be increased, the flow of traffic (in vehicles per min) is carefully monitored from 6:00 A.M. to 6:00 P.M. The data collected are shown the table (6:00 A.M. corresponds to $t = 0$). (a) Draw a scatterplot and decide on an appropriate form of regression, then find the regression equation and graph the function and scatterplot on the same screen. (b) Use the regression equation and its graph to find the maximum flow of traffic for the morning and evening rush hours. (c) During what time(s) of day is the flow rate 350 vehicles per hour?

Time (6:00 A.M. → 0)	Volume (vehicles/min)
0	0
2	222
4	100
6	114
8	360
10	550
11	429

90. The Goddard Memorial Rocket Club is testing a new two-stage rocket. Using a specialized tracking device, the velocity of the rocket is monitored every second for the first 4.5 sec of flight, with the data collected in the table shown. (a) Draw a scatterplot and decide on an appropriate form of regression, then find the regression equation and graph the function and scatterplot on the same screen. (b) Use the regression equation and its graph to find how many seconds elapsed before the first stage burned out,

Time (sec)	Velocity (ft/sec)
0	0
1	441
2	484
3	459
4	696

and the rocket's velocity at this time, then (c) determine how many seconds elapsed (after liftoff) until the second stage ignited. (d) At a velocity of 1000 ft/sec, the fuel was exhausted and the return chutes deployed. How many seconds after liftoff did this occur?

91. A posh restaurant in a thriving neighborhood opens at 10 A.M. for the lunch crowd, and closes at 9 P.M. as the dinner crowd leaves. In order to ensure that an adequate number of cooks and servers are available, their hourly customer count is monitored each day for 1 month with the data averaged and compiled in the table shown. (a) Draw a scatterplot and decide on an appropriate form of regression, then find the regression equation and graph the function and scatterplot on the same screen. (b) Use the regression equation and its graph to find what time the restaurant reaches its morning peak and its evening peak. (c) At what time is business slowest, and how many customers are in the restaurant at that time? (d) Between what times is the restaurant serving 100 customers or more?

Time (10 A.M. → 0)	Customer count
0	0
2	79
4	41
6	43
9	122
11	3

92. Using the wind to generate power is becoming more and more prevalent. While most people are aware that a wind turbine generates more power with a stronger wind, many are not aware that the generators are built with a stall mechanism to protect the generator, blades, and infrastructure in very high winds. This affects the actual power output as the generator operates near its threshold. The power output [in watts (W)] of a certain generator is shown in the table for wind velocity v in miles per hour. (a) Draw a scatterplot and decide on an appropriate form of regression, then find the regression equation and graph the function and scatterplot on the same screen. (b) Use the regression equation and its graph to find the maximum safe power output for this generator, and the wind speed at which this occurs. (c) What is the power output in a 23 mph wind? (d) If the manufacturer stipulates that the turbine will experience automatic shutdown when power output exceeds 900 W, what is the greatest wind speed this turbine can tolerate?

Wind velocity (mph)	Power (W)
20	419
25	623
30	635
35	593
40	639

▶ EXTENDING THE CONCEPT

93. As discussed in this section, the study of end-behavior looks at what happens to the graph of a function as $|x| \to \infty$. Notice that as $|x| \to \infty$, both $\frac{1}{x}$ and $\frac{1}{x^2}$ approach zero. This fact can be used to study the end-behavior of polynomial graphs.

a. For $f(x) = x^3 + x^2 - 3x + 6$, factoring out x^3 gives the expression $f(x) = x^3\left(1 + \frac{1}{x} - \frac{3}{x^2} + \frac{6}{x^3}\right)$. What happens to the value of the expression as $x \to \infty$? As $x \to -\infty$?

b. Factor out x^4 from $g(x) = x^4 + 3x^3 - 4x^2 + 5x - 1$. What happens to the value of the expression as $x \to \infty$? As $x \to -\infty$? How does this affirm the end-behavior must be up/up?

94. If u, v, w, and z represent the roots of the quartic polynomial $ax^4 + bx^3 + cx^2 + dx + e = 0$, then the following relationships are true: (a) $u + v + w + z = -b$, (b) $u(v + z) + v(w + z) + w(u + z) = c$, (c) $u(vw + wz) + v(uz + wz) = -d$, and (d) $u \cdot v \cdot w \cdot z = e$. Use these tests to verify that $x = -3, -1, 2, 4$ are the solutions to $x^4 - 2x^3 - 13x^2 + 14x + 24 = 0$, then use these zeroes and the factored form to write the equation in polynomial form to confirm results.

95. For what value of c will three of the four real roots of $x^4 + 5x^3 + x^2 - 21x + c = 0$ be shared by the polynomial $x^3 + 2x^2 - 5x - 6 = 0$?

Show the following equations have no rational roots.

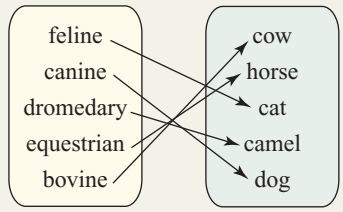
96. $x^5 - x^4 - x^3 + x^2 - 2x + 3 = 0$

97. $x^5 - 2x^4 - x^3 + 2x^2 - 3x + 4 = 0$

▶ MAINTAINING YOUR SKILLS

98. **(3.6)** Given $f(x) = x^2 - 2x$ and $g(x) = \frac{1}{x}$, find the compositions $h(x) = (f \circ g)(x)$ and $H(x) = (g \circ f)(x)$, then state the domain of each.

99. **(3.1)** By direct substitution, verify that $x = 1 - 2i$ is a solution to $x^2 - 2x + 5 = 0$ and name the second solution.



100. **(Appendix A.3/Appendix A.6)** Solve each of the following equations.

a. $-(2x + 5) - (6 - x) + 3 = x - 3(x + 2)$

b. $\sqrt{x + 1} + 3 = \sqrt{2x} + 2$

c. $\dfrac{2}{x - 3} + 5 = \dfrac{21}{x^2 - 9} + 4$

101. **(1.3)** Determine if the relation shown is a function. If not, explain how the definition of a function is violated.

MID-CHAPTER CHECK

1. Compute $(x^3 + 8x^2 + 7x - 14) \div (x + 2)$ using long division and write the result in two ways:

(a) dividend = (quotient)(divisor) + remainder and

(b) $\dfrac{\text{dividend}}{\text{divisor}} = (\text{quotient}) + \dfrac{\text{remainder}}{\text{divisor}}$.

2. Given that $x - 2$ is a factor of $f(x) = 2x^4 - x^3 - 8x^2 + x + 6$, use the rational zeroes theorem to write $f(x)$ in completely factored form.

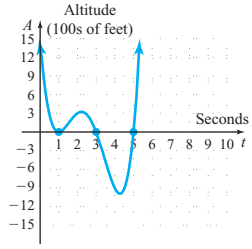
3. Use the remainder theorem to evaluate $f(-2)$, given $f(x) = -3x^4 + 7x^2 - 8x + 11$.

4. Use the factor theorem to find a third-degree polynomial having $x = -2$ and $x = 1 + i$ as roots.

5. Use the intermediate value theorem to show that $g(x) = x^3 - 6x - 4$ has a root in the interval $(2, 3)$.

6. Use the rational zeroes theorem, tests for -1 and 1, synthetic division, and the remainder theorem to write $f(x) = x^4 + 5x^3 - 20x - 16$ in completely factored form.

7. Find all the zeroes of h, real and complex: $h(x) = x^4 + 3x^3 + 10x^2 + 6x - 20$.



8. Sketch the graph of p using its degree, end-behavior, y-intercept, zeroes of multiplicity, and any midinterval points needed, given $p(x) = (x + 1)^2(x - 1)(x - 3)$.

9. Use the *Guidelines for Graphing* to draw the graph of $q(x) = x^3 + 5x^2 + 2x - 8$.

10. When fighter pilots train for dogfighting, a "hard-deck" is usually established below which no competitive activity can take place. The polynomial graph given shows Maverick's altitude above and below this hard-deck during a 5-sec interval.

a. What is the minimum possible degree polynomial that could form this graph? Why?

b. How many seconds (total) was Maverick below the hard-deck for these 5 sec of the exercise?

c. At the beginning of this time interval ($t = 0$), Maverick's altitude was 1500 ft above the hard-deck. Use this fact and the graph given to help construct an equation model in factored form and in polynomial form, adjusting the lead coefficient if needed. Use the equation to determine Maverick's altitude in relation to the hard-deck at $t = 2$ and $t = 4$.

REINFORCING BASIC CONCEPTS

Approximating Real Zeroes

Consider the equation $x^4 + x^3 + x - 6 = 0$. Using the rational zeroes theorem, the possible rational zeroes are $\{\pm 1, \pm 6, \pm 2, \pm 3\}$. The tests for 1 and -1 indicate that neither is a zero: $f(1) = -3$ and $f(-1) = -7$. Descartes' rule of signs reveals there must be one positive real zero since the coefficients of $f(x)$ change sign one time: $f(x) = x^4 + x^3 + x - 6$, and one negative real zero since $f(-x)$ also changes sign one time: $f(-x) = x^4 - x^3 - x - 6$. The remaining two zeroes must be complex. Using $x = 2$ with synthetic division shows 2 is not a zero, but the coefficients in the quotient row are all positive, so 2 is an upper bound:

2	1	1	0	1	−6	coefficients of $f(x)$
		2	6	12	26	
	1	3	6	13	20	$q(x)$

Using $x = -2$ shows that -2 is a zero *and a lower bound* for all other zeroes (quotient row alternates in sign):

−2	1	−1	2	−3	6	coefficients of $f(x)$
	1	−3	2	−4	0	$q_1(x)$

This means the remaining real zero must be a positive irrational number less than 2 (all other possible rational zeroes were eliminated). The quotient polynomial $q_1(x) = x^3 - x^2 + 2x - 3$ is not factorable, yet we're left with the challenge of finding this final zero. While there are many advanced techniques available for approximating irrational zeroes, at this level either technology or a technique called **bisection** is commonly used. The bisection method combines the intermediate value theorem with successively smaller intervals of the input variable, to narrow down the location of the irrational zero. Although "bisection" implies halving the interval each time, any number within the interval will do. The bisection method may be most efficient using a succession of short input/output tables as shown, with the number of tables increased if greater accuracy is desired. Since $f(1) = -3$ and $f(2) = 20$, the intermediate value theorem tells us the zero must be in the interval [1, 2]. We begin our search here, rounding noninteger outputs to the nearest 100th. As a visual aid, positive outputs are in blue, negative outputs in red.

x	$f(x)$	Conclusion
1	−3	← Zero is here, use $x = 1.25$ next
1.5	3.94	
2	20	

x	$f(x)$	Conclusion
1	−3	
1.25	−0.36	← Zero is here, use $x = 1.30$ next
1.5	3.94	

x	$f(x)$	Conclusion
1.25	−0.36	← Zero is here, use $x = 1.275$ next
1.30	0.35	
1.5	3.94	

A reasonable estimate for the zero appears to be $x = 1.275$. Evaluating the function at this point gives $f(1.275) \approx -0.0097$, which is very close to zero. Naturally, a closer approximation is obtained using the capabilities of a graphing calculator. To seven decimal places the zero is $x \approx 1.2756822$.

Exercise 1: Use the intermediate value theorem to show that $f(x) = x^3 - 3x + 1$ has a zero in the interval [1, 2], then use bisection to locate the zero to three decimal place accuracy.

Exercise 2: The function $f(x) = x^4 + 3x - 15$ has two real zeroes in the interval $[-5, 5]$. Use the intermediate value theorem to locate the zeroes, then use bisection to find the zeroes accurate to three decimal places.

4.4 Graphing Rational Functions

LEARNING OBJECTIVES

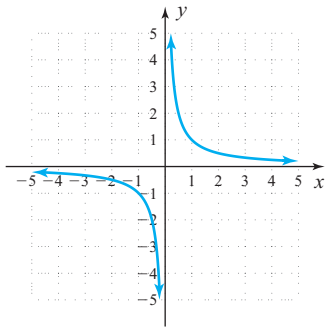
In Section 4.4 you will see how we can:

- ❑ **A.** Locate the vertical asymptotes and find the domain of a rational function
- ❑ **B.** Apply the concept of "roots of multiplicity" to rational functions and graphs
- ❑ **C.** Find horizontal asymptotes of rational functions
- ❑ **D.** Graph general rational functions
- ❑ **E.** Solve applications of rational functions

Our first exposure to rational functions occurred in Section 2.4, where we looked at the attributes and properties of the basic rational functions $f(x) = \frac{1}{x}$ and $g(x) = \frac{1}{x^2}$ shown in Figures 4.32 and 4.33.

Figure 4.32

$f(x) = \frac{1}{x}$



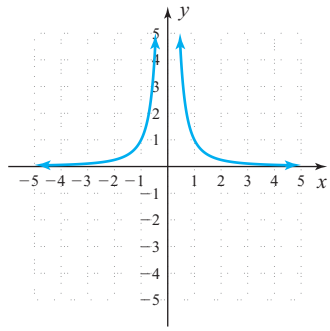


Figure 4.33

$g(x) = \frac{1}{x^2}$

Much of what we learned about these functions can be generalized and applied to the general rational functions that follow. For convenience and emphasis, the definition of a rational function is repeated here.

Rational Functions

A rational function $V(x)$ is one of the form

$$V(x) = \frac{p(x)}{d(x)},$$

where p and d are polynomials and $d(x) \neq 0$.
The domain of $V(x)$ is all real numbers, *except the zeroes of d.*

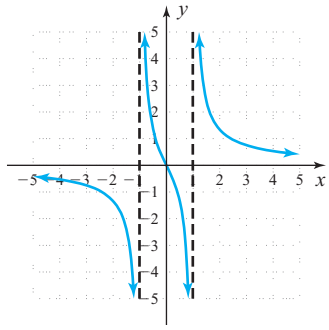
Our study begins by taking a closer look at the zeroes of $d(x)$ that are excluded from the domain, and what happens to the graph of a rational function at or near these zeroes. These observations will form a key component of graphing general rational functions.

A. Rational Functions and Vertical Asymptotes

The graphs shown in Figures 4.34 through 4.37 illustrate that rational graphs come in many shapes, often in "pieces," and exhibit asymptotic behavior.

Figure 4.34

$g(x) = \frac{2x}{x^2 - 1}$



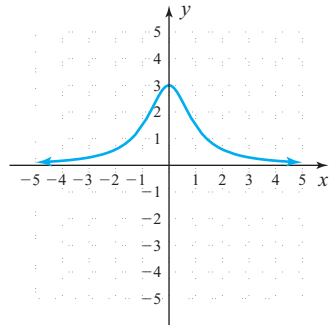


Figure 4.35

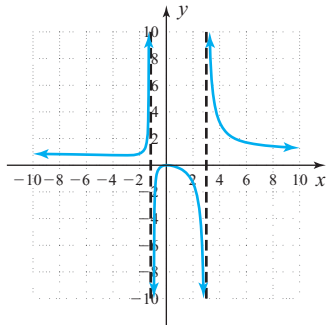
$w(x) = \frac{3}{x^2 + 1}$

WORTHY OF NOTE

In Section 2.5, we studied special cases of $\frac{p(x)}{d(x)}$, where p and d shared a common factor, creating a "hole" in the graph. Rational functions of this form will be investigated further in Section 4.5. In this section, we'll assume the functions are given in simplest form (the numerator and denominator have no common factors).

Figure 4.36

$$h(x) = \frac{x^2}{x^2 - 2x - 3}$$



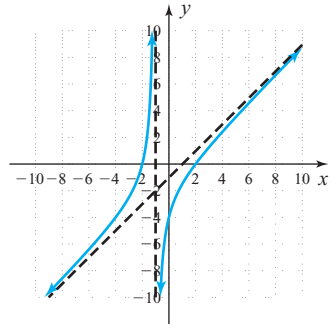


Figure 4.37

$$v(x) = \frac{x^2 - 4}{x + 1}$$

For the functions $f(x) = \frac{1}{x}$ and $g(x) = \frac{1}{x^2}$, a vertical asymptote occurred at the zero of each denominator. This actually applies to all rational functions *in simplified form*. For $V(x) = \frac{p(x)}{d(x)}$, if c is a zero of $d(x)$, the function can be evaluated at every point near c, but not *at* c. This creates a **break** or **discontinuity** in the graph of V resulting in the asymptotic behavior.

Vertical Asymptotes of a Rational Function

Given $V(x) = \dfrac{p(x)}{d(x)}$ is a rational function in simplest form, vertical asymptotes will occur at the real zeroes of d.

Breaks created by vertical asymptotes are said to be **nonremovable,** because there is no way to repair the break, even if a piecewise-defined function were used. **See Example 5, Section 2.6.**

EXAMPLE 1 ▶ Finding Vertical Asymptotes and the Domain of a Rational Function

Locate the vertical asymptote(s) of each function given, then state its domain.

a. $g(x) = \dfrac{2x}{x^2 - 1}$ **b.** $w(x) = \dfrac{3}{x^2 + 1}$

c. $h(x) = \dfrac{x^2}{x^2 - 2x - 3}$ **d.** $v(x) = \dfrac{x^2 - 4}{x + 1}$

Solution ▶

a. Setting the denominator equal to zero gives $x^2 - 1 = 0$, so vertical asymptotes will occur at $x = -1$ and $x = 1$. The domain of g is $x \in (-\infty, -1) \cup (-1, 1) \cup (1, \infty)$. See Figure 4.34.

b. Since the equation $x^2 + 1 = 0$ has no real zeroes, there are no vertical asymptotes and the domain of w is unrestricted: $x \in \mathbb{R}$. See Figure 4.35.

c. Solving $x^2 - 2x - 3 = 0$ gives $(x + 1)(x - 3) = 0$, with solutions $x = -1$ and $x = 3$. There are vertical asymptotes at $x = -1$ and $x = 3$, and the domain of h is $x \in (-\infty, -1) \cup (-1, 3) \cup (3, \infty)$. See Figure 4.36.

d. Solving $x + 1 = 0$ gives $x = -1$, and a vertical asymptote will occur at $x = -1$. The domain of v is $x \in (-\infty, -1) \cup (-1, \infty)$. See Figure 4.37.

Now try Exercises 7 through 14 ▶

Using a **TABLE** for the function $g(x)$ from Example 1(a), we again note that we're able to evaluate rational functions for all values *near* the zeroes of the denominator, but not *at* these zeroes. See Figures 4.38 through 4.40.

Figure 4.38

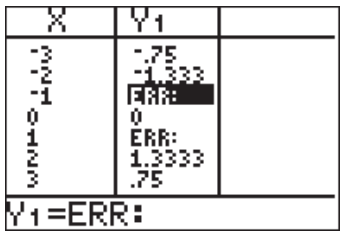

Figure 4.39

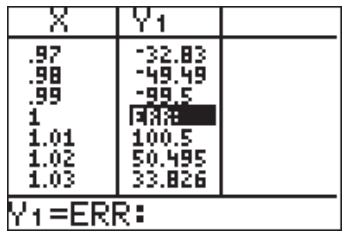

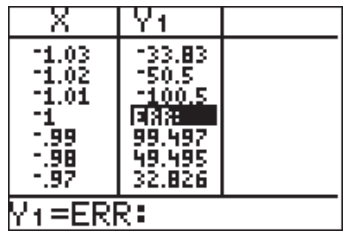

Figure 4.40

A. You've just seen how we can locate vertical asymptotes and find the domain of a rational function

B. Vertical Asymptotes and Multiplicities

The "cross" and "bounce" concept used for polynomial graphs can also be applied to rational graphs, particularly when viewed in terms of sign changes in the dependent variable. As you can see in Figures 4.41 to 4.43, the function $f(x) = \dfrac{1}{x+2}$ changes sign at the asymptote $x = -2$ (negative on one side, positive on the other), and the zero of the denominator has multiplicity 1 (odd). The function $g(x) = \dfrac{1}{(x-1)^2}$ does not change sign at the asymptote $x = 1$ (positive on both sides), and its denominator has multiplicity 2 (even). As with our earlier study of multiplicities, when these two are combined into the single function $v(x) = \dfrac{1}{(x+2)(x-1)^2}$, the function still changes sign at $x = -2$, and does not change sign at $x = 1$.

Figure 4.41

$f(x) = \dfrac{1}{x+2}$

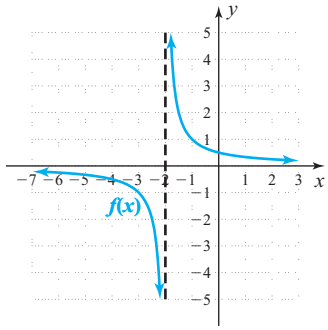

Figure 4.42

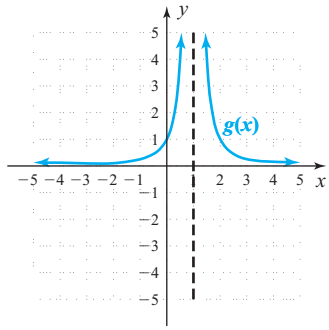
$g(x) = \dfrac{1}{(x-1)^2}$



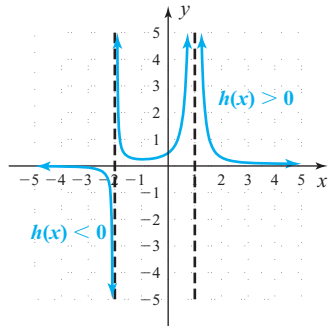


Figure 4.43

$h(x) = \dfrac{1}{(x+2)(x-1)^2}$

EXAMPLE 2 ▶ **Finding Sign Changes at Vertical Asymptotes**

Locate the vertical asymptotes of each function and state whether the function will change sign from one side of the asymptote(s) to the other.

a. $f(x) = \dfrac{x^2 - 4x + 4}{x^2 - 2x - 3}$ **b.** $g(x) = \dfrac{x^2 + 2}{x^2 + 2x + 1}$

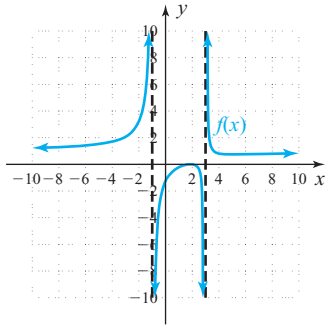
Solution ▶

a. Factoring the denominator of f and setting it equal to zero gives $(x + 1)(x - 3) = 0$, and vertical asymptotes will occur at $x = -1$ and $x = 3$ (both multiplicity 1). The function will change sign at each asymptote (see Figure 4.44). Factoring the numerator gives $(x - 2)^2 = 0$, and the graph will "bounce" off the x-axis at the zero $x = 2$ (multiplicity even—no sign change).

b. Factoring the denominator of g and setting it equal to zero gives $(x + 1)^2 = 0$. There will be a vertical asymptote at $x = -1$, but the function will not change sign since it's a zero of even multiplicity (see Figure 4.45).

Figure 4.44

$$f(x) = \frac{x^2 - 4x + 4}{x^2 - 2x - 3}$$



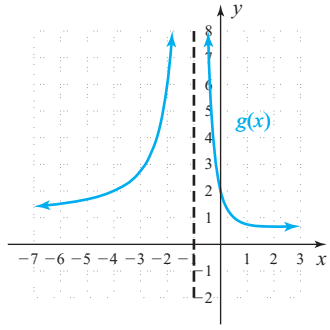


Figure 4.45

$$g(x) = \frac{x^2 + 2}{x^2 + 2x + 1}$$

Now try Exercises 15 through 20 ▶

☑ **B.** You've just seen how we can apply the concept of "roots of multiplicity" to rational functions and graphs

C. Finding Horizontal Asymptotes

A study of horizontal asymptotes is closely related to our study of "dominant terms" in Section 4.3. Recall the highest degree term in a polynomial tends to dominate all other terms as $|x| \to \infty$. For $v(x) = \dfrac{2x^2 + 4x + 3}{x^2 + 2x + 1}$, both polynomials *have the same degree,* so $\dfrac{2x^2 + 4x + 3}{x^2 + 2x + 1} \approx \dfrac{2x^2}{x^2} = 2$ for large values of x: as $|x| \to \infty$, $y \to 2$ and $y = 2$ is a horizontal asymptote for v. When the degree of the numerator is *smaller* than the degree of the denominator, our earlier work with $y = \frac{1}{x}$ and $y = \frac{1}{x^2}$ showed there was a horizontal asymptote at $y = 0$ (the x-axis), since as $|x| \to \infty$, $y \to 0$. In general,

LOOKING AHEAD

In Section 4.5 we will explore two additional kinds of asymptotic behavior, (1) oblique (slant) asymptotes and (2) asymptotes that are nonlinear.

Horizontal Asymptotes

Given $V(x) = \dfrac{p(x)}{d(x)}$ is a rational function in lowest terms, where the leading term of p is ax^n and the leading term of d is bx^m (p has degree n, d has degree m).

I. If $n < m$, there is a horizontal asymptote at $y = 0$ (the x-axis).
II. If $n = m$, there is a horizontal asymptote at $y = \frac{a}{b}$.
III. If $n > m$, the graph has no horizontal asymptote.

Finally, while the graph of a rational function can never "cross" the vertical asymptote $x = h$ (since the function simply cannot be evaluated at h), it is possible for a graph to cross the horizontal asymptote $y = k$ (some do, others do not). To find out which is the case, we set the function equal to k and solve.

EXAMPLE 3 ▶ Locating Horizontal Asymptotes

Locate the horizontal asymptote for each function, if one exists. Then determine if the graph will cross the asymptote.

a. $f(x) = \dfrac{3x}{x^2 + 2}$ **b.** $g(x) = \dfrac{x^2 - 4}{x^2 - 1}$ **c.** $v(x) = \dfrac{3x^2 - x - 6}{x^2 + x - 6}$

Solution ▶

a. For $f(x)$, the degree of the numerator $<$ degree of the denominator, indicating a horizontal asymptote at $y = 0$. Solving $f(x) = 0$, we find $x = 0$ is the only solution and the graph will cross the horizontal asymptote at (0, 0) (see Figure 4.46).

b. For $g(x)$, the degree of the numerator and the denominator are equal. This means $g(x) \approx \dfrac{x^2}{x^2} = 1$ for large values of x, and there is a horizontal asymptote at $y = 1$. Solving $g(x) = 1$ gives

$$\begin{aligned} \frac{x^2 - 4}{x^2 - 1} &= 1 && y = 1 \rightarrow \text{horizontal asymptote} \\ x^2 - 4 &= x^2 - 1 && \text{multiply by } x^2 - 1 \\ -4 &= -1 && \text{no solution} \end{aligned}$$

The graph will not cross the asymptote (see Figure 4.47).

c. For $v(x)$, the degree of the numerator and denominator are once again equal, so $v(x) \approx \dfrac{3x^2}{x^2} = 3$ and there is a horizontal asymptote at $y = 3$. Solving $v(x) = 3$ gives

$$\begin{aligned} \frac{3x^2 - x - 6}{x^2 + x - 6} &= 3 && y = 3 \rightarrow \text{horizontal asymptote} \\ 3x^2 - x - 6 &= 3(x^2 + x - 6) && \text{multiply by } x^2 + x - 6 \\ 3x^2 - x - 6 &= 3x^2 + 3x - 18 && \text{distribute} \\ -4x + 12 &= 0 && \text{simplify} \\ x &= 3 && \text{result} \end{aligned}$$

The graph will cross its asymptote at $x = 3$ (see Figure 4.48).

Figure 4.46

$f(x) = \dfrac{3x}{x^2 + 2}$

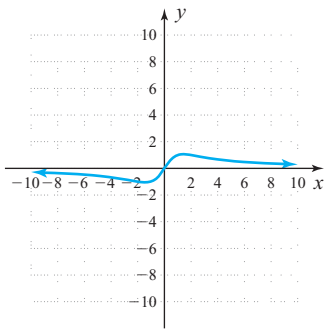

Figure 4.47

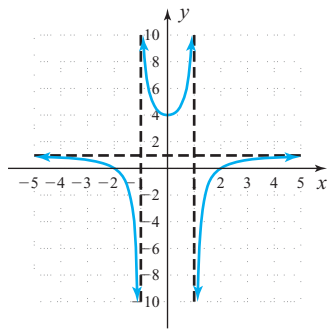
$g(x) = \dfrac{x^2 - 4}{x^2 - 1}$



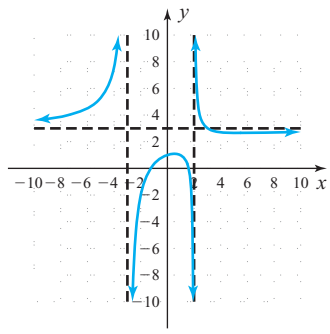


Figure 4.48

$v(x) = \dfrac{3x^2 - x - 6}{x^2 + x - 6}$

Now try Exercises 21 through 26 ▶

Using the **TABLE** feature once again gives a numerical confirmation of asymptotic behavior in the horizontal direction. For $f(x)$ from Example 3, the table verifies that larger positive values of x produce smaller and smaller values of $f(x)$: as $x \to \infty, f(x) \to 0$ (Figure 4.49). For $v(x)$, a table will confirm that the graph passes through the horizontal asymptote at the point (3, 3) (Figure 4.50), but still approaches the asymptote $y = 3$ as x becomes very large: as $x \to \infty$, $v(x) \to 3$ (Figure 4.51).

Figure 4.49

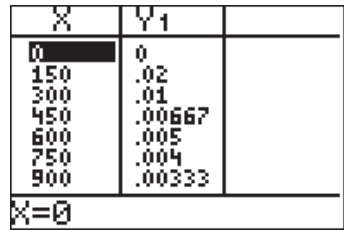

Figure 4.50

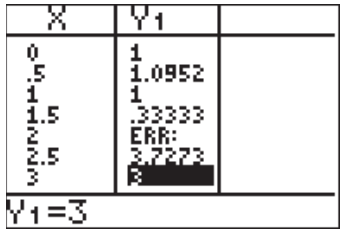

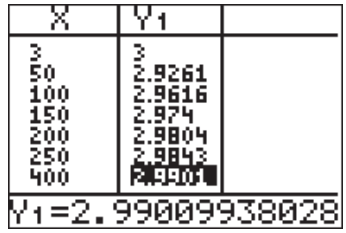

Figure 4.51

Finally, it's helpful to note that the location of all nonvertical asymptotes and whether or not the graph crosses through them can actually be found using division. The quotient $q(x)$ gives the equation of the asymptote, and the zeroes of the remainder $r(x)$ will indicate if and where the graph and asymptote will cross. From Example 3(c), long division gives $q(x) = 3$ and $r(x) = -4x + 12$ (verify this), showing there is a horizontal asymptote at $y = 3$, which the graph crosses at $x = 3$ since $r(3) = 0$. **See Exercises 27 through 30.**

☑ **C.** You've just seen how we can find the horizontal asymptotes of rational functions

D. The Graph of a Rational Function

Our observations to this point lead us to this general strategy for graphing rational functions. Not all graphs require every step, but together they provide an effective approach.

Guidelines for Graphing Rational Functions

Given $V(x) = \dfrac{p(x)}{d(x)}$ $[d(x) \neq 0]$ is a rational function in lowest terms,

1. Find $V(0)$ (if it exists): the y-intercept
2. Find the zeroes of p (if they exist): the x-intercept(s).
3. Find the zeroes of d (if they exist): the vertical asymptotes.
4. Locate the horizontal asymptote if it exists.
5. Determine if the graph will cross the horizontal asymptote.
6. Compute any additional points needed to sketch the graph.

- Draw the asymptotes, plot the intercepts and additional points, and determine where $V(x)$ changes sign to complete the graph.

As you work to complete the graph, it helps to keep the following in mind:

- The graph *must* go through its plotted points and approach the asymptotes.
- The graph *may* cross a horizontal asymptote, but *never* a vertical asymptote.
- Function values *must* change sign at any zero of odd multiplicity.

EXAMPLE 4 ▶ Graphing Rational Functions

Graph each function given.

a. $f(x) = \dfrac{x^2 - x - 6}{x^2 + x - 6}$ **b.** $g(x) = \dfrac{2x^2 - 4x + 2}{x^2 - 7}$

Solution ▶ **a.** Begin by writing f in factored form: $f(x) = \dfrac{(x + 2)(x - 3)}{(x + 3)(x - 2)}$.

1. y-intercept: $f(0) = \dfrac{(2)(-3)}{(3)(-2)} = 1$, so the y-intercept is $(0, 1)$.

2. x-intercepts: Setting the numerator equal to zero gives $(x + 2)(x - 3) = 0$, showing the x-intercepts will be $(-2, 0)$ and $(3, 0)$.

3. Vertical asymptote(s): Setting the denominator equal to zero gives $(x + 3)(x - 2) = 0$, showing there will be vertical asymptotes at $x = -3$ and $x = 2$.

4. Horizontal asymptote: Since the degree of the numerator and the degree of the denominator are equal, $y = \dfrac{x^2}{x^2} = 1$ is a horizontal asymptote.

5. Solving $\dfrac{x^2 - x - 6}{x^2 + x - 6} = 1$ $f(x) = 1 \rightarrow$ horizontal asymptote

$x^2 - x - 6 = x^2 + x - 6$ multiply by $x^2 + x - 6$

$-2x = 0$ simplify

$x = 0$ solve

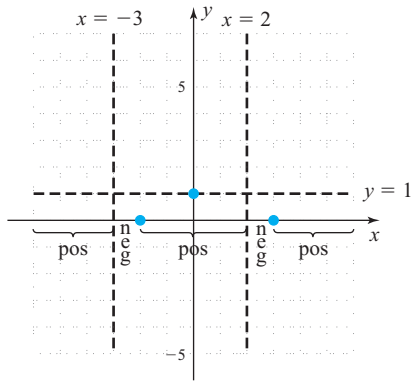
The graph will cross the horizontal asymptote at $(0, 1)$.

The information from steps 1 through 5 is shown in Figure 4.52, and indicates we have no information about the graph in the interval $(-\infty, -3)$. Since rational functions are defined for all real numbers except the zeroes of d, we know there must be a "piece" of the graph in this interval.

6. Selecting $x = -4$ to compute one additional point, we find $f(-4) = \frac{(-2)(-7)}{(-1)(-6)} = \frac{14}{6} = \frac{7}{3}$. The point is $(-4, \frac{7}{3})$.

All factors of f are linear, so function values will alternate sign in the intervals created by x-intercepts and vertical asymptotes. The y-intercept $(0, 1)$ shows $f(x)$ is positive in the interval containing 0. To meet all necessary conditions, we complete the graph as shown in Figure 4.53.

Figure 4.52



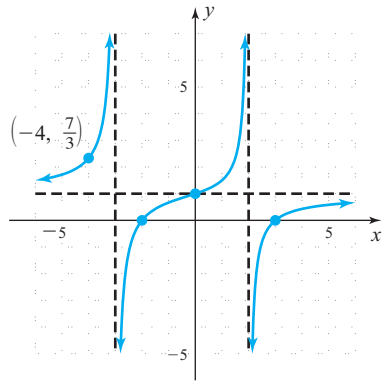


Figure 4.53

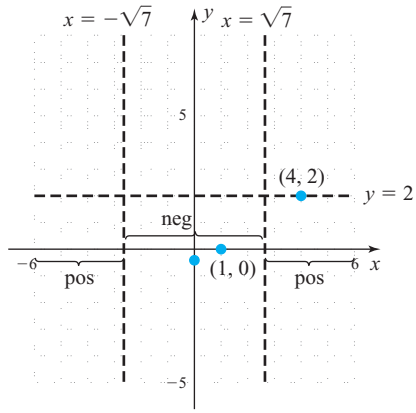
b. Writing g in factored form gives $g(x) = \dfrac{2(x^2 - 2x + 1)}{x^2 - 7} = \dfrac{2(x - 1)^2}{(x + \sqrt{7})(x - \sqrt{7})}$.

1. y-intercept: $g(0) = \dfrac{2(-1)^2}{(\sqrt{7})(-\sqrt{7})} = -\dfrac{2}{7}$. The y-intercept is $\left(0, -\dfrac{2}{7}\right)$.

2. x-intercept(s): Setting the numerator equal to zero gives $2(x - 1)^2 = 0$, with $x = 1$ as a zero of multiplicity 2. The x-intercept is $(1, 0)$.

3. Vertical asymptote(s): Setting the denominator equal to zero gives $(x + \sqrt{7})(x - \sqrt{7}) = 0$, showing there will be asymptotes at $x = -\sqrt{7}$ and $x = \sqrt{7}$.



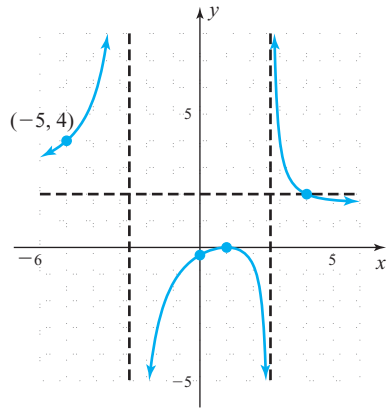
4. Horizontal asymptote: The degree of the numerator is equal to the degree of denominator, so $y = \dfrac{2x^2}{x^2} = 2$ is a horizontal asymptote.

5. Solve $\dfrac{2x^2 - 4x + 2}{x^2 - 7} = 2$ $\quad g(x) = 2 \rightarrow$ horizontal asymptote

$$\begin{aligned} 2x^2 - 4x + 2 &= 2x^2 - 14 && \text{multiply by } x^2 - 7 \\ -4x &= -16 && \text{simplify} \\ x &= 4 && \text{solve} \end{aligned}$$

The graph will cross its horizontal asymptote at $(4, 2)$. The information from steps 1 to 5 is shown in Figure 4.54, and indicates we have no information about the graph in the interval $(-\infty, -\sqrt{7})$.

Figure 4.54



6. Selecting $x = -5$, $g(-5) = \dfrac{2(-5 - 1)^2}{(-5)^2 - 7}$

$$= \frac{2(-6)^2}{25 - 7} = \frac{2(36)}{18} = 4$$

The point $(-5, 4)$ is on the graph (Figure 4.55).

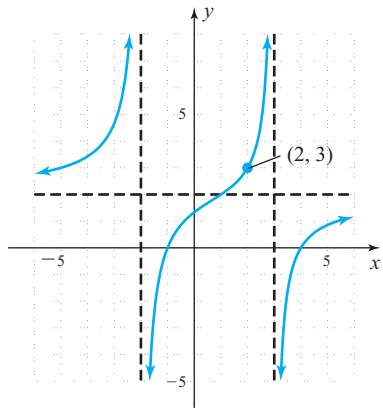
Figure 4.55

Since factors of the denominator have odd multiplicity, function values will alternate sign on either side of the asymptotes. The factor in the numerator has even multiplicity, so the graph will "bounce off" the x-axis at $x = 1$ (no change in sign). The y-intercept $(0, -\frac{2}{7})$ shows the function is negative in the interval containing 0. This information and the completed graph are shown in Figure 4.55.

WORTHY OF NOTE

It's useful to note that the number of "pieces" forming a rational graph will always be one more than the number of vertical asymptotes. The graph of $f(x) = \dfrac{3x}{x^2 + 2}$ (Figure 4.46) has no vertical asymptotes and one piece, $y = \frac{-1}{x}$ has one vertical asymptote and two pieces, $g(x) = \dfrac{x^2 - 4}{x^2 - 1}$ (Figure 4.47) has two vertical asymptotes and three pieces, and so on.

Now try Exercises 31 through 54 ▶



Examples 3 and 4 demonstrate that graphs of rational functions come in a large variety. Once the components of the graph have been found, completing the graph presents an intriguing and puzzle-like challenge as we attempt to sketch a graph that meets all conditions. As we've done with other functions, can you reverse this process? That is, given the *graph* of a rational function, can you construct its equation?

EXAMPLE 5 ▶ Finding the Equation of a Rational Function from Its Graph

Use the graph of $f(x)$ shown to construct its equation.

Solution ▶ The x-intercepts are $(-1, 0)$ and $(4, 0)$, so the numerator must contain the factors $(x + 1)$ and $(x - 4)$. The vertical asymptotes are $x = -2$ and $x = 3$, so the denominator must have the factors $(x + 2)$ and $(x - 3)$. So far we have:

$$f(x) = \frac{a(x + 1)(x - 4)}{(x + 2)(x - 3)}$$

Since $(2, 3)$ is on the graph, we substitute 2 for x and 3 for $f(x)$ to solve for a:

$$3 = \frac{a(2 + 1)(2 - 4)}{(2 + 2)(2 - 3)}$$ substitute 3 for $f(x)$ and 2 for x

$$3 = \frac{3a}{2}$$ simplify

$$2 = a$$ solve

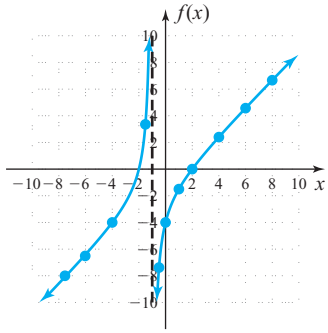
The result is $f(x) = \dfrac{2(x + 1)(x - 4)}{(x + 2)(x - 3)} = \dfrac{2x^2 - 6x - 8}{x^2 - x - 6}$, with a horizontal asymptote at $y = 2$ and a y-intercept of $(0, \frac{4}{3})$, which fit the graph very well.

Now try Exercises 55 through 58 ▶

As a final note, there are many rational graphs that have x- and y-intercepts and vertical asymptotes, *but no horizontal asymptotes*. Two examples are shown in Figures 4.56 and 4.57.

Figure 4.56

$$f(x) = \frac{x^2 - 4}{x + 1}$$



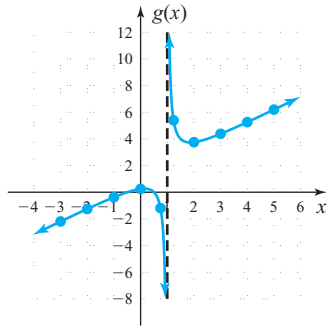


Figure 4.57

$$g(x) = \frac{x^2 - \frac{1}{4}}{x - 1}$$

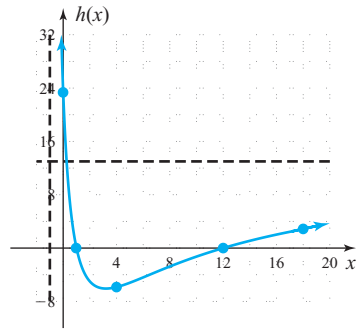
D. You've just seen how we can graph general rational functions

Without more information regarding nonhorizontal asymptotes, sketching these graphs requires a substantial number of plotted points. Rational graphs of this type will be studied in more detail in Section 4.5, enabling us to complete each graph using far fewer points. **See Exercises 59 through 62.**

E. Applications of Rational Functions

In many applications of rational functions, the coefficients can be rather large and the graph should be scaled appropriately.

EXAMPLE 6 ▶ **Modeling the Rides at an Amusement Park**



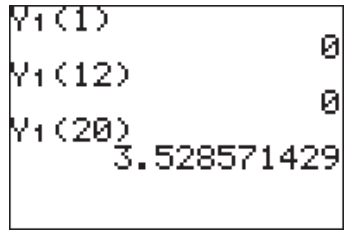
A popular amusement park wants to add new rides and asks various contractors to submit ideas. Suppose one ride engineer offers plans for a ride that begins with a near vertical drop into a dark tunnel, quickly turns and becomes more horizontal, pops out the tunnel's end, then coasts up to the exit platform, braking 20 m from the release point. The height of a rider above ground is modeled by the function $h(x) = \dfrac{39x^2 - 507x + 468}{3x^2 + 23x + 20}$, where $h(x)$ is the height in meters at a horizontal distance of x meters from the release point.

a. Graph the function for $x \in [-1, 20]$.
b. How high is the release point for this ride?
c. How long is the tunnel from entrance to exit?
d. What is the height of the exit platform?

Solution ▶

a. Here we begin by noting the y-intercept is $h(0) = \dfrac{468}{20}$ or 23.4 m. Also, since the degree of the numerator is equal to that of the denominator, the ratio of leading terms $\dfrac{39x^2}{3x^2}$ indicates a horizontal asymptote at $y = 13$. Writing $h(x)$ in factored form gives $h(x) = \dfrac{39(x - 1)(x - 12)}{(3x + 20)(x + 1)}$, showing the x-intercepts will be (1, 0) and (12, 0), with vertical asymptotes at $x = -6.\overline{6}$ and $x = -1$. Computing midinterval points of $x = 4$, 8, and 18 gives (4, −5.85), (8, −2.76), and (18, 2.83). Graphing the function over the specified interval produces the graph shown in Figure 4.58.

Figure 4.58



b. From the context, the release point is at 23.4 m.

c. The ride enters the tunnel at $x = 1$ and exits at $x = 12$, making the tunnel 11 m long.

d. Since the ride begins braking at a distance of 20 m, the platform must be $h(20) \approx 3.5$ m high. See Figure 4.59.

Figure 4.59

Now try Exercises 65 through 76 ▶

As a final note, the ride proposed in Example 6 was never approved due to excessive g-forces on the riders. Example 6 helps to illustrate that when it comes to applications of rational functions, portions of the graph may be ignored due to the context. In addition, some applications may focus on a specific attribute of the graph, such as the horizontal asymptotes in **Exercises 65, 66,** and elsewhere, or the vertical asymptotes in **Exercises 67 and 68.**

☑ **E.** You've just seen how we can solve applications of rational functions

4.4 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. Write the following in direction/approach notation. *As x becomes an infinitely large negative number, y approaches 2.* _____

2. For any constant k, the notation as $|x| \to +\infty$, $y \to k$ is an indication of a _____ asymptote, while $x \to k$, $|y| \to +\infty$ indicates a _____ asymptote.

3. Vertical asymptotes are found by setting the _____ equal to zero. The x-intercepts are found by setting the _____ equal to zero.

4. If the degree of the numerator is equal to the degree of the denominator, a horizontal asymptote occurs at $y = \frac{a}{b}$, where $\frac{a}{b}$ represents the ratio of the _____ _____.

5. Use the function $g(x) = \dfrac{3x^2 - 2x}{2x^2 - 3}$ and a table of values to discuss the concept of horizontal asymptotes. At what positive value of x is the graph of g within 0.01 of its horizontal asymptote?

6. Name all of the "tools" at your disposal that play a role in the graphing of rational functions. Which tools are indispensable and always used? Which are used only as the situation merits?

▶ DEVELOPING YOUR SKILLS

Give the location of the vertical asymptote(s) if they exist, and state the function's domain.

7. $f(x) = \dfrac{x + 2}{x - 3}$

8. $F(x) = \dfrac{4x}{2x - 3}$

9. $g(x) = \dfrac{3x^2}{x^2 - 9}$

10. $G(x) = \dfrac{x + 1}{9x^2 - 4}$

11. $h(x) = \dfrac{x^2 - 1}{2x^2 + 3x - 5}$

12. $H(x) = \dfrac{x - 5}{2x^2 - x - 3}$

13. $p(x) = \dfrac{2x + 3}{x^2 + x + 1}$

14. $q(x) = \dfrac{2x^3}{x^2 + 4}$

Give the location of the vertical asymptote(s) if they exist, and state whether function values will change sign (positive to negative or negative to positive) from one side of the asymptote to the other.

15. $Y_1 = \dfrac{x + 1}{x^2 - x - 6}$

16. $Y_2 = \dfrac{2x + 3}{x^2 - x - 20}$

17. $r(x) = \dfrac{x^2 + 3x - 10}{x^2 - 6x + 9}$

18. $R(x) = \dfrac{x^2 - 2x - 15}{x^2 - 4x + 4}$

19. $Y_1 = \dfrac{x}{x^3 + 2x^2 - 4x - 8}$

20. $Y_2 = \dfrac{-2x}{x^3 + x^2 - x - 1}$

For the functions given, (a) determine if a horizontal asymptote exists and (b) determine if the graph will cross the asymptote, and if so, where it crosses.

21. $Y_1 = \dfrac{2x - 3}{x^2 + 1}$

22. $Y_2 = \dfrac{4x + 3}{2x^2 + 5}$

23. $r(x) = \dfrac{4x^2 - 9}{x^2 - 3x - 18}$

24. $R(x) = \dfrac{2x^2 - x - 10}{x^2 + 5}$

25. $p(x) = \dfrac{3x^2 - 5}{x^2 - 1}$

26. $P(x) = \dfrac{3x^2 - 5x - 2}{x^2 - 4}$

Apply long division to find the quotient and remainder for each function. Use this information to determine the equation of the horizontal asymptote, and whether the graph will cross this asymptote. Verify answers by graphing the functions on a graphing calculator and locating points of intersection.

27. $v(x) = \dfrac{8x}{x^2 + 1}$

28. $f(x) = \dfrac{4x + 8}{x^2 + 1}$

29. $g(x) = \dfrac{2x^2 - 8x}{x^2 - 4}$

30. $h(x) = \dfrac{x^2 - x - 6}{x^2 - 1}$

Give the location of the *x*- and *y*-intercepts (if they exist), and discuss the behavior of the function (bounce or cross) at each *x*-intercept.

31. $f(x) = \dfrac{x^2 - 3x}{x^2 - 5}$

32. $F(x) = \dfrac{2x - x^2}{x^2 + 2x - 3}$

33. $g(x) = \dfrac{x^2 + 3x - 4}{x^2 - 1}$

34. $G(x) = \dfrac{x^2 + 7x + 6}{x^2 - 2}$

35. $h(x) = \dfrac{x^3 - 6x^2 + 9x}{4 - x^2}$

36. $H(x) = \dfrac{4x + 4x^2 + x^3}{x^2 - 1}$

Use the *Guidelines for Graphing Rational Functions* to graph the functions given.

37. $f(x) = \dfrac{x + 3}{x - 1}$

38. $g(x) = \dfrac{x - 4}{x + 2}$

39. $F(x) = \dfrac{8x}{x^2 + 4}$

40. $G(x) = \dfrac{-12x}{x^2 + 3}$

41. $p(x) = \dfrac{-2x^2}{x^2 - 4}$

42. $P(x) = \dfrac{3x^2}{x^2 - 9}$

43. $q(x) = \dfrac{2x - x^2}{x^2 + 4x - 5}$

44. $Q(x) = \dfrac{x^2 + 3x}{x^2 - 2x - 3}$

45. $h(x) = \dfrac{-3x}{x^2 - 6x + 9}$

46. $H(x) = \dfrac{2x}{x^2 - 2x + 1}$

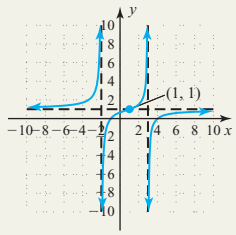
47. $Y_1 = \dfrac{x - 1}{x^2 - 3x - 4}$

48. $Y_2 = \dfrac{1 - x}{x^2 - 2x}$

49. $s(x) = \dfrac{4x^2}{2x^2 + 4}$

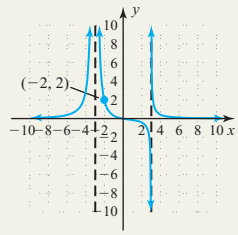
50. $S(x) = \dfrac{-2x^2}{x^2 + 1}$

51. $Y_1 = \dfrac{x^2 - 4}{x^2 - 1}$



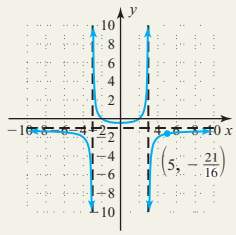
52. $Y_2 = \dfrac{x^2 - x - 12}{x^2 + x - 12}$

53. $v(x) = \dfrac{-2x}{x^3 + 2x^2 - 4x - 8}$

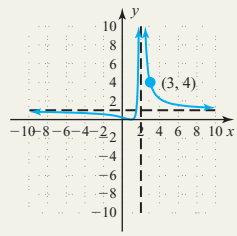


54. $V(x) = \dfrac{3x}{x^3 + x^2 - x - 1}$

Use the vertical asymptotes, *x*-intercepts, and their multiplicities to construct an equation that corresponds to each graph. Be sure the *y*-intercept estimated from the graph matches the value given by your equation for $x = 0$. Check work on a graphing calculator.



55.



56.

57.

58.

Graph the following using the *Guidelines for Graphing Rational Functions*. From the equations given, note there are no horizontal asymptotes (the degree of each numerator is greater than the degree of the denominator) and a large number of plotted points may be necessary to complete each graph.

59. $v(x) = \dfrac{x^2 - 4}{x}$

60. $f(x) = \dfrac{9 - x^2}{x - 1}$

61. $g(x) = \dfrac{x^2}{x - 1}$

62. $h(x) = \dfrac{1 - x^2}{x + 2}$

▶ WORKING WITH FORMULAS

63. Population density: $D(x) = \dfrac{ax}{x^2 + b}$

The population density of urban areas (in people per square mile) can be modeled by the formula shown, where a and b are constants related to the overall population and sprawl of the area under study, and $D(x)$ is the population density (in hundreds), x mi from the center of downtown.

Graph the function for $a = 63$ and $b = 20$ over the interval $x \in [0, 50]$, and then use the graph to answer the following questions.

a. What is the significance of the *horizontal asymptote* (what does it mean in this context)?

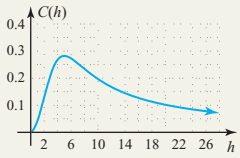
b. How far from downtown does the population density fall below 525 people per square mile? How far until the density falls below 300 people per square mile?

c. Use the graph and a table to determine how far from downtown the population density reaches a maximum. What is this maximum?

64. Cost of removing pollutants: $C(x) = \dfrac{kx}{100 - x}$

Some industries resist cleaner air standards because the cost of removing pollutants rises dramatically as higher standards are set. This phenomenon can be modeled by the formula given, where $C(x)$ is the cost (in thousands of dollars) of removing x% of the pollutant and k is a constant that depends on the type of pollutant and other factors.

Graph the function for $k = 250$ over the interval $x \in [0, 100]$, and then use the graph to answer the following questions.



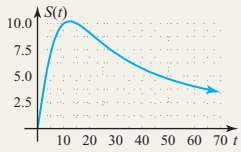
a. What is the significance of the *vertical asymptote* (what does it mean in this context)?

b. If new laws are passed that require 80% of a pollutant to be removed, while the existing law requires only 75%, how much will the new legislation cost the company? Compare the cost of the 5% increase from 75% to 80% with the cost of the 1% increase from 90% to 91%.

c. What percent of the pollutants can be removed if the company budgets 2250 thousand dollars?

▶ APPLICATIONS

65. Medication in the bloodstream: The concentration C of a certain medicine in the bloodstream h hours after being injected into the shoulder is given by the function: $C(h) = \dfrac{2h^2 + h}{h^3 + 70}$. Use the given graph of the function to answer the following questions.



a. Approximately how many hours after injection did the maximum concentration occur? What was the maximum concentration?

b. Use $C(h)$ to *compute* the rate of change for the intervals $h = 8$ to $h = 10$ and $h = 20$ to $h = 22$. What do you notice?

c. Use mathematical notation to state what happens to the concentration C as the number of hours becomes infinitely large. What role does the h-axis play for this function?

66. Supply and demand: In response to certain market demands, manufacturers will quickly get a product out on the market to take advantage of consumer interest. Once the product is released, it is not uncommon for sales to initially skyrocket, taper off, and then gradually decrease as consumer interest wanes. For a certain product, sales can be modeled by the function $S(t) = \dfrac{250t}{t^2 + 150}$, where $S(t)$ represents the daily sales (in \$10,000) t days after the product has debuted. Use the given graph of the function to answer the following questions.

a. Approximately how many days after the product came out did sales reach a maximum? What was the maximum sales?

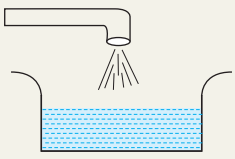
b. Use $S(t)$ to compute the rate of change for the intervals $t = 7$ to $t = 8$ and $t = 60$ to $t = 62$. What do you notice?

c. Use mathematical notation to state what happens to the daily sales S as the number of days becomes infinitely large. What role does the t-axis play for this function?

67. Cost to remove pollutants: For a certain coal-burning power plant, the cost to remove pollutants from plant emissions can be modeled by $C(p) = \dfrac{80p}{100 - p}$, where $C(p)$ represents the cost (in thousands of dollars) to remove p percent of the pollutants. (a) Find the cost to remove 20%, 50%, and 80% of the pollutants, then comment on the results; (b) graph the function using an appropriate scale; and (c) use mathematical notation to state what happens if the power company attempts to remove 100% of the pollutants.

68. Costs of recycling: A large city has initiated a new recycling effort, and wants to distribute recycling bins for use in separating various recyclable materials. City planners anticipate the cost of the program can be modeled by the function $C(p) = \dfrac{220p}{100 - p}$, where $C(p)$ represents the cost (in \$10,000) to distribute the bins to p percent of the population. (a) Find the cost to distribute bins to 25%, 50%, and 75% of the population, then comment on the results; (b) graph the function using an appropriate scale; and (c) use mathematical notation to state what happens if the city attempts to give recycling bins to 100% of the population.

Memory retention: Due to their asymptotic behavior, rational functions are often used to model the mind's ability to retain information over a long period of time—the "use it or lose it" phenomenon.



69. Language retention: A large group of students is asked to memorize a list of 50 Italian words, a language that is unfamiliar to them. The group is then tested regularly to see how many of the words are retained over a period of time. The average number of words retained is modeled by the function $W(t) = \dfrac{6t + 40}{t}$, where $W(t)$ represents the number of words remembered after t days.

- **a.** Graph the function over the interval $t \in [1, 40]$. How many days until only half the words are remembered? How many days until only one-fifth of the words are remembered?
- **b.** After 10 days, what is the average number of words retained? How many days until only 8 words can be recalled?
- **c.** What is the significance of the horizontal asymptote (what does it mean in this context)?

70. Language retention: A similar study asked students to memorize 50 Hawaiian words, a language that is both unfamiliar and phonetically foreign to them (see Exercise 69). The average number of words retained is modeled by the function $W(t) = \dfrac{4t + 20}{t}$, where $W(t)$ represents the number of words after t days.

- **a.** Graph the function over the interval $t \in [1, 40]$. How many days until only half the words are remembered? How does this compare to Exercise 69? How many days until only one-fifth of the words are remembered?
- **b.** After 7 days, what is the average number of words retained? How many days until only 5 words can be recalled?
- **c.** What is the significance of the horizontal asymptote (what does it mean in this context)?

Concentration and dilution: When antifreeze is mixed with water, it becomes diluted—less than 100% antifreeze. The more water added, the less concentrated the antifreeze becomes, with this process continuing until a desired concentration is met. This application and many similar to it can be modeled by rational functions.

71. Concentration of antifreeze: A 400-gal tank currently holds 40 gal of a 25% antifreeze solution. To raise the concentration of the antifreeze in the tank, x gal of a 75% antifreeze solution is pumped in.

- **a.** Show the formula for the resulting concentration is $C(x) = \dfrac{40 + 3x}{160 + 4x}$ after simplifying, and graph the function over the interval $x \in [0, 360]$.
- **b.** What is the concentration of the antifreeze in the tank after 10 gal of the new solution are added? After 120 gal have been added? How much liquid is now in the tank?
- **c.** If the concentration level is now at 65%, how many gallons of the 75% solution have been added? How many gallons of liquid are in the tank now?
- **d.** What is the maximum antifreeze concentration that can be attained in a tank of this size? What is the maximum concentration that can be attained in a tank of "unlimited" size?

72. Concentration of sodium chloride: A sodium chloride solution has a concentration of 0.2 oz (weight) per gallon. The solution is pumped into an 800-gal tank currently holding 40 gal of pure water, at a rate of 10 gal/min.

- **a.** Find a function $A(t)$ modeling the amount of liquid in the tank after t min, and a function $S(t)$ for the amount of sodium chloride in the tank after t min.
- **b.** The concentration $C(t)$ in ounces per gallon is measured by the ratio $\dfrac{S(t)}{A(t)}$, a rational function. Graph the function on the interval $t \in [0, 100]$. What is the concentration level (in ounces per gallon) after 6 min? After 28 min? How many gallons of liquid are in the tank at this time?
- **c.** If the concentration level is now 0.184 oz/gal, how long have the pumps been running? How many gallons of liquid are in the tank now?
- **d.** What is the maximum concentration that can be attained in a tank of this size? What is the maximum concentration that can be attained in a tank of "unlimited" size?

Average cost of manufacturing an item: The cost "C" to manufacture an item depends on the relatively fixed costs "K" for remaining in business (utilities, maintenance, transportation, etc.) and the actual cost "c" of manufacturing the item (labor and materials). For x items the cost is $C(x) = K + cx$. The average cost "A" of manufacturing an item is then $A(x) = \dfrac{C(x)}{x}$.

73. Manufacturing water heaters: A company that manufactures water heaters finds their fixed costs are normally \$50,000 per month, while the cost to manufacture each heater is \$125. Due to factory size and the current equipment, the company can produce a maximum of 5000 water heaters per month during a good month.

a. Use the average cost function to find the average cost if 500 water heaters are manufactured each month. What is the average cost if 1000 heaters are made?

b. What level of production will bring the average cost down to \$150 per water heater?

c. If the average cost is currently \$137.50, how many water heaters are being produced that month?

d. What's the significance of the horizontal asymptote for the average cost function (what does it mean in this context)? Will the company ever break the \$130 average cost level? Why or why not?

74. Producing biodegradable disposable diapers: An enterprising company has finally developed a better disposable diaper that is biodegradable. The brand becomes wildly popular and production is soaring. The fixed cost of production is \$20,000 per month, while the cost of manufacturing is \$6.00 per case (48 diapers). Even while working three shifts around-the-clock, the maximum production level is 16,000 cases per month. The company figures it will be profitable if it can bring costs down to an average of \$7 per case.

a. Use the average cost function to find the average cost if 2000 cases are produced each month. What is the average cost if 4000 cases are made?

b. What level of production will bring the average cost down to \$8 per case?

c. If the average cost is currently \$10 per case, how many cases are being produced?

d. What's the significance of the horizontal asymptote for the average cost function (what does it mean in this context)? Will the company ever reach its goal of \$7/case at its maximum production? What level of production would help them meet their goal?

Test averages and grade point averages: To calculate a test average we sum all test points P and divide by the number of tests N: $\dfrac{P}{N}$. To compute the score or scores needed on future tests to raise the average grade to a desired grade G, we add the number of additional tests n to the denominator, and the number of additional tests times the projected grade g on each test to the numerator: $G(n) = \dfrac{P + ng}{N + n}$. The result is a rational function with some "eye-opening" results.

75. Computing an average grade: After four tests, Bobby Lou's test average was an 84. [*Hint:* $P = 4(84) = 336$.]

a. Assume that she gets a 95 on all remaining tests ($g = 95$). Graph the resulting function on a calculator using the window $n \in [0, 20]$ and $G(n) \in [80 \text{ to } 100]$. Use the calculator to determine how many tests are required to lift her grade to a 90 under these conditions.

b. At some colleges, the range for an "A" grade is 93–100. How many tests would Bobby Lou have to score a 95 on, to raise her average to higher than 93? Were you surprised?

c. Describe the significance of the horizontal asymptote of the average grade function. Is a test average of 95 possible for her under these conditions?

d. Assume now that Bobby Lou scores 100 on all remaining tests ($g = 100$). Approximately how many more tests are required to lift her grade average to higher than 93?

76. Computing a GPA: At most colleges, $A \to 4$ grade points, $B \to 3$, $C \to 2$, and $D \to 1$. After taking 56 credit hours, Aurelio's GPA is 2.5. [*Hint:* In the formula given, $P = 2.5(56) = 140$.]

a. Assume Aurelio is determined to get A's (4 grade points or $g = 4$), for all remaining credit hours. Graph the resulting function on a calculator using the window $n \in [0, 60]$ and $G(n) \in [2, 4]$. Use the calculator to determine the number of credit hours required to lift his GPA to over 2.75 under these conditions.

b. At some colleges, scholarship money is available only to students with a 3.0 average or higher. How many (perfect 4.0) credit hours would Aurelio have to earn, to raise his GPA to 3.0 or higher? Were you surprised?

c. Describe the significance of the horizontal asymptote of the GPA function. Is a GPA of 4.0 possible for him under these conditions?

▶ EXTENDING THE CONCEPT

77. In addition to determining *if* a function has a vertical asymptote, we are often interested in *how fast* the graph approaches the asymptote. As in previous investigations, this involves the function's rate of change over a small interval. Exercise 64 describes the rising cost of removing pollutants from the air. As noted there, the rate of increase in the cost changes as higher requirements are set. To quantify this change, we'll compute the rate of change $\frac{\Delta C}{\Delta x} = \frac{C(x_2) - C(x_1)}{x_2 - x_1}$ for $C(x) = \frac{250x}{100 - x}$.

a. Find the rate of change of the function in the following intervals:

$x \in [60, 61]$ $x \in [70, 71]$

$x \in [80, 81]$ $x \in [90, 91]$

b. What do you notice? How much did the rate increase from the first interval to the second? From the second to the third? From the third to the fourth?

c. Recompute parts (a) and (b) using the function $C(x) = \frac{350x}{100 - x}$. Comment on what you notice.

78. Consider the function $f(x) = \frac{ax^2 + k}{bx^2 + h}$, where a, b, k, and h are constants and $a, b > 0$.

a. What can you say about asymptotes and intercepts of this function if $h, k > 0$?

b. Now assume $k < 0$ and $h > 0$. How does this affect the asymptotes? The intercepts?

c. If $b = 1$ and $a > 1$, how does this affect the results from part (b)?

d. How is the graph affected if $k > 0$ and $h < 0$?

e. Find values of a, b, h, and k that create a function with a horizontal asymptote at $y = \frac{3}{2}$, x-intercepts at $(-2, 0)$ and $(2, 0)$, a y-intercept of $(0, -4)$, and no vertical asymptotes.

▶ MAINTAINING YOUR SKILLS

79. **(1.4)** Find the equation of a line that is perpendicular to $3x - 4y = 12$ and contains the point $(2, -3)$.

80. **(4.1)** Use synthetic division and the remainder theorem to find the value of $f(4)$, $f(\frac{3}{2})$, and $f(2)$:$f(x) = 2x^3 - 7x^2 + 5x + 3$.

81. **(3.2)** Solve the following equation using the quadratic formula, then write the equation in factored form: $12x^2 + 55x - 48 = 0$.

82. **(Appendix A.1/3.1)** Describe/Define each set of numbers: complex $\mathbb{C}$, rational $\mathbb{Q}$, and integers $\mathbb{Z}$.

4.5 Additional Insights into Rational Functions

LEARNING OBJECTIVES

In Section 4.5 you will see how we can:

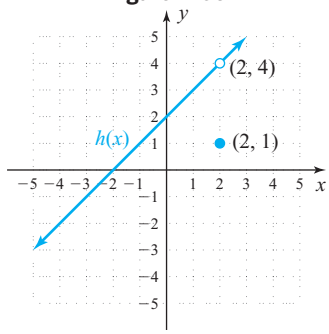
- ❑ **A.** Graph rational functions with removable discontinuities
- ❑ **B.** Graph rational functions with oblique or nonlinear asymptotes
- ❑ **C.** Solve applications involving rational functions

In Section 4.4, we studied rational functions whose graphs had horizontal and/or vertical asymptotes. In this section, we'll study functions with asymptotes that are *neither* horizontal nor vertical. In addition, we'll further explore the "break" we saw in graphs of certain piecewise-defined functions, that of a simple "hole" created when the numerator and denominator of a rational function share a common variable factor.

A. Rational Functions and Removable Discontinuities

In Example 6 of Section 2.5, we graphed the piecewise-defined function $h(x) = \begin{cases} \dfrac{x^2 - 4}{x - 2} & x \neq 2 \\ 1 & x = 2 \end{cases}$. The second piece is simply the point (2, 1). The first piece is a rational function, but instead of a vertical asymptote at $x = 2$ (the zero of the denominator), its graph is actually the line $y = x + 2$ with a "hole" at (2, 4) called a **removable discontinuity** (Figure 4.60). The hole occurs because the numerator and denominator of $y = \dfrac{x^2 - 4}{x - 2}$ share the common factor $(x - 2)$, and canceling these factors leaves $y = x + 2$, a continuous function. However, the *original function* is not defined at $x = 2$, so we must delete the single point at $x = 2, y = 4$ from the graph of the line (Figure 4.60).

Figure 4.60



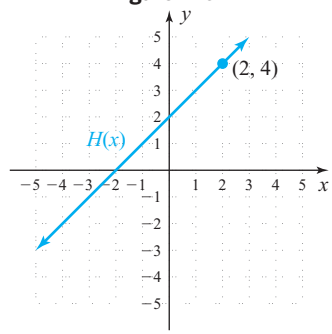


Figure 4.61

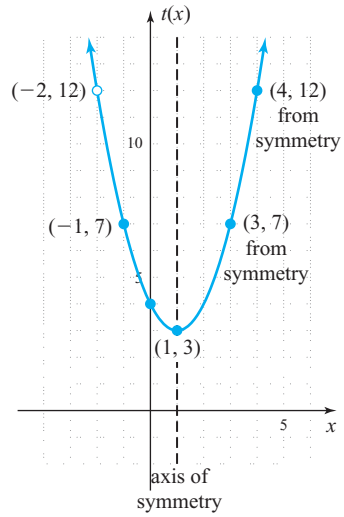
We can *remove* or fix this discontinuity by redefining the second piece as $h(x) = 4$, when $x = 2$. This would create a new and continuous function, $H(x) = \begin{cases} \dfrac{x^2 - 4}{x - 2} & x \neq 2 \\ 4 & x = 2 \end{cases}$ (Figure 4.61).

It's possible for a rational graph to have more than one removable discontinuity, or to be nonlinear with a removable discontinuity. For cases where we elect to repair the break, we will adopt the convention of using the corresponding upper case letter to name the new function, as we did here.

EXAMPLE 1 ▶ Graphing Rational Functions with Removable Discontinuities

Graph the function $t(x) = \dfrac{x^3 + 8}{x + 2}$. If there is a removable discontinuity, repair the break using an appropriate piecewise-defined function.



Solution ▶ Note the domain of t does not include $x = -2$. We begin by factoring as before to identify zeroes and asymptotes, but find the numerator and denominator share a common factor, which we remove.

$$\begin{aligned} t(x) &= \frac{x^3 + 8}{x + 2} \\ &= \frac{(\cancel{x + 2})(x^2 - 2x + 4)}{\cancel{x + 2}} \\ &= x^2 - 2x + 4; \text{ where } x \neq -2 \end{aligned}$$

The graph of t will be the same as $y = x^2 - 2x + 4$ *for all values except* $x = -2$. Here we have a parabola, opening upward, with y-intercept (0, 4). From the vertex formula, the x-coordinate of the vertex will be $\dfrac{-b}{2a} = \dfrac{-(-2)}{2(1)} = 1$, giving $y = 3$

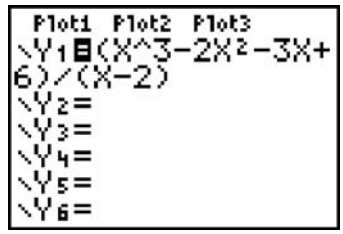
after substitution. The vertex is (1, 3). Evaluating $t(-1)$ we find $(-1, 7)$ is on the graph, giving the point (3, 7) using the axis of symmetry. We draw a parabola through these points, noting the original function is not defined at -2, and there will be a "hole" in the graph at $(-2, y)$. The value of y is found by substituting -2 for x in the simplified form: $(-2)^2 - 2(-2) + 4 = 12$. This information produces the graph shown. We can repair the break using the function

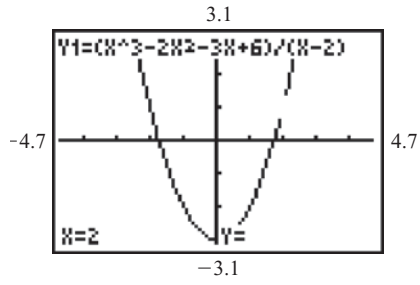
$$T(x) = \begin{cases} \dfrac{x^3 + 8}{x + 2} & x \neq -2 \\ 12 & x = -2 \end{cases}$$

Now try Exercises 7 through 18 ▶

The TRACE feature of a graphing calculator is a wonderful tool for understanding the characteristics of a function. We'll illustrate using the function $h(x) = \dfrac{f(x)}{g(x)}$, where $f(x) = x^3 - 2x^2 - 3x + 6$ and $g(x) = x - 2$ (similar to Example 1). Enter $\dfrac{f(x)}{g(x)}$ on the Y= screen as Y_1 (Figure 4.62), then graph the function using ZOOM **4:ZDecimal.** Recall this will allow the calculator to trace through Δx intervals of 0.1. After pressing the TRACE key, the cursor appears on the graph at the y-intercept $(0, -3)$ and its location is displayed at the bottom of the screen. Note that there is a "hole" in the graph in the first quadrant (Figure 4.63). We can walk the cursor along the curve in either direction using the left arrow ‹ and right arrow › keys to determine exactly where this hole occurs. Walking the cursor to the right, we note *that no output is displayed for* $x = 2$.

Figure 4.62





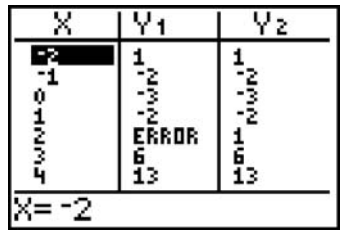


Figure 4.63

Next, simplify $\dfrac{f(x)}{g(x)}$ and enter the result as Y_2. Factoring the numerator by grouping and reducing the common factors gives $\dfrac{f(x)}{g(x)} = \dfrac{(x^2 - 3)(x - 2)}{(x - 2)}$, so $Y_2 = x^2 - 3$. Graphing both functions reveals that they are identical, except that $Y_2 = x^2 - 3$ *covers the hole left by* Y_1 using $x = 2, y = 1$. In other words, Y_1 is equivalent to Y_2 except at $x = 2$. This can also be seen using the **TABLE** feature of a calculator, which displays an error message for Y_1 when $x = 2$ is input, but shows an output of 1 for Y_2 (Figure 4.64). The bottom line is—the domain of h is all real numbers except $x = 2$.

Figure 4.64

A. You've just seen how we can graph rational functions with removable discontinuities

B. Rational Functions with Oblique or Nonlinear Asymptotes

In Section 4.4, we found that for $V(x) = \dfrac{p(x)}{d(x)}$, the location of nonvertical asymptotes was determined by comparing the degree of p with the degree of d. As review, for $p(x)$ with leading term ax^n and $d(x)$ with leading term bx^m,

- If $n < m$, the line $y = 0$ is a horizontal asymptote.
- If $n = m$, the line $y = \frac{a}{b}$ is a horizontal asymptote.

But what happens if the degree of the numerator is *greater than* the degree of the denominator? To investigate, consider the functions f, g, and h in Figures 4.65 to 4.68, whose only difference is the degree of the numerator.

Figure 4.65

$f(x) = \dfrac{2x}{x^2 + 1}$

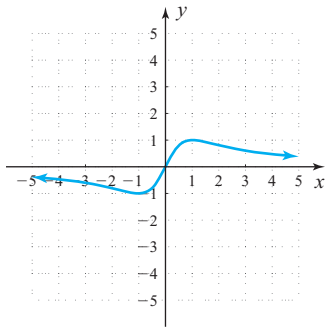

Figure 4.66

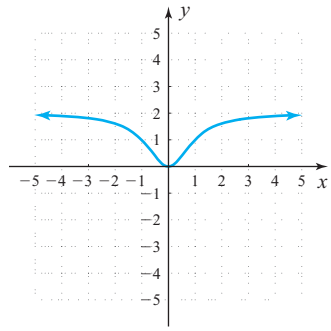
$g(x) = \dfrac{2x^2}{x^2 + 1}$



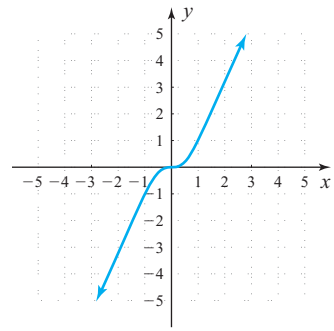


Figure 4.67

$h(x) = \dfrac{2x^3}{x^2 + 1}$

The graph of f has a horizontal asymptote at $y = 0$ since the denominator is of larger degree (as $|x| \to \infty, y \to 0$). As we might have anticipated, the horizontal asymptote for g is $y = 2$, the ratio of leading coefficients (as $|x| \to \infty, y \to 2$). The graph of h has no horizontal asymptote, yet appears to be asymptotic to some slanted line. The table in Figure 4.68 suggests that as $|x| \to \infty, y \to 2x = Y_2$. To see why, note the function $h(x) = \dfrac{2x^3}{x^2 + 1}$ can be considered an "improper fraction," similar to how we apply this designation to the fraction $\frac{3}{2}$. To write h in "proper" form, we use long division, writing the dividend as $2x^3 + 0x^2 + 0x + 0$, and the divisor as $x^2 + 0x + 1$.

Figure 4.68

$Y_2 = 2X$

X	Y_1	Y_2
0	0	0
25	49.92	50
50	99.96	100
75	149.97	150
100	199.98	200
125	249.98	250
150	299.99	300

X=0

The ratio $\dfrac{2x^3}{x^2}$ (from dividend / from divisor) shows $\mathbf{2x}$ will be our first multiplier.

$$\begin{array}{r} \qquad\qquad 2x \\ \text{divisor} \to x^2 + 0x + 1 \overline{)\,2x^3 + 0x^2 + 0x + 0} \\ \underline{-(2x^3 + 0x^2 + 2x)} \qquad \text{multiply } 2x(x^2 + 0x + 1) \\ -2x \qquad\qquad \text{subtract, next term is 0} \end{array}$$

The result shows $h(x) = 2x + \dfrac{-2x}{x^2 + 1}$. Note as $|x| \to \infty$, the term $\dfrac{-2x}{x^2 + 1}$ becomes very small and closer to zero, so $h(x) \approx 2x$ for large x. This is an example of an **oblique asymptote.** In general,

Oblique and Nonlinear Asymptotes

Given $V(x) = \dfrac{p(x)}{d(x)}$ is a rational function in simplest form, where the degree of p is greater than the degree of d, the graph will have an oblique or nonlinear asymptote as determined by $q(x)$, where $q(x)$ is the quotient polynomial after division.

If the denominator is a monomial, term-by-term division is the most efficient means of computing the quotient. If the denominator is not a monomial, either synthetic division or long division must be used. From our work in Section 4.4, $q(x)$ will give the location of the asymptote, and the zeroes of the remainder (if they exist) will indicate where the function crosses the asymptote.

We conclude that an oblique or slant asymptote occurs when the degree of the numerator is one more than the degree of the denominator, as that indicates $q(x)$ will be linear. A nonlinear asymptote will occur when the degree of the numerator is larger by two or more.

EXAMPLE 2 ▶ **Graphing a Rational Function with an Oblique Asymptote**

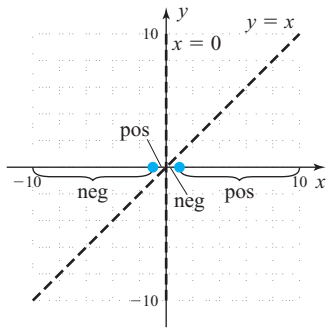
Graph the function $f(x) = \dfrac{x^2 - 1}{x}$.

Solution ▶ Using the *Guidelines,* we find $f(x) = \dfrac{(x + 1)(x - 1)}{x}$ and proceed:

1. y-intercept: The graph has no y-intercept since $f(0)$ is undefined.
2. x-intercepts: From $(x + 1)(x - 1) = 0$, the x-intercepts are $(-1, 0)$ and $(1, 0)$. Since both have multiplicity 1, the graph will cross the x-axis and the function will change sign at these points.
3. Vertical asymptote(s): $x = 0$ with multiplicity 1. The function will change sign at $x = 0$.
4. Horizontal/oblique asymptote: Since the degree of numerator $>$ the degree of denominator, we rewrite f using division. Using term-by-term division (the denominator is a monomial) produces $f(x) = \dfrac{x^2 - 1}{x} = \dfrac{x^2}{x} - \dfrac{1}{x} = x - \dfrac{1}{x}$. The quotient polynomial is $q(x) = x$ and the graph has the oblique asymptote $y = x$.
5. To determine if the function will cross the asymptote, we note the remainder is $r(x) = \dfrac{-1}{x}$, which has no real zeroes. The graph will not cross the oblique asymptote.

The information from steps 1 through 5 is displayed in Figure 4.69. While this is sufficient to sketch the graph, we select $x = -4$ and $x = 4$ and compute the additional points: $f(-4) = -\frac{15}{4}$ and $f(4) = \frac{15}{4}$. To meet all necessary conditions, we complete the graph as shown in Figure 4.70.

Figure 4.69



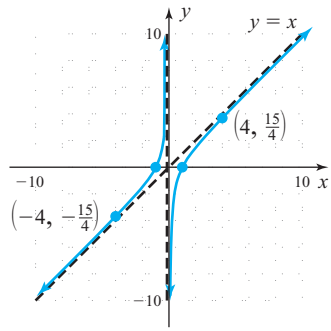


Figure 4.70

Now try Exercises 19 through 24 ▶

EXAMPLE 3 ▶ **Graphing a Rational Function with an Oblique Asymptote**

Graph the function: $h(x) = \dfrac{x^2}{x - 1}$

Solution ▶ The function is already in "factored form."

1. y-intercept: Since $h(0) = 0$, the y-intercept is $(0, 0)$.
2. x-intercept: $(0, 0)$; From, $x^2 = 0$, we have $x = 0$ with multiplicity two. The x-intercept is $(0, 0)$ and the function will not change sign here.
3. Vertical asymptote: Solving $x - 1 = 0$ gives $x = 1$ with multiplicity one. There is a vertical asymptote at $x = 1$ and the function will change sign here.
4. Horizontal/oblique asymptote: Since the degree of numerator $>$ the degree of denominator, we rewrite h using division. The denominator is linear so we use synthetic division:

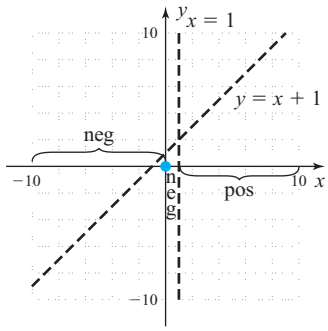
use 1 as a "divisor" | 1 | 0 | 0 | coefficients of dividend
↓ | 1 | 1
1 | 1 | 1 | quotient and remainder

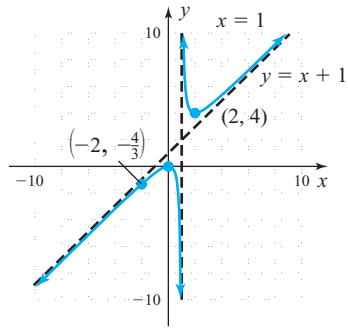
Since $q(x) = x + 1$ the graph has an oblique asymptote at $y = x + 1$.

5. The remainder is $r(x) = 1$, a constant. The graph will not cross the slant asymptote.

The information gathered in steps 1 through 5 is shown Figure 4.71, and is actually sufficient to complete the graph. If you feel a little unsure about how to "puzzle" out the graph, find additional points in the first and third quadrants: $h(2) = 4$ and $h(-2) = -\frac{4}{3}$. Since the graph will "bounce" at $x = 0$ and output values must change sign at $x = 1$, all conditions are met with the graph shown in Figure 4.72.

Figure 4.71





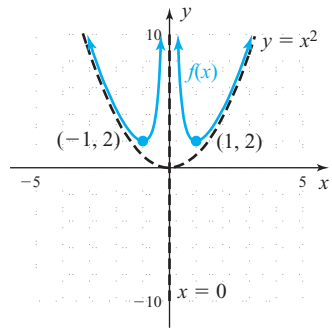


Figure 4.72

Now try Exercises 25 through 46 ▶

Finally, it would be a mistake to think that all asymptotes are linear. In fact, when the degree of the numerator is two more than the degree of the denominator, a parabolic asymptote results. Functions of this type often occur in applications of rational functions, and are used to minimize cost, materials, distances, or other considerations of great importance to business and industry. For $f(x) = \dfrac{x^4 + 1}{x^2}$, term-by-term division gives $x^2 + \dfrac{1}{x^2}$ and the quotient $q(x) = x^2$ is a nonlinear, parabolic asymptote (see Figure 4.73). For more on nonlinear asymptotes, **see Exercises 47 through 50.**

Figure 4.73

☑ **B.** You've just seen how we can graph rational functions with oblique or nonlinear asymptotes

C. Applications of Rational Functions

Rational functions have applications in a wide variety of fields, including environmental studies, manufacturing, and various branches of medicine. In most practical applications, only the values from Quadrant I have meaning since inputs and outputs must often be positive **(see Exercises 51 and 52).** Here we investigate an application involving manufacturing and average cost.

EXAMPLE 4 ▶ Solving an Application of Rational Functions

Suppose the cost (in thousands of dollars) of manufacturing x thousand of a given item is modeled by the function $C(x) = x^2 + 4x + 3$. The *average cost* of each item would then be expressed by

$$A(x) = \frac{x^2 + 4x + 3}{x} = \frac{\text{total cost}}{\text{number of items}}$$

a. Graph the function $A(x)$.

b. Find how many thousand items are manufactured when the average cost is \$8.

c. Determine how many thousand items should be manufactured to minimize the average cost (use the graph to estimate this minimum average cost).

Solution ▶

a. The function is already in simplest form.

1. y-intercept: none [$A(0)$ is undefined]

2. x-intercept(s): After factoring we obtain $(x + 3)(x + 1) = 0$, and the zeroes of the numerator are $x = -1$ and $x = -3$, both with multiplicity one. The graph will cross the x-axis at each intercept.

3. Vertical asymptote: $x = 0$, multiplicity one; the function will change sign at $x = 0$.

4. Horizontal/oblique asymptote: The degree of numerator $>$ the degree of denominator, so we divide using term-by-term division:

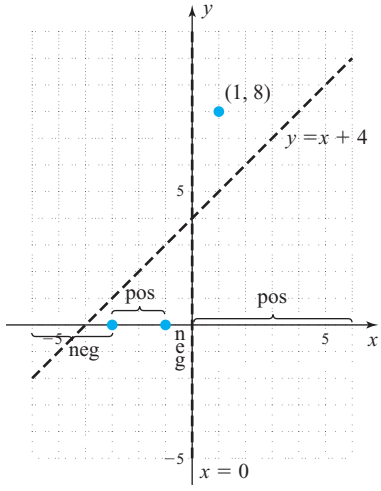
$$\frac{x^2 + 4x + 3}{x} = \frac{x^2}{x} + \frac{4x}{x} + \frac{3}{x}$$
$$= x + 4 + \frac{3}{x}$$

The line $q(x) = x + 4$ is an oblique asymptote.

5. The remainder $\frac{3}{x}$ has no real zeroes, so the graph will not cross the slant asymptote.

The function changes sign at both x-intercepts and at the asymptote $x = 0$. The information from steps 1 through 5 is shown in Figure 4.74 and perhaps an additional point in Quadrant I would help to complete the graph: $A(1) = 8$. The point (1, 8) is on the graph, showing A is positive in the interval containing 1 (since $y = 8$ is positive). Since output values will alternate in sign as stipulated above, all conditions are met with the graph shown in Figure 4.75.

Figure 4.74



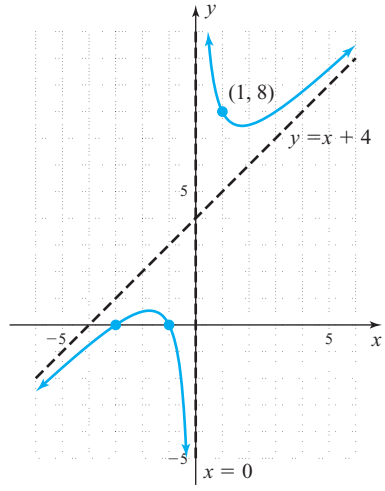


Figure 4.75

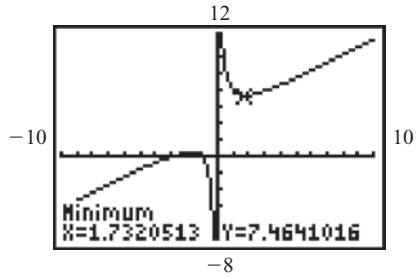


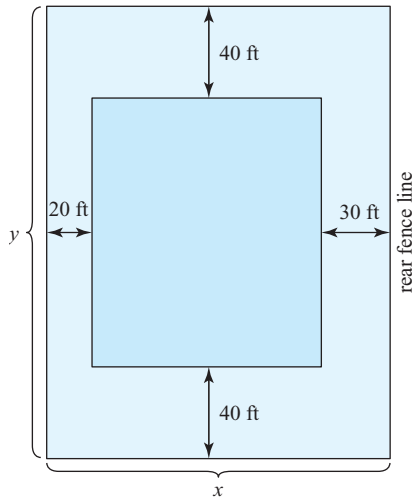
b. To find the number of items manufactured when average cost is \$8, we replace $A(x)$ with 8 and solve: $\dfrac{x^2 + 4x + 3}{x} = 8$:

$$\begin{aligned} x^2 + 4x + 3 &= 8x \\ x^2 - 4x + 3 &= 0 \\ (x - 1)(x - 3) &= 0 \\ x = 1 \quad &\text{or} \quad x = 3 \end{aligned}$$

The average cost is \$8 when 1000 items or 3000 items are manufactured.

c. From the graph, it appears that the minimum average cost is close to \$7.50, when approximately 1500 to 1800 items are manufactured. Using a graphing calculator, we find that the minimum average cost is approximately \$7.46, when about 1732 items are manufactured (Figure 4.76).

Figure 4.76



Now try Exercises 55 and 56 ▶

In some applications, the functions we use are initially defined in *two variables* rather than just one, as in $H(x, y) = (x - 50)(y - 80)$. However, in the solution process a substitution is used to rewrite the relationship as a function in one variable and we can proceed as before.

EXAMPLE 5 ▶ Using a Rational Function to Solve a Layout Application

The building codes in a new subdivision require that a rectangular home be built at least 20 ft from the street, 40 ft from the neighboring lots, and 30 ft from the rear fence line.

a. Find a function $A(x, y)$ for the area of the lot, and a function $H(x, y)$ for the area of the home (the inner rectangle).

b. If a new home is to have a floor area of 2000 ft^2, $H(x, y) = 2000$. Substitute 2000 for $H(x, y)$ and solve for y, then substitute the result in $A(x, y)$ to write the area A as a function of x alone (simplify the result).

c. Graph $A(x)$ on a calculator, using the window $X \in [-50, 150]$; $Y \in [-30{,}000, 30{,}000]$. Then graph $y = 80x + 2000$ on the same screen. How are these two graphs related?

d. Use the graph of $A(x)$ in Quadrant I to determine the minimum dimensions of a lot that satisfies the subdivision's requirements (to the nearest tenth of a foot). Also state the dimensions of the house.

Solution ▶

a. The area of the lot is simply width times length, so $A(x, y) = xy$. For the house, these dimensions are decreased by 50 ft and 80 ft respectively, so $H(x, y) = (x - 50)(y - 80)$.

b. Given $H(x, y) = 2000$ produces the equation $2000 = (x - 50)(y - 80)$, and solving for y gives

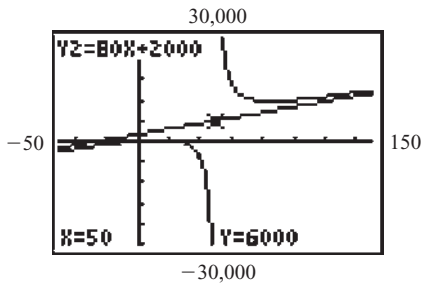
$$2000 = (x - 50)(y - 80) \quad \text{given equation}$$

$$\frac{2000}{x - 50} = y - 80 \quad \text{divide by } x - 50$$

$$\frac{2000}{x - 50} + 80 = y \quad \text{add 80}$$

$$\frac{2000}{x - 50} + \frac{80(x - 50)}{x - 50} = y \quad \text{find LCD}$$

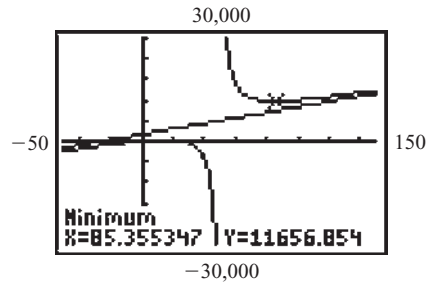
$$\frac{80x - 2000}{x - 50} = y \quad \text{combine terms}$$



Substituting this expression for y in $A(x, y) = xy$ produces

$$A(x) = x\left(\frac{80x - 2000}{x - 50}\right) \quad \text{substitute } \frac{80x - 2000}{x - 50} \text{ for } y$$

$$= \frac{80x^2 - 2000x}{x - 50} \quad \text{multiply}$$



c. The graph of $Y_1 = A(x)$ appears in Figure 4.77 using the prescribed window. $Y_2 = 80x + 2000$ appears to be an oblique asymptote for A, which can be verified using synthetic division.

Figure 4.77

d. Using the 2nd TRACE **(CALC) 3:minimum** feature of a calculator, the minimum width is $x \approx 85.4$ ft (see Figure 4.78). Substituting 85.4 for x in $y = \dfrac{80x - 2000}{x - 50}$, gives the length $y \approx 136.5$ ft. The dimensions of the house must be $85.4 - 50 = 35.4$ ft, by $136.5 - 80 = 56.5$ ft.

Figure 4.78

As expected, the area of the house will be $(35.4)(56.5) \approx 2000$ ft^2.

C. You've just seen how we can solve applications involving rational functions

Now try Exercises 57 through 60 ▶

4.5 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. The graph of $V(x) = \dfrac{3x^3}{x^2 + 4}$ will have a _____ asymptote, since the degree of the numerator is one greater than the degree of the denominator.
2. If the degree of the numerator is greater than the degree of the denominator, the graph will have an _____ or _____ asymptote.
3. If the degree of the numerator is _____ more than the degree of the denominator, the graph will have a parabolic asymptote.
4. If the denominator is a _____, use term by term division to find the quotient. Otherwise, _____ or long division must be used.
5. Discuss/Explain how you would create a function with a parabolic asymptote and two vertical asymptotes.
6. Complete Exercise 7 in expository form. That is, work this exercise out completely, discussing each step of the process as you go.

▶ DEVELOPING YOUR SKILLS

Graph each function. If there is a removable discontinuity, repair the break using an appropriate piecewise-defined function.

7. $f(x) = \dfrac{x^2 - 4}{x + 2}$
8. $f(x) = \dfrac{x^2 - 9}{x + 3}$
9. $g(x) = \dfrac{x^2 - 2x - 3}{x + 1}$
10. $g(x) = \dfrac{x^2 - 3x - 10}{x - 5}$
11. $h(x) = \dfrac{3x - 2x^2}{2x - 3}$
12. $h(x) = \dfrac{4x - 5x^2}{5x - 4}$
13. $p(x) = \dfrac{x^3 - 8}{x - 2}$
14. $p(x) = \dfrac{8x^3 - 1}{2x - 1}$
15. $q(x) = \dfrac{x^3 - 7x - 6}{x + 1}$
16. $q(x) = \dfrac{x^3 - 3x + 2}{x + 2}$
17. $r(x) = \dfrac{x^3 + 3x^2 - x - 3}{x^2 + 2x - 3}$
18. $r(x) = \dfrac{x^3 - 2x^2 - 4x + 8}{x^2 - 4}$

Graph each function using the *Guidelines for Graphing Rational Functions,* which is simply modified to include nonlinear asymptotes. Clearly label all intercepts and asymptotes and any additional points used to sketch the graph. Round to tenths as needed.

19. $Y_1 = \dfrac{x^2 - 4}{x}$
20. $Y_2 = \dfrac{x^2 - x - 6}{x}$
21. $v(x) = \dfrac{3 - x^2}{x}$
22. $V(x) = \dfrac{7 - x^2}{x}$

23. $w(x) = \dfrac{x^2 + 1}{x}$

24. $W(x) = \dfrac{x^2 + 4}{2x}$

25. $h(x) = \dfrac{x^3 - 2x^2 + 3}{x^2}$

26. $H(x) = \dfrac{x^3 + x^2 - 2}{x^2}$

27. $Y_1 = \dfrac{x^3 + 3x^2 - 4}{x^2}$

28. $Y_2 = \dfrac{x^3 - 3x^2 + 4}{x^2}$

29. $f(x) = \dfrac{x^3 - 3x + 2}{x^2}$

30. $F(x) = \dfrac{x^3 - 12x - 16}{x^2}$

31. $Y_3 = \dfrac{x^3 - 5x^2 + 4}{x^2}$

32. $Y_4 = \dfrac{x^3 + 5x^2 - 6}{x^2}$

33. $r(x) = \dfrac{x^3 - x^2 - 4x + 4}{x^2}$

34. $R(x) = \dfrac{x^3 - 2x^2 - 9x + 18}{x^2}$

35. $g(x) = \dfrac{x^2 + 4x + 4}{x + 3}$

36. $G(x) = \dfrac{x^2 - 2x + 1}{x - 2}$

37. $f(x) = \dfrac{x^2 + 1}{x + 1}$

38. $F(x) = \dfrac{x^2 + x + 1}{x - 1}$

39. $Y_3 = \dfrac{x^2 - 4}{x + 1}$

40. $Y_4 = \dfrac{x^2 - x - 6}{x - 1}$

41. $v(x) = \dfrac{x^3 - 4x}{x^2 - 1}$

42. $V(x) = \dfrac{9x - x^3}{x^2 - 4}$

43. $w(x) = \dfrac{16x - x^3}{x^2 + 4}$

44. $W(x) = \dfrac{x^3 - 7x + 6}{2 + x^2}$

45. $Y_1 = \dfrac{x^3 - 3x + 2}{x^2 - 9}$

46. $Y_2 = \dfrac{x^3 - x^2 - 12x}{x^2 - 7}$

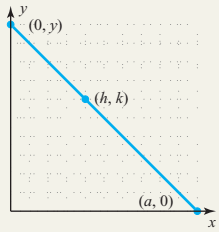
47. $p(x) = \dfrac{x^4 + 4}{x^2 + 1}$

48. $P(x) = \dfrac{x^4 - 5x^2 + 4}{x^2 + 2}$

49. $q(x) = \dfrac{10 + 9x^2 - x^4}{x^2 + 5}$

50. $Q(x) = \dfrac{x^4 - 2x^2 + 3}{x^2}$

Graph each function and its nonlinear asymptote on the same screen, using the window specified. Then locate the minimum value of f in the first quadrant.



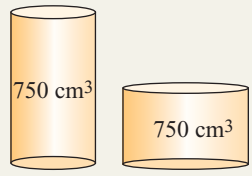
51. $f(x) = \dfrac{x^3 + 500}{x}$;
$X \in [-24, 24]$, $Y \in [-500, 500]$

52. $f(x) = \dfrac{2\pi x^3 + 750}{x}$;
$X \in [-12, 12]$, $Y \in [-750, 750]$

▶ WORKING WITH FORMULAS

53. Area of a first quadrant triangle:
$$A(a) = \frac{1}{2}\left(\frac{ka^2}{a - h}\right)$$

The area of a right triangle in the first quadrant, formed by a line with negative slope through the point (h, k) and legs that lie along the positive axes is given by the formula shown, where a represents the x-intercept of the resulting line ($h < a$). The area of the triangle varies with the slope of the line. Assume the line contains the point (5, 6).



a. Find the equation of the vertical and slant asymptotes.

b. Find the area of the triangle if it has an x-intercept of (11, 0).

c. Use a graphing calculator to graph the function on an appropriate window. Does the shape of the graph look familiar? Use the calculator to find the value of a that minimizes $A(a)$. That is, find the x-intercept that results in a triangle with the smallest possible area.

54. Surface area of a cylinder with fixed volume:
$$S = \frac{2\pi r^3 + 2V}{r}$$

It's possible to construct many different cylinders that will hold a specified volume, by changing the radius and height. This is critically important to producers who want to minimize the cost of packing canned goods and marketers who want to present an attractive product. The surface area of the cylinder can be found using the formula shown, where the radius is r and $V = \pi r^2 h$ is known. Assume the fixed volume is 750 cm^3.

a. Find the equation of the vertical asymptote. How would you describe the nonlinear asymptote?

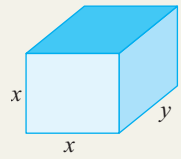
b. If the radius of the cylinder is 2 cm, what is its surface area?

c. Use a graphing calculator to graph the function on an appropriate window, and use it to find the value of r that minimizes $S(r)$. That is, find the radius that results in a cylinder with the smallest possible area, while still holding a volume of 750 cm^3.

▶ APPLICATIONS

Costs of manufacturing: As in Example 4, the cost $C(x)$ of manufacturing is sometimes nonlinear and can increase dramatically with each item. For the average cost function $A(x) = \dfrac{C(x)}{x}$, consider the following.

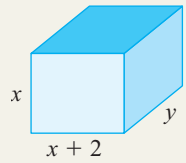
55. Assume the monthly cost of manufacturing custom-crafted storage sheds is modeled by the function $C(x) = 4x^2 + 53x + 250$.



- **a.** Write the average cost function and state the equation of the vertical and oblique asymptotes.
- **b.** Enter the cost function $C(x)$ as Y_1 on a graphing calculator, and the average cost function $A(x)$ as Y_2. Using the **TABLE** feature, find the cost and average cost of making 1, 2, and 3 sheds.
- **c.** Scroll down the table to where it appears that average cost is a minimum. According to the table, how many sheds should be made each month to minimize costs? What is the minimum cost?
- **d.** Graph the average cost function and its asymptotes, using a window that shows the entire function. Use the graph to confirm the result from part (c).

56. Assume the monthly cost of manufacturing playground equipment that combines a play house, slides, and swings is modeled by the function $C(x) = 5x^2 + 94x + 576$. The company has projected that they will be profitable if they can bring their average cost down to \$200 per set of playground equipment.

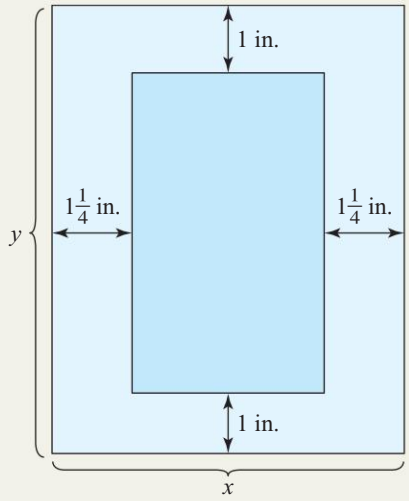
- **a.** Write the average cost function and state the equation of the vertical and oblique asymptotes.
- **b.** Enter the cost function $C(x)$ as Y_1 on a graphing calculator, and the average cost function $A(x)$ as Y_2. Using the TABLE feature, find the cost and average cost of making 1, 2, and 3 playground equipment combinations. Why would the average cost fall so dramatically early on?
- **c.** Scroll down the table to where it appears that average cost is a minimum. According to the table, how many sets of equipment should be made each month to minimize costs? What is the minimum cost? Will the company be profitable under these conditions?
- **d.** Graph the average cost function and its asymptotes, using a window that shows the entire function. Use the graph to confirm the result from part (c).



Minimum cost of packaging: Similar to Exercise 54, manufacturers can minimize their costs by shipping merchandise in packages that use a minimum amount of material. After all, rectangular boxes come in different sizes and there are many combinations of length, width, and height that will hold a specified volume.

57. A clothing manufacturer wishes to ship lots of 12 ft^3 of clothing in boxes with square ends and rectangular sides.

- **a.** Find a function $S(x, y)$ for the surface area of the box, and a function $V(x, y)$ for the volume of the box.
- **b.** Solve for y in $V(x, y) = 12$ (volume is 12 ft^3) and use the result to write the surface area as a function $S(x)$ in terms of x alone (simplify the result).
- **c.** On a graphing calculator, graph the function $S(x)$ using the window $x \in [-8, 8]$; $y \in [-100, 100]$. Then graph $y = 2x^2$ on the same screen. How are these two graphs related?
- **d.** Use the graph of $S(x)$ in Quadrant I to determine the dimensions that will minimize the surface area of the box, yet still hold 12 ft^3 of clothing. Clearly state the values of x and y, *in terms of feet and inches*, rounded to the nearest $\frac{1}{2}$ in.

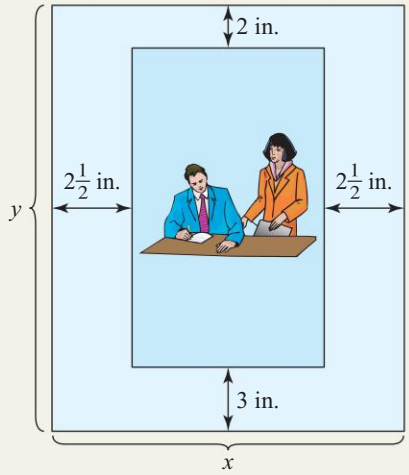


58. A maker of packaging materials needs to ship 36 ft^3 of foam "peanuts" to his customers across the country, using boxes with the dimensions shown.

- **a.** Find a function $S(x, y)$ for the surface area of the box, and a function $V(x, y)$ for the volume of the box.
- **b.** Solve for y in $V(x, y) = 36$ (volume is 36 ft^3), and use the result to write the surface area as a function $S(x)$ in terms of x alone (simplify the result).
- **c.** On a graphing calculator, graph the function $S(x)$ using the window $x \in [-10, 10]$; $y \in [-200, 200]$. Then graph $y = 2x^2 + 4x$ on the same screen. How are these two graphs related?
- **d.** Use the graph of $S(x)$ in Quadrant I to determine the dimensions that will minimize the surface area of the box, yet still hold the foam peanuts. Clearly state the values of x and y, *in terms of feet and inches,* rounded to the nearest $\frac{1}{2}$ in.

Printing and publishing: In the design of magazine pages, posters, and other published materials, an effort is made to maximize the usable area of the page while maintaining an attractive border, or minimizing the page size that will hold a certain amount of print or art work.

59. An editor has a story that requires 60 in^2 of print. Company standards require a 1-in. border at the top and bottom of a page, and 1.25-in. borders along both sides.



a. Find a function $A(x, y)$ for the area of the page, and a function $R(x, y)$ for the area of the inner rectangle (the printed portion).

b. Solve for y in $R(x, y) = 60$, and use the result to write the area from part (a) as a function $A(x)$ in terms of x alone (simplify the result).

c. On a graphing calculator, graph the function $A(x)$ using the window $x \in [-30, 30]$; $y \in [-100, 200]$. Then graph $y = 2x + 60$ on the same screen. How are these two graphs related?

d. Use the graph of $A(x)$ in Quadrant I to determine the page of minimum size that satisfies these border requirements and holds the necessary print. Clearly state the values of x and y, rounded to the nearest hundredth of an inch.

60. *The Poster Shoppe* creates posters, handbills, billboards, and other advertising for business customers. An order comes in for a poster with 500 in^2 of usable area, with margins of 2 in. across the top, 3 in. across the bottom, and 2.5 in. on each side.

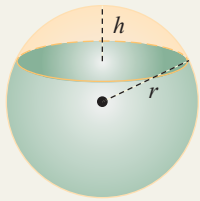
a. Find a function $A(x, y)$ for the area of the page, and a function $R(x, y)$ for the area of the inner rectangle (the usable area).

b. Solve for y in $R(x, y) = 500$, and use the result to write the area from part (a) as a function $A(x)$ in terms of x alone (simplify the result).

c. On a graphing calculator, graph $A(x)$ using the window $x \in [-100, 100]$; $y \in [-800, 1600]$. Then graph $y = 5x + 500$ on the same screen. How are these two graphs related?

d. Use the graph of $A(x)$ in Quadrant I to determine the poster of minimum size that satisfies these border requirements and has the necessary usable area. Clearly state the values of x and y, rounded to the nearest hundredth of an inch.

61. The formula from Exercise 54 has an interesting derivation. The volume of a cylinder is $V = \pi r^2 h$, while the surface area is given by $S = 2\pi r^2 + 2\pi rh$ (the circular top and bottom + the area of the side).



a. Solve the volume formula for the variable h.

b. Substitute the resulting expression for h into the surface area formula and simplify.

c. Combine the resulting two terms using the least common denominator, and the result is the formula from Exercise 54.

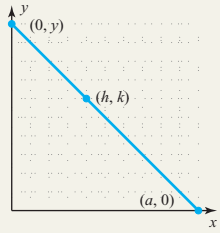
d. Assume the volume of a can must be 1200 cm^3. Use a calculator to graph the function S using an appropriate window, then use it to find the radius r and height h that will result in a cylinder with the smallest possible area, while still holding a volume of 1200 cm^3. What is the minimum surface area? Also see Exercise 62.

62. The surface area of a spherical cap is given by $S = 2\pi rh$, where r is the radius of the sphere and h is the perpendicular distance from the sphere's surface to the plane intersecting the sphere, forming the cap. The volume of the cap is $V = \frac{1}{3}\pi h^2(3r - h)$. Similar to Exercise 61, a formula can be found that will minimize the area of a cap that holds a specified volume.

a. Solve the volume formula for the variable r.

b. Substitute the resulting expression for r into the surface area formula and simplify. The result is a formula for surface area given solely in terms of the volume V and the height h.

c. Assume the volume of the spherical cap is 500 cm^3. Use a graphing calculator to graph the resulting function on an appropriate window, and use the graph to find the height h that will result in a spherical cap with the smallest possible area, while still holding a volume of 500 cm^3.



d. Use this value of h and $V = 500$ cm^3 to find the radius of the sphere.

▶ EXTENDING THE CONCEPT

63. Consider rational functions of the form $f(x) = \dfrac{x^2 - a}{x - b}$. Use a graphing calculator to explore cases where $a = b^2 + 1$, $a = b^2$, and $a = b^2 - 1$. What do you notice? Explain/Discuss why the graphs differ. It's helpful to note that when graphing functions of this form, the "center" of the graph will be at $(b, b^2 - a)$, and the window size can be set accordingly for an optimal view. Do some investigation on this function and determine/explain *why* the "center" of the graph is at $(b, b^2 - a)$.

64. The formula from Exercise 53 also has an interesting derivation, and the process involves this sequence:

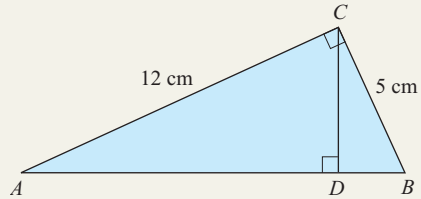
a. Use the points $(a, 0)$ and (h, k) to find the slope of the line, and the point-slope formula to find the equation of the line in terms of y.

b. Use this equation to find the x- and y-intercepts of the line in terms of a, k, and h.

c. Complete the derivation using these intercepts and the triangle formula $A = \frac{1}{2}BH$.

d. If the lines goes through (4, 4) the area formula becomes $A = \dfrac{1}{2}\left(\dfrac{4a^2}{a - 4}\right)$. Find the minimum value of this rational function. What can you say about the triangle with minimum area through (h, k), where $h = k$? Verify using the points (5, 5), and (6, 6).

65. Referring to Exercises 54 and 61, suppose that instead of a closed cylinder, with both a top and bottom, we needed to manufacture *open cylinders,* like tennis ball cans that use a lid made from a different material. Derive the formula that will minimize the surface area of an open cylinder, and use it to find the cylinder with minimum surface area that will hold 90 in^3 of material.



▶ MAINTAINING YOUR SKILLS

66. **(3.1)** Compute the quotient $\dfrac{5i}{1 + 2i}$, then check your answer using multiplication.

67. **(1.4)** Write the equation of the line in slope intercept form and state the slope and y-intercept: $-3x + 4y = -16$.

68. **(3.2)** Given $f(x) = ax^2 + bx + c$, use the discriminant to state conditions where the function will have: (a) two, real/rational roots, (b) two, real/irrational roots, (c) one real and rational root, (d) one real/irrational root, (e) one complex root, and (f) two complex roots.

69. **(Appendix A.6/3.2)** For triangle ABC as shown, (a) find the perimeter; (b) find the length of $\overline{CD}$, given $(\overline{CB})^2 = \overline{AB} \cdot \overline{DB}$; (c) find the area; and (d) find the areas of the two smaller triangles.

4.6 Polynomial and Rational Inequalities

LEARNING OBJECTIVES

In Section 4.6 you will see how we can:

- ❑ **A.** Solve polynomial inequalities
- ❑ **B.** Solve rational inequalities
- ❑ **C.** Solve applications of inequalities

A. Polynomial Inequalities

Our work with quadratic inequalities (Section 3.4) transfers seamlessly to inequalities involving higher degree polynomials and the same two methods can be employed. The first involves drawing a quick sketch of the function, and using the concepts of multiplicity and end-behavior. The second involves the use of multiple interval tests, to check on the sign of the function in each interval.

Solving Inequalities Graphically

After writing the polynomial in standard form, find the zeroes, plot them on the x-axis, and determine the solution set using end-behavior and the behavior at each zero (cross—sign change; or bounce—no change in sign). In this process, any irreducible quadratic factors can be ignored, as they have no effect on the solution set. In summary,

Solving Polynomial Inequalities

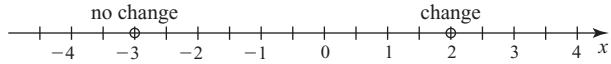
Given $f(x)$ is a polynomial in standard form,

1. Write f in completely factored form.
2. Plot real zeroes on the x-axis, noting their multiplicity.
   - If the multiplicity is odd the function will **change** sign.
   - If the multiplicity is even, there will be **no change** in sign.
3. Use the end-behavior to determine the sign of f in the outermost intervals, then label the other intervals as $f(x) < 0$ or $f(x) > 0$ by analyzing the multiplicity of neighboring zeroes.
4. State the solution in interval notation.

EXAMPLE 1 ▶ **Solving a Polynomial Inequality**

Solve the inequality $x^3 - 18 < -4x^2 + 3x$.

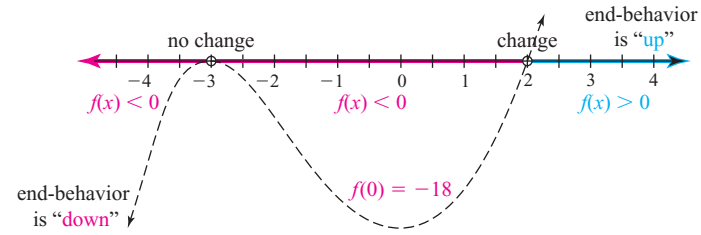
Solution ▶ In standard form we have $x^3 + 4x^2 - 3x - 18 < 0$, which is equivalent to $f(x) < 0$ where $f(x) = x^3 + 4x^2 - 3x - 18$. The polynomial cannot be factored by grouping and testing 1 and -1 shows neither is a zero. Using $x = 2$ and synthetic division gives



use 2 as a "divisor"

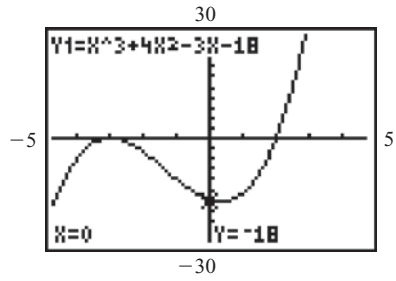
$$\begin{array}{r|rrrr} 2 & 1 & 4 & -3 & -18 \\ & \downarrow & 2 & 12 & 18 \\ \hline & 1 & 6 & 9 & 0 \end{array}$$

with a quotient of $x^2 + 6x + 9$ and a remainder of zero.



1. The factored form is $f(x) = (x - 2)(x^2 + 6x + 9) = (x - 2)(x + 3)^2$.
2. The graph will bounce off the x-axis at $x = -3$ (f will not change sign), and cross the x-axis at $x = 2$ (f will change sign). This is illustrated in Figure 4.79, which uses open dots due to the strict inequality.

Figure 4.79



3. The polynomial has odd degree with a positive lead coefficient, so end-behavior is down/up, which we note in the outermost intervals. Working from the left, f will not change sign at $x = -3$, showing $f(x) < 0$ in the left and middle intervals. This is supported by the y-intercept $(0, -18)$. See Figure 4.80.

Figure 4.80

4. From the diagram, we see that $f(x) < 0$ for $x \in (-\infty, -3) \cup (-3, 2)$, which must also be the solution interval for $x^3 - 18 < -4x^2 + 3x$. The complete graph appearing in Figure 4.81 definitely shows the graph is below the x-axis $[f(x) < 0]$ from $-\infty$ to 2, except at $x = -3$ where the graph touches the x-axis without crossing.

Figure 4.81

Now try Exercises 7 through 18 ▶

EXAMPLE 2 ▶ Solving a Polynomial Inequality

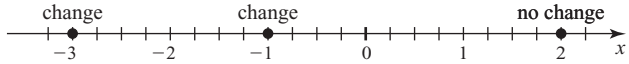
Solve the inequality $x^4 + 4x \le 9x^2 - 12$.

Solution ▶ Writing the polynomial in standard form gives $x^4 - 9x^2 + 4x + 12 \le 0$ $[f(x) \le 0]$. Testing 1 and -1 shows $x = 1$ is not a zero, but $x = -1$ is. Using synthetic division with $x = -1$ gives

use -1 as a "divisor"

-1	1	0	-9	4	12
	↓	-1	1	8	-12
	1	-1	-8	12	0

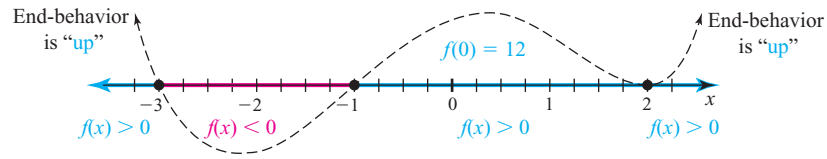
with a quotient of $q_1(x) = x^3 - x^2 - 8x + 12$ and a remainder of zero. As $q_1(x)$ is not easily factored, we continue with synthetic division using $x = 2$.



use 2 as a "divisor"

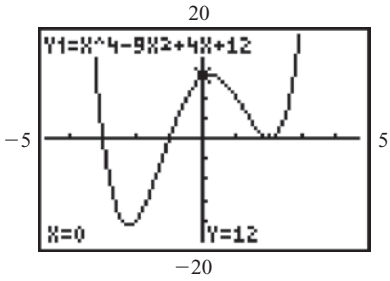
2	1	-1	-8	12
	↓	2	2	-12
	1	1	-6	0

The result is $q_2(x) = x^2 + x - 6$ with a remainder of zero.



1. The factored form is $f(x) = (x + 1)(x - 2)(x^2 + x - 6) = (x + 1)(x - 2)^2(x + 3)$.
2. The graph will "cross" at $x = -1$ and -3, and f will change sign. The graph will "bounce"at $x = 2$ and f will not change sign. This is illustrated in Figure 4.82 which uses closed dots since $f(x)$ *can* be equal to zero.

Figure 4.82



3. With even degree and positive lead coefficient, the end-behavior is up/up. Working from the leftmost interval, $f(x) > 0$, the function must change sign at $x = -3$ (going below the x-axis), and again at $x = -1$ (going above the x-axis). This is supported by the y-intercept (0, 12). The graph then "bounces" at $x = 2$, remaining above the x-axis (no sign change). This produces the sketch shown in Figure 4.83.

Figure 4.83

4. From the diagram, we see that $f(x) \le 0$ for $x \in [-3, -1]$, and at the single point $x = 2$. This shows the solution for $x^4 + 4x \le 9x^2 - 12$ is $x \in [-3, -1] \cup \{2\}$. The actual graph is shown in Figure 4.84. The graph is below or touching the x-axis from -3 to -1 and at $x = 2$.

Figure 4.84

Now try Exercises 19 through 24 ▶

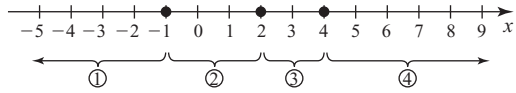
Solving Function Inequalities Using Interval Tests

As an alternative to graphical analysis an **interval test method** can be used to solve polynomial (and rational) inequalities. The x-intercepts (and vertical asymptotes in the case of rational functions) are noted on the x-axis, then a test number is selected from each interval. Since polynomial and rational functions are continuous over their entire domain, the sign of the function at these test values will be the sign of the function for all values of x in the chosen interval.

EXAMPLE 3 ▶ **Solving a Polynomial Inequality**

Solve the inequality $x^3 + 8 \le 5x^2 - 2x$.

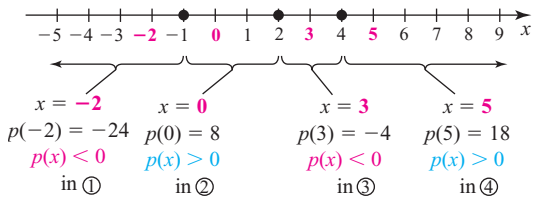
Solution ▶ Writing the relationship in function form gives $p(x) = x^3 - 5x^2 + 2x + 8$, with solutions needed to $p(x) \le 0$. The tests for 1 and -1 show $x = -1$ is a root, and using -1 with synthetic division gives



use -1 as a "divisor"

-1	1	-5	2	8
	↓	-1	6	-8
	1	-6	8	0

The quotient is $q(x) = x^2 - 6x + 8$, with a remainder of 0.

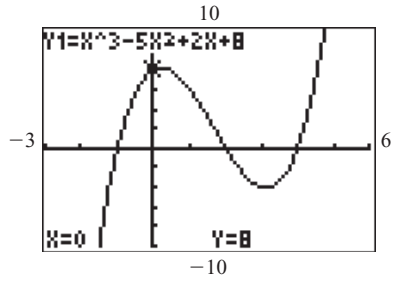


The factored form is $p(x) = (x + 1)(x^2 - 6x + 8) = (x + 1)(x - 2)(x - 4)$. The x-intercepts are $(-1, 0)$, $(2, 0)$, and $(4, 0)$. Plotting these intercepts creates four intervals on the x-axis (Figure 4.85).

Figure 4.85

Selecting a test value from each interval gives the information shown in Figure 4.86.

Figure 4.86



WORTHY OF NOTE

When evaluating a function using the interval test method, it's usually easier to use the factored form instead of the polynomial form, since all you really need is whether the result will be positive or negative. For instance, you could likely tell $p(3) = (3 + 1)(3 - 2)(3 - 4)$ is going to be negative, more quickly than $p(3) = (3)^3 - 5(3)^2 + 2(3) + 8$.

The interval tests show $x^3 + 8 \le 5x^2 - 2x$ for $x \in (-\infty, -1] \cup [2, 4]$. The graph is shown in Figure 4.87.

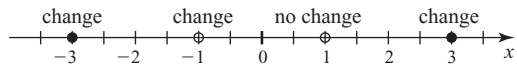
Figure 4.87

☑ **A.** You've just seen how we can solve polynomial inequalities

Now try Exercises 25 and 26 ▶

B. Rational Inequalities

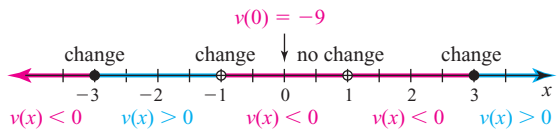
In general, the solution process for polynomial and rational inequalities is virtually identical, once we recognize that vertical asymptotes also break the x-axis into intervals where function values may change sign. However, for rational functions it's more efficient to begin the analysis using the y-intercept or a test point, rather than end-behavior, although either will do.



EXAMPLE 4 ▶ **Solving a Rational Inequality by Analysis**

Solve $\dfrac{x^2 - 9}{x^3 - x^2 - x + 1} \le 0$.

Solution ▶ In function form, $v(x) = \dfrac{x^2 - 9}{x^3 - x^2 - x + 1}$ and we want the solution for $v(x) \le 0$. The numerator and denominator are in standard form. The numerator factors easily, and the denominator can be factored by grouping.

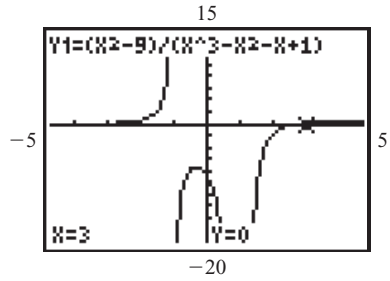


1. The factored form is $v(x) = \dfrac{(x - 3)(x + 3)}{(x - 1)^2(x + 1)}$.
2. $v(x)$ will change sign at $x = 3$, -3, and -1 as all have odd multiplicity, but will not change sign at $x = 1$ (even multiplicity). Note that zeroes of the denominator will always be indicated by open dots (Figure 4.88) as they are excluded from any solution set.

Figure 4.88

3. The y-intercept is $(0, -9)$, indicating that function values will be negative in the interval containing zero. Working outward from this interval using the "change/no change" approach, gives the solution indicated in Figure 4.89.

Figure 4.89



WORTHY OF NOTE

End-behavior can also be used to analyze rational inequalities, although using the y-intercept may be more efficient. For the function $v(x)$ from Example 5 we have $\dfrac{x^2-9}{x^3-x^2-x+1} \approx \dfrac{x^2}{x^3} = \dfrac{1}{x}$ for large values of x, indicating $v(x) > 0$ to the far right and $v(x) < 0$ to the far left. The analysis of each interval can then begin from either side.

4. For $v(x) \le 0$, the solution is $x \in (-\infty, -3] \cup (-1, 1) \cup (1, 3]$.

Finding a window that clearly displays all features of rational function can sometimes be difficult. In these cases, we could investigate each piece separately to confirm solutions. For this example, most of the features of $v(x)$ can be seen using a window size of $X \in [-5, 5]$ and $Y \in [20, 15]$, and we note the graph in Figure 4.90 strongly tends to support our solution.

Figure 4.90

Now try Exercises 27 through 40 ▶

If the rational inequality is not given in function form or is composed of more than one term, start by writing the inequality with zero on one side, then combine terms into a single expression. This is the most efficient way of determining the zeroes of the function and the location of any vertical asymptotes.

EXAMPLE 5 ▶ Solving a Rational Inequality Using Interval Tests

Solve the inequality $\dfrac{x-2}{x-3} \le \dfrac{1}{x+3}$.

Solution ▶ Rewrite the inequality with zero on one side: $\dfrac{x-2}{x-3} - \dfrac{1}{x+3} \le 0$. This is equivalent to $v(x) \le 0$, where $v(x) = \dfrac{x-2}{x-3} - \dfrac{1}{x+3}$. Combining the expressions on the right, we have

$$v(x) = \frac{(x-2)(x+3) - 1(x-3)}{(x+3)(x-3)} \qquad \text{LCD is } (x+3)(x-3)$$

$$= \frac{x^2+x-6-x+3}{(x+3)(x-3)} \qquad \text{multiply}$$

$$= \frac{x^2-3}{(x+3)(x-3)} \qquad \text{simplify}$$

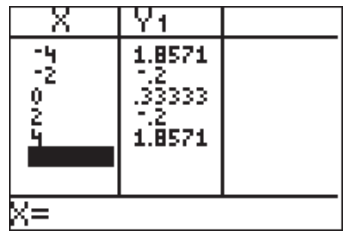
1. The factored form is $v(x) = \dfrac{(x+\sqrt{3})(x-\sqrt{3})}{(x+3)(x-3)}$. $\quad x^2 - k = (x+\sqrt{k})(x-\sqrt{k})$

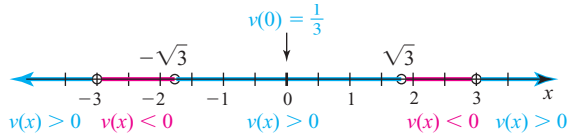
2. The zeroes and asymptotes will occur at $x = -\sqrt{3}, \sqrt{3}, -3$, and 3, which we plot on the x-axis, creating five intervals (Figure 4.91).

Figure 4.91

3. From left to right, we select one test value from each interval created by the zeroes and vertical asymptotes. We chose: $x = -4, -2, 0, 2$, and 4 (see Figure 4.92). The results are shown in Figure 4.93, with the conclusion noted beneath each interval.

Figure 4.92





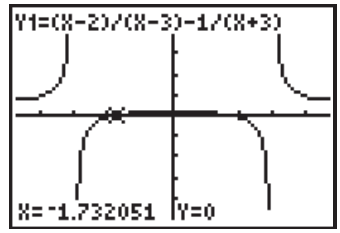


Figure 4.93

4. The solution for $\frac{x-2}{x-3} \le \frac{1}{x+3}$ is $x \in (-3, -\sqrt{3}] \cup [\sqrt{3}, 3)$.

To check these solutions graphically, we subtract $\frac{1}{x+3}$ from both sides and graph $Y_1 = \frac{x-2}{x-3} - \frac{1}{x+3}$ to look for intervals where the graph is below the x-axis. The graph is shown in Figure 4.94 and verifies our solution.

Figure 4.94

☑ **B.** You've just seen how we can solve rational inequalities

Now try Exercises 41 through 60 ▶

C. Applications of Inequalities

Applications of inequalities come in many varieties. In addition to stating the solution algebraically, these exercises often compel us to consider the *context of each application* as we state the solution set.

EXAMPLE 6 ▶ **Solving Applications of Inequalities**

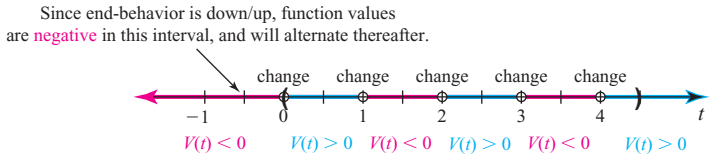
The velocity of a particle (in feet per second) as it floats through air turbulence is given by $V(t) = t^5 - 10t^4 + 35t^3 - 50t^2 + 24t$, where t is the time in seconds and $0 < t < 4.5$. During what intervals of time is the particle moving in the positive direction $[V(t) > 0]$?

Solution ▶ Begin by writing V in factored form. Testing 1 and -1 shows $t = 1$ is a root. Factoring out t gives $V(t) = t(t^4 - 10t^3 + 35t^2 - 50t + 24)$, and using $t = 1$ with synthetic division yields

use 1 as a "divisor"

1	1	−10	35	−50	24
	↓	1	−9	26	−24
	1	−9	26	−24	|0

The quotient is $q_1(t) = t^3 - 9t^2 + 26t - 24$. Using $t = 2$, we continue with the division on $q_1(t)$ which gives:



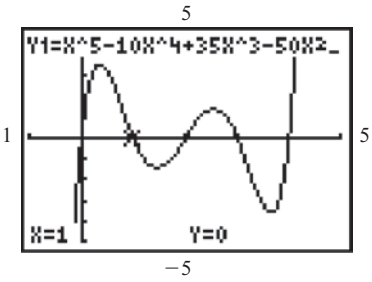
use 2 as a "divisor"

2	1	−9	26	−24
	↓	2	−14	24
	1	−7	12	|0

This shows $V(t) = t(t-1)(t-2)(t^2 - 7t + 12)$.

1. The completely factored form is $V(t) = t(t-1)(t-2)(t-3)(t-4)$.
2. All zeroes have odd multiplicity and function values will change sign.
3. With odd degree and a positive leading coefficient, end-behavior is down/up.

Function values will be negative in the far left interval and alternate in sign thereafter. The solution diagram is shown in the figure (the parentheses shown on the number line indicate the domain given).



4. For $V(t) > 0$, the solution is $t \in (0, 1) \cup (2, 3) \cup (4, 4.5)$. The particle is moving in the positive direction in these time intervals.

Now try Exercises 63 through 70 ▶

C. You've just seen how we can solve applications of inequalities

To verify the analysis in Example 6, we graph $V(t)$ using the window $X \in [-1, 5]$ and $Y \in [-5, 5]$. As Figure 4.95 shows, function values are positive (graph is above the x-axis) when $t \in (0, 1) \cup (2, 3) \cup (4, 4.5)$.

Figure 4.95

4.6 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. To solve a polynomial or rational inequality, begin by plotting the location of all zeroes and _____ asymptotes (if they exist), then consider the _____ of each.

2. For strict inequalities, the zeroes are _____ from the solution set. For nonstrict inequalities, zeroes are _____. The values at which vertical asymptotes occur are always _____.

3. Since the graph of $g(x) = x^4 + 3$, opens upward with a vertex at $(0, 3)$ the solution set for $g(x) > 0$ is _____.

4. To solve a polynomial/rational inequality, it helps to find the sign of f in some interval. This can quickly be done using the _____ or _____ of the function.

5. Compare/Contrast the process for solving $x^2 - 3x - 4 \geq 0$ with $\dfrac{1}{x^2 - 3x - 4} \geq 0$. Are there similarities? What are the differences?

6. Compare/Contrast the process for solving $(x + 1)(x - 3)(x^2 + 1) > 0$ with $(x + 1)(x - 3) > 0$. Are there similarities? What are the differences?

▶ DEVELOPING YOUR SKILLS

Solve each polynomial inequality indicated using a number line and the behavior of the graph at each zero. Write all answers in interval notation.

7. $(x + 3)(x - 5) < 0$ **8.** $(x - 2)(x + 7) < 0$

9. $(x + 1)^2(x - 4) \geq 0$ **10.** $(x + 6)(x - 1)^2 \leq 0$

11. $(x + 2)^3(x - 2)^2(x - 4) \geq 0$

12. $(x - 1)^3(x + 2)^2(x - 3) \leq 0$

13. $x^2 + 4x + 1 < 0$ **14.** $x^2 - 6x + 4 > 0$

15. $x^3 + x^2 - 5x + 3 \leq 0$

16. $x^3 + x^2 - 8x - 12 \geq 0$

17. $x^3 - 7x + 6 > 0$ **18.** $x^3 - 13x + 12 > 0$

19. $x^4 - 10x^2 > -9$ **20.** $x^4 + 36 < 13x^2$

21. $x^4 - 9x^2 > 4x - 12$

22. $x^4 - 16 > 5x^3 - 20x$

23. $x^4 - 6x^3 \leq -8x^2 - 6x + 9$

24. $x^4 - 3x^2 + 8 \leq 4x^3 - 10x$

Solve each inequality using the interval test method.

25. $-4x + 12 < -x^3 + 3x^2$

26. $x^3 + 8 < 5x^2 - 2x$ **27.** $\dfrac{x^2 - x - 6}{x^2 - 1} \geq 0$

28. $\dfrac{x^2 - 4x - 21}{x - 3} < 0$

Solve each rational inequality indicated using a number line and the behavior of the graph at each zero. Write all answers in interval notation.

29. $f(x) = \dfrac{x + 3}{x - 2}$; $f(x) \leq 0$

30. $F(x) = \dfrac{x - 4}{x + 1}$; $F(x) \geq 0$

31. $g(x) = \dfrac{x + 1}{x^2 + 4x + 4}$; $g(x) < 0$

32. $G(x) = \dfrac{x - 3}{x^2 - 2x + 1}$; $G(x) > 0$

33. $\dfrac{2 - x}{x^2 - x - 6} \geq 0$ **34.** $\dfrac{1 - x}{x^2 - 2x - 8} \leq 0$

35. $\dfrac{2x - x^2}{x^2 + 4x - 5} < 0$ **36.** $\dfrac{x^2 + 3x}{x^2 - 2x - 3} > 0$

37. $\dfrac{x^2 - 4}{x^3 - 13x + 12} \geq 0$ **38.** $\dfrac{x^2 + x - 6}{x^3 - 7x + 6} \leq 0$

39. $\dfrac{x^2 + 5x - 14}{x^3 + x^2 - 5x + 3} > 0$

40. $\dfrac{x^2 + 2x - 8}{x^3 + 5x^2 + 3x - 9} < 0$

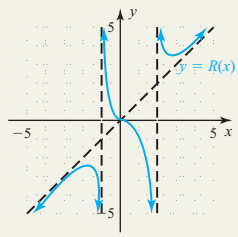
41. $\dfrac{2}{x - 2} \leq \dfrac{1}{x}$ **42.** $\dfrac{5}{x + 3} \geq \dfrac{3}{x}$

43. $\dfrac{x - 3}{x + 17} > \dfrac{1}{x - 1}$ **44.** $\dfrac{1}{x + 5} < \dfrac{x - 2}{x - 7}$

45. $\dfrac{x + 1}{x - 2} \geq \dfrac{x + 2}{x + 3}$ **46.** $\dfrac{x - 3}{x - 6} \leq \dfrac{x + 1}{x + 4}$

47. $\dfrac{x + 2}{x^2 + 9} > 0$ **48.** $\dfrac{x^2 + 4}{x - 3} < 0$

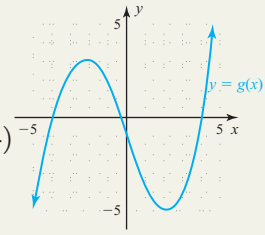
49. $\dfrac{x^3 + 1}{x^2 + 1} > 0$ **50.** $\dfrac{x^2 + 4}{x^3 - 8} < 0$



51. $\dfrac{x^4 - 5x^2 - 36}{x^2 - 2x + 1} > 0$ **52.** $\dfrac{x^4 - 3x^2 - 4}{x^2 - x - 20} < 0$

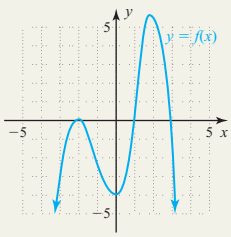
53. $x^2 - 2x \geq 15$ **54.** $x^2 + 3x \geq 18$

55. $x^3 \geq 9x$ **56.** $x^3 \leq 4x$



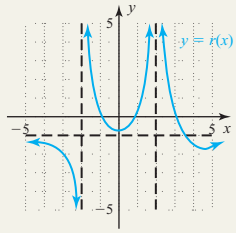
Match the correct solution with the inequality and graph given.

57. $R(x) \leq 0$



a. $x \in (-\infty, -1) \cup (0, 2)$
b. $x \in [0, 1] \cup (2, \infty)$
c. $x \in [-5, -1] \cup [2, 5]$
d. $x \in (-\infty, -1) \cup [0, 2)$
e. none of these

58. $g(x) \geq 0$



a. $x \in (-4, -0.5) \cup (4, \infty)$
b. $x \in [-0.5, 4] \cup [4, 5]$
c. $x \in (-\infty, -4) \cup (-0.5, 4)$
d. $x \in [-4, -0.5] \cup [4, \infty)$
e. none of these

59. $f(x) < 0$

a. $x \in (-5, -2) \cup (3, 5)$
b. $x \in (-\infty, -2) \cup (-2, 1) \cup (3, \infty)$
c. $x \in (-\infty, -2) \cup (3, \infty)$
d. $x \in (-\infty, -2) \cup (-2, 1] \cup [3, \infty)$
e. none of these

60. $r(x) \geq 0$

a. $x \in (-\infty, -2) \cup [-1, 1] \cup [3, \infty)$
b. $x \in (-2, -1] \cup [1, 2) \cup (2, 3]$
c. $x \in (-\infty, -2) \cup (2, \infty)$
d. $x \in (-2, -1) \cup (1, 2) \cup (2, 3]$
e. none of these

▶ WORKING WITH FORMULAS

61. Discriminant of the reduced cubic $x^3 + px + q = 0$: $D = -(4p^3 + 27q^2)$

The discriminant of a cubic equation is less well known than that of the quadratic, but serves the same purpose. The discriminant of the reduced cubic is given by the formula shown, where p is the linear coefficient and q is the constant term. If $D > 0$, there will be three real and distinct roots. If $D = 0$, there are still three real roots, but one is a repeated root (multiplicity two). If $D < 0$, there are one real and two complex roots. Suppose we wish to study the family of cubic equations where $q = p + 1$.

a. Verify the resulting discriminant is $D = -(4p^3 + 27p^2 + 54p + 27)$.

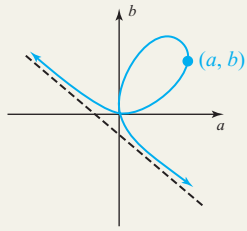
b. Determine the values of p and q for which this family of equations has a repeated real root. In other words, solve the equation $-(4p^3 + 27p^2 + 54p + 27) = 0$ using the rational zeroes theorem and synthetic division to write D in completely factored form.

c. Use the factored form from part (b) to determine the values of p and q for which this family of equations has three real and distinct roots. In other words, solve $D > 0$.

d. Verify the results of parts (b) and (c) on a graphing calculator.

62. Coordinates for the folium of Descartes:

The interesting relation shown here is called the folium (leaf) of Descartes. The folium is most often graphed using what are called *parametric equations,* in which the coordinates a and b are expressed in terms of the parameter x ("k" is a constant that affects the size of the leaf). Since each is an individual function, the x- and y-coordinates can be investigated individually in rectangular coordinates using $F(x) = \dfrac{3x}{1 + x^3}$ and $G(x) = \dfrac{3x^2}{1 + x^3}$ (assume $k = 1$ for now).

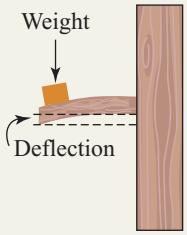


$$\begin{cases} a = \dfrac{3kx}{1 + x^3} \\ b = \dfrac{3kx^2}{1 + x^3} \end{cases}$$

a. Graph each function using the techniques from this chapter.

b. Will $F(x)$ ever be equal to $G(x)$? If so, for what values of x?

c. According to your graph, for what values of x will the *x-coordinate* of the folium be positive? In other words, solve $F(x) = \dfrac{3x}{1 + x^3} > 0$.



d. For what values of x will the *y-coordinate* of the folium be positive? Solve $G(x) = \dfrac{3x^2}{1 + x^3} > 0$.

Folium of Descartes

▶ APPLICATIONS

Deflection of a beam: The amount of deflection in a rectangular wooden beam of length L ft can be approximated by $d(x) = k(x^3 - 3L^2x + 2L^3)$, where k is a constant that depends on the characteristics of the wood and the force applied, and x is the *distance from the unsupported end* of the beam ($x < L$).

63. Find the equation for a beam 8 ft long and use it for the following:

a. For what distances x is the quantity $\dfrac{d(x)}{k}$ less than 189 units?

b. What is the amount of deflection 4 ft from the unsupported end ($x = 4$)?

c. For what distances x is the quantity $\dfrac{d(x)}{k}$ greater than 475 units?

d. If safety concerns prohibit a deflection of more than $648k$ units, what is the shortest distance from the end of the beam that the force can be applied?

64. Find the equation for a beam 9 ft long and use it for the following:

a. For what distances x is the quantity $\dfrac{d(x)}{k}$ less than 216 units?

b. What is the amount of deflection 4 ft from the unsupported end ($x = 4$)?

c. For what distances x is the quantity $\dfrac{d(x)}{k}$ greater than $550k$ units?

d. Compare the answer to 63b with the answer to 64b. What can you conclude?

Average speed for a round-trip: Surprisingly, the average speed of a round-trip is *not* the sum of the average speed in each direction divided by two. For a fixed distance D, consider rate r_1 in time t_1 for one direction, and rate r_2 in time t_2 for the other, giving $r_1 = \dfrac{D}{t_1}$ and $r_2 = \dfrac{D}{t_2}$. The average speed for the round-trip is $R = \dfrac{2D}{t_1 + t_2}$.

65. The distance from St. Louis, Missouri, to Springfield, Illinois, is approximately 80 mi. Suppose that Sione, due to the age of his vehicle, made the round-trip with an average speed of 40 mph.

a. Use the relationships stated to verify that $r_2 = \dfrac{20r_1}{r_1 - 20}$.

b. Discuss the meaning of the horizontal and vertical asymptotes in this context.

c. Verify algebraically the speed returning would be greater than the speed going for $20 < r_1 < 40$. In other words, solve the inequality $\dfrac{20r_1}{r_1 - 20} > r_1$ using the ideas from this section.

66. The distance from Boston, Massachusetts, to Hartford, Connecticut, is approximately 100 mi. Suppose that Stella, due to excellent driving conditions, made the round-trip with an average speed of 60 mph.

a. Use the relationships above to verify that $r_2 = \dfrac{30r_1}{r_1 - 30}$.

b. Discuss the meaning of the horizontal and vertical asymptotes in this context.

c. Verify algebraically the speed returning would be greater than the speed going for $30 < r_1 < 60$. In other words, solve the inequality $\dfrac{30r_1}{r_1 - 30} > r_1$ using the ideas from this section.

Electrical resistance and temperature: The amount of electrical resistance R in a medium depends on the temperature, and for certain materials can be modeled by the equation $R(t) = 0.01t^2 + 0.1t + k$, where $R(t)$ is the resistance (in ohms Ω) at temperature t ($t \geq 0°$) in degrees Celsius, and k is the resistance at $t = 0°$C.

67. Suppose $k = 30$ for a certain medium. Write the resistance equation and use it to answer the following.

a. For what temperatures is the resistance less than 42 Ω?

b. For what temperatures is the resistance greater than 36 Ω?

c. If it becomes uneconomical to run electricity through the medium for resistances greater than 60 Ω, for what temperatures should the electricity generator be shut down?

68. Suppose $k = 20$. Write the resistance equation and solve the following.

a. For what temperatures is the resistance less than 26 Ω?

b. For what temperatures is the resistance greater than 40 Ω?

c. If it becomes uneconomical to run electricity through the medium for resistances greater than 50 Ω, for what temperatures should the electricity generator be shut down?

69. Sum of consecutive squares: The sum of the first n squares $1^2 + 2^2 + 3^2 + \cdots + n^2$ is given by the formula $S(n) = \dfrac{2n^3 + 3n^2 + n}{6}$. Use the equation to solve the following inequalities.

a. For what number of consecutive squares is $S(n) \geq 30$?

b. For what number of consecutive squares is $S(n) \leq 285$?

c. What is the maximum number of consecutive squares that can be summed without the result exceeding three digits?

70. Sum of consecutive cubes: The sum of the first n cubes $1^3 + 2^3 + 3^3 + \cdots + n^3$ is given by the formula $S(n) = \dfrac{n^4 + 2n^3 + n^2}{4}$. Use the equation to solve the following inequalities.

a. For what number of consecutive cubes is $S(n) \geq 100$?

b. For what number of consecutive cubes is $S(n) \leq 784$?

c. What is the maximum number of consecutive cubes that can be summed without the result exceeding three digits?

▶ EXTENDING THE CONCEPT

71. (a) Is it possible for the solution set of a polynomial inequality to be all real numbers? If not, discuss why. If so, provide an example. (b) Is it possible for the solution set of a rational inequality to be all real numbers? If not, discuss why. If so, provide an example.

72. As in our earlier studies, if n is an even number, the expression $\sqrt[n]{A}$ represents a real number only if $A \geq 0$. Use this idea to find the domain of the following functions.

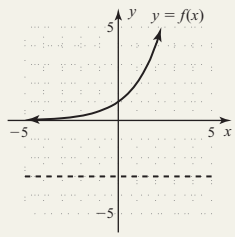
a. $f(x) = \sqrt{2x^3 - x^2 - 16x + 15}$

b. $g(x) = \sqrt[4]{2x^3 + x^2 - 22x + 24}$

c. $p(x) = \sqrt[4]{\dfrac{x + 2}{x^2 - 2x - 35}}$

d. $q(x) = \sqrt{\dfrac{x^2 - 1}{x^2 - x - 6}}$

73. Find one polynomial inequality and one rational inequality that have the solution $x \in (-\infty, -2) \cup (0, 1) \cup (1, \infty)$.



74. Using the tools of calculus, it can be shown that $f(x) = x^4 - 4x^3 - 12x^2 + 32x + 39$ is increasing in the intervals where $F(x) = x^3 - 3x^2 - 6x + 8$ is positive. Solve the inequality $F(x) > 0$ using the ideas from this section, then verify $f(x)\uparrow$ in these intervals by graphing f on a graphing calculator and using the TRACE feature.

75. Using the tools of calculus, it can be shown that $r(x) = \dfrac{x^2 - 3x - 4}{x - 8}$ is decreasing in the intervals where $R(x) = \dfrac{x^2 - 16x + 28}{(x - 8)^2}$ is negative. Solve the inequality $R(x) < 0$ using the ideas from this section, then verify $r(x)\downarrow$ in these intervals by graphing r on a graphing calculator and using the TRACE feature.

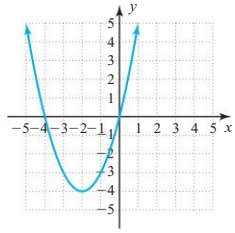
▶ MAINTAINING YOUR SKILLS

76. **(2.2)** Use the graph of $f(x)$ given to sketch the graph of $y = f(x + 2) - 3$.

Exercise 76

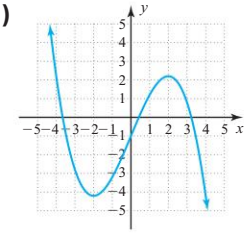
77. **(2.5/4.5)** Graph the function $f(x) = \dfrac{x^2 + 2x - 8}{x + 4}$. If there is a removable discontinuity, repair the break using an appropriate piecewise-defined function.

78. **(Appendix A.6)** Solve the equation $\dfrac{1}{2}\sqrt{16 - x} - \dfrac{x}{2} = 2$. Check solutions in the original equation.



79. **(2.3)** Solve the absolute value inequality: $-2|x - 3| + 5 \geq -7$

MAKING CONNECTIONS



Making Connections: Graphically, Symbolically, Numerically, and Verbally

Eight graphs (a) through (h) are given. Match the characteristics shown in 1 through 16 to one of the eight graphs.

(g)

(h)

1. ____ $\frac{1}{6}(x+4)(x-1)(x-3)$

2. ____ $y = -(x+2)^2 + 4$

3. ____ min degree 3, y-int: $(0, -1)$

4. ____ min degree 4, one repeated root, relative max $y = 0$ at $x = -1$

5. ____ $y = x(x-4)$

6. ____ $f(x) > 0$ only for $x \in (-4, 0)$

7. ____ $f(-1) = 4, f(2) = 1$

8. ____ $f(x)\uparrow$ only for $x \in (-2, 2)$

9. ____ $(y+4) = \frac{1}{6}(x+4)$

10. ____ $y = -\frac{3}{2}x$

11. ____ axis of symmetry $x = -2, f(-1) = -3$

12. ____ min degree 4, one repeated root, lead coefficient $a < 0$

13. ____ axis of symmetry $x = -2, f(-3) = 3$

14. ____ $f(x) > 0$ for $x \in (-4, 1) \cup (3, \infty)$

15. ____ $f(x)\uparrow$ only for $x \in (-3, -1) \cup (1, \infty)$

16. ____ $f(x) = 4.2$ for $x = -2$ and $x = 4$

SUMMARY AND CONCEPT REVIEW

SECTION 4.1 Synthetic Division; the Remainder and Factor Theorems

KEY CONCEPTS

- Synthetic division is an abbreviated form of long division. Only the coefficients of the dividend are used, since "standard form" ensures like place values are aligned. Zero placeholders are used for "missing" terms. The "divisor" must be linear with leading coefficient 1.
- To divide a polynomial by $x - c$, use c in the synthetic division; to divide by $x + c$, use $-c$.
- After setting up the synthetic division template, drop the leading coefficient of the dividend into place, then multiply in the diagonal direction, place the product in the next column, and add in the vertical direction, continuing to the last column.
- The final sum is the remainder r, the numbers preceding it are the coefficients of $q(x)$.
- Remainder theorem: If $p(x)$ is divided by $x - c$, the remainder is equal to $p(c)$. The theorem can be used to evaluate polynomials at $x = c$.

- Factor theorem: If $p(c) = 0$, then c is a zero of p and $(x - c)$ is a factor. Conversely, if $(x - c)$ is a factor of p, then $p(c) = 0$. The theorem can be used to factor a polynomial or build a polynomial from its zeroes.
- The remainder and factor theorems also apply when c is a complex number.

EXERCISES

Divide using long division and clearly identify the quotient and remainder:

1. $\dfrac{x^3 + 4x^2 - 5x - 6}{x - 2}$ **2.** $\dfrac{x^3 + 2x - 4}{x^2 - x}$

3. Use the factor theorem to show that $x + 7$ is a factor of $2x^4 + 13x^3 - 6x^2 + 9x + 14$.

4. Complete the division and write $h(x)$ as $h(x) = d(x)q(x) + r(x)$, given $\dfrac{h(x)}{d(x)} = \dfrac{x^3 - 4x + 5}{x - 2}$.

5. Use the factor theorem to help factor $p(x) = x^3 + 2x^2 - 11x - 12$ completely.

6. Use the factor and remainder theorems to factor h, given $x = 4$ is a zero: $h(x) = x^4 - 3x^3 - 4x^2 - 2x + 8$.

Use the remainder theorem:

7. Show $x = \frac{1}{2}$ is a zero of V: $V(x) = 4x^3 + 8x^2 - 3x - 1$.

8. Show $x = 3i$ is a zero of W: $W(x) = x^3 - 2x^2 + 9x - 18$.

9. Find $h(-7)$ given $h(x) = x^3 + 9x^2 + 13x - 10$.

Use the factor theorem:

10. Find a degree 3 polynomial in standard form with zeroes $x = 1$, $x = -\sqrt{5}$, and $x = \sqrt{5}$.

11. Find a fourth-degree polynomial in standard form with one real zero, given $x = 1$ and $x = -2i$ are zeroes.

12. Use synthetic division and the remainder theorem to answer: At a busy shopping mall, customers are constantly coming and going. One summer afternoon during the hours from 12 o'clock noon to 6 in the evening, the number of customers in the mall could be modeled by $C(t) = 3t^3 - 28t^2 + 66t + 35$, where $C(t)$ is the number of customers (in tens), t hours after 12 noon. (a) How many customers were in the mall at noon? (b) Were more customers in the mall at 2:00 or at 3:00 P.M.? How many more? (c) Was the mall busier at 1:00 P.M. (after lunch) or 6:00 P.M. (around dinner time)?

SECTION 4.2 The Zeroes of Polynomial Functions

KEY CONCEPTS

- Fundamental theorem of algebra: Every complex polynomial of degree $n \geq 1$ has at least one complex zero.
- Linear factorization theorem: Every complex polynomial of degree $n \geq 1$ has exactly n linear factors, and can be written in the form $p(x) = a(x - c_1)(x - c_2)\ldots(x - c_n)$, where $a \neq 0$ and $c_1, c_2, \ldots, c_n$ are (not necessarily distinct) complex numbers.
- For a polynomial p in factored form with repeated factors $(x - c)^m$, c is a zero of multiplicity m. If m is odd, c is a zero of odd multiplicity; if m is even, c is a zero of even multiplicity.
- Corollaries to the linear factorization theorem:
  - I. If p is a polynomial with real coefficients, p can be factored into linear factors (not necessarily distinct) and irreducible quadratic factors having real coefficients.
  - II. If p is a polynomial with real coefficients, the complex zeroes of p must occur in conjugate pairs. If $a + bi$ $(b \neq 0)$, is a zero, then $a - bi$ is also a zero.
  - III. If p is a polynomial with degree $n \geq 1$, then p will have exactly n zeroes (real or complex), where zeroes of multiplicity m are counted m times.
- Intermediate value theorem: If p is a polynomial with real coefficients where $p(a)$ and $p(b)$ have opposite signs, then there is at least one c between a and b such that $p(c) = 0$.
- Rational zeroes theorem: If a real polynomial has integer coefficients, rational zeroes must be of the form $\frac{p}{q}$, where p is a factor of the constant term and q is a factor of the leading coefficient.
- Descartes' rule of signs, upper and lower bounds property, tests for -1 and 1, and graphing technology can all be used with the rational zeroes theorem to factor, solve, and graph polynomial functions.

EXERCISES

Using the tools from this section,

13. List all possible rational zeroes of $p(x) = 4x^3 - 16x^2 + 11x + 10$.

14. Find all rational zeroes of $p(x) = 4x^3 - 16x^2 + 11x + 10$.

15. Write $P(x) = 2x^3 - 3x^2 - 17x - 12$ in completely factored form.

16. Prove that $h(x) = x^4 - 7x^2 - 2x + 3$ has no rational zeroes.

17. Identify two intervals (of those given) that contain a zero of $P(x) = x^4 - 3x^3 - 8x^2 + 12x + 6$: $[-2, -1]$, $[1, 2]$, $[2, 3]$, $[4, 5]$. Then verify your answer using a graphing calculator.

18. Discuss the number of possible positive, negative, and complex zeroes for $g(x) = x^4 + 3x^3 - 2x^2 - x - 30$. Then identify which combination is correct using a graphing calculator.

SECTION 4.3 Graphing Polynomial Functions

KEY CONCEPTS

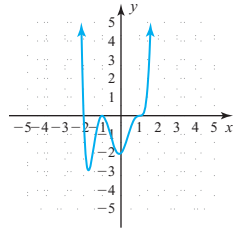
- All polynomial graphs are smooth, continuous curves.
- A polynomial of degree n has *at most* $n - 1$ turning points. The precise location of these turning points are the local maximums or local minimums of the function.
- If the degree of a polynomial is odd, the ends of its graph will point in opposite directions (like $y = mx$). If the degree is even, the ends will point in the same direction (like $y = ax^2$). The sign of the lead coefficient determines the actual behavior.
- The "behavior" of a polynomial graph near its zeroes is determined by the multiplicity of the zero. For any factor $(x - c)^m$, the graph will "cross through" the x-axis if m is odd and "bounce off" the x-axis (touching at just one point) if m is even. The larger the value of m, the flatter (more compressed) the graph will be near c.
- To "round-out" a graph, additional *midinterval points* can be found between known zeroes.
- These ideas help to establish the *Guidelines for Graphing Polynomial Functions*. See page 345.

EXERCISES

State the degree, end-behavior, and y-intercept, but do not graph.

19. $f(x) = -3x^5 + 2x^4 + 9x - 4$

20. $g(x) = (x - 1)(x + 2)^2(x - 2)$



Graph using the *Guidelines for Graphing Polynomials.*

21. $p(x) = (x + 1)^3(x - 2)^2$

22. $q(x) = 2x^3 - 3x^2 - 9x + 10$

23. $h(x) = x^4 - 6x^3 + 8x^2 + 6x - 9$

24. For the graph of $P(x)$ shown, (a) state whether the degree of P is even or odd, (b) use the graph to locate the zeroes of P and state whether their multiplicity is even or odd, and (c) find the minimum possible degree of P and write it in factored form. Assume all zeroes are real.

SECTION 4.4 Graphing Rational Functions

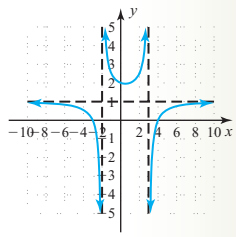
KEY CONCEPTS

- A rational function is one of the form $V(x) = \dfrac{p(x)}{d(x)}$, where p and d are polynomials and $d(x) \neq 0$.
- The domain of V is all real numbers, except the zeroes of d.
- If zero is in the domain of V, substitute 0 for x to find the y-intercept.
- The zeroes of V (if they exist), are solutions to $p(x) = 0$.
- The line $y = k$ is a horizontal asymptote of V if as $|x|$ increases without bound, $V(x)$ approaches k.
- If $\dfrac{p(x)}{d(x)}$ is in simplest form, vertical asymptotes will occur at the zeroes of d.

- The line $x = h$ is a vertical asymptote of V if as x approaches h, $V(x)$ increases/decreases without bound.
- If the degree of p is less than the degree of d, $y = 0$ (the x-axis) is a horizontal asymptote. If the degree of p is equal to the degree of d, $y = \frac{a}{b}$ is a horizontal asymptote, where a is the leading coefficient of p, and b is the leading coefficient of d.
- The *Guidelines for Graphing Rational Functions* can be found on page 361.

EXERCISES

25. For the function $V(x) = \dfrac{x^2 - 9}{x^2 - 3x - 4}$, state the following but do not graph: (a) domain (in set notation), (b) equations of the horizontal and vertical asymptotes, (c) the x- and y-intercept(s), and (d) the value of $V(1)$.



26. For $v(x) = \dfrac{(x+1)^2}{x+2}$, will the function change sign at $x = -1$? Will the function change sign at $x = -2$? Justify your responses.

Graph using the *Guidelines for Graphing Rational Functions.*

27. $v(x) = \dfrac{x^2 - 4x}{x^2 - 4}$

28. $t(x) = \dfrac{2x^2}{x^2 - 5}$

29. Use the vertical asymptotes, x-intercepts, and their multiplicities to construct an equation that corresponds to the given graph. Be sure the y-intercept on the graph matches the value given by your equation. Assume these features are integer-valued. Check your work on a graphing calculator.

30. The average cost of producing a popular board game is given by the function $A(x) = \dfrac{5000 + 15x}{x}$; $x \geq 1000$. (a) Identify the horizontal asymptote of the function and explain its meaning in this context. (b) To be profitable, management believes the average cost must be below \$17.50. What levels of production will make the company profitable?

SECTION 4.5 Additional Insights into Rational Functions

KEY CONCEPTS

- If $V = \dfrac{p(x)}{d(x)}$ is not in simplest form, with p and d sharing factors of the form $x - c$, the graph will have a removable discontinuity (a hole or gap) at $x = c$. The discontinuity can be "removed" (repaired) by redefining V using a piecewise-defined function.
- If $V = \dfrac{p(x)}{d(x)}$ is in simplest form, and the degree of p is greater than the degree of d, the graph will have an oblique or nonlinear asymptote, as determined by the quotient polynomial after division. If the degree of p is greater by 1, the result is a slant (oblique) asymptote. If the degree of p is greater by 2, the result is a parabolic asymptote.

EXERCISES

31. Determine if the graph of h will have a vertical asymptote or a removable discontinuity, then graph the function $h(x) = \dfrac{x^3 - 2x^2 - 9x + 18}{x - 2}$.

32. Sketch the graph of $h(x) = \dfrac{x^2 - 3x - 4}{x + 1}$. If there is a removable discontinuity, repair the break by redefining h using an appropriate piecewise-defined function.

Graph the functions using the *Guidelines for Graphing Rational Functions.*

33. $h(x) = \dfrac{x^2 - 2x}{x - 3}$

34. $t(x) = \dfrac{x^3 - 7x + 6}{x^2}$

35. The cost to make x thousand party favors is given by $C(x) = x^2 - 2x + 6$, where $x \geq 1$ and C is in thousands of dollars. For the average cost of production $A(x) = \dfrac{x^2 - 2x + 6}{x}$, (a) graph the function, (b) use the graph to estimate the level of production that will make average cost a minimum, and (c) state the average cost of a single party favor at this level of production.

SECTION 4.6 Polynomial and Rational Inequalities

KEY CONCEPTS

- To solve polynomial inequalities, write $P(x)$ in factored form and note the multiplicity of each real zero.
- Plot real zeroes on a number line. The graph will cross the x-axis at zeroes of odd multiplicity (P will change sign), and bounce off the axis at zeroes of even multiplicity (P will not change sign).
- Use the end-behavior, y-intercept, or a test point to determine the sign of P in a given interval, then label all other intervals as $P(x) > 0$ or $P(x) < 0$ by analyzing the multiplicity of neighboring zeroes. Use the resulting diagram to state the solution.
- The solution process for rational inequalities and polynomial inequalities is virtually identical, considering that vertical asymptotes also create intervals where function values may change sign, depending on their multiplicity.
- Polynomial and rational inequalities can also be solved using an interval test method. Since polynomials and rational functions are continuous on their domains, the sign of the function at any one point in an interval will be the same as for all other points in that interval.

EXERCISES

Solve each inequality indicated using a number line and the behavior of the graph at each zero.

36. $x^3 + x^2 > 10x - 8$ **37.** $\dfrac{x^2 - 3x - 10}{x - 2} \geq 0$ **38.** $\dfrac{x}{x - 2} \leq \dfrac{-1}{x}$

PRACTICE TEST

1. Complete the square to write each function as a transformation. Then graph each function and label the vertex and all intercepts (if they exist).

a. $f(x) = -x^2 + 10x - 16$

b. $g(x) = \dfrac{1}{2}x^2 + 4x + 16$

2. The graph of a quadratic function has a vertex of $(-1, -2)$, and passes through the origin. Find the other intercept, and the equation of the graph in standard form.

3. Suppose the function $d(t) = t^2 - 14t$ models the depth of a scuba diver at time t, as she dives underwater from a steep shoreline, reaches a certain depth, and swims back to the surface.

a. What is her depth after 4 sec? After 6 sec?

b. What was the maximum depth of the dive?

c. How many seconds was the diver beneath the surface?

4. Compute the quotient using long division: $\dfrac{x^3 - 3x^2 + 5x - 2}{x^2 + 2x + 1}$.

5. Find the quotient and remainder using synthetic division: $\dfrac{x^3 + 4x^2 - 5x - 20}{x + 2}$.

6. Use the remainder theorem to show $(x + 3)$ is a factor of $x^4 - 15x^2 - 10x + 24$.

7. Given $f(x) = 2x^3 + 4x^2 - 5x + 2$, find the value of $f(-3)$ using synthetic division and the remainder theorem.

8. Given $x = 2$ and $x = 3i$ are two zeroes of a real polynomial $P(x)$ with degree 3. Use the factor theorem to find $P(x)$.

9. Factor the polynomial and state the multiplicity of each zero: $Q(x) = (x^2 - 3x + 2)(x^3 - 2x^2 - x + 2)$.

10. Given $C(x) = x^4 + x^3 + 7x^2 + 9x - 18$, (a) use the rational zeroes theorem to list all possible rational zeroes; (b) apply Descartes' rule of signs to count the number of possible positive, negative, and complex zeroes; and (c) use this information along with the tests for 1 and -1, synthetic division, and the factor theorem to factor C completely.

11. Over a 10-yr period, the balance of payments (deficit versus surplus) for a small county was modeled by the function $f(x) = \frac{1}{2}x^3 - 7x^2 + 28x - 32$, where $x = 0$ corresponds to 2000 and $f(x)$ is the deficit or surplus in millions of dollars. (a) Use the rational roots theorem and synthetic division to find the years the county "broke even" (debt = surplus = 0) from 2000 to 2010. (b) How many years did the county run a surplus during this period? (c) What was the surplus/deficit in 2007?

12. Sketch the graph of $f(x) = (x - 3)(x + 1)^3(x + 2)^2$ using the degree, end-behavior, x- and y-intercepts, zeroes of multiplicity, and a few "midinterval" points.

13. Use the *Guidelines for Graphing Polynomials* to graph $g(x) = x^4 - 9x^2 - 4x + 12$.

14. Use the *Guidelines for Graphing Rational Functions* to graph $h(x) = \dfrac{x - 2}{x^2 - 3x - 4}$.

15. Suppose the cost of cleaning contaminated soil from a dump site is modeled by $C(x) = \dfrac{300x}{100 - x}$, where $C(x)$ is the cost (in \$1000s) to remove x% of the contaminants. Graph using $x \in [0, 100]$, and use the graph to answer the following questions.

a. What is the significance of the *vertical asymptote* (what does it mean in this context)?

b. If EPA regulations are changed so that 85% of the contaminants must be removed, instead of the 80% previously required, how much additional cost will the new regulations add? Compare the cost of the 5% increase from 80% to 85% with the cost of the 5% increase from 90% to 95%. What do you notice?

c. What percent of the pollutants can be removed if the company budgets \$2,200,000?

16. Graph using the *Guidelines for Graphing Rational Functions*.

a. $r(x) = \dfrac{x^3 - x^2 - 9x + 9}{x^2}$

b. $R(x) = \dfrac{x^3 + 7x - 6}{x^2 - 4}$

17. Find the level of production that will minimize the average cost of an item, if production costs are modeled by $C(x) = 2x^2 + 25x + 128$, where $C(x)$ is the cost to manufacture x hundred items.

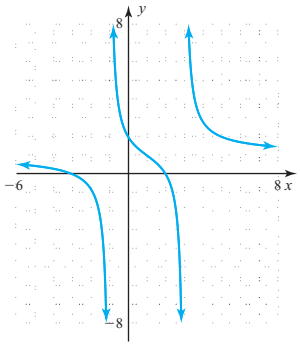
18. Solve each inequality

a. $x^3 - 13x \le 12$ **b.** $\dfrac{3}{x - 2} < \dfrac{2}{x}$

19. Suppose the concentration of a chemical in the bloodstream of a large animal h hr after injection into muscle tissue is modeled by the formula $C(h) = \dfrac{2h^2 + 5h}{h^3 + 55}$.

a. Sketch a graph of the function for the intervals $x \in [-5, 20], y \in [0, 1]$.

b. Where is the vertical asymptote? Does it play a role in this context?



c. What is the concentration after 2 hr? After 8 hr?

d. How long does it take the concentration to fall below 20% $[C(h) < 0.2]$?

e. When does the maximum concentration of the chemical occur? What is this maximum?

f. Describe the significance of the horizontal asymptote in this context.

20. Use the vertical asymptotes, x-intercepts, and their multiplicities to construct an equation that corresponds to the given graph. Be sure the y-intercept on the graph matches the value given by your equation. Assume these features are integer-valued. Check your work on a graphing calculator.

CALCULATOR EXPLORATION AND DISCOVERY

Complex Zeroes, Repeated Zeroes, and Inequalities

This *Calculator Exploration and Discovery* will explore the relationship between the solution of a polynomial (or rational) inequality and the complex zeroes and repeated zeroes of the related function. After all, if complex zeroes can never create an x-intercept, how do they affect the function? And if a zero of even multiplicity never crosses the x-axis (always bounces), can it still affect a nonstrict (*less than or equal to* or *greater than or equal to*) inequality? These are interesting and important questions, with numerous avenues of exploration. To begin, consider the function

$Y_1 = (x + 3)^2(x^3 - 1)$. In completely factored form $Y_1 = (x + 3)^2(x - 1)(x^2 + x + 1)$. This is a polynomial function of degree 5 with two real zeroes (one repeated), two complex zeroes (the quadratic factor is irreducible), and after viewing the graph on Figure 4.99, four turning points. From the graph (or by analysis), we have $Y_1 \le 0$ for $x \le 1$. Now let's consider $Y_2 = (x + 3)^2(x - 1)$, the same function as Y_1, less the quadratic factor. Since complex zeroes never "cross the x-axis" anyway, the removal of this factor *cannot affect the solution set of the inequality!* But how does it affect the function? Y_2 is now a function of degree three, with three real zeroes (one repeated) and only two turning points (Figure 4.100). But even so, the solution to $Y_2 \le 0$ is the same as for $Y_1 \le 0$: $x \le 1$. Finally, let's look at $Y_3 = x - 1$, the same function as Y_2 but with the repeated zero removed. The key here is to notice that since $(x - 3)^2$ will be nonnegative for any value of x, it too does not change the solution set of the "less than or equal to inequality," only the shape of the graph. Y_3 is a function of degree 1, with one real zero and no turning points, *but the solution interval for $Y_3 \le 0$ is the same solution interval as Y_2 and Y_1*: $x \le 1$ (see Figure 4.101).

Figure 4.99

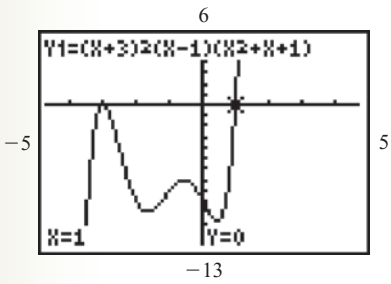


Figure 4.100

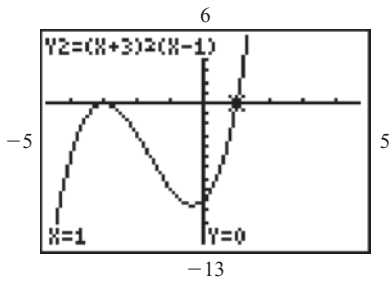

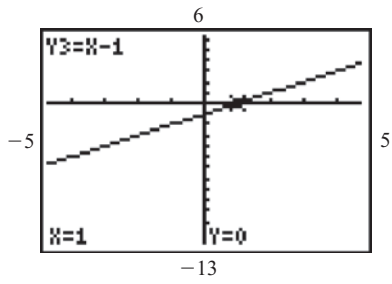

Figure 4.101

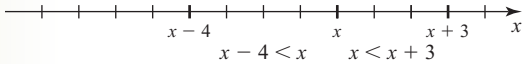
Explore these relationships further using the exercises in (A) and (B) given, using a "greater than or equal to" inequality. Begin by writing Y_1 in completely factored form.

(A) $Y_1 = (x^3 - 6x^2 + 32)(x^2 + 1)$
$Y_2 = x^3 - 6x^2 + 32$
$Y_3 = x + 2$

(B) $Y_1 = (x + 3)^2(x^3 - 2x^2 + x - 2)$
$Y_2 = (x + 3)^2(x - 2)$
$Y_3 = x - 2$

Exercise 1: Based on what you've noticed, comment on how the irreducible quadratic factors of a polynomial affect its graph. What role do they play in the solution of inequalities?



Exercise 2: How do zeroes of even multiplicity affect the solution set of nonstrict inequalities (less/greater than or equal to)?

STRENGTHENING CORE SKILLS

Solving Inequalities Using the Push Principle

The most common method for solving polynomial inequalities involves finding the zeroes of the function and checking the sign of the function in the intervals between these zeroes. In Section 4.6, we relied on the end-behavior of the graph, the sign of the function at the y-intercept, and the multiplicity of the zeroes to determine the solution. There is a third method that is more conceptual in nature, but in many cases highly efficient. It is based on two very simple ideas, the first involving only order relations and the number line:

A. Given any number x and constant $k > 0$: $x > x - k$ and $x < x + k$.

This statement simply reinforces the idea that if a is left of b on the number line, then $a < b$. As shown in the diagram, $x - 4 < x$ and $x < x + 3$, from which $x - 4 < x + 3$ for any x.

B. The second idea reiterates well-known ideas regarding the multiplication of signed numbers. For any number of factors:
if there is an even number of negative factors, the result is positive;
if there is an odd number of negative factors, the result is negative.

These two ideas work together to solve inequalities using what we'll call the *push principle*. Consider the inequality $x^2 - x - 12 > 0$. The factored form is $(x - 4)(x + 3) > 0$ and we want the product of these two factors to be positive. From (A), both factors will be positive if $(x - 4)$ is positive, since it's the smaller of the two; and both factors will be negative if $x + 3 < 0$, since it's the larger. The solution set is found by solving these two simple inequalities: $x - 4 > 0$ gives $x > 4$ and $x + 3 < 0$ gives $x < -3$. If the inequality were $(x - 4)(x + 3) < 0$ instead, we require one negative factor and one positive factor. Due to order relations and the number line, the larger factor must be the positive one: $x + 3 > 0$ so $x > -3$. The smaller factor must be the negative one: $x - 4 < 0$ and $x < 4$. This gives the solution $-3 < x < 4$ as can be verified using any alternative method. Solutions to all other polynomial and rational inequalities are an extension of these two cases.

Illustration 1 ▶ Solve $x^3 - 7x + 6 < 0$ using the push principle.

Solution ▶ The polynomial can be factored using the tests for 1 and -1 and synthetic division. The factors are $(x - 2)(x - 1)(x + 3) < 0$, which we've conveniently written in increasing order. For the product of three factors to be negative we require: (1) three negative factors or (2) one negative and two positive factors. The first condition is met by simply making the largest factor negative, as it will ensure the smaller factors are also negative: $x + 3 < 0$ so $x < -3$. The second condition is met by making the smaller factor negative and the "middle" factor positive: $x - 2 < 0$ *and* $x - 1 > 0$. The second solution interval is $x < 2$ and $x > 1$, or $1 < x < 2$.

Note the push principle does not require the testing of intervals between the zeroes, nor the "cross/bounce" analysis at the zeroes and vertical asymptotes (of rational functions). In addition, irreducible quadratic factors can still be ignored as they contribute nothing to the solution of real inequalities, and factors of even multiplicity can be overlooked precisely because there is no sign change at these roots.

Illustration 2 ▶ Solve $(x^2 + 1)(x - 2)^2(x + 3) \geq 0$ using the push principle.

Solution ▶ Since the factor $(x^2 + 1)$ does not affect the solution set, this inequality will have the same solution as $(x - 2)^2(x + 3) \geq 0$. Further, since $(x - 2)^2$ will be nonnegative for all x, the original inequality *has the same solution set as* $(x + 3) \geq 0$! The solution is $x \geq -3$.

With some practice, the push principle can be a very effective tool. Use it to solve the following exercises. Check all solutions by graphing the function on a graphing calculator.

Exercise 1: $x^3 - 3x - 18 \leq 0$

Exercise 2: $\dfrac{x + 1}{x^2 - 4} > 0$

Exercise 3: $x^3 - 13x + 12 < 0$

Exercise 4: $x^3 - 3x + 2 \geq 0$

Exercise 5: $x^4 - x^2 - 12 > 0$

Exercise 6: $(x^2 + 5)(x^2 - 9)(x + 2)^2(x - 1) \geq 0$

CUMULATIVE REVIEW CHAPTERS 1–4

1. Solve for R: $\dfrac{1}{R} = \dfrac{1}{R_1} + \dfrac{1}{R_2}$

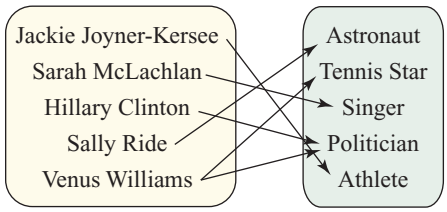
2. Solve for x: $\dfrac{2}{x + 1} + 1 = \dfrac{5}{x^2 - 1}$

3. Factor each expression completely:

a. $x^3 - 1$ **b.** $x^3 - 3x^2 - 4x + 12$

4. Solve using the quadratic formula. Write answers in both exact and approximate form: $2x^2 + 4x + 1 = 0$.

5. Solve the following inequality: $x + 3 < 5$ *or* $5 - x < 4$.



6. Name the eight toolbox functions, give their equations, then draw a sketch of each.

7. Use substitution to verify that $x = 2 - 3i$ is a solution to $x^2 - 4x + 13 = 0$.

8. Solve the rational inequality: $\dfrac{x + 4}{x - 2} < 3$.

9. As part of a study on traffic conditions, the mayor of a small city tracks her driving time to work each day for six months and finds a linear and increasing relationship. On day 1, her drive time was 17 min. By day 61 the drive time had increased to 28 min. Find a linear function that models the drive time and use it to estimate the drive time on day 121, if the trend continues. Explain what the slope of the line means in this context.

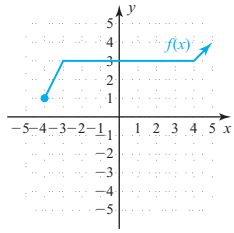
10. Does the relation shown represent a function? If not, discuss/explain why not.

11. The data given shows the profit of a new company for the first 6 months of business, and is closely modeled by the function $p(m) = 1.18x^2 - 10.99x + 4.6$; where $p(m)$ is the profit earned in month m. Assuming this trend continues, use this function to find the first month a profit will be earned ($p > 0$).

Exercise 11

Month	Profit (1000s)
1	−5
2	−13
3	−18
4	−20
5	−21
6	−19

12. Graph the function $g(x) = \dfrac{-1}{(x+2)^2} + 3$ using transformations of a basic function.



13. Find $f^{-1}(x)$, given $f(x) = \sqrt[3]{2x-3}$, then use composition to verify your inverse is correct.

14. Graph $f(x) = x^2 - 4x + 7$ by completing the square, then state intervals where:

a. $f(x) \geq 0$ **b.** $f(x)\uparrow$

15. Given the graph of a general function $f(x)$, graph $F(x) = -f(x+1) + 2$.

Exercise 15

16. Graph the piecewise-defined function given:

$$f(x) = \begin{cases} -3 & x < -1 \\ x & -1 \leq x \leq 1 \\ 3x & x > 1 \end{cases}$$

17. Y varies directly with X and inversely with the square of Z. If $Y = 10$ when $X = 32$ and $Z = 4$, find X when $Z = 15$ and $Y = 1.4$.

18. Use the rational zeroes theorem and synthetic division to find all zeroes (real and complex) of $f(x) = x^4 - 2x^2 + 16x - 15$.

19. Sketch the graph of $f(x) = x^3 - 3x^2 - 6x + 8$.

20. Sketch the graph of $h(x) = \dfrac{x-1}{x^2-4}$ and use the zeroes and vertical asymptotes to solve $h(x) \geq 0$.

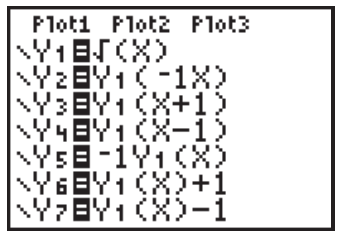
Exercises 21 through 25 require the use of a graphing calculator.

21. Given $Y_1 = 1.47x^3 - 0.51x^2 + 1.99$, use your calculator to evaluate $Y_1(4)$, $Y_1(-3.71)$, and $Y_1(0.09)$. Round your answers to two decimal places if necessary.

22. Use a graphing calculator to locate the point(s) of intersection of the graph of $r(x) = \dfrac{1.12 - 3x^2}{1.5x^2 + 2.2x}$ with its horizontal asymptote. Round your answer(s) to two decimal places if necessary.

23. Use a calculator in complex mode to express the following complex numbers in $a + bi$ form. Round to the nearest hundredth if necessary.

a. $(2.4 - 1.2i)^6$



b. $\dfrac{7 - 6i}{4 + 5i}$

c. $(0.3 + 8.2i)(1.9 - 3.3i)$

d. i^{15}

24. Identify intervals containing the zeroes of $f(x) = x^4 + 3x^3 - x^2 - 7x - 3$ by using the intermediate value theorem and the table feature of your graphing calculator. Use TblStart $= -5$ and ΔTbl $= 0.1$, so none of the intervals are greater than 0.1 units wide. Assume all real zeroes are between -5 and 5.

25. Using the calculator screen shown, identify which function (Y_2 through Y_7) performs the indicated transformation of Y_1. Verify your answers with your calculator.

a. Y_1 shifted up 1 unit

b. Y_1 shifted down 1 unit

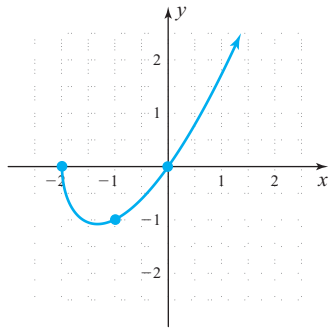
c. Y_1 shifted right 1 unit

d. Y_1 shifted left 1 unit

e. Y_1 reflected across x-axis

f. Y_1 reflected across y-axis

CONNECTIONS TO CALCULUS



In a calculus course, many of the graphing techniques demonstrated in Chapters 2, 3, and 4 are applied to a wider variety of functions, but with little change in the basic approach. The graph of a function will always depend on its domain, end-behavior, y-intercept, x-intercept(s), midinterval points, maximum and minimum values, intervals where the function is positive or negative, and so on. In addition, these elements remain in play even when the function is not polynomial or rational, as demonstrated in Example 1. Further, locating the maximum and minimum values of a function is a vital component of calculus, as in its application we often seek the maximum illumination, lowest cost, greatest efficiency, and the like. These ideas behind locating extreme values are addressed in Examples 2 and 3.

Graphing Techniques

EXAMPLE 1 ▶ **Graphing a Radical Function**

Graph the function $f(x) = x\sqrt{2 + x}$.

Solution ▶ From the radical factor we note the domain is $x \in [-2, \infty)$. The y-intercept is (0, 0), with x-intercepts at (0, 0) and (−2, 0). From the given expression, we see that as $x \to \infty$, $y \to \infty$, and the end-behavior will be "up on the right." Evaluating at the "midinterval point" $x = -1$ gives $f(-1) = -1$, showing $f(x) < 0$ in the interval $(-2, 0)$, and $f(x) > 0$ for $x > 0$. Using this information and connecting the given points with a smooth curve produces the graph shown.

Now try Exercises 1 through 6 ▶

From the graph of $f(x) = x\sqrt{2 + x}$ in Example 1, the point $(-1, -1)$ appears to be near the minimum value of the function. However, as we noted in Chapter 4, maximum and minimum values of a function rarely occur at these "midinterval points," and finding them often requires the tools of calculus and good algebra skills.

EXAMPLE 2 ▶ **Locating Maximum or Minimum Values**

Using calculus, it can be shown that the minimum value of $f(x) = x\sqrt{2 + x}$ actually occurs at the zero of $f'(x) = x\left(\dfrac{1}{2\sqrt{2 + x}}\right) + \sqrt{2 + x}$. Find the zero and locate this minimum value.

Solution ▶ Substituting 0 for $f'(x)$ produces the following sequence:

$$0 = \frac{x}{2\sqrt{2 + x}} + \sqrt{2 + x}$$

$$-\sqrt{2 + x} = \frac{x}{2\sqrt{2 + x}} \qquad \text{subtract } \sqrt{2 + x}$$

$$2 + x = \frac{x^2}{4(2 + x)} \qquad \text{square both sides}$$

$$4(2 + x)^2 = x^2 \qquad \text{multiply by } 4(2+x)$$

WORTHY OF NOTE

The rotation $f'(x)$ is read "f prime of x," and is commonly used to denote the slope of the line drawn tangent to the curve at x.

$$16 + 16x + 4x^2 = x^2 \qquad \text{expand binomial square and distribute 4}$$
$$3x^2 + 16x + 16 = 0 \qquad \text{set equal to zero}$$
$$(3x + 4)(x + 4) = 0 \qquad \text{factor}$$
$$x = -\frac{4}{3} \quad x = -4 \qquad \text{result}$$

Since -4 is outside the domain of f, the minimum value must occur at $x = -\frac{4}{3}$. Note the zero(s) of f' will tell us *where* the minimum value occurs, but to find this minimum we must use this zero *in the original function*. A minimum value of $f\left(-\frac{4}{3}\right) \approx -1.1$ will occur at $\left(-\frac{4}{3}, f\left(-\frac{4}{3}\right)\right) \approx \left(-\frac{4}{3}, -1.1\right)$.

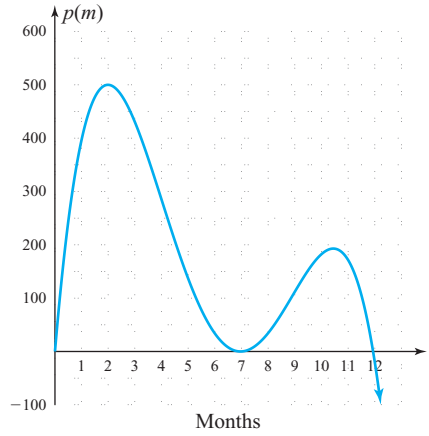
Now try Exercises 7 through 10 ▶

In Exercise 86 of Section 4.3, the function model for a population of insects was given as $p(m) = -m^4 + 26m^3 - 217m^2 + 588m$, where $p(m)$ represents the insect population (in hundreds of thousands) for month m. As mentioned in the chapter opener, health officials may be very interested in the month(s) that this population reaches a peak, as they prepare vaccines or attempt to raise public awareness. A graph of the function provides a visual representation of population growth, and helps to identify what months need to be targeted.

EXAMPLE 3 ▶ **Locating Maximum and Minimum Values**

The graph of

$$p(m) = -m^4 + 26m^3 - 217m^2 + 588m$$



(modeling the population of insects) is shown. Using the tools of calculus, it can be shown that the zeroes of

$$p'(m) = -4m^3 + 78m^2 - 434m + 588$$

give the *location* of the maximum and minimum values of p:

a. Find these zeroes.

b. Then substitute these zeroes into $p(m)$ to find the actual maximum and minimum values.

Solution ▶

a. To begin, we set the equation equal to zero and factor out -2:

$$0 = -2(2m^3 - 39m^2 + 217m - 294)$$

The tests for 1 and -1 show neither is a zero. Using $x = 2$ and the remainder theorem to help factor p' gives

2	2	−39	217	−294
		4	−70	294
	2	−35	147	0

This shows $m = 2$ is a zero and $m - 2$ is a factor, resulting in the equation $0 = -2(m - 2)(2m^2 - 35m + 147)$. Using the quadratic formula (or trial-and-error factoring) shows the remaining zeroes of p' are $m = 7$ and $m = \frac{21}{2}$.

b. By inspecting the graph of p it indeed appears the maximum/minimum values (peaks and valleys) occur at $m = 2$, 7, and 10.5, and it only remains to find the actual values by substituting these into $p(m)$.

$$\begin{aligned} p(2) &= -(2)^4 + 26(2)^3 - 217(2)^2 + 588(2) \\ &= -16 + 208 - 868 + 1176 \\ &= 500 \\ p(7) &= -(7)^4 + 26(7)^3 - 217(7)^2 + 588(7) \\ &= -2401 + 8918 - 10{,}633 + 4116 \\ &= 0 \\ p(10.5) &= -(10.5)^4 + 26(10.5)^3 - 217(10.5)^2 + 588(10.5) \\ &= 192.9375 \end{aligned}$$

The maximum infestation of 50,000,000 insects occurs at $m = 2$ (February), and a minimum population of 0 insects occurs at $m = 7$ (July). The population of insects then peaks at a lower level of about 19,300,000 insects at $m = 10.5$ (mid-October).

Now try Exercises 11 and 12 ▶

In Examples 2 and 3 it's important to note that a maximum or minimum value is an *output value* (from the range), and not an ordered pair. Considering the "cause and effect" nature of a function, the cause of a higher or lower insect population is the time of year, the effect is the population of insects at that time.

Connections to Calculus Exercises

State the domain, end-behavior, and *y*-intercept of each function. Then find the *x*-intercepts and use any midinterval points or other graphing "tools" needed to complete the graph.

1. $f(x) = x\sqrt{3 - x}$

2. $g(x) = 2x^2\sqrt{x} - 6x\sqrt{x}$

3. $h(x) = x\sqrt{9 - x^2}$

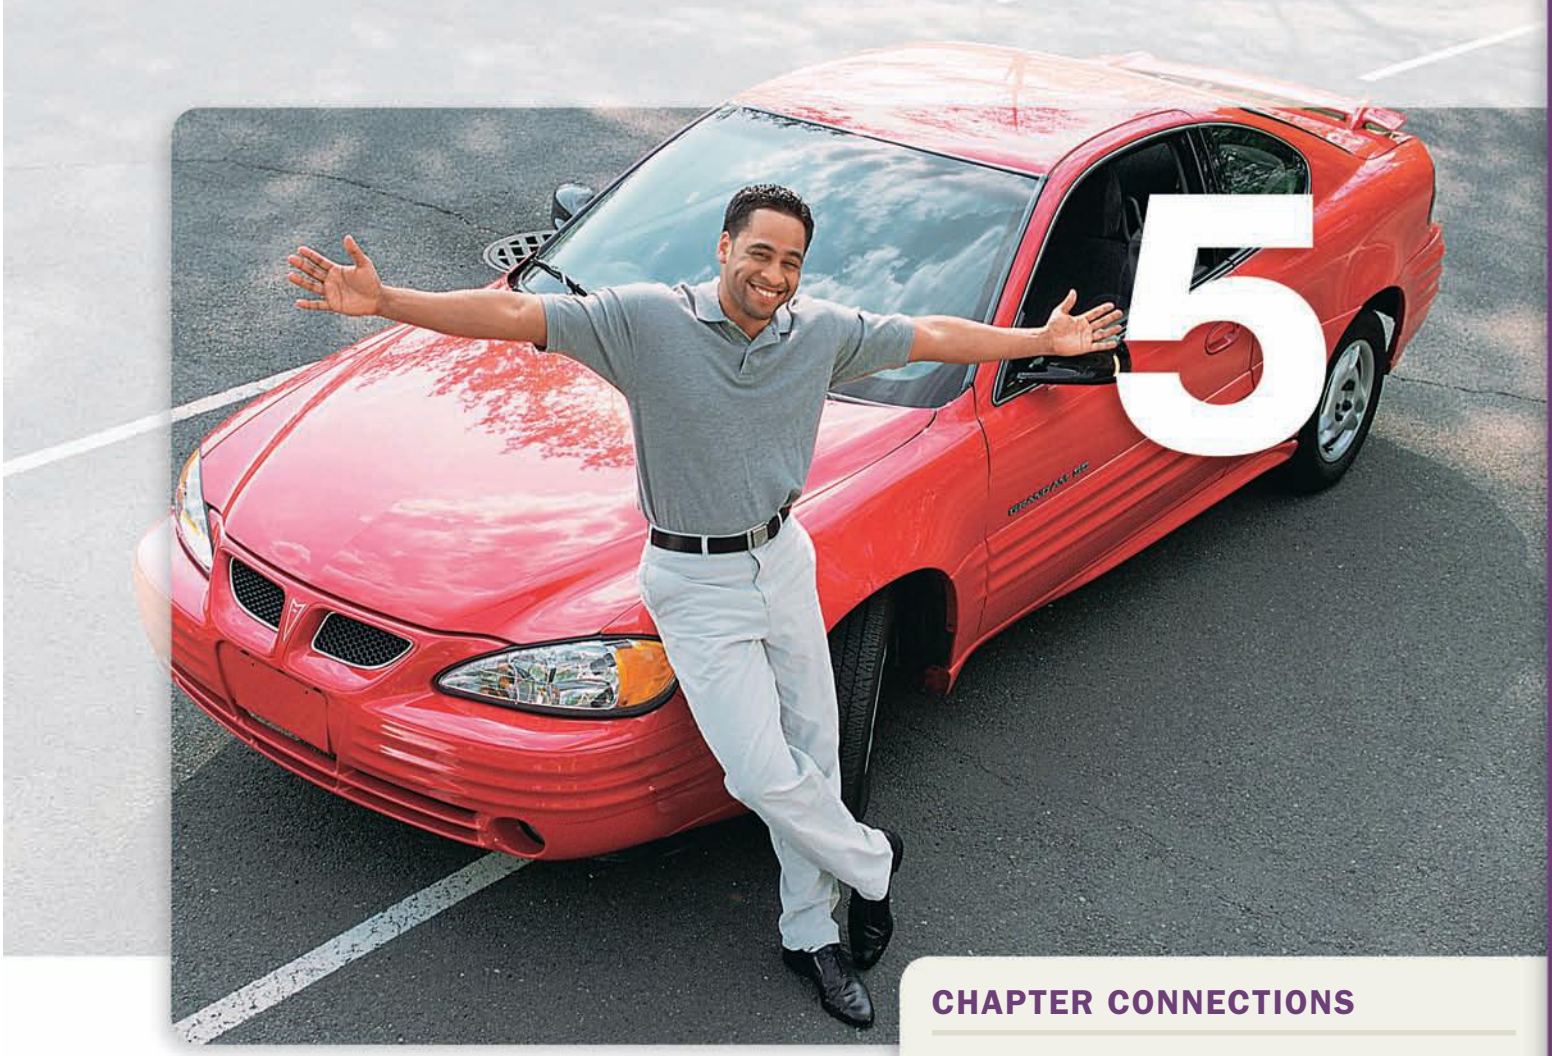
4. $v(x) = \sqrt[3]{2x}\sqrt{x + 5}$

5. The anxiety level of an Olympic skater is modeled by the function $p(x) = x^3 + 2x^2 - 5x - 6$, where $p(x)$ is his anxiety level at time x in minutes, and $x = 0$ is the start time of his skating routine ($p < 0 \rightarrow$ calm and relaxed, $p > 0 \rightarrow$ anxious, $p = 0 \rightarrow$ normal). State the domain, end-behavior, and y-intercept of p, then find the x-intercepts and use any midinterval points or other graphing "tools" needed to complete the graph.

6. From a height of 1200 ft, an ASARI plane (advanced sonar and radar imaging) flies over a canyon to ascertain the depth of a channel cut by a river through the canyon. The main point of interest is the location where a tall hill remains in the middle of the channel. Using the data gathered, the operators determine the terrain can be modeled by the function $h(x) = x^4 - 10x^2 + 9$, where $h(x)$ represents the height (in hundreds of feet) at a distance of x hundred feet from the top of the hill. State the domain, end-behavior, and y-intercept of h, then find the x-intercepts and use any midinterval points or other graphing "tools" needed to complete the graph.

Using calculus, it can be shown that the maximum or minimum value of the functions from 1 through 6 (designated by lower case letters), actually occur at the zeroes of the corresponding functions in 7 through 12. Find and clearly state the maximum or minimum value(s) for each function, and where they will occur. Round to two decimal places as needed.

7. $f'(x) = \sqrt{3 - x} - \dfrac{x}{2\sqrt{3 - x}}$



8. $g'(x) = 5x^{\frac{3}{2}} - 9x^{\frac{1}{2}}$

9. $h'(x) = \dfrac{-x^2}{\sqrt{9 - x^2}} + \sqrt{9 - x^2}$

10. $v'(x) = \dfrac{(2x)^{\frac{1}{3}}}{2(x + 5)^{\frac{1}{2}}} + \dfrac{2(x + 5)^{\frac{1}{2}}}{3(2x)^{\frac{2}{3}}}$

11. Using the tools of calculus, it can be shown that the maximum and minimum values of p (Exercise 5) occur at the zeroes of $p'(x) = 3x^2 + 4x - 5$. Determine the maximum level of anxiety felt by the skater and when it occurs. What is the minimum level of anxiety? When does it occur? (Note: In realistic terms we might consider the domain of p to be $-3 \leq x \leq 3$.)

12. Using the tools of calculus, it can be shown that the maximum and minimum values of h (Exercise 6) occur at the zeroes of $h'(x) = 4x^3 - 20x$. Determine the maximum height, and where this maximum occurs, then find the depth of the first channel the plane flies over. How far from the top of the hill does this occur? What do you notice about the depth of the second channel? (Note: In realistic terms we might consider the domain of h to be about $-3.1 \leq x \leq 3.1$.)

CHAPTER CONNECTIONS

The largest purchase that most individuals will make in their lifetime is that of a car or home. The monthly payment $\mathcal{P}$ required to amortize (pay off) the loan can be calculated using the formula

$$\mathcal{P} = \frac{AR}{1 - (1 - R)^{-12t}}$$

where A is the amount financed; t is the time in years; and $R = \frac{r}{12}$, where r is the annual rate of interest. This study of exponential and logarithmic functions will help you become a more knowledgeable consumer.

▶ This application appears as Exercise 53 in Section 5.6.

Connections to Calculus

While exponential and logarithmic functions play a vital role in modeling real-world phenomena, they are also invaluable tools in a study of calculus. The properties of logarithms help simplify some otherwise difficult computations, while many new and important functions are defined in terms of base-e exponential functions. The *Connections to Calculus* feature for Chapter 5 offers additional work with exponential and logarithmic properties in preparation for their use in a calculus course.

5.1 One-to-One and Inverse Functions

LEARNING OBJECTIVES

In Section 5.1 you will see how we can:

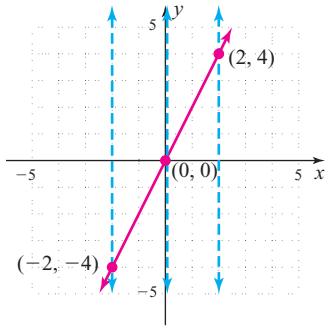
- ❑ **A.** Identify one-to-one functions
- ❑ **B.** Explore inverse functions using ordered pairs
- ❑ **C.** Find inverse functions using an algebraic method
- ❑ **D.** Graph a function and its inverse
- ❑ **E.** Solve applications of inverse functions

Consider the function $f(x) = 2x - 3$. If $f(x) = 7$, the equation becomes $2x - 3 = 7$, and the corresponding value of x can be found using *inverse operations*. In this section, we introduce the concept of an *inverse function,* which can be viewed as a formula for finding x-values that correspond to *any* given value of $f(x)$.

A. Identifying One-to-One Functions

The graphs of $y = 2x$ and $y = x^2$ are shown in Figures 5.1 and 5.2. The dashed, vertical lines clearly indicate both are functions, with each x-value corresponding to only one y. But the points on $y = 2x$ have one characteristic those from $y = x^2$ do not—*each y-value also corresponds to only one x* (for $y = x^2$, 4 corresponds to both -2 and 2). If each element from the range of a function corresponds to only one element of the domain, the function is said to be **one-to-one.**

Figure 5.1



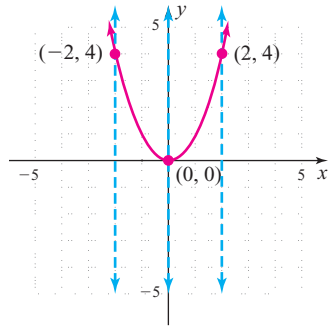


Figure 5.2

One-to-One Functions

A function f is one-to-one if every element in the range, corresponds to only one element of the domain.

In symbols, if $f(x_1) = f(x_2)$ then $x_1 = x_2$, or
if $x_1 \neq x_2$, then $f(x_1) \neq f(x_2)$.

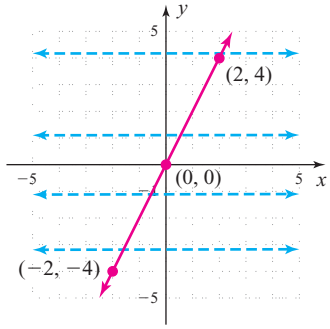
From this definition, we note the graph of a one-to-one function must not only pass a vertical line test (to show each x corresponds to only one y), but also pass a **horizontal line test** (to show each y corresponds to only one x).

Horizontal Line Test

If every horizontal line intersects the graph of a function in at most one point, the function is one-to-one.

Notice the graph of $y = 2x$ (Figure 5.3) passes the horizontal line test, while the graph of $y = x^2$ (Figure 5.4) does not.

Figure 5.3



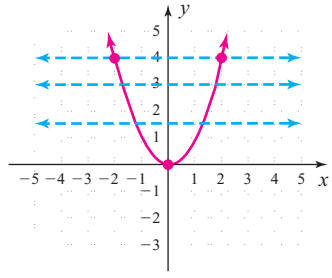


Figure 5.4

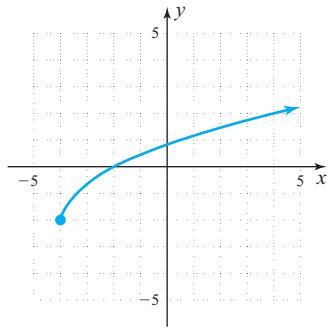
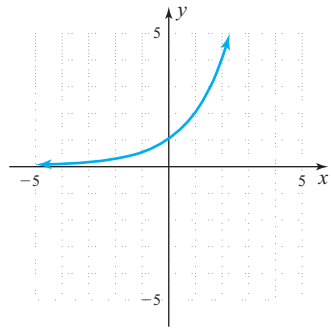
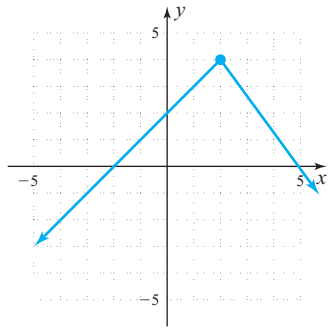


If the function is pointwise-defined or given in ordered pair form, we simply check to see that no given second coordinate is paired with more than one first coordinate.

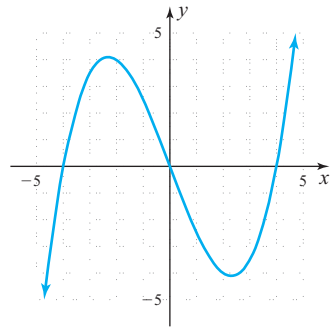


EXAMPLE 1 ▶ **Identifying One-to-One Functions**

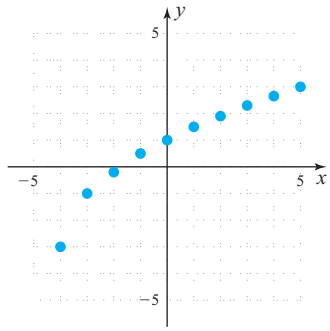
Determine whether each graph or relation shown depicts a function. If so, determine whether the function is one-to-one.



a.



b.



c.

d.

e.

f. $\{(-4, 1), (-3, 5), (-1, 1), (-2, 3), (-3, -2), (4, 4)\}$

Solution ▶ A careful inspection shows all five graphs depict functions, since each passes the vertical line test [the relation in (f) is not a function since the input -3 corresponds to two outputs]. Only (a), (b), and (e) pass the horizontal line test and are *one-to-one* functions.

A. You've just seen how we can identify one-to-one functions

Now try Exercises 7 through 26 ▶

B. Inverse Functions and Ordered Pairs

Consider the function $f(x) = 2x - 3$ and the solutions shown in Table 5.1. Figure 5.5 shows this function in diagram form (in blue), and illustrates that for each element of the domain, we *multiply by 2, then subtract 3*. An **inverse function** for f is one that takes the result of these operations (elements of the range), and returns the original

Table 5.1

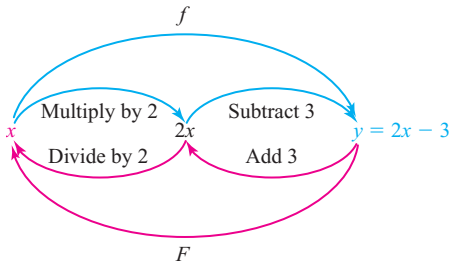
x	$f(x)$
−3	−9
0	−3
2	1
5	7
8	13

Table 5.2

x	$F(x)$
−9	−3
−3	0
1	2
7	5
13	8

domain element. Figures 5.5 and 5.6 show that function F achieves this by "undoing" the operations in reverse order: *add 3, then divide by 2* (in red). A table of values for $F(x)$ is shown (Table 5.2).

Figure 5.5



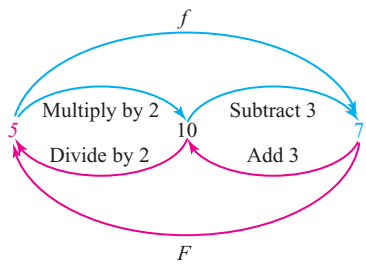


Figure 5.6

From this illustration we make the following observations regarding an inverse function, which we actually denote as $f^{-1}(x)$.

Inverse Functions

If f is a one-to-one function with ordered pairs (a, b),

1. $f^{-1}(x)$ is a one-to-one function with ordered pairs (b, a).
2. The range of f will be the domain of $f^{-1}(x)$.
3. The domain of f will be the range of $f^{-1}(x)$.

CAUTION ▶ The notation $f^{-1}(x)$ is simply a way of denoting an inverse function and has nothing to do with exponential properties. In particular, $f^{-1}(x)$ does *not* mean $\frac{1}{f(x)}$.

EXAMPLE 2 ▶ **Finding the Inverse of a Function**

Find the inverse of each one-to-one function given:

a. $f(x) = \{(-4, 13), (-1, 7), (0, 5), (2, 1), (5, -5), (8, -11)\}$

b. $p(x) = -3x + 2$

Solution ▶

a. When a function is defined as a set of ordered pairs, the inverse function is found by simply interchanging the x- and y-coordinates: $f^{-1}(x) = \{(13, -4), (7, -1), (5, 0), (1, 2), (-5, 5), (-11, 8)\}$.

b. Using diagrams similar to Figures 5.5 and 5.6, we reason that $p^{-1}(x)$ will subtract 2, then divide the result by -3: $p^{-1}(x) = \frac{x - 2}{-3}$. As a test, we find that $(-2, 8)$, $(0, 2)$, and $(3, -7)$ are solutions to $p(x)$, and note that $(8, -2)$, $(2, 0)$, and $(-7, 3)$ are indeed solutions to $p^{-1}(x)$.

B. You've just seen how we can explore inverse functions using ordered pairs

Now try Exercises 27 through 38 ▶

C. Finding Inverse Functions Using an Algebraic Method

The fact that interchanging x- and y-values helps determine an inverse function can be generalized to develop an **algebraic method** for finding inverses. Instead of interchanging *specific* x- and y-values, we actually interchange the x- and y-*variables,* then solve the equation for y. The process is summarized here.

WORTHY OF NOTE

If a function is *not* one-to-one, no inverse function exists since interchanging the x- and y-coordinates will result in a nonfunction. For instance, interchanging the coordinates of $(-2, 4)$ and $(2, 4)$ from $y = x^2$ results in $(4, -2)$ and $(4, 2)$, and we have one x-value being mapped to two y-values, in violation of the function definition.

Finding an Inverse Function

1. Use y instead of $f(x)$.
2. Interchange x and y.
3. Solve the new equation for y.
4. The result gives the inverse function: substitute $f^{-1}(x)$ for y.

In this process, it might seem like we're using the *same* y to represent two different functions. To see why there is actually no contradiction, **see Exercise 97.**

EXAMPLE 3 ▶ **Finding Inverse Functions Algebraically**

State the domain and range of the function given, then use the algebraic method to find the inverse function, and state *its* domain and range.

a. $f(x) = \sqrt[3]{x + 5}$ **b.** $g(x) = \dfrac{2x}{x + 1}$

Solution ▶

a. $f(x) = \sqrt[3]{x + 5}, x \in \mathbb{R}, y \in \mathbb{R}$

$y = \sqrt[3]{x + 5}$ use y instead of $f(x)$

$x = \sqrt[3]{y + 5}$ interchange x and y

$x^3 = y + 5$ cube both sides

$x^3 - 5 = y$ solve for y

$x^3 - 5 = f^{-1}(x)$ the result is $f^{-1}(x)$

$f^{-1}(x) = x^3 - 5, x \in \mathbb{R}, y \in \mathbb{R}$

b. $g(x) = \dfrac{2x}{x + 1}, x \neq -1, y \neq 2$

$y = \dfrac{2x}{x + 1}$ use y instead of $f(x)$

$x = \dfrac{2y}{y + 1}$ interchange x and y

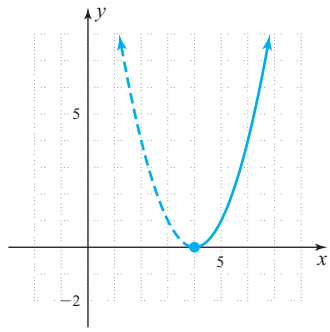
$xy + x = 2y$ multiply by $y + 1$ and distribute

$x = 2y - xy$ gather terms with y

$x = y(2 - x)$ factor

$\dfrac{x}{2 - x} = y$ solve for y

$g^{-1}(x) = \dfrac{x}{2 - x}, x \neq 2, y \neq -1$



Now try Exercises 39 through 46 ▶

In cases where a given function is *not* one-to-one, we can sometimes restrict the domain to create a function that *is,* and then determine an inverse. The restriction we use is arbitrary, and only requires that the result produce all possible range values. Most often, we simply choose a limited domain that seems convenient or reasonable.

EXAMPLE 4 ▶ **Restricting the Domain to Create a One-to-One Function**

Given $f(x) = (x - 4)^2$, restrict the domain to create a one-to-one function, then find $f^{-1}(x)$. State the domain and range of both resulting functions.

Solution ▶ The graph of f is a parabola, opening upward with the vertex at (4, 0). Restricting the domain to $x \geq 4$ (see figure) leaves only the "right branch" of the parabola, creating a one-to-one function without affecting the range, $y \in [0, \infty)$. For $f(x) = (x - 4)^2$ with restricted domain $x \geq 4$, we have

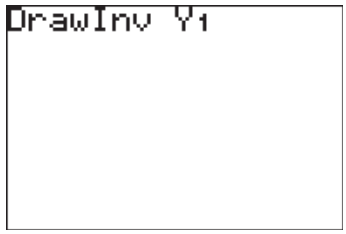
$f(x) = (x - 4)^2$	given function
$y = (x - 4)^2$	use y instead of $f(x)$
$x = (y - 4)^2$	interchange x and y
$\pm\sqrt{x} = y - 4$	take square roots
$\sqrt{x} + 4 = y$	solve for y, use $\sqrt{x}$ since $x \geq 4$

The result shows $f^{-1}(x) = \sqrt{x} + 4$, with domain $x \in [0, \infty)$ and range $y \in [4, \infty)$ (the domain of f becomes the range of f^{-1}, and the range of f becomes the domain of f^{-1}).

Now try Exercises 47 through 52 ▶

We can further illustrate the ideas from Example 4 using a calculator's ability to draw inverses. On the Y= screen, set $Y_1 = X^2$ and GRAPH this function on a WINDOW size of $[-7.5, 7.5]$ for x and $[-3, 7]$ for y. Then go to the home screen and access the **DrawInv** feature using 2nd PRGM **(DRAW) 8:DrawInv.** This will place the **DrawInv** feature on the home screen, where we specify that we want the inverse of Y_1 (Figure 5.7). Pressing ENTER returns us to the graph, where we discover that since $y = x^2$ is *not one-to-one,* the calculator has graphed the *inverse relation* (Figure 5.8).

Figure 5.7



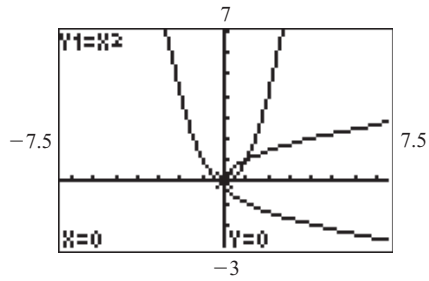


Figure 5.8

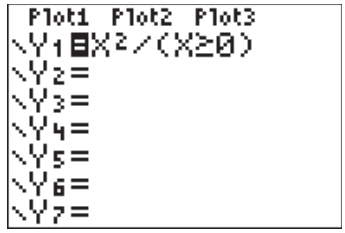
Returning to the Y= screen and restricting the domain of Y_1 to $x \geq 0$ (Figure 5.9), then repeating the sequence above, produces the graphs shown in Figure 5.10. Note the given function is now one-to-one, and its inverse is also now a function (and one-to one).

Figure 5.9



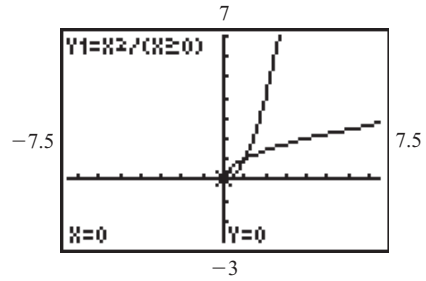


Figure 5.10

While we now have the ability to *find* the inverse of a function, we still lack a definitive method of *verifying* the inverse is correct. Actually, the diagrams in Figures 5.5 and 5.6 suggest just such a method. If we use the function f itself as an input for f^{-1}, or the function f^{-1} as an input for f, the end result should simply be x, as each function "undoes" the operations of the other. From Section 3.6 this is called a composition of functions and using the notation for composition we have,

Verifying Inverse Functions

If f is a one-to-one function, then the function f^{-1} exists, where

$$(f \circ f^{-1})(x) = x \qquad \text{and} \qquad (f^{-1} \circ f)(x) = x$$

EXAMPLE 5 ▶ **Finding and Verifying an Inverse Function**

Use the algebraic method to find the inverse function for $f(x) = \sqrt{x+2}$. Then verify the inverse you found is correct.

Solution ▶ Since the graph of f is the graph of $y = \sqrt{x}$ shifted 2 units left, we know f is one-to-one with domain $x \in [-2, \infty)$ and range $y \in [0, \infty)$. This is important since the *domain and range values will be interchanged for the inverse function*. The domain of f^{-1} will be $x \in [0, \infty)$ and its range $y \in [-2, \infty)$.

$$\begin{aligned}
f(x) &= \sqrt{x+2} && \text{given function; } x \geq -2\\
y &= \sqrt{x+2} && \text{use } y \text{ instead of } f(x)\\
x &= \sqrt{y+2} && \text{interchange } x \text{ and } y\\
x^2 &= y+2 && \text{solve for } y \text{ (square both sides)}\\
x^2 - 2 &= y && \text{subtract 2}\\
f^{-1}(x) &= x^2 - 2 && \text{the result is } f^{-1}(x);\ D{:}\ x \in [0,\infty),\ R{:}\ y \in [-2,\infty)
\end{aligned}$$

Verify ▶

$$\begin{aligned}
(f \circ f^{-1})(x) &= f[f^{-1}(x)] && f^{-1}(x) \text{ is an input for } f\\
&= \sqrt{f^{-1}(x)+2} && f \text{ adds 2 to inputs, then takes the square root}\\
&= \sqrt{(x^2-2)+2} && \text{substitute } x^2-2 \text{ for } f^{-1}(x)\\
&= \sqrt{x^2} && \text{simplify}\\
&= x \checkmark && \text{since the domain of } f^{-1}(x) \text{ is } x \in [0,\infty)
\end{aligned}$$

$$\begin{aligned}
(f^{-1} \circ f)(x) &= f^{-1}[f(x)] && f(x) \text{ is an input for } f^{-1}\\
&= [f(x)]^2 - 2 && f^{-1} \text{ squares inputs, then subtracts 2}\\
&= [\sqrt{x+2}]^2 - 2 && \text{substitute } \sqrt{x+2} \text{ for } f(x)\\
&= x + 2 - 2 && \text{simplify}\\
&= x \checkmark && \text{result}
\end{aligned}$$

Now try Exercises 53 through 78 ▶

C. You've just seen how we can find inverse functions using an algebraic method

D. The Graph of a Function and Its Inverse

Graphing a function and its inverse on the same axes reveals an interesting and useful relationship—the graphs are reflections across the line $y = x$ (the identity function). Consider the function $f(x) = 2x + 3$, and its inverse $f^{-1}(x) = \dfrac{x-3}{2} = \dfrac{1}{2}x - \dfrac{3}{2}$. In Figure 5.11, the points $(1, 5)$, $(0, 3)$, $(-\frac{3}{2}, 0)$, and $(-4, -5)$ from f (see Table 5.3) are graphed in blue, with the points $(5, 1)$, $(3, 0)$, $(0, -\frac{3}{2})$, and $(-5, -4)$ (see Table 5.4) from f^{-1} graphed in red (note the x- and y-values are reversed). Graphing both lines illustrates this symmetry (Figure 5.12).

Table 5.3

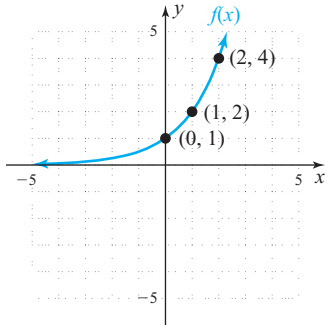
0	$-\frac{3}{2}$
-5	-4

EXAMPLE 6 ▶ **Graphing a Function and Its Inverse**

Given the graph shown in Figure 5.13, draw a graph of the inverse function.

Figure 5.13



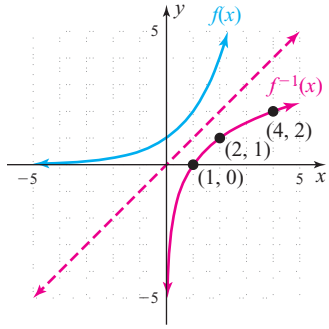


Figure 5.14

Solution ▶ From the graph, the domain of f appears to be $x \in \mathbb{R}$ and the range is $y \in (0, \infty)$. This means the domain of f^{-1} will be $x \in (0, \infty)$ and the range will be $y \in \mathbb{R}$. To sketch f^{-1}, draw the line $y = x$, interchange the x- and y-coordinates of the selected points, then plot these points and draw a smooth curve using the domain and range boundaries as a guide. The result is shown in Figure 5.14.

Now try Exercises 79 through 84 ▶

A summary of important concepts is provided here.

Functions and Inverse Functions

1. If the graph of a function passes the horizontal line test, the function is one-to-one.
2. If a function f is one-to-one, the function f^{-1} exists.
3. The domain of f is the range of f^{-1}, and the range of f is the domain of f^{-1}.
4. For a function f and its inverse f^{-1}, $(f \circ f^{-1})(x) = x$ and $(f^{-1} \circ f)(x) = x$.
5. The graphs of f and f^{-1} are symmetric to the line $y = x$.

These ideas can be illustrated and reaffirmed using a graphing calculator. To begin, enter the functions $Y_1 = 2\sqrt[3]{X - 2}$ and $Y_2 = \frac{X^3}{8} + 2$ (which appear to be inverse functions) on the Y= screen, along with $Y_3 = X$. Press ZOOM **6:ZStandard,** then ZOOM **5:ZSquare** to obtain a screen that is in perspective. The graphs seem to be reflections across the line $y = x$ (Figure 5.15). To verify, we can use the **TABLE**

feature. As shown in Figure 5.16, the points $(1, -2)$, $(2, 0)$ and $(3, 2)$ are on the graph of Y_1, and the points $(-2, 1)$, $(0, 2)$, and $(2, 3)$ are on the graph of Y_2. While this seems convincing (the x- and y-coordinates *are* interchanged), a graphing calculator can actually *compose the functions* to help verify the inverse relationship. After entering $Y_4 = Y_1(Y_2(X))$ and $Y_5 = Y_2(Y_1(X))$ on the Y= screen (deactivating Y_1, Y_2, and Y_3), the **TABLE** in Figure 5.17 now shows that one function indeed "undoes" the other, leaving $Y_4 = Y_5 = x$. **See Exercises 85 through 88.**

Figure 5.15

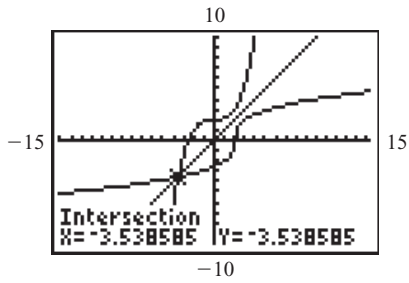

Figure 5.16

X	Y_1	Y_2

☑ **D.** You've just seen how we can graph a function and its inverse

E. Applications of Inverse Functions

Our final example illustrates one of the many ways that inverse functions can be applied.

EXAMPLE 7 ▶ **Using Volume to Understand Inverse Functions**

The volume of an equipoise cylinder (height equal to diameter) is given by $v(x) = 2\pi x^3$ (since $h = d = 2r$), where $v(x)$ represents the volume in units cubed and x represents the radius of the cylinder.

a. Find the volume of such a cylinder if $x = 10$ ft.

b. Find $v^{-1}(x)$, and discuss what the input and output variables represent.

Solution ▶

a.
$$\begin{aligned} v(x) &= 2\pi x^3 && \text{given function} \\ v(10) &= 2\pi(10)^3 && \text{substitute 10 for } x \\ &= 2000\pi && 10^3 = 1000, \text{ exact form} \end{aligned}$$

With a radius of 10 ft, the volume of the cylinder would be 2000π ft^3.

b.
$$\begin{aligned} v(x) &= 2\pi x^3 && \text{given function} \\ y &= 2\pi x^3 && \text{use } y \text{ instead of } v(x) \\ x &= 2\pi y^3 && \text{interchange } x \text{ and } y \\ \frac{x}{2\pi} &= y^3 && \text{solve for } y \\ \sqrt[3]{\frac{x}{2\pi}} &= y && \text{result} \end{aligned}$$

The inverse function is $v^{-1}(x) = \sqrt[3]{\frac{x}{2\pi}}$. In this case, the input x is a given volume, the output $v^{-1}(x)$ is the radius of an equipoise cylinder that will hold this volume.

☑ **E.** You've just seen how we can solve applications of inverse functions

Now try Exercises 91 through 96 ▶

5.1 EXERCISES

▶ CONCEPTS AND VOCABULARY

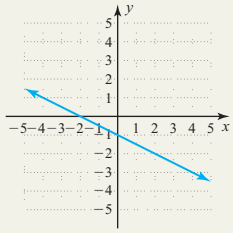
Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. A function is one-to-one if each _____ coordinate corresponds to exactly _____ first coordinate.

2. If every _____ line intersects the graph of a function in at most _____ point, the function is one-to-one.

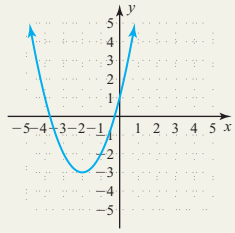
3. A certain function is defined by the ordered pairs $(-2, -11)$, $(0, -5)$, $(2, 1)$, and $(4, 19)$. The inverse function is _____.

4. To find f^{-1} using the algebraic method, we (1) use _____ instead of $f(x)$, (2) _____ x and y, (3) _____ for y and replace y with $f^{-1}(x)$.



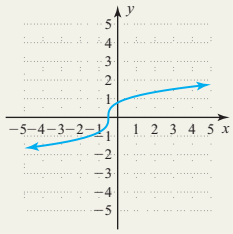
5. State true or false and explain why: *To show that g is the inverse function for f, simply show that* $(f \circ g)(x) = x$. Include an example in your response.

6. Discuss/Explain why no inverse function exists for $f(x) = (x + 3)^2$ and $g(x) = \sqrt{4 - x^2}$. How would the domain of each function have to be restricted to allow for an inverse function?

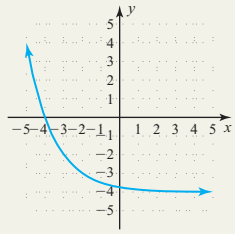


▶ DEVELOPING YOUR SKILLS

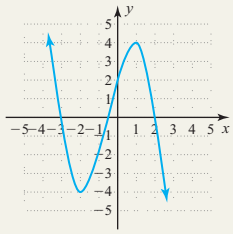
Determine whether each graph given is the graph of a one-to-one function. If not, give examples of how the definition of one-to-oneness is violated.



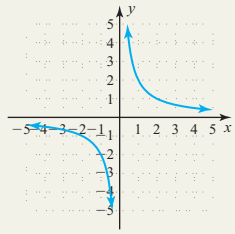
7.



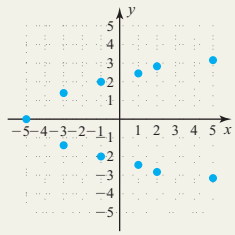
8.



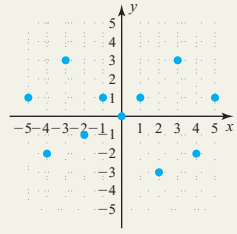
9.



10.



11.



12.

13.

14.

Determine whether the functions given are one-to-one. If not, state why.

15. $\{(-7, 4), (-1, 9), (0, 5), (-2, 1), (5, -5)\}$

16. $\{(9, 1), (-2, 7), (7, 4), (3, 9), (2, 7)\}$

17. $\{(-6, 1), (4, -9), (0, 11), (-2, 7), (-4, 5), (8, 1)\}$

18. $\{(-6, 2), (-3, 7), (8, 0), (12, -1), (2, -3), (1, 3)\}$

Determine if the functions given are one-to-one by noting the function family to which each belongs and mentally picturing the shape of the graph. If a function is not one-to-one, discuss how the definition of one-to-oneness is violated.

19. $f(x) = 3x - 5$

20. $g(x) = (x + 2)^3 - 1$

21. $h(x) = -|x - 4| + 3$

22. $p(t) = 3t^2 + 5$

23. $s(t) = \sqrt{2t - 1} + 5$

24. $r(t) = \sqrt[3]{t + 1} - 2$

25. $y = 3$

26. $y = -2x$

For Exercises 27 to 30, find the inverse function of the one-to-one functions given.

27. $f(x) = \{(-2, 1), (-1, 4), (0, 5), (2, 9), (5, 15)\}$

28. $g(x) = \{(-2, 30), (-1, 11), (0, 4), (1, 3), (2, 2)\}$

29. $v(x)$ is defined by the ordered pairs shown.

X	Y1

12	-1
21	-2
[redacted]	-3

X=32

30. $w(x)$ is defined by the ordered pairs shown.

X	Y1
-6	4
-5	2.5
-2	-2
0	-5
3	-9.5
4	-11
[redacted]	-15.5

X=7

Find the inverse function using diagrams similar to those illustrated in Example 2. Check the result using three test points.

31. $f(x) = x + 5$

32. $g(x) = x - 4$

33. $p(x) = -\frac{4}{5}x$

34. $r(x) = \frac{3x}{4}$

35. $f(x) = 4x + 3$

36. $g(x) = 5x - 2$

37. $t(x) = \sqrt[3]{x - 4}$

38. $s(x) = \sqrt[3]{x + 2}$

State the domain and range of $f(x)$, then use the algebraic method to find the inverse function and state its domain and range. Finally, find any three ordered pairs (a, b) that satisfy f, and verify the ordered pairs (b, a) satisfy the equation for f^{-1}.

39. $f(x) = \sqrt[3]{x - 2}$

40. $f(x) = \sqrt[3]{x + 3}$

41. $f(x) = x^3 + 1$

42. $f(x) = x^3 - 2$

43. $f(x) = \dfrac{8}{x + 2}$

44. $f(x) = \dfrac{12}{x - 1}$

45. $f(x) = \dfrac{x}{x + 1}$

46. $f(x) = \dfrac{x + 2}{1 - x}$

The functions given in Exercises 47 through 52 are not one-to-one. (a) Determine a domain restriction that preserves all range values and creates a one-to-one function, then state the new domain and range. (b) State the domain and range of the inverse function and find its equation.

47. $f(x) = (x + 5)^2$

48. $g(x) = x^2 + 3$

49. $v(x) = \dfrac{8}{(x - 3)^2}$

50. $V(x) = \dfrac{4}{x^2} + 2$

51. $p(x) = (x + 4)^2 - 2$

52. $q(x) = \dfrac{4}{(x - 2)^2} + 1$

For each function $f(x)$ given, prove (using a composition) that $g(x) = f^{-1}(x)$.

53. $f(x) = -2x + 5, g(x) = \dfrac{x - 5}{-2}$

54. $f(x) = 3x - 4, g(x) = \dfrac{x + 4}{3}$

55. $f(x) = \sqrt[3]{x + 5}, g(x) = x^3 - 5$

56. $f(x) = \sqrt[3]{x - 4}, g(x) = x^3 + 4$

57. $f(x) = \frac{2}{3}x - 6, g(x) = \frac{3}{2}x + 9$

58. $f(x) = \frac{4}{5}x + 6, g(x) = \frac{5}{4}x - \frac{15}{2}$

59. $f(x) = x^2 - 3; x \geq 0, g(x) = \sqrt{x + 3}$

60. $f(x) = x^2 + 8; x \geq 0, g(x) = \sqrt{x - 8}$

Find the inverse of each function $f(x)$ given, then prove (by composition) your inverse function is correct. Note the domain and range of f in each case is all real numbers.

61. $f(x) = 3x - 5$

62. $f(x) = 5x + 4$

63. $f(x) = \dfrac{x - 5}{2}$

64. $f(x) = \dfrac{x + 4}{3}$

65. $f(x) = \frac{1}{2}x - 3$

66. $f(x) = \frac{2}{3}x + 1$

67. $f(x) = x^3 + 3$

68. $f(x) = x^3 - 4$

69. $f(x) = \sqrt[3]{2x + 1}$

70. $f(x) = \sqrt[3]{3x - 2}$

71. $f(x) = \dfrac{(x - 1)^3}{8}$

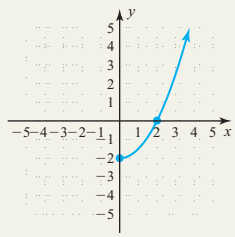
72. $f(x) = \dfrac{(x + 3)^3}{-27}$

The functions given in Exercises 73 through 78 are one-to-one. State the implied domain of each function given, and use these to state the domain and range of the inverse function. Then find the inverse and prove by composition that your inverse is correct.

73. $f(x) = \sqrt{3x + 2}$

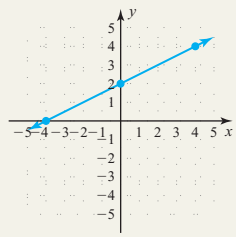
74. $g(x) = \sqrt{2x - 5}$

75. $p(x) = 2\sqrt{x - 3}$



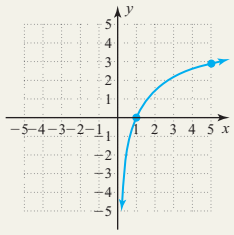
76. $q(x) = 4\sqrt{x + 1}$

77. $v(x) = x^2 + 3; x \geq 0$

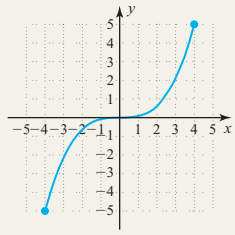


78. $w(x) = x^2 - 1; x \geq 0$

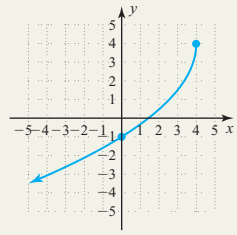
Determine the domain and range for each one-to-one function whose graph is given, and use this information to state the domain and range of the inverse function. Then sketch in the line $y = x$, estimate the location of two or more points on the graph, and use this information to graph $f^{-1}(x)$ on the same grid.



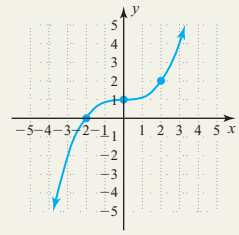
79.



80.



81.



82.

83.

84.

For the functions given, (a) find $f^{-1}(x)$, then use your calculator to verify they are inverses by (b) using ordered pairs, (c) composing the functions, and (d) showing their graphs are symmetric to $y = x$.

85. $f(x) = 2x + 1$

86. $g(x) = x^2 + 1; x \geq 0$

87. $h(x) = \dfrac{x}{x + 1}$

88. $j(x) = 2\sqrt{x + 9} - 6$

▶ WORKING WITH FORMULAS

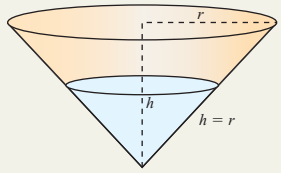
89. The height of a projected image: $f(x) = \frac{1}{2}x - 8.5$

The height of an image projected on a screen is given by the formula shown, where $f(x)$ represents the actual height of the image on the projector (in centimeters) and x is the distance of the projector from the screen (in centimeters). (a) When the projector is 80 cm from the screen, how large is the image? (b) Show that the inverse function is $f^{-1}(x) = 2x + 17$, then input your answer from part (a) and comment on the result. What information does the inverse function give?

90. The radius of a sphere: $r(x) = \sqrt[3]{\dfrac{3x}{4\pi}}$

In generic form, the radius of a sphere is given by the formula shown, where $r(x)$ represents the radius and x represents the volume of the sphere in cubic units. (a) If a weather balloon that is roughly spherical holds 14,130 in^3 of helium, what is the radius of the balloon (use $\pi \approx 3.14$)? (b) Show that the inverse function is $r^{-1}(x) = \frac{4}{3}\pi x^3$, then input your answer from part (a) and comment on the result. What information does the inverse function give?

▶ APPLICATIONS



91. Temperature and altitude: The temperature (in degrees Fahrenheit) at a given altitude can be approximated by the function $f(x) = -\frac{7}{2}x + 59$, where $f(x)$ represents the temperature and x represents the altitude in thousands of feet. (a) What is the approximate temperature at an altitude of 35,000 ft (normal cruising altitude for commercial airliners)? (b) Find $f^{-1}(x)$, and state what the independent and dependent variables represent. (c) If the temperature outside a weather balloon is $-18°$F, what is the approximate altitude of the balloon?

92. Fines for speeding: In some localities, there is a set formula to determine the amount of a fine for exceeding posted speed limits. Suppose the amount of the fine for exceeding a 50 mph speed limit was given by the function $f(x) = 12x - 560$ $(x > 50)$ where $f(x)$ represents the fine in dollars for a speed of x mph. (a) What is the fine for traveling 65 mph through this speed zone? (b) Find $f^{-1}(x)$, and state what the independent and dependent variables represent. (c) If a fine of \$172 were assessed, how fast was the driver going through this speed zone?

93. Effect of gravity: Due to the effect of gravity, the distance an object has fallen after being dropped is given by the function $f(x) = 16x^2; x \geq 0$, where $f(x)$ represents the distance in feet after x sec. (a) How far has the object fallen 3 sec after it has been dropped? (b) Find $f^{-1}(x)$, and state what the independent and dependent variables represent. (c) If the object is dropped from a height of 784 ft, how many seconds until it hits the ground (stops falling)?

94. Area and radius: In generic form, the area of a circle is given by $f(x) = \pi x^2$, where $f(x)$ represents the area in square units for a circle with radius x. (a) A pet dog is tethered to a stake in the backyard. If the tether is 10 ft long, how much area does the dog have to roam (use $\pi \approx 3.14$)? (b) Find $f^{-1}(x)$, and state what the independent and dependent variables represent. (c) If the owners want to allow the dog 1256 ft^2 of area to live and roam, how long a tether should be used?

95. Volume of a cone: In generic form, the volume of an equipoise cone (height equal to radius) is given by $f(x) = \frac{1}{3}\pi x^3$, where $f(x)$ represents the volume in units^3 and x represents the height of the cone. (a) Find the volume of such a cone if $r = 30$ ft (use $\pi \approx 3.14$). (b) Find $f^{-1}(x)$, and state what the independent and dependent variables represent. (c) If the volume of water in the cone is 763.02 ft^3, how deep is the water at its deepest point?

96. Wind power: The power delivered by a certain wind-powered generator can be modeled by the function $f(x) = \dfrac{x^3}{2500}$, where $f(x)$ is the horsepower (hp) delivered by the generator and x represents the speed of the wind in miles per hour. (a) Use the model to determine how much horsepower is generated by a 30 mph wind. (b) The person monitoring the output of the generators (wind generators are usually erected in large numbers) would like a function that gives the wind speed based on the horsepower readings on the gauges in the monitoring station. For this purpose, find $f^{-1}(x)$ and state what the independent and dependent variables represent. (c) If gauges show 25.6 hp is being generated, how fast is the wind blowing?

▶ EXTENDING THE CONCEPT

97. For a deeper understanding of the algebraic method for finding an inverse, suppose a function f is defined as $f(x)$:$\{(x, y) \mid y = 3x - 6\}$. We can then define the inverse as f^{-1}: $\{(x, y) \mid x = 3y - 6\}$, having interchanged x and y in the equation portion. The equation for f^{-1} is not in standard form, but (x, y) still represents all ordered pairs satisfying either equation. Solving for y gives f^{-1}:$\left\{(x, y) \;\middle|\; y = \dfrac{x}{3} + 2\right\}$, and demonstrates the role of steps 2, 3, and 4 of the method. (a) Find five ordered pairs that satisfy the equation for f, then (b) interchange their coordinates and show they satisfy the equation for f^{-1}.

98. By inspection, which of the following is the inverse function for $f(x) = \dfrac{2}{3}\left(x - \dfrac{1}{2}\right)^5 + \dfrac{4}{5}$?

a. $f^{-1}(x) = \sqrt[5]{\dfrac{1}{2}\left(x - \dfrac{2}{3}\right)} - \dfrac{4}{5}$

b. $f^{-1}(x) = \dfrac{3}{2}\sqrt[5]{(x - 2)} - \dfrac{5}{4}$

c. $f^{-1}(x) = \dfrac{3}{2}\sqrt[5]{\left(x + \dfrac{1}{2}\right)} - \dfrac{5}{4}$

d. $f^{-1}(x) = \sqrt[5]{\dfrac{3}{2}\left(x - \dfrac{4}{5}\right)} + \dfrac{1}{2}$

▶ MAINTAINING YOUR SKILLS

99. (Appendix A.3) Write as many of the following formulas as you can from memory:

a. perimeter of a rectangle
b. area of a circle
c. volume of a cylinder
d. volume of a cone
e. circumference of a circle
f. area of a triangle
g. area of a trapezoid
h. volume of a sphere
i. Pythagorean theorem

100. (3.2) Given $f(x) = x^2 - x - 2$, solve the inequality $f(x) \le 0$ using the x-intercepts and end-behavior of the graph.

101. (3.4) For the function $y = 2\sqrt{x + 3}$, find the average rate of change between $x = 1$ and $x = 2$, and between $x = 4$ and $x = 5$. Which is greater? Why?

102. (Appendix A.4) Solve the following cubic equations by factoring:

a. $x^3 - 5x = 0$
b. $x^3 - 7x^2 - 4x + 28 = 0$
c. $x^3 - 3x^2 = 0$
d. $x^3 - 3x^2 - 4x = 0$

5.2 Exponential Functions

LEARNING OBJECTIVES

In Section 5.2 you will see how we can:

- ❑ **A.** Evaluate an exponential function
- ❑ **B.** Graph general exponential functions
- ❑ **C.** Graph base-*e* exponential functions
- ❑ **D.** Solve exponential equations and applications

Demographics is the statistical study of human populations. In this section, we introduce the family of *exponential functions,* which are widely used to model population growth or decline with additional applications in science, engineering, and many other fields. As with other functions, we begin with a study of the graph and its characteristics.

A. Evaluating Exponential Functions

In the boomtowns of the old west, it was not uncommon for a town to double in size every year (at least for a time) as the lure of gold drew more and more people westward. When this type of growth is modeled using mathematics, exponents play a lead role. Suppose the town of Goldsboro had 1000 residents when gold was first discovered. After 1 yr the population doubled to 2000 residents. The next year it doubled again to 4000, then again to 8000, then to 16,000 and so on. You probably recognize the digits in blue as powers of two (indicating the population is *doubling*), with each one multiplied by 1000 (the initial population). This suggests we can model the relationship using

$$P(x) = 1000 \cdot 2^x$$

where $P(x)$ is the population after x yr. Further, we can evaluate this function, called an **exponential function,** for *fractional parts of a year* using rational exponents. The population of Goldsboro one-and-a-half years after the gold rush was

$$\begin{aligned} P\left(\frac{3}{2}\right) &= 1000 \cdot 2^{\frac{3}{2}} \\ &= 1000 \cdot (\sqrt{2})^3 \\ &\approx 2828 \text{ people} \end{aligned}$$

In general, exponential functions are defined as follows.

WORTHY OF NOTE

To properly understand the exponential function and its graph requires that we evaluate $f(x) = 2^x$ even when x is *irrational*. For example, what does $2^{\sqrt{5}}$ mean? While the technical details require calculus, it can be shown that successive approximations of $2^{\sqrt{5}}$ as in $2^{2.2360}$, $2^{2.23606}$, $2^{2.236067}$, . . . approach a unique real number, and that $f(x) = 2^x$ exists for all real numbers x.

Exponential Functions

For $b > 0$, $b \neq 1$, and all real numbers x,

$$f(x) = b^x$$

defines the base b exponential function.

Limiting b to positive values ensures that outputs will be real numbers, and the restriction $b \neq 1$ is needed since $y = 1^x$ is a constant function (1 raised to *any* power is still 1). Specifically note the domain of an exponential function is *all real numbers,* and that all of the familiar properties of exponents still hold. A summary of these properties follows. For a complete review, see Appendix A.2.

Exponential Properties

For real numbers a, b, m, and n, with $a, b > 0$,

$$b^m \cdot b^n = b^{m+n} \qquad \frac{b^m}{b^n} = b^{m-n} \qquad (b^m)^n = b^{mn}$$

$$(ab)^n = a^n \cdot b^n \qquad b^{-n} = \frac{1}{b^n} \qquad \left(\frac{b}{a}\right)^{-n} = \left(\frac{a}{b}\right)^n$$

EXAMPLE 1 ▶ **Evaluating Exponential Functions**

Evaluate each exponential function for $x = 2$, $x = -1$, $x = \frac{1}{2}$, and $x = \pi$. Use a calculator for $x = \pi$, rounding to five decimal places.

a. $f(x) = 4^x$ **b.** $g(x) = \left(\frac{4}{9}\right)^x$

Solution ▶

a. For $f(x) = 4^x$,

$$f(2) = 4^2 = 16$$

$$f(-1) = 4^{-1} = \frac{1}{4}$$

$$f\left(\frac{1}{2}\right) = 4^{\frac{1}{2}} = \sqrt{4} = 2$$

$$f(\pi) = 4^{\pi} \approx 77.88023$$

b. For $g(x) = \left(\frac{4}{9}\right)^x$,

$$g(2) = \left(\frac{4}{9}\right)^2 = \frac{16}{81}$$

$$g(-1) = \left(\frac{4}{9}\right)^{-1} = \frac{9}{4}$$

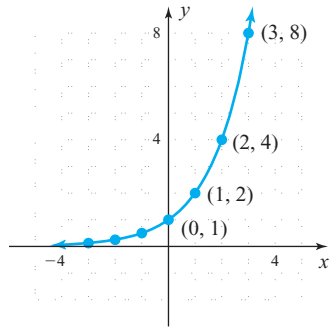
$$g\left(\frac{1}{2}\right) = \left(\frac{4}{9}\right)^{\frac{1}{2}} = \sqrt{\frac{4}{9}} = \frac{2}{3}$$

$$g(\pi) = \left(\frac{4}{9}\right)^{\pi} \approx 0.07827$$

☑ **A.** You've just seen how we can evaluate an exponential function

Now try Exercises 7 through 10 ▶

B. Graphing Exponential Functions



To gain a better understanding of exponential functions, we'll graph examples of $y = b^x$ and note some of the characteristic features. Since $b \neq 1$, it seems reasonable that we graph one exponential function where $b > 1$ and one where $0 < b < 1$.

EXAMPLE 2 ▶ **Graphing Exponential Functions with $b > 1$**

Graph $y = 2^x$ using a table of values.

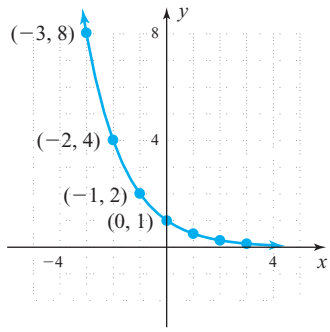
Solution ▶ To get an idea of the graph's shape we'll use integer values from -3 to 3 in our table, then draw the graph as a continuous curve, since the function is defined for all real numbers.

x	$y = 2^x$
-3	$2^{-3} = \frac{1}{8}$
-2	$2^{-2} = \frac{1}{4}$
-1	$2^{-1} = \frac{1}{2}$
0	$2^0 = 1$
1	$2^1 = 2$
2	$2^2 = 4$
3	$2^3 = 8$

WORTHY OF NOTE

As in Example 2, functions that are increasing for all $x \in D$ are said to be **monotonically increasing** or simply **monotonic functions.** The function in Example 3 is monotonically decreasing.

Now try Exercises 11 and 12 ▶



Several important observations can now be made. First note the x-axis (the line $y = 0$) is a horizontal asymptote for the function, because as $x \to -\infty$, $y \to 0$. Second, the function is increasing over its entire domain, giving the function a range of $y \in (0, \infty)$.

EXAMPLE 3 ▶ **Graphing Exponential Functions with $0 < b < 1$**

Graph $y = (\frac{1}{2})^x$ using a table of values.

Solution ▶ Using properties of exponents, we can write $(\frac{1}{2})^x$ as $(\frac{2}{1})^{-x} = 2^{-x}$. Again using integers from -3 to 3, we plot the ordered pairs and draw a continuous curve.

x	$y = 2^{-x}$
-3	$2^{-(-3)} = 2^3 = 8$
-2	$2^{-(-2)} = 2^2 = 4$
-1	$2^{-(-1)} = 2^1 = 2$
0	$2^0 = 1$
1	$2^{-1} = \frac{1}{2}$
2	$2^{-2} = \frac{1}{4}$
3	$2^{-3} = \frac{1}{8}$

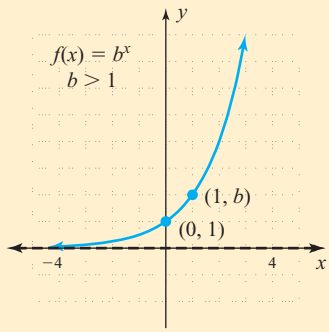
Now try Exercises 13 and 14 ▶

We note this graph is also asymptotic to the x-axis, but *decreasing on its domain.* In addition, both $y = 2^x$ and $y = 2^{-x} = (\frac{1}{2})^x$ have a y-intercept of (0, 1) and both are one-to-one, which suggests that an inverse function can be found. Finally, observe that $y = b^{-x}$ is *a reflection of* $y = b^x$ *across the y-axis,* a property that indicates these basic graphs might also be transformed in other ways, as were the toolbox functions. The characteristics of exponential functions are summarized here:

$f(x) = b^x$, $b > 0$ and $b \neq 1$

- one-to-one function
- domain: $x \in \mathbb{R}$
- increasing if $b > 1$
- y-intercept (0, 1)
- range: $y \in (0, \infty)$
- decreasing if $0 < b < 1$
- asymptotic to the x-axis (the line $y = 0$)

Figure 5.18



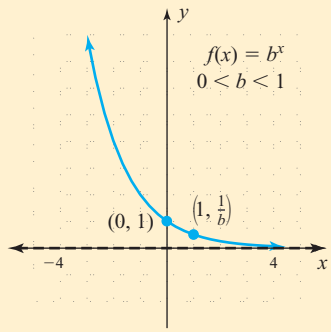


Figure 5.19

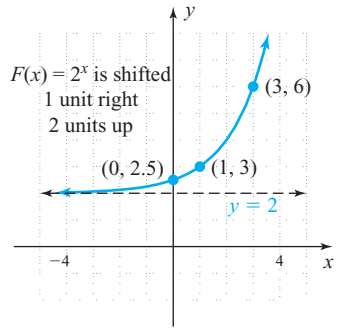


WORTHY OF NOTE

When an exponential function is increasing, it can be referred to as a "growth function." When decreasing, it is often called a "decay function." Each of the graphs shown in Figures 5.18 and 5.19 should now be added to your repertoire of basic functions, to be sketched from memory and analyzed or used as needed.

Just as the graph of a quadratic function maintains its parabolic shape regardless of the transformations applied, exponential functions will also maintain their general shape and features. Any sum or difference applied to the basic function ($y = b^x \pm k$ vs. $y = b^x$) will cause a vertical shift in the same direction as the sign, and any change to input values ($y = b^{x+h}$ vs. $y = b^x$) will cause a horizontal shift in a direction opposite the sign. For cases where multiple transformations are to be applied, refer to the sequence outlined on page 127.

EXAMPLE 4 ▶ **Graphing Exponential Functions Using Transformations**

Graph $F(x) = 2^{x-1} + 2$ using transformations of the basic function $f(x) = 2^x$ (not by simply plotting points). Clearly state what transformations are applied.

Solution ▶ The graph of F is that of the basic function $f(x) = 2^x$ with a horizontal shift 1 unit right and a vertical shift 2 units up. With this in mind the horizontal asymptote also shifts from $y = 0$ to $y = 2$ and (0, 1) shifts to (1, 3). The y-intercept of F is at (0, 2.5):

$$\begin{aligned} F(0) &= 2^{(0)-1} + 2 \\ &= 2^{-1} + 2 \\ &= \frac{1}{2} + 2 \\ &= 2.5 \end{aligned}$$

To help sketch a more accurate graph, the point (3, 6) can be used: $F(3) = 6$.

Now try Exercises 15 through 30 ▶

B. You've just seen how we can graph general exponential functions

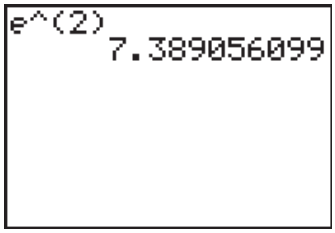
C. The Base-e Exponential Function: $f(x) = e^x$

In nature, exponential growth occurs when the rate of change in a population's growth is in constant proportion to its current size. Using the rate of change notation, $\frac{\Delta P}{\Delta t} = kP$, where k is a constant. For the city of Goldsboro, we know the population at time t is given by $P(t) = 1000 \cdot 2^t$, but have no information on this value of k **(see Exercise 90).** We can actually rewrite this function, and other exponential functions, using a base that gives the value of k directly and without having to apply the difference quotient. This new base is an irrational number, symbolized by the letter e. In Section 5.6 we'll develop the number e in the context of compound interest, while making numerous references to our discussion here, where we define e as follows.

WORTHY OF NOTE

Just as the ratio of a circle's circumference to its diameter is an irrational number symbolized by π, the irrational number that results from $\left(1 + \frac{1}{x}\right)^x$ for infinitely large x is symbolized by e. Writing exponential functions in terms of e simplifies many calculations in advanced courses, and offers additional advantages in applications of exponential functions.

The Number *e*



For $x > 0$,

$$\text{as } x \to \infty, \left(1 + \frac{1}{x}\right)^x \to e$$

In words, e is the number that $\left(1 + \frac{1}{x}\right)^x$ approaches as x becomes infinitely large.

It has been proven that as x grows without bound, $\left(1 + \frac{1}{x}\right)^x$ indeed approaches the unique, irrational number that we have named e. Table 5.5 gives approximate values of the expression for selected values of x, and shows $e \approx 2.71828$ to five decimal places.

Figure 5.20

The result is the base-e **exponential function:** $f(x) = e^x$, also called the **natural exponential function.** Instead of having to enter a decimal approximation when computing with e, most calculators have an "e^x" key, usually as the 2nd function for the key marked LN. To find the value of e^2, use the keystrokes 2nd LN 2) ENTER, and the calculator display should read 7.389056099. Note the calculator supplies the left parenthesis for the exponent, and you must supply the right. See Figure 5.20.

Table 5.5

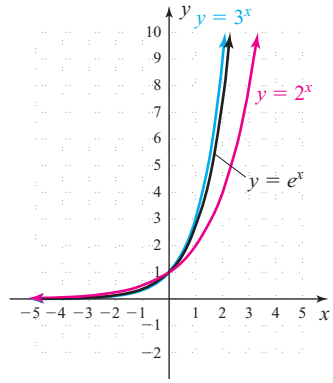
x	Approximate Value $(1 + \frac{1}{x})^x$
10	2.59
100	2.705
1000	2.7169
10,000	2.71815
100,000	2.718268
1,000,000	2.7182805
10,000,000	2.71828169

EXAMPLE 5 ▶ **Evaluating the Natural Exponential Function**

Use a calculator to evaluate $f(x) = e^x$ for the values of x given. Round to six decimal places as needed.

a. $f(3)$ **b.** $f(1)$ **c.** $f(0)$ **d.** $f(\frac{1}{2})$

Solution ▶



a. $f(3) = e^3 \approx 20.085537$ **b.** $f(1) = e^1 \approx 2.718282$

c. $f(0) = e^0 = 1$ (exactly) **d.** $f(\frac{1}{2}) = e^{\frac{1}{2}} \approx 1.648721$

Now try Exercises 31 through 36 ▶

Although e is an irrational number, the graph of $y = e^x$ behaves in exactly the same way and has the same characteristics as other exponential graphs. Figure 5.21 shows this graph on the same grid as $y = 2^x$ and $y = 3^x$. As we might expect, all three graphs are increasing, have an asymptote at $y = 0$, and contain the point (0, 1), with the graph of $y = e^x$ "between" the other two. The domain for all three functions, as with all basic exponential functions, is $x \in (-\infty, \infty)$ with range $y \in (0, \infty)$. The same transformations applied earlier can also be applied to the graph of $y = e^x$. **See Exercises 37 through 42.**

Figure 5.21

☑ **C.** You've just seen how we can graph base-e exponential functions

D. Solving Exponential Equations Using the Uniqueness Property

Since exponential functions are one-to-one, we can solve equations where each side is an exponential term with the identical base. This is because one-to-oneness guarantees a unique solution to the equation.

WORTHY OF NOTE

Exponential functions are very different from the power functions studied earlier. For power functions, the base is variable and the exponent is constant: $y = x^b$, while for exponential functions the *exponent is a variable* and the *base is constant*: $y = b^x$.

Exponential Equations and the Uniqueness Property

For all real numbers m, n, and b, where $b > 0$ and $b \neq 1$,

1. If $b^m = b^n$, then $m = n$.

2. If $m \neq n$, then $b^m \neq b^n$

Equal bases imply exponents are equal.

The equation $2^x = 32$ can be written as $2^x = 2^5$, and we note $x = 5$ is a solution. Although $3^x = 32$ can be written as $3^x = 2^5$, the bases are not alike and the solution to this equation must wait until additional tools are developed in Section 5.5.

EXAMPLE 6 ▶ **Solving Exponential Equations**

Solve the exponential equations using the uniqueness property.

a. $3^{2x-1} = 81$ **b.** $\left(\frac{1}{6}\right)^{-3x-2} = 36^{x+1}$ **c.** $e^x e^2 = \dfrac{e^4}{e^{x+1}}$

Solution ▶

a.

$$\begin{aligned} 3^{2x-1} &= 81 && \text{given}\\ 3^{2x-1} &= 3^4 && \text{rewrite using base 3}\\ \Rightarrow 2x - 1 &= 4 && \text{uniqueness property}\\ x &= \frac{5}{2} && \text{solve for } x \end{aligned}$$

Check ▶

$$\begin{aligned} 3^{2x-1} &= 81 && \text{given}\\ 3^{2(\frac{5}{2})-1} &= 81 && \text{substitute } \tfrac{5}{2} \text{ for } x\\ 3^{5-1} &= 81 && \text{simplify}\\ 3^4 &= 81 && \text{result checks}\\ 81 &= 81 \end{aligned}$$

The remaining checks are left to the student.

b.

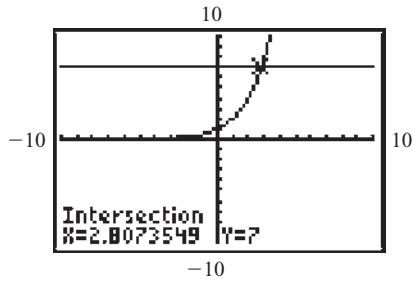
$$\begin{aligned} \left(\frac{1}{6}\right)^{-3x-2} &= 36^{x+1} && \text{given}\\ (6^{-1})^{-3x-2} &= (6^2)^{x+1} && \text{rewrite using base 6}\\ 6^{3x+2} &= 6^{2x+2} && \text{power property of exponents}\\ \Rightarrow 3x + 2 &= 2x + 2 && \text{uniqueness property}\\ x &= 0 && \text{solve for } x \end{aligned}$$

c.

$$\begin{aligned} e^x e^2 &= \frac{e^4}{e^{x+1}} && \text{given}\\ e^{x+2} &= e^{4-(x+1)} && \text{product property; quotient property}\\ e^{x+2} &= e^{3-x} && \text{simplify}\\ \Rightarrow x + 2 &= 3 - x && \text{uniqueness property}\\ 2x &= 1 && \text{add } x\text{, subtract 2}\\ x &= \frac{1}{2} && \text{solve for } x \end{aligned}$$

Now try Exercises 43 through 62 ▶

Earlier in this section, we showed the exponential function $f(x) = b^x$ was defined for all real numbers and was a one-to-one function. This is important because it establishes that equations like $2^x = 7$ must have a solution, even if x is not rational. In fact, since $2^2 = 4$ and $2^3 = 8$, the following inequalities indicate the solution must be between 2 and 3



$$\begin{aligned} 4 < 7 < 8 \quad & \text{7 is between 4 and 8}\\ 2^2 < 2^x < 2^3 \quad & \text{replace 4 with } 2^2\text{, 8 with } 2^3\\ \Rightarrow 2 < x < 3 \quad & x \text{ must be between 2 and 3} \end{aligned}$$

Until we develop an inverse for exponential functions, we are unable to solve many of these equations in exact form. We can, however, get a very close approximation using a graphing calculator. For the equation $2^x = 7$, enter $Y_1 = 2^X$ and $Y_2 = 7$ on the Y= screen. Then press ZOOM 6 to graph both functions (see Figure 5.22). To find the point of intersection, press 2nd TRACE **(CALC)** and select option **5:intersect,** then press ENTER *three*

times (to identify the intersecting functions and bypass "Guess"). The x- and y-coordinates of the point of intersection will appear at the bottom of the screen, with the x-coordinate being the solution. As you can see, x is indeed between 2 and 3. **See Exercises 63 through 66.**

Two common applications of exponential functions involve appreciation (as when an item grows in value over time), and depreciation (as when tools and equipment decrease in value over time).

Figure 5.22

EXAMPLE 7 ▶ **Applications of Exponential Functions—Depreciation**

For insurance purposes, it is estimated that large household appliances lose $\frac{1}{5}$ of their value each year. The current value can then be modeled by the function $V(t) = V_0(\frac{4}{5})^t$, where V_0 is the initial value and $V(t)$ represents the value after t years. How many years does it take a washing machine that cost \$625 new, to depreciate to a value of \$256?

Solution ▶ For this exercise, $V_0 = \$625$ and $V(t) = \$256$. The formula yields

$$V(t) = V_0\left(\frac{4}{5}\right)^t \quad \text{given}$$

$$256 = 625\left(\frac{4}{5}\right)^t \quad \text{substitute known values}$$

$$\frac{256}{625} = \left(\frac{4}{5}\right)^t \quad \text{divide by 625}$$

$$\left(\frac{4}{5}\right)^4 = \left(\frac{4}{5}\right)^t \quad \text{equate bases } \frac{256}{625} = \left(\frac{4}{5}\right)^4$$

$$\Rightarrow 4 = t \quad \text{Uniqueness Property}$$

After 4 yr, the washing machine's value has dropped to \$256.

Now try Exercises 69 through 74 ▶

Another very practical application of the natural exponential function involves **Newton's law of cooling.** This law or formula models the temperature of an object as it cools down, as when a pizza is removed from the oven and placed on the kitchen counter. The function model is

$$T(x) = T_R + (T_0 - T_R)e^{kx}, k < 0$$

where T_0 represents the initial temperature of the object, T_R represents the temperature of the room or surrounding medium, $T(x)$ is the temperature of the object x min later, and k is the cooling rate as determined by the nature and physical properties of the object.

EXAMPLE 8 ▶ **Applying an Exponential Function—Newton's Law of Cooling**

A pizza is taken from a 425°F oven and placed on the counter to cool. If the temperature in the kitchen is 75°F, and the cooling rate for this type of pizza is $k = -0.35$,

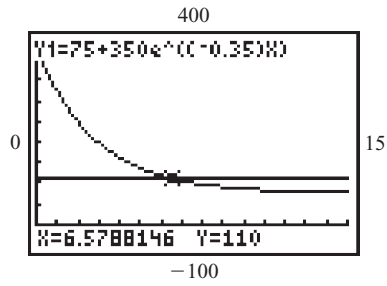
a. What is the temperature (to the nearest degree) of the pizza 2 min later?

b. To the nearest minute, how long until the pizza has cooled to a temperature below 90°F?

c. If Zack and Raef like to eat their pizza at a temperature of about 110°F, how many minutes should they wait to "dig in"?

Solution ▶ Begin by substituting the given values to obtain the equation model:

$$\begin{aligned} T(x) &= T_R + (T_0 - T_R)e^{kx} && \text{general equation model} \\ &= 75 + (425 - 75)e^{-0.35x} && \text{substitute 75 for } T_R\text{, 425 for } T_0\text{, and } -0.35 \text{ for } k \\ &= 75 + 350e^{-0.35x} && \text{simplify} \end{aligned}$$



For part (a) we simply find $T(2)$:

a. $$\begin{aligned} T(2) &= 75 + 350e^{-0.35(2)} && \text{substitute 2 for } x \\ &\approx 249 && \text{result} \end{aligned}$$

Two minutes later, the temperature of the pizza is near 249°.

b. Using the **TABLE** feature of a graphing calculator shows the pizza reaches a temperature of just under 90° after 9 min: $T(9) \approx 90°\text{F}$.

c. We elect to use the intersection-of-graphs method. After setting an appropriate window, we enter $Y_1 = 75 + 350e^{-0.35x}$ and $Y_2 = 110$, then press 2nd CALC option **5:intersect.** After pressing ENTER three times, the coordinates of the point of intersection appear at the bottom of the screen: $x \approx 6.6$, $y = 110$. It appears the boys should wait about $6\frac{1}{2}$ min for the pizza to cool.

D. You've just seen how we can solve exponential equations and applications

Now try Exercises 75 and 76 ▶

There are a number of additional applications of exponential functions in the Exercise Set. **See Exercises 77 through 84.**

5.2 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. An exponential function is one of the form $y =$ _____, where _____ > 0, _____ $\neq 1$, and _____ is any real number.

2. The domain of $y = b^x$ is all _____ _____, and the range is $y \in$ _____. Further, as $x \to -\infty$, y _____.

3. For exponential functions of the form $y = ab^x$, the y-intercept is $(0,$ _____$)$, since $b^0 =$ _____ for any real number b.

4. If each side of an equation can be written as an exponential term with the same base, the equation can be solved using the _____ _____.

5. State true or false and explain why: $y = b^x$ is always increasing if $0 < b < 1$.

6. Discuss/Explain the statement, "For $k > 0$, the y-intercept of $y = ab^x + k$ is $(0, a + k)$."

▶ DEVELOPING YOUR SKILLS

Evaluate each function as indicated. Use a calculator only as needed, rounding results to thousandths.

7. $P(t) = 4^t$; $t = 2$, $t = \frac{1}{2}$, $t = \frac{3}{2}$, $t = \sqrt{3}$

8. $Q(t) = 8^t$; $t = 2$, $t = \frac{1}{3}$, $t = \frac{5}{3}$, $t = \sqrt{5}$

9. $V(n) = (\frac{1}{8})^n$; $n = 0$, $n = 2$, $n = \frac{2}{3}$, $n = -2$

10. $W(m) = (\frac{4}{9})^m$; $m = 0$, $m = 3$, $m = \frac{3}{2}$, $m = -2$

Graph each function using a table of values and integer inputs between −3 and 3. Clearly label the *y*-intercept and one additional point, then state whether the function is increasing or decreasing.

11. $y = 3^x$

12. $y = 4^x$

13. $y = (\frac{1}{3})^x$

14. $y = (\frac{1}{4})^x$

Graph each of the following functions by *translating the basic function* $y = b^x$, sketching the asymptote, and strategically plotting a few points to round out the graph. Clearly state the basic function and what shifts are applied.

15. $y = 3^x + 2$

16. $y = 3^x - 3$

17. $y = 3^{x+3}$

18. $y = 3^{x-2}$

19. $y = 3^{-x}$

20. $y = 3^{-x} - 2$

21. $y = (\frac{1}{3})^x + 1$

22. $y = (\frac{1}{3})^x - 4$

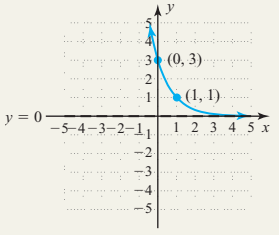
23. $y = (\frac{1}{3})^{x-2}$

24. $y = (\frac{1}{3})^{x+2}$

Match each exponential equation to the correct graph.

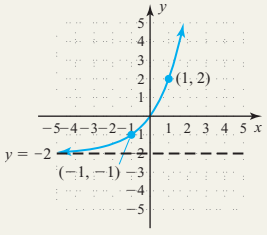
25. $y = 5^{-x}$

26. $y = 4^{-x}$



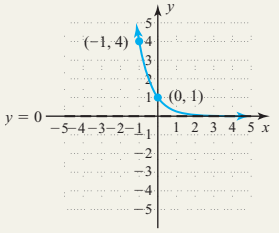
27. $y = 3^{-x+1}$

28. $y = 3^{-x} + 1$

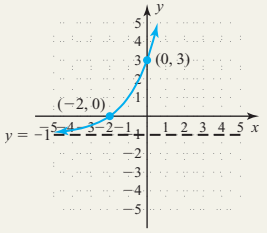


29. $y = 2^{x+1} - 2$

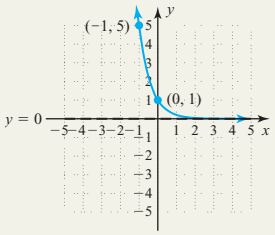
30. $y = 2^{x+2} - 1$



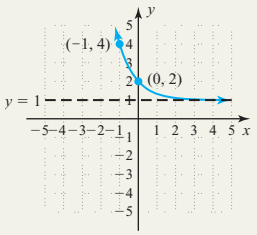
a.



b.



c.



d.

e.

f.

Use a calculator to evaluate each expression, rounded to six decimal places.

31. e^1

32. e^0

33. e^2

34. $e^{-3.2}$

35. $e^{\sqrt{2}}$

36. e^{π}

Graph each exponential function.

37. $f(x) = e^{x+3} - 2$

38. $g(x) = e^{x-2} + 1$

39. $r(t) = -e^t + 2$

40. $s(t) = -e^{t+2}$

41. $p(x) = e^{-x+2} - 1$

42. $q(x) = e^{-x-1} + 2$

Solve each exponential equation and check your answer by substituting into the original equation.

43. $10^x = 1000$

44. $144 = 12^x$

45. $25^x = 125$

46. $81 = 27^x$

47. $8^{x+2} = 32$

48. $9^{x-1} = 27$

49. $32^x = 16^{x+1}$

50. $100^{x+2} = 1000^x$

51. $(\frac{1}{5})^x = 125$

52. $(\frac{1}{4})^x = 64$

53. $(\frac{1}{3})^{2x} = 9^{x-6}$

54. $(\frac{1}{2})^{3x} = 8^{x-2}$

55. $(\frac{1}{9})^{x-5} = 3^{3x}$

56. $2^{-2x} = (\frac{1}{32})^{x-3}$

57. $25^{3x} = 125^{x-2}$

58. $27^{2x+4} = 9^{4x}$

59. $\dfrac{e^4}{e^{2-x}} = e^3 e$

60. $e^x(e^x + e) = \dfrac{e^x + e^{3x}}{e^{-x}}$

61. $(e^{2x-4})^3 = \dfrac{e^{x+5}}{e^2}$

62. $e^x e^{x+3} = (e^{x+2})^3$

Solve the following equations. First estimate the answer by bounding it between two integers, then solve the equation graphically. Adjust the viewing window as needed.

63. $3^x = 22$

64. $2^x = 2.125$

65. $e^{x-1} = 9$

66. $e^{0.5x} = 8$

▶ WORKING WITH FORMULAS

67. The growth of bacteria: $P(t) = 1000 \cdot 3^t$

If the initial population of a common bacterium is 1000 and the population triples every day, its population is given by the formula shown, where $P(t)$ is the total population after t days. (a) Find the total population 12 hr, 1 day, $1\frac{1}{2}$ days, and 2 days later. (b) Do the outputs show the population is tripling every 24 hr (1 day)? (c) Explain why this is an increasing function. (d) Graph the function using an appropriate scale.

68. Spinners with numbers 1 to 4: $P(x) = (\frac{1}{4})^x$

Games that involve moving pieces around a board using a fair spinner are fairly common. If the spinner has the numbers 1 through 4, the probability that any one number is spun repeatedly is given by the formula shown, where x represents the number of spins and $P(x)$ represents the probability the same number results x times. (a) What is the probability that the first player spins a 2? (b) What is the probability that all four players spin a 2? (c) Explain why this is a decreasing function.

▶ APPLICATIONS

69. Depreciation: The financial analyst for a large construction firm estimates that its heavy equipment loses one-fifth of its value each year. The current value of the equipment is then modeled by the function $V(t) = V_0(\frac{4}{5})^t$, where V_0 represents the initial value, t is in years, and $V(t)$ represents the value after t years. (a) How much is a large earthmover worth after 1 yr if it cost \$125 thousand new? (b) How many years does it take for the earthmover to depreciate to a value of \$64 thousand?

70. Depreciation: Photocopiers have become a critical part of the operation of many businesses, and due to their heavy use they can depreciate in value very quickly. If a copier loses $\frac{3}{8}$ of its value each year, the current value of the copier can be modeled by the function $V(t) = V_0(\frac{5}{8})^t$, where V_0 represents the initial value, t is in years, and $V(t)$ represents the value after t yr. (a) How much is this copier worth after one year if it cost \$64 thousand new? (b) How many years does it take for the copier to depreciate to a value of \$25 thousand?

71. Depreciation: Margaret Madison, DDS, estimates that her dental equipment loses one-sixth of its value each year. (a) Determine the value of an x-ray machine after 5 yr if it cost \$216 thousand new, and (b) determine how long until the machine is worth less than \$125 thousand.

72. Exponential decay: The groundskeeper of a local high school estimates that due to heavy usage by the baseball and softball teams, the pitcher's mound loses one-fifth of its height every month. Use this information to find an equation that models this information and then determine: (a) If the mound was 25 cm to begin, how long until the height becomes less than 16 cm high (meaning it must be entirely rebuilt)? (b) If the mound were allowed to deteriorate further, find the height after 3 months.

73. Exponential growth: Similar to a small town doubling in size after a discovery of gold, a business that develops a product in high demand has the potential for doubling its revenue each year for a number of years. The revenue would be modeled by the function $R(t) = R_0 2^t$, where R_0 represents the initial revenue, and $R(t)$ represents the revenue after t years. (a) How much revenue is being generated after 4 yr, if the company's initial revenue was \$2.5 million? (b) How many years does it take for the business to be generating \$320 million in revenue?

74. Exponential growth: If a company's revenue grows at a rate of 150% per year (rather than doubling as in Exercise 73), the revenue would be modeled by the function $R(t) = R_0(\frac{3}{2})^t$, where R_0 represents the initial revenue, and $R(t)$ represents the revenue after t years. (a) How much revenue is being generated after 3 yr, if the company's initial revenue was \$256 thousand? (b) How long until the business is generating \$1944 thousand in revenue? (*Hint:* Reduce the fraction.)

Use Newton's law of cooling to complete Exercises 75 and 76: $T(x) = T_R + (T_0 - T_R)e^{kx}$.

75. Cold party drinks: Janae was late getting ready for the party, and the liters of soft drinks she bought were still at room temperature (73°F) with guests due to arrive in 15 min. If she puts these in her freezer at −10°F, will the drinks be cold enough (35°F) for her guests? Assume $k \approx -0.031$.

76. Warm party drinks: Newton's law of cooling applies equally well if the "cooling is negative," meaning the object is taken from a colder medium and placed in a warmer one. If a can of soft drink is taken from a 35°F cooler and placed in a room where the temperature is 75°F, how long will it take the drink to warm to 65°F? Assume $k \approx -0.031$.

Photochromatic sunglasses: Sunglasses that darken in sunlight (photochromatic sunglasses) contain millions of molecules of a substance known as *silver halide*. The molecules are transparent indoors in the absence of ultraviolent (UV) light. Outdoors, UV light from the sun causes the molecules to change shape, darkening the lenses in response to the intensity of the UV light. For certain lenses, the function $T(x) = 0.85^x$ models the transparency of the lenses (as a percentage) based on a UV index x. Find the transparency (to the nearest percent), if the lenses are exposed to

77. sunlight with a UV index of 7 (a high exposure).

78. sunlight with a UV index of 5.5 (a moderate exposure).

79. Given that a UV index of 11 is very high and most individuals should stay indoors, what is the minimum transparency percentage for these lenses?

80. Use a trial-and-error process and a graphing calculator to determine the UV index when the lenses are 50% transparent.

Modeling inflation: Assuming the rate of inflation is 5% per year, the predicted price of an item can be modeled by the function $P(t) = P_0(1.05)^t$, where P_0 represents the initial price of the item and t is in years. Use this information to solve Exercises 81 and 82.

81. What will the price of a new car be in the year 2015, if it cost $20,000 in the year 2010?

82. What will the price of a gallon of milk be in the year 2015, if it cost $3.95 in the year 2010? Round to the nearest cent.

Modeling radioactive decay: The half-life of a radioactive substance is the time required for half an initial amount of the substance to disappear through decay. The amount of the substance remaining is given by the formula $Q(t) = Q_0(\frac{1}{2})^{\frac{t}{h}}$, where h is the half-life, t represents the elapsed time, and $Q(t)$ represents the amount that remains (t and h must have the same unit of time). Use this information to solve Exercises 83 and 84.

83. Some isotopes of the substance known as thorium have a half-life of only 8 min. (a) If 64 grams are initially present, how many grams (g) of the substance remain after 24 min? (b) How many minutes until only 1 gram (g) of the substance remains?

84. Some isotopes of sodium have a half-life of about 16 hr. (a) If 128 g are initially present, how many grams of the substance remain after 2 days (48 hr)? (b) How many hours until only 1 g of the substance remains?

▶ EXTENDING THE CONCEPT

85. If $10^{2x} = 25$, what is the value of 10^{-x}?

86. If $5^{3x} = 27$, what is the value of 5^{2x}?

87. If $3^{0.5x} = 5$, what is the value of 3^{x+1}?

88. If $\left(\frac{1}{2}\right)^{x+1} = \frac{1}{3}$, what is the value of $\left(\frac{1}{2}\right)^{-x}$?

89. The formula $f(x) = (\frac{1}{2})^x$ gives the probability that "x" number of flips result in heads (or tails). First determine the probability that 20 flips results in *20 heads in a row.* Then use the Internet or some other resource to determine the probability of winning a state lottery (expressed as a decimal). Which has the greater probability? Were you surprised?

The growth rate constant that governs an exponential function was introduced on page 425.

90. In later sections, we will easily be able to find the growth constant k for Goldsboro, where $P(t) = 1000 \cdot 2^t$. For now we'll approximate its value using the rate of change formula on a very small interval of the domain. From the definition of an exponential function, $\frac{\Delta P}{\Delta t} = kP(t)$. Since k is constant, we can choose any value of t, say $t = 4$. For $h = 0.0001$, we have $\frac{1000 \cdot 2^{4+0.0001} - 1000 \cdot 2^4}{0.0001} = k \cdot P(4)$. (a) Use the equation shown to solve for k (round to thousandths). (b) Show that k is constant by completing the same exercise for $t = 2$ and $t = 6$. (c) Verify that $P(t) = 1000 \cdot 2^t$ and $P(t) = 1000e^{kt}$ give approximately the same results.

▶ MAINTAINING YOUR SKILLS

91. **(1.3)** Given $f(x) = 2x^2 - 3x$, determine: $f(-1), f(\frac{1}{3}), f(a), f(a + h)$

92. **(2.2)** Graph $g(x) = \sqrt{x + 2} - 1$ using a shift of a basic function. Then state the domain and range of g.

93. **(Appendix A.6)** Solve the following equations:

a. $-2\sqrt{x - 3} + 7 = 21$

b. $\dfrac{9}{x + 3} + 3 = \dfrac{12}{x - 3}$

94. **(Appendix A.3)** Identify each formula:

a. $\frac{4}{3}\pi r^3$

b. $\frac{1}{2}bh$

c. lwh

d. $a^2 + b^2 = c^2$

5.3 Logarithms and Logarithmic Functions

LEARNING OBJECTIVES

In Section 5.3 you will see how we can:

- ❑ **A.** Write exponential equations in logarithmic form
- ❑ **B.** Find common logarithms and natural logarithms
- ❑ **C.** Graph logarithmic functions
- ❑ **D.** Find the domain of a logarithmic function
- ❑ **E.** Solve applications of logarithmic functions

A **transcendental function** is one whose solutions are beyond or *transcend* the methods applied to polynomial functions. The exponential function and its inverse, called the logarithmic function, are transcendental functions. In this section, we'll use the concept of an inverse to develop an understanding of the logarithmic function, which has numerous applications that include measuring pH levels, sound and earthquake intensities, barometric pressure, and other natural phenomena.

A. Exponential Equations and Logarithmic Form

While exponential functions have a large number of significant applications, we can't appreciate their full value until we develop the inverse function. Without it, we're unable to solve all but the simplest equations, of the type encountered in Section 5.2. Using the fact that $f(x) = b^x$ is one-to-one, we have the following:

1. The function $f^{-1}(x)$ must exist.
2. We can graph $f^{-1}(x)$ by interchanging the x- and y-coordinates of points from $f(x)$.
3. The domain of $f(x)$ will become the range of $f^{-1}(x)$.
4. The range of $f(x)$ will become the domain of $f^{-1}(x)$.
5. The graph of $f^{-1}(x)$ will be a reflection of $f(x)$ across the line $y = x$.

Table 5.6 contains selected values for $f(x) = 2^x$. The values for $f^{-1}(x)$ in Table 5.7 were found by interchanging x- and y-coordinates. Both functions were then graphed using these values.

Table 5.6
$f(x)$: $y = 2^x$

x	y
-3	$\frac{1}{8}$
-2	$\frac{1}{4}$
-1	$\frac{1}{2}$
0	1
1	2
2	4
3	8

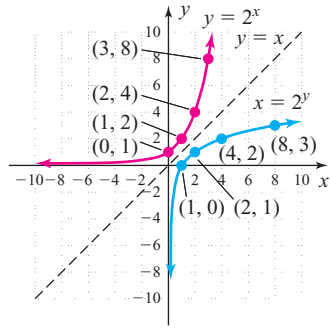


Table 5.7
$f^{-1}(x)$: $x = 2^y$

x	$y = f^{-1}(x)$
$\frac{1}{8}$	-3
$\frac{1}{4}$	-2
$\frac{1}{2}$	-1
1	0
2	1
4	2
8	3

The interchange of x and y and the graphs in Figure 5.23 show that $f^{-1}(x)$ has an x-intercept of $(1, 0)$, a vertical asymptote at $x = 0$, a domain of $x \in (0, \infty)$, and a range of $y \in (-\infty, \infty)$. To find *an equation* for $f^{-1}(x)$, we'll attempt to use the algebraic approach employed previously. For $f(x) = 2^x$,

1. use y instead of $f(x)$: $y = 2^x$. **2.** interchange x and y: $x = 2^y$.

Figure 5.23

WORTHY OF NOTE

The word *logarithm* was coined by John Napier in 1614, and loosely translated from its Greek origins means "to reason with numbers."

At this point we have an *implicit* equation for the inverse function, but no algebraic operations that enable us to solve *explicitly* for y in terms of x. Instead, we write $x = 2^y$ in function form by noting that "y is the exponent that goes on base 2 to obtain x." In the language of mathematics, this phrase is represented by $y = \log_2 x$ and is called a **logarithmic function** with base 2. For example, from Table 5.7 we have: -3 is the exponent that goes on base 2 to get $\frac{1}{8}$, and this is written $-3 = \log_2 \frac{1}{8}$ since $2^{-3} = \frac{1}{8}$ ✓. For $y = b^x, x = b^y \rightarrow y = \log_b x$ is the inverse function, and is read, "y is the logarithm base b of x." For this new function, we must always keep in mind what y *represents*—y is an exponent. In fact, *y is the exponent that goes on base b to obtain x*: $y = \log_b x$.

Logarithmic Functions

For positive numbers x and b, with $b \neq 1$,

$$y = \log_b x \text{ if and only if } x = b^y$$

The function $f(x) = \log_b x$ is a logarithmic function with base b. The expression $\log_b x$ is simply called a logarithm, and represents the exponent on b that yields x.

WORTHY OF NOTE

Since base-10 logarithms occur so frequently, we usually use only $\log x$ to represent $\log_{10} x$. We do something similar with square roots. Technically, the "square root of x" should be written $\sqrt[2]{x}$. However, square roots are so common we often leave off the two, assuming that if no index is written, an index of two is intended.

Finally, note the equations $x = b^y$ and $y = \log_b x$ are equivalent. We say that $x = b^y$ is the **exponential form** of the equation, whereas $y = \log_b x$ is written in **logarithmic form.** Of all possible bases for $\log_b x$, the most common are base 10 (likely due to our base-10 number system), and base e (due to the advantages it offers in advanced courses). The expression $\log_{10} x$ is called a **common logarithm,** and we simply write $\log x$ for $\log_{10} x$. The expression $\log_e x$ is called a **natural logarithm,** and is written in abbreviated form as $\ln x$.

EXAMPLE 1 ▶ Converting from Logarithmic Form to Exponential Form

Write each equation in words, then in exponential form.

a. $3 = \log_2 8$ **b.** $1 = \log 10$ **c.** $0 = \ln 1$ **d.** $-2 = \log_3(\frac{1}{9})$

Solution ▶

a. $3 = \log_2 8 \rightarrow 3$ is the exponent on base 2 for 8: $2^3 = 8$.

b. $1 = \log 10 \rightarrow 1$ is the exponent on base 10 for 10: $10^1 = 10$.

c. $0 = \ln 1 \rightarrow 0$ is the exponent on base e for 1: $e^0 = 1$.

d. $-2 = \log_3(\frac{1}{9}) \rightarrow -2$ is the exponent on base 3 for $\frac{1}{9}$: $3^{-2} = \frac{1}{9}$.

Now try Exercises 7 through 22 ▶

To convert from exponential form to logarithmic form, note the exponent on the base and read from there. For $5^3 = 125$, "3 is the exponent that goes on base 5 for 125," or *3 is the logarithm base 5 of 125*: $3 = \log_5 125$.

EXAMPLE 2 ▶ **Converting from Exponential Form to Logarithmic Form**

Write each equation in words, then in logarithmic form.

a. $10^3 = 1000$ **b.** $2^{-1} = \frac{1}{2}$ **c.** $e^2 \approx 7.389$ **d.** $9^{\frac{3}{2}} = 27$

Solution ▶

a. $10^3 = 1000 \rightarrow 3$ is the exponent on base 10 for 1000, or
3 is the logarithm base 10 of 1000: $3 = \log 1000$.

b. $2^{-1} = \frac{1}{2} \rightarrow -1$ is the exponent on base 2 for $\frac{1}{2}$, or
-1 is the logarithm base 2 of $\frac{1}{2}$: $-1 = \log_2(\frac{1}{2})$.

c. $e^2 \approx 7.389 \rightarrow 2$ is the exponent on base e for 7.389, or
2 is the logarithm base e of 7.389: $2 \approx \ln 7.389$.

d. $9^{\frac{3}{2}} = 27 \rightarrow \frac{3}{2}$ is the exponent on base 9 for 27, or
$\frac{3}{2}$ is the logarithm base 9 of 27: $\frac{3}{2} = \log_9 27$.

☑ **A.** You've just seen how we can write exponential equations in logarithmic form

Now try Exercises 23 through 38 ▶

B. Finding Common Logarithms and Natural Logarithms

Some logarithms are easy to evaluate. For example, $\log 100 = 2$ since $10^2 = 100$, and $\log \frac{1}{100} = -2$ since $10^{-2} = \frac{1}{100}$. But what about the expressions log 850 and ln 4? Because logarithmic functions are continuous on their domains, a value exists for log 850 and the equation $10^x = 850$ must have a solution. Further, the inequalities

$$\log 100 < \log 850 < \log 1000$$
$$2 < \log 850 < 3$$

tell us that log 850 must be between 2 and 3. Fortunately, modern calculators can compute base-10 and base-e logarithms instantly, often with nine-decimal-place accuracy. For log 850, press LOG, then input 850 and press ENTER. The display should read 2.929418926. We can also use the calculator to verify $10^{2.929418926} = 850$ (see Figure 5.24). For ln 4, press the LN key, then input 4 and press ENTER to obtain 1.386294361. Figure 5.25 verifies that $e^{1.386294361} = 4$.

Figure 5.24

EXAMPLE 3 ▶ **Finding the Value of a Logarithm**

Determine the value of each logarithm without using a calculator:

a. $\log_2 8$ **b.** $\log_5(\frac{1}{25})$ **c.** $\ln e$ **d.** $\log \sqrt{10}$

Solution ▶

a. $\log_2 8$ represents the exponent on 2 for 8: $\log_2 8 = 3$, since $2^3 = 8$.

b. $\log_5(\frac{1}{25})$ represents the exponent on 5 for $\frac{1}{25}$: $\log_5 \frac{1}{25} = -2$, since $5^{-2} = \frac{1}{25}$.

c. $\ln e$ represents the exponent on e for e: $\ln e = 1$, since $e^1 = e$.

d. $\log \sqrt{10}$ represents the exponent on 10 for $\sqrt{10}$: $\log \sqrt{10} = \frac{1}{2}$, since $10^{\frac{1}{2}} = \sqrt{10}$.

Now try Exercises 39 through 50 ▶

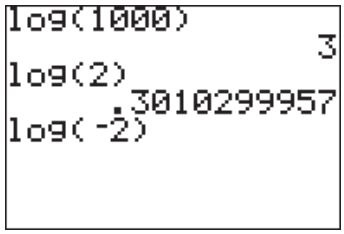
EXAMPLE 4 ▶ **Using a Calculator to Find Logarithms**

Use a calculator to evaluate each logarithmic expression. Verify the result.

a. $\log 1857$ **b.** $\log 0.258$ **c.** $\ln 3.592$

Solution ▶

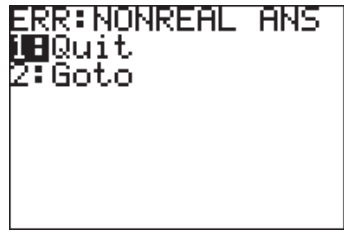
a. $\log 1857 = 3.268811904$,
$10^{3.268811904} = 1857$ ✓



b. $\log 0.258 = -0.588380294$,
$10^{-0.588380294} = 0.258$ ✓

c. $\ln 3.592 \approx 1.27870915$
$e^{1.27870915} \approx 3.592$ ✓

B. You've just seen how we can find common logarithms and natural logarithms

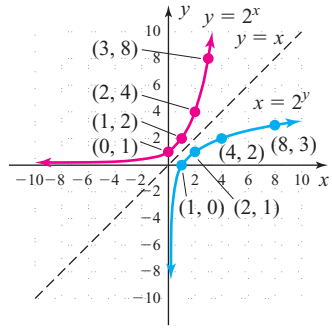


Now try Exercises 51 through 58 ▶

Figure 5.26

Finally, note that if $x > 10$, the value of $\log x$ is greater than 1, but if $0 < x < 10$ the value of $\log x$ is less than 1. Also, if $x < 0$, the expression $\log x$ does not represent a real number (the domain of $y = \log_b x$ does not include negative numbers). See Figures 5.26 and 5.27.

Figure 5.27



C. Graphing Logarithmic Functions

For convenience and ease of calculation, our first examples of logarithmic graphs are done using base-2 logarithms. However, the basic shape of a logarithmic graph remains unchanged regardless of the base used, and transformations can be applied to $y = \log_b(x)$ for any value of b. For $y = a\log(x \pm h) \pm k$, a continues to govern stretches, compressions, and vertical reflections, the graph will shift horizontally h units opposite the sign, and shift k units vertically in the same direction as the sign. Our earlier graph of $y = \log_2 x$ was completed using $x = 2^y$ as the inverse function for $y = 2^x$ (Figure 5.23). For reference, the graph is repeated in Figure 5.28.

WORTHY OF NOTE

As with the basic graphs we studied in Section 2.2, logarithmic graphs maintain the same characteristics when transformations are applied, and these graphs *should be added to your collection of basic functions,* ready for recall or analysis as the situation requires.

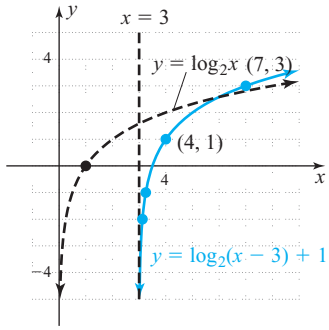


Figure 5.28

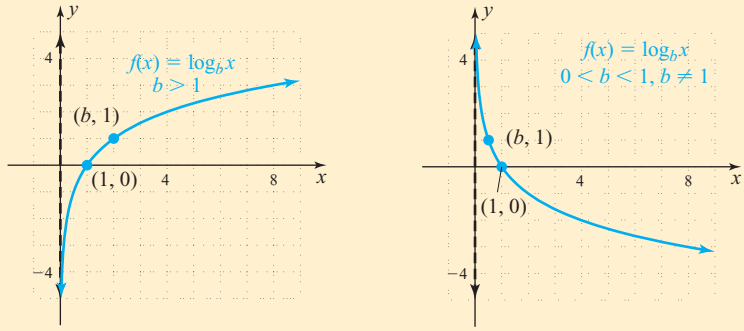
EXAMPLE 5 ▶ **Graphing Logarithmic Functions Using Transformations**

Graph $f(x) = \log_2(x - 3) + 1$ using transformations of $y = \log_2 x$ (not by simply plotting points). Clearly state what transformations are applied.

Solution ▶

The graph of f is the same as that of $y = \log_2 x$, shifted 3 units right and 1 unit up. The vertical asymptote will be at $x = 3$ and the point $(1, 0)$ from the basic graph becomes $(1 + 3, 0 + 1) = (4, 1)$. Knowing the graph's basic shape, we compute one additional point using $x = 7$:

$$\begin{aligned} f(7) &= \log_2(7 - 3) + 1 \\ &= \log_2 4 + 1 \\ &= 2 + 1 \\ &= 3 \end{aligned}$$



The point $(7, 3)$ is on the graph, shown in the figure.

Now try Exercises 59 through 72 ▶

As with the exponential functions, much can be learned from graphs of logarithmic functions and a summary of important characteristics is given here.

$f(x) = \log_b x$, $b > 0$ and $b \neq 1$

- one-to-one function
- domain: $x \in (0, \infty)$
- increasing if $b > 1$
- x-intercept $(1, 0)$
- range: $y \in \mathbb{R}$
- decreasing if $0 < b < 1$
- asymptotic to the y-axis (the line $x = 0$)

☑ **C.** You've just seen how we can graph logarithmic functions

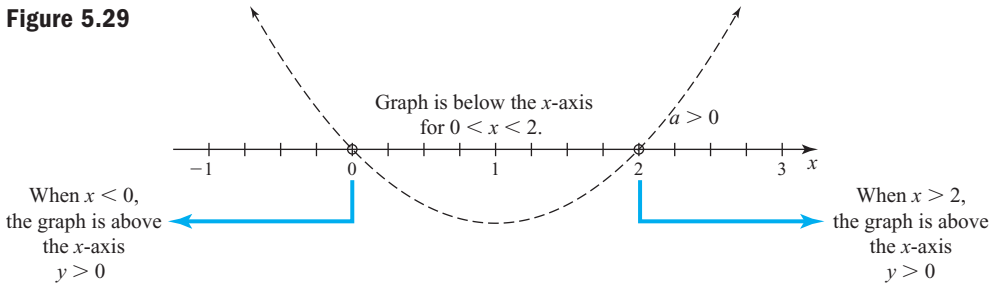
D. Finding the Domain of a Logarithmic Function

Examples 5 and 6 illustrate how the domain of a logarithmic function can change when certain transformations are applied. Since the domain consists of *positive* real numbers, the argument of a logarithmic function must be greater than zero. This means finding the domain often consists of solving various inequalities, which can be done using the skills acquired in Sections 3.2 and 4.6.

EXAMPLE 6 ▶ **Finding the Domain of a Logarithmic Function**

Determine the domain of each function.

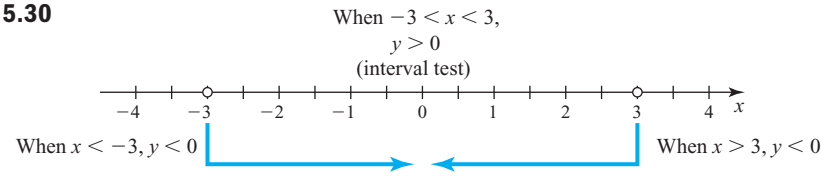
a. $p(x) = \log_2(2x + 3)$ **b.** $q(x) = \log_5(x^2 - 2x)$



c. $r(x) = \log\left(\dfrac{3 - x}{x + 3}\right)$ **d.** $f(x) = \ln|x - 2|$

Solution ▶ Begin by writing the argument of each function as a "greater than" inequality.

a. Solving $2x + 3 > 0$ for x gives $x > -\frac{3}{2}$, and the domain of p is $x \in (-\frac{3}{2}, \infty)$.

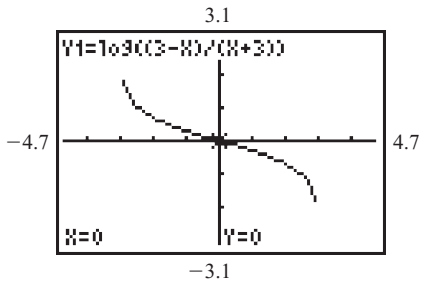


b. For $x^2 - 2x > 0$, we note $y = x^2 - 2x$ is a parabola, opening upward, with zeroes at $x = 0$ and $x = 2$ (see Figure 5.29). This means $x^2 - 2x$ will be positive for $x < 0$ and $x > 2$. The domain of q is $x \in (-\infty, 0) \cup (2, \infty)$.

Figure 5.29

c. For $\dfrac{3-x}{x+3} > 0$, we note $y = \dfrac{3-x}{x+3}$ has a zero at $x = 3$, with a vertical asymptote at $x = -3$ and here we opt to use the interval test method to solve the inequality. Outputs are positive when $x = 0$ (see Figure 5.30), so y is positive in the interval $(-3, 3)$ and negative elsewhere. The domain of r is $x \in (-3, 3)$.

Figure 5.30



d. For $|x - 2| > 0$, we note $y = |x - 2|$ is the graph of $y = |x|$ shifted 2 units right, with its vertex at $(2, 0)$. The graph is positive for all x, except at $x = 2$. The domain of f is $x \in (-\infty, 2) \cup (2, \infty)$.

D. You've just seen how we can find the domain of a logarithmic function

Now try Exercises 73 through 78

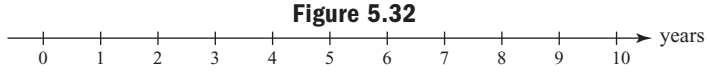
The domain for $r(x) = \log\left(\dfrac{3-x}{x+3}\right)$ from Example 7(c) can also be confirmed using the LOG key on a graphing calculator. Use this key to enter the equation as Y_1 on the Y= screen, then graph the function using the ZOOM **4:ZDecimal** option. Both the graph (Figure 5.31) and TABLE feature help to confirm the domain is $x \in (-3, 3)$.

Figure 5.31

E. Applications of Logarithms

The use of logarithmic scales as a tool of measurement is primarily due to the range of values for the phenomenon being measured. For instance, time is generally measured on a linear scale, and for short periods a linear scale is appropriate. For the time line in Figure 5.32, each tick-mark *represents 1 unit,* and the time line can display a period of 10 yr. However, the scale would be useless in a study of geology or the age of the universe. If we scale the number line logarithmically, each tick-mark *represents a power of 10* (Figure 5.33) and a scale of the same length can now display a time period of 10 billion years.

Figure 5.32



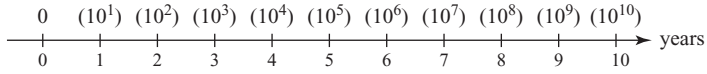


Figure 5.33

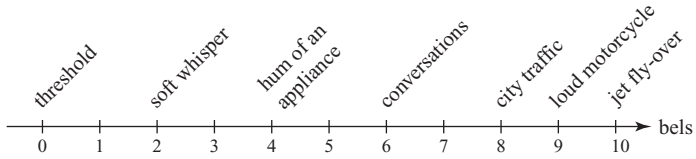
WORTHY OF NOTE

The **decibel** (dB) is the reference unit for sound, and is based on the faintest sound a person can hear, called the **threshold of audibility.** It is a base-10 logarithmic scale, meaning a sound 10 times more intense is one bel louder.

In much the same way, logarithmic measures are needed in a study of sound and earthquake intensity, as the scream of a jet engine is over 1 billion times more intense than the threshold of hearing, and the most destructive earthquakes are billions of times stronger than the slightest earth movement that can be felt. Similar ranges exist in the measurement of light, acidity, and voltage. Figures 5.34 and 5.35 show logarithmic scales for measuring sound in decibels (1 bel = 10 decibels) and earthquake intensity in Richter values (or magnitudes).

Figure 5.34



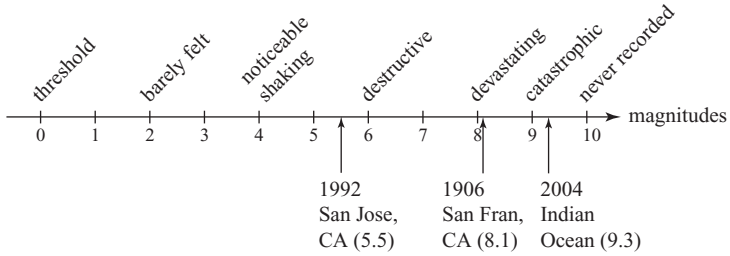


Figure 5.35

The slightest earth movement perceptible is called the **reference intensity** I_0, with the intensity I of stronger earthquakes expressed as a multiple of I_0. The earthquake that struck Haiti in January of 2010 was measured at over 10,500,000 times this reference intensity, or $I = 10{,}500{,}000I_0$. To find the Richter value (magnitude) of this earthquake, we simply take the base-10 logarithm of the ratio $\frac{I}{I_0}$ to express these values on a logarithmic scale. In function form, $M(I) = \log\left(\frac{I}{I_0}\right)$, and we find that the Haitian earthquake had a magnitude of just over 7.0: $\log\left(\frac{10{,}500{,}000I_0}{I_0}\right) = \log(10{,}500{,}000) \approx 7.0$.

EXAMPLE 7A ▶ Finding the Magnitude of an Earthquake

Find the magnitude of the earthquakes (rounded to hundredths) with the intensities given.

a. Eureka earthquake; January 9, 2010, near Humboldt county, California: $I = 3{,}162{,}000I_0$.

b. Sumatra-Andaman earthquake; December 26, 2004, near the west coast of Sumatra, Indonesia: $I = 1{,}995{,}260{,}000I_0$.

Solution ▶

a.
$$M(I) = \log\left(\frac{I}{I_0}\right) \quad \text{magnitude equation}$$
$$M(3{,}162{,}000I_0) = \log\left(\frac{3{,}162{,}000I_0}{I_0}\right) \quad \text{substitute } 3{,}162{,}000I_0 \text{ for } I$$
$$= \log 3{,}162{,}000 \quad \text{simplify}$$
$$\approx 6.5 \quad \text{result}$$

The earthquake had a magnitude of about 6.5.

b.
$$M(I) = \log\left(\frac{I}{I_0}\right) \quad \text{magnitude equation}$$
$$M(1{,}995{,}260{,}000I_0) = \log\left(\frac{1{,}995{,}260{,}000I_0}{I_0}\right) \quad \text{substitute } 1{,}995{,}260{,}000I_0 \text{ for } I$$
$$= \log 1{,}995{,}260{,}000 \quad \text{simplify}$$
$$\approx 9.3 \quad \text{result}$$

The earthquake had a magnitude of about 9.3.

EXAMPLE 7B ▶ Comparing Earthquake Intensity to the Reference Intensity

How many times more intense than the reference intensity I_0 was the Peruvian earthquake of June 23, 2001, with magnitude 8.4.

Solution ▶

$$M(I) = \log\left(\frac{I}{I_0}\right) \quad \text{magnitude equation}$$

$$8.4 = \log\left(\frac{I}{I_0}\right) \quad \text{substitute 8.4 for } M(I)$$

$$10^{8.4} = \left(\frac{I}{I_0}\right) \quad \text{exponential form}$$

$$I = 10^{8.4} I_0 \quad \text{solve for } I$$

$$I \approx 251{,}188{,}643 I_0 \quad 10^{8.4} \approx 251{,}188{,}643$$

The earthquake was over 251 million times more intense than the reference intensity.

EXAMPLE 7C ▶ Comparing Earthquake Intensities

Referring to Example 7A, how many times more intense was the Sumatra earthquake as compared to the Eureka earthquake?

Solution ▶ The Sumatra quake had a Richter value of 9.3, with an intensity of $10^{9.3}$. Similarly, the Eureka quake was measured at 6.5 on the Richter scale, with an intensity of $10^{6.5}$. Using these intensities, we find that the Sumatra quake was $\frac{10^{9.3}}{10^{6.5}} = 10^{2.8}$ or about 631 times more intense than the Eureka quake.

Now try Exercises 81 through 94 ▶

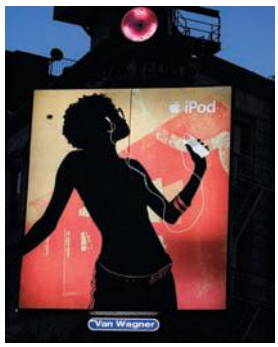
A second application of logarithmic functions involves the relationship between altitude and barometric pressure. The altitude or height above sea level can be determined by the formula $H = (30T + 8000)\ln\left(\frac{P_0}{P}\right)$, where H is the altitude in meters for a temperature T in degrees Celsius, P is the barometric pressure at a given altitude in units called **centimeters of mercury** (cmHg), and P_0 is the barometric pressure at sea level: 76 cmHg.

EXAMPLE 8 ▶ Using Logarithms to Determine Altitude

Hikers at the summit of Mt. Shasta in northern California take a pressure reading of 45.1 cmHg at a temperature of 9°C. How high is Mt. Shasta?

Solution ▶ For this exercise, $P_0 = 76$, $P = 45.1$, and $T = 9$. The formula yields

$$H = (30T + 8000)\ln\left(\frac{P_0}{P}\right) \quad \text{given formula}$$



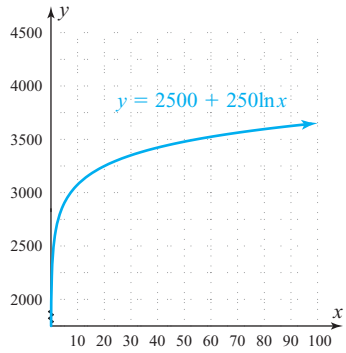
$$= [30(9) + 8000]\ln\left(\frac{76}{45.1}\right) \quad \text{substitute given values}$$

$$= 8270\ln\left(\frac{76}{45.1}\right) \quad \text{simplify}$$

$$\approx 4316 \quad \text{result}$$

Mt. Shasta is about 4316 m high.

Now try Exercises 95 through 98 ▶



Our final application shows the versatility of logarithmic functions, and their value as a real-world model. Large advertising agencies are well aware that after a new ad campaign, sales will increase rapidly as more people become aware of the product. Continued advertising will give the new product additional market share, but once the "newness" wears off and the competition begins responding, sales tend to taper off—regardless of any additional amount spent on ads. This phenomenon can be modeled by the function

$$S(d) = k + a \ln d$$

where $S(d)$ is the number of expected sales after d dollars are spent, and a and k are constants related to product type and market size.

EXAMPLE 9 ▶ **Using Logarithms for Marketing Strategies**

Market research has shown that sales of the MusicMaster, a new system for downloading and playing music, can be approximated by the equation $S(d) = 2500 + 250 \ln d$, where $S(d)$ is the number of sales after d thousand dollars is spent on advertising. The graph of $y = S(d)$ is shown.

a. What sales volume is expected if the advertising budget is \$40,000?

b. If the company needs to sell 3500 units to begin making a profit, how much should be spent on advertising?

Solution ▶

a. For sales volume, we simply evaluate the function for $d = 40$ (d in thousands):

$$\begin{aligned} S(d) &= 2500 + 250 \ln d && \text{given equation} \\ S(40) &= 2500 + 250 \ln 40 && \text{substitute 40 for } d \\ &\approx 2500 + 922 && 250 \ln 40 \approx 922 \\ &= 3422 \end{aligned}$$

Spending \$40,000 on advertising will generate approximately 3422 sales.

b. To find the advertising budget needed, we substitute number of sales and solve for d.

$$\begin{aligned} S(d) &= 2500 + 250 \ln d && \text{given equation} \\ 3500 &= 2500 + 250 \ln d && \text{substitute 3500 for } S(d) \\ 1000 &= 250 \ln d && \text{subtract 2500} \\ 4 &= \ln d && \text{divide by 250} \\ e^4 &= d && \text{exponential form} \\ 54.598 &\approx d && e^4 \approx 54.598 \end{aligned}$$

About \$54,600 should be spent in order to sell 3500 units.

Now try Exercises 99 and 100 ▶

E. You've just seen how we can solve applications of logarithmic functions

From the graph of $S(d)$ given in Example 10, it is apparent that while the number of sales continues to grow as more money is spent, the rate of growth slows considerably beyond \$50,000. In cases like this a *numeric* view of what's happening can be more meaningful. Here we'll use the **TABLE** feature in an entirely new way to investigate the number of sales gained for each additional \$1000 spent. For $Y_1 = 2500 + 250 \ln x$, we'll enter $Y_2 = Y_1(x) - Y_1(x - 1)$, which will automatically have the calculator find the difference between the current number of sales (spending x thousand dollars), and the number of sales made when \$1000 less is spent ($x - 1$ dollars). Figure 5.36 shows that initially each additional \$1000 spent results in a substantial sales increase, while Figure 5.37 shows very minor increases for a like amount spent.

There are a number of other interesting applications of logarithmic functions in the Exercise Set. **See Exercises 101 through 106.**

5.3 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. A logarithmic function is of the form $y =$ _____, where ___ $>$ 0, ___ $\neq 1$ and inputs are _____ than zero.
2. The range of $y = \log_b x$ is all _____ _____, and the domain is $x \in$ _____. Further, as $x \to 0$, $y \to$ _____.
3. For logarithmic functions of the form $y = \log_b x$, the x-intercept is _____, since $\log_b 1 =$ ___.
4. The function $y = \log_b x$ is an increasing function if _____, and a decreasing function if _____.
5. What number does the expression $\log_2 32$ represent? Discuss/Explain how $\log_2 32 = \log_2 2^5$ justifies this fact.
6. Explain how the graph of $Y = \log_b(x - 3)$ can be obtained from $y = \log_b x$. Where is the "new" x-intercept? Where is the new asymptote?

▶ DEVELOPING YOUR SKILLS

Write each equation in exponential form.

7. $3 = \log_2 8$
8. $2 = \log_3 9$
9. $-1 = \log_7 \frac{1}{7}$
10. $-3 = \ln \frac{1}{e^3}$
11. $0 = \log_9 1$
12. $0 = \ln 1$
13. $\frac{1}{3} = \log_8 2$
14. $\frac{1}{2} = \log_{81} 9$
15. $1 = \log_2 2$
16. $1 = \ln e$
17. $\log_7 49 = 2$
18. $\log_4 16 = 2$
19. $\log 100 = 2$
20. $\log 10{,}000 = 4$
21. $\ln(54.598) \approx 4$
22. $\log 0.001 = -3$

Write each equation in logarithmic form.

23. $4^3 = 64$
24. $e^3 \approx 20.086$
25. $3^{-2} = \frac{1}{9}$
26. $2^{-3} = \frac{1}{8}$
27. $e^0 = 1$
28. $8^0 = 1$
29. $(\frac{1}{3})^{-3} = 27$
30. $(\frac{1}{5})^{-2} = 25$
31. $10^3 = 1000$
32. $e^1 = e$
33. $10^{-2} = \frac{1}{100}$
34. $10^{-5} = \frac{1}{100{,}000}$
35. $4^{\frac{3}{2}} = 8$
36. $e^{\frac{3}{4}} \approx 2.117$
37. $4^{\frac{-3}{2}} = \frac{1}{8}$
38. $27^{\frac{-2}{3}} = \frac{1}{9}$

Determine the value of each logarithm without using a calculator.

39. $\log_4 4$

40. $\log_9 9$

41. $\log_{11} 121$

42. $\log_{12} 144$

43. $\ln e$

44. $\ln e^2$

45. $\log_4 2$

46. $\log_{81} 9$

47. $\log_7 \frac{1}{49}$

48. $\log_9 \frac{1}{81}$

49. $\ln \frac{1}{e^2}$

50. $\ln \frac{1}{\sqrt{e}}$

Use a calculator to evaluate each expression, rounded to four decimal places.

51. log 50

52. log 47

53. ln 1.6

54. ln 0.75

55. ln 225

56. ln 381

57. $\log \sqrt{37}$

58. $\log 4\pi$

Graph each function *using transformations* of $y = \log_b x$ and strategically plotting a few points. Clearly state the transformations applied.

59. $f(x) = \log_2 x + 3$

60. $g(x) = \log_2(x - 2)$

61. $h(x) = \log_2(x - 2) + 3$

62. $p(x) = \log_3 x - 2$

63. $q(x) = \ln(x + 1)$

64. $r(x) = \ln(x + 1) - 2$

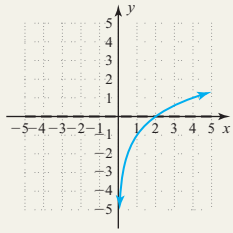
65. $Y_1 = -\ln(x + 1)$

66. $Y_2 = -\ln x + 2$

Use the transformation equation $y = af(x \pm h) \pm k$ and the asymptotes and intercept(s) of the parent function to match each equation to one of the graphs given. Assume $b > 1$.

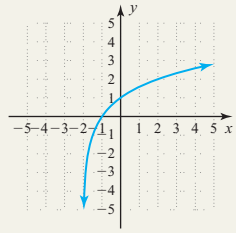
67. $y = \log_b(x + 2)$

68. $y = 2\log_b x$



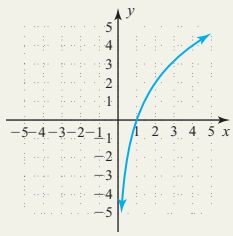
69. $y = 1 - \log_b x$

70. $y = \log_b x - 1$

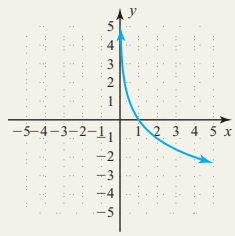


71. $y = \log_b x + 2$

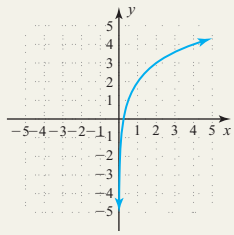
72. $y = -\log_b x$



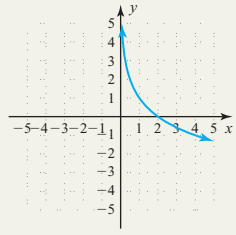
I.



II.



III.



IV.

V.

VI.

Determine the domain of the following functions.

73. $y = \log_6\left(\frac{x + 1}{x - 3}\right)$

74. $y = \ln\left(\frac{x - 2}{x + 3}\right)$

75. $y = \log_5\sqrt{2x - 3}$

76. $y = \ln\sqrt{5 - 3x}$

77. $y = \log(9 - x^2)$

78. $y = \ln(9x - x^2)$

▶ WORKING THE FORMULAS

79. pH level: $f(x) = -\log x$

The pH level of a solution indicates the concentration of hydrogen (H^+) ions in a unit called *moles per liter*. The pH level $f(x)$ is given by the formula shown (often written as $pH = -\log[H^+]$), where x is the ion concentration (given in scientific notation). A solution with pH < 7 is called an acid (lemon juice: pH ≈ 2), and a solution with pH > 7 is called a base (household ammonia: pH ≈ 11). Use the formula to determine the pH level of tomato juice if $x = 7.94 \times 10^{-5}$ moles per liter. Is this an acid or base solution?

80. Time required for an investment to double:

$$T(r) = \frac{\log 2}{\log(1 + r)}$$

The time required for an investment to double in value is given by the formula shown, where $T(r)$ represents the time required for an investment to double if invested at interest rate r (expressed as a decimal). How long would it take an investment to double if the interest rate were (a) 5%, (b) 8%, (c) 12%?

▶ APPLICATIONS

Earthquake intensity: Use the information provided in Example 8 to answer the following.

81. Find the value of $M(I)$ given

a. $I = 50{,}000I_0$ **b.** $I = 75{,}000{,}000\ I_0$.

82. Find the intensity I of the earthquake given

a. $M(I) = 3.2$ **b.** $M(I) = 8.1$.

Determine how many times more intense the first quake was compared to the second.

83. Great Chilean quake (1960): magnitude 9.5
Kobe, Japan, quake (1995): magnitude 6.9

84. Northern Sumatra (2004): magnitude 9.1
Southern Greece (2008): magnitude 4.5

85. Earthquake intensity: On June 25, 1989, an earthquake with magnitude 6.2 shook the southeast side of the Island of Hawaii (near Kalapana), causing some $1,000,000 in damage. On October 15, 2006, an earthquake measuring 6.7 on the Richter scale shook the northwest side of the island, causing over $100,000,000 in damage. How much more intense was the 2006 quake?

86. Earthquake intensity: The most intense earthquake of the modern era occurred in Chile on May 22, 1960, and measured 9.5 on the Richter scale. How many times more intense was this earthquake, than the quake that hit Northern Sumatra (Indonesia) on March 28, 2005, and measured 8.7?

Brightness of a star: The brightness or intensity I of a star as perceived by the naked eye is measured in units called *magnitudes.* The brightest stars have magnitude 1 $[M(I) = 1]$ and the dimmest have magnitude 6 $[M(I) = 6]$. The magnitude of a star is given by the equation $M(I) = 6 - 2.5 \cdot \log\left(\frac{I}{I_0}\right)$, where I is the actual intensity of light from the star and I_0 is the faintest light visible to the human eye, called the reference intensity. The intensity I is often given as a multiple of this reference intensity.

87. Find the value of $M(I)$ given

a. $I = 27I_0$ and **b.** $I = 85I_0$.

88. Find the intensity I of a star given

a. $M(I) = 1.6$ and **b.** $M(I) = 5.2$.

Intensity of sound: The intensity of sound as perceived by the human ear is measured in units called decibels (dB). The loudest sounds that can be withstood without damage to the eardrum are in the 120- to 130-dB range, while a whisper may measure in the 15- to 20-dB range. Decibel measure is given by the equation $D(I) = 10 \log\left(\frac{I}{I_0}\right)$, where I is the actual intensity of the sound and I_0 is the faintest sound perceptible by the human ear—called the reference intensity. The intensity I is often given as a multiple of this reference intensity, with the constant 10^{-16} (watts per cm^2; W/cm^2) used as the threshold of audibility.

89. Find the value of $D(I)$ given

a. $I = 10^{-14}$ and **b.** $I = 10^{-4}$.

90. Find the intensity I of the sound given

a. $D(I) = 83$ and **b.** $D(I) = 125$.

Determine how many times more intense the first sound is compared to the second.

91. pneumatic hammer: 11.2 bels
heavy lawn mower: 8.5 bels

92. train horn: 7.5 bels
soft music: 3.4 bels

93. Sound intensity of a hair dryer: Every morning (it seems), Jose is awakened by the mind-jarring, ear-jamming sound of his daughter's hair dryer (75 dB). He knew he was exaggerating, but told her (many times) of how it reminded him of his railroad days, when the air compressor for the pneumatic tools was running (110 dB). In fact, how many times more intense was the sound of the air compressor compared to the sound of the hair dryer?

94. Sound intensity of a busy street: The decibel level of noisy, downtown traffic has been estimated at 87 dB, while the laughter and banter at a loud party might be in the 60 dB range. How many times more intense is the sound of the downtown traffic?

The *barometric equation* $H = (30T + 8000)\ln\left(\frac{P_0}{P}\right)$ was discussed in Example 9.

95. Temperature and atmospheric pressure: Determine the height of Mount McKinley (Alaska), if the temperature at the summit is −10°C, with a barometric reading of 34 cmHg.

96. Temperature and atmospheric pressure: A large passenger plane is flying cross-country. The instruments on board show an air temperature of 3°C, with a barometric pressure of 22 cmHg. What is the altitude of the plane?

97. Altitude and atmospheric pressure: By definition, a mountain pass is a low point between two mountains. Passes may be very short with steep slopes, or as large as a valley between two peaks. Perhaps the highest drivable pass in the world is the Semo La pass in central Tibet. At its highest elevation, a temperature reading of 8°C was taken, along with a barometer reading of 39.3 cmHg. (a) Approximately how high is the Semo La pass? (b) While traveling up to this pass, an elevation marker is seen. If the barometer reading was 47.1 cmHg at a temperature of 12°C, what height did the marker give?

98. Altitude and atmospheric pressure: Hikers on Mt. Everest take successive readings of 35 cmHg at 5°C and 30 cmHg at −10°C. (a) How far up the mountain are they at each reading? (b) Approximate the height of Mt. Everest if the temperature at the summit is −27°C and the barometric pressure is 22.2 cmHg.

99. Marketing budgets: An advertising agency has determined the number of items sold by a certain client is modeled by the equation $N(A) = 1500 + 315 \ln A$, where $N(A)$ represents the number of sales after spending A thousands of dollars on advertising. Determine the approximate number of items sold on an advertising budget of (a) \$10,000; (b) \$50,000. (c) Use the TABLE feature of a calculator to estimate how large a budget is needed (to the nearest \$500 dollars) to sell 3000 items.

100. Sports promotions: The accountants for a major boxing promoter have determined that the number of pay-per-view subscriptions sold to their championship bouts can be modeled by the function $N(d) = 15{,}000 + 5850 \ln d$, where $N(d)$ represents the number of subscriptions sold after spending d thousand dollars on promotional activities. Determine the number of subscriptions sold if (a) \$50,000 and (b) \$100,000 is spent. (c) Determine how much should be spent (to the nearest \$1000 dollars) to sell over 50,000 subscriptions by simplifying the logarithmic equation and writing the result in exponential form.

101. Home ventilation: In the construction of new housing, there is considerable emphasis placed on correct ventilation. If too little outdoor air enters a home, pollutants can sometimes accumulate to levels that pose a health risk. For homes of various sizes, ventilation requirements have been established and are based on floor area and the number of bedrooms. For a three-bedroom home, the relationship can be modeled by the function $C(x) = 42 \ln x - 270$, where $C(x)$ represents the number of cubic feet of air per minute (cfm) that should be exchanged with outside air in a home with floor area x (in square feet). (a) How many cfm of exchanged air are needed for a three-bedroom home with a floor area of 2500 ft^2? (b) If a three-bedroom home is being mechanically ventilated by a system with 40 cfm capacity, what is the square footage of the home, assuming it is built to code?

102. Runway takeoff distance: Many will remember the August 27, 2006, crash of a commuter jet at Lexington's Blue Grass Airport, that was mistakenly trying to take off on a runway that was just too short. Forty-nine lives were lost. The minimum required length of a runway depends on the maximum allowable takeoff weight (mtw) of a specific plane. This relationship can be approximated by the function $L(x) = 2085 \ln x - 14{,}900$, where $L(x)$ represents the required length of a runway in feet, for a plane with x mtw in pounds.

a. The Airbus-320 has a 169,750 lb mtw. What minimum runway length is required for takeoff?

b. By simplifying the logarithmic equation that results and writing the equation in exponential form, determine the mtw of a Learjet 30, which requires a runway of 5550 ft to takeoff safely.

Memory retention: Under certain conditions, a person's retention of random facts can be modeled by the equation $P(x) = 95 - 14 \log_2 x$, where $P(x)$ is the percentage of those facts retained after x number of days. Find the percentage of facts a person might retain after x days for the values given. Note that many of the values given are powers of 2. Use the change-of-base formula for those that are not.

103. **a.** 1 day **b.** 4 days **c.** 16 days

104. **a.** 32 days **b.** 64 days **c.** 78 days

105. pH level: Use the formula given in Exercise 79 to determine the pH level of black coffee if $x = 5.1 \times 10^{-5}$ moles per liter. Is black coffee considered an acid or base solution?

106. Tripling time: The length of time required for an amount of money to *triple* is given by the formula $T(r) = \dfrac{\log 3}{\log(1 + r)}$ (see Exercise 80). Use the **TABLE** feature of a graphing calculator to help estimate what interest rate is needed for an investment to triple in nine years.

▶ EXTENDING THE CONCEPT

107. Many texts and reference books give estimates of the noise level (in decibels dB) of common sounds. Through reading and research, try to locate or approximate where the following sounds would fall along this scale. In addition, determine at what point pain or ear damage begins to occur.

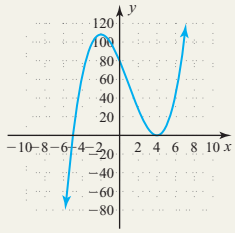
a. threshold of audibility **b.** lawn mower
c. whisper **d.** loud rock concert
e. lively party **f.** jet engine

108. Determine the value of x that makes the equation true: $\log_3[\log_3(\log_3 x)] = 0$.

109. Find the value of each expression without using a calculator.

a. $\log_{64}\frac{1}{16}$ **b.** $\log_{\frac{4}{9}}\frac{27}{8}$ **c.** $\log_{0.25}32$

110. Suppose you and I represent two different numbers. Is the following cryptogram true or false? *The log of me base me is one and the log of you base you is one, but the log of you base me is equal to the log of me base you turned upside down.*



▶ MAINTAINING YOUR SKILLS

111. (2.2) Graph $g(x) = \sqrt[3]{x+2} - 1$ by shifting the parent function. Then state the domain and range of g.

112. (Appendix A.4) Factor the following expressions:

a. $x^3 - 8$ **b.** $a^2 - 49$
c. $n^2 - 10n + 25$ **d.** $2b^2 - 7b + 6$

113. (4.2/4.6) For the graph shown, write the solution set for $f(x) < 0$. Then write the equation of the graph in factored form and in polynomial form.

114. (2.1) A function $f(x)$ is defined by the ordered pairs shown in the table. Is the function (a) linear? (b) increasing? Justify your answers.

x	y
−10	0
−9	−2
−8	−8
−6	−18
−5	−50
−4	−72

5.4 Properties of Logarithms

LEARNING OBJECTIVES

In Section 5.4 you will see how we can:

- ❑ **A.** Solve logarithmic equations using the fundamental properties of logarithms
- ❑ **B.** Apply the product, quotient, and power properties of logarithms
- ❑ **C.** Apply the change-of-base formula
- ❑ **D.** Solve applications using properties of logarithms

Logarithmic and exponential expressions have several fundamental properties that enable us to solve some basic equations. In this section, we'll learn how to use these relationships effectively, and introduce additional properties that enable us to simplify more complex equations before relying on the same fundamental properties to complete the solution.

A. Solving Equations Using the Fundamental Properties of Logarithms

In Section 5.3, we converted expressions from exponential form to logarithmic form using the basic definition: $x = b^y \Leftrightarrow y = \log_b x$. This relationship reveals the following fundamental properties:

Fundamental Properties of Logarithms

For any base $b > 0$, $b \neq 1$,

I. $\log_b b = 1$, since $b^1 = b$

II. $\log_b 1 = 0$, since $b^0 = 1$

III. $\log_b b^x = x$, since $b^x = b^x$

IV. $b^{\log_b x} = x$ $(x > 0)$, since $\log_b x = \log_b x$

To see the verification of Property IV more clearly, again note that for $y = \log_b x$, $b^y = x$ is the exponential form, and substituting $\log_b x$ for y yields $b^{\log_b x} = x$. Also note that Properties III and IV demonstrate that $y = \log_b x$ and $y = b^x$ are inverse functions. In common language, "a base-b logarithm *undoes* a base-b exponential," and "a base-b exponential *undoes* a base-b logarithm." For $f(x) = \log_b x$ and $f^{-1}(x) = b^x$, using a composition verifies the inverse relationship just as in Example 5 from Section 5.1:

$$\begin{aligned}(f \circ f^{-1})(x) &= f[f^{-1}(x)] \\ &= \log_b b^x \\ &= x\end{aligned} \qquad \begin{aligned}(f^{-1} \circ f)(x) &= f^{-1}[f(x)] \\ &= b^{\log_b x} \\ &= x\end{aligned}$$

These properties can be used to solve basic equations involving logarithms and exponentials. From the uniqueness property for exponents (page 426), note that if $\log_b x = k$, then $b^{\log_b x} = b^k$, and we say that we have *exponentiated* both sides.

EXAMPLE 1 ▶ **Solving Basic Logarithmic Equations**

Solve each equation by applying fundamental properties. Answer in exact form and approximate form using a calculator (round to 1000ths).

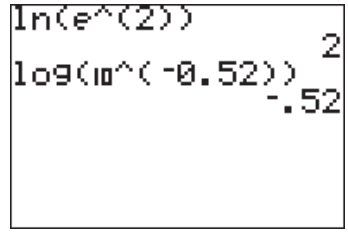
a. $\ln x = 2$ **b.** $-0.52 = \log x$

Solution ▶

a.

$\ln x = 2$	given
$e^{\ln x} = e^2$	exponentiate both sides
$x = e^2$	Property IV, exact form
≈ 7.389	approximate form

b.



$-0.52 = \log x$	given
$10^{-0.52} = 10^{\log x}$	exponentiate both sides
$10^{-0.52} = x$	Property IV, exact form
$0.302 \approx x$	approximate form

Now try Exercises 7 through 10 ▶

Note that checking the exact solutions by substitution is a direct application of Property III (Figure 5.38).

Also, we observe that exponentiating both sides of the equation produces the same result as simply writing the original equation in exponential form, and the process can be viewed in terms of either approach.

Figure 5.38

EXAMPLE 2 ▶ **Solving Basic Exponential Equations**

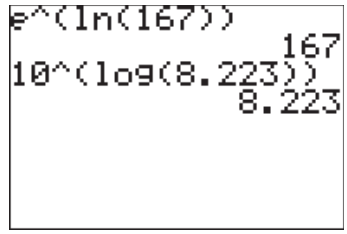
Solve each equation by applying fundamental properties. Answer in exact form and approximate form using a calculator (round to 1000ths).

a. $e^x = 167$ **b.** $10^x = 8.223$

Solution ▶

a.

$e^x = 167$	given
$\ln e^x = \ln 167$	use natural log
$x = \ln 167$	Property III, exact form
$x \approx 5.118$	approximate form



b.

$10^x = 8.223$	given
$\log 10^x = \log 8.223$	use common log
$x = \log 8.223$	Property III, exact form
$x \approx 0.915$	approximate form

Now try Exercises 11 through 14 ▶

Similar to our observations from Example 1, taking the logarithm of both sides produced the same result as writing the equation in logarithmic form, and the process can be viewed in terms of either approach. Also note that here, checking the exact solution by substitution is a direct application of Property IV (Figure 5.39).

Figure 5.39

If an equation has a single logarithmic or exponential term (base 10 or base e), the equation can be solved by isolating this term and applying one of the fundamental properties as in Examples 1 and 2.

EXAMPLE 3 ▶ **Solving Exponential Equations**

Solve each equation. Write answers in exact form and approximate form to four decimal places.

a. $10^x - 29 = 51$ **b.** $3e^{x+1} - 5 = 7$

Solution ▶

a. $10^x - 29 = 51$ given

$10^x = 80$ add 29

Since the left-hand side is base 10, we apply the common logarithm.

$\log 10^x = \log 80$ take the common log of both sides

$x = \log 80$ Property III (exact form)

≈ 1.9031 approximate form

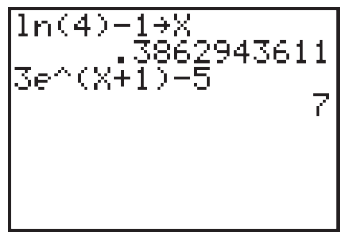
b. $3e^{x+1} - 5 = 7$ given

$3e^{x+1} = 12$ add 5

$e^{x+1} = 4$ divide by 3

Since the left-hand side is base e, we apply the natural logarithm.

$\ln e^{x+1} = \ln 4$ take the natural log of both sides



$x + 1 = \ln 4$ Property III

$x = \ln 4 - 1$ solve for x (exact form)

≈ 0.3863 approximate form

Now try Exercises 15 through 20 ▶

Figure 5.40

As an alternative to using the exact form to check solutions, we can STO (store) the exact result in storage location X,T,θ,n (the function variable x) and simply enter the original equation on the home screen. The verification for Example 3(b) is shown in Figure 5.40.

EXAMPLE 4 ▶ **Solving Logarithmic Equations**

Solve each equation. Write answers in exact form and approximate form to four decimal places.

a. $2 \log (7x) + 1 = 4$ **b.** $-4 \ln (x + 1) - 5 = 7$

Solution ▶

a. $2\log(7x) + 1 = 4$ given

$2\log(7x) = 3$ subtract 1

$\log(7x) = \frac{3}{2}$ divide by 2

$7x = 10^{\frac{3}{2}}$ exponential form

$x = \frac{10^{\frac{3}{2}}}{7}$ divide by 7 (exact form)

≈ 4.5175 approximate form

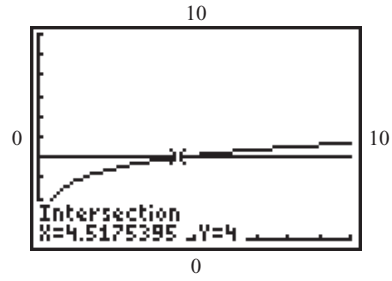
b. $-4\ln(x + 1) - 5 = 7$ given

$-4\ln(x + 1) = 12$ add 5

$\ln(x + 1) = -3$ divide by -4

$x + 1 = e^{-3}$ exponential form

$x = e^{-3} - 1$ subtract 1 (exact form)



≈ -0.9502 approximate form

Now try Exercises 21 through 26 ▶

A. You've just seen how we can solve logarithmic equations using the fundamental properties of logarithms

As with other kinds of equations, solutions to logarithmic and exponential equations can be found using the intersection-of-graphs method or the zeroes method. For Example 4(a) and the intersection method, enter $Y_1 = 2\log(7X) + 1$ and $Y_2 = 4$ on the Y= screen (from the domain of the function and the expected result, we know to set a window that includes only Quadrant I). Using the 2nd TRACE **(CALC) 5:intersect** option, we press ENTER three times to identify each curve and bypass the "Guess" option. The calculator then finds the point of intersection and prints it at the bottom of the screen, and verifies our calculated result.

Figure 5.41

B. The Product, Quotient, and Power Properties of Logarithms

Generally speaking, equation solving involves simplifying the equation, isolating a variable term on one side, and applying an inverse to solve for the unknown. For logarithmic equations such as $\log x + \log(x + 3) = 1$, we must find a way to combine the terms on the left, before we can work toward a solution. This requires a further exploration of logarithmic properties.

Due to the close connection between exponents and logarithms, their properties are very similar. To illustrate, we'll use terms that can all be written in the form 2^x, and write the equations $8 \cdot 4 = 32$, $\frac{8}{4} = 2$, and $8^2 = 64$ in both exponential form and logarithmic form.

The exponents from a product are added:

exponential form: $2^3 \cdot 2^2 = 2^{3+2}$

logarithmic form: $\log_2(8 \cdot 4) = \log_2 8 + \log_2 4$

The exponents from a quotient are subtracted:

exponential form: $\frac{2^3}{2^2} = 2^{3-2}$

logarithmic form: $\log_2\left(\frac{8}{4}\right) = \log_2 8 - \log_2 4$

The exponents from a power are multiplied:

exponential form: $(2^3)^2 = 2^{3 \cdot 2}$

logarithmic form: $\log_2 8^2 = 2 \cdot \log_2 8$

Each illustration can be generalized and applied with any base b.

WORTHY OF NOTE
For a more detailed verification of these properties, see Appendix B.

Properties of Logarithms

Given M, N, and $b \neq 1$ are *positive* real numbers, and *any* real number p.

Product Property	Quotient Property	Power Property
$\log_b(MN) = \log_b M + \log_b N$	$\log_b\left(\frac{M}{N}\right) = \log_b M - \log_b N$	$\log_b M^p = p\log_b M$
The log of a product is a sum of logarithms.	The log of a quotient is a difference of logarithms.	The log of a quantity to a power is the power times the log of the quantity.

CAUTION ▶ It's very important that you read and understand these properties correctly. In particular: (1) $\log(M + N) \neq \log M + \log N$, (2) $\log\left(\frac{M}{N}\right) \neq \frac{\log M}{\log N}$, and (3) $\frac{\log M}{\log N} \neq \log M - \log N$. For $M = 100$ and $N = 10$, statement (1) would indicate $\log 110 = 2 + 1$X, (2) would indicate that $1 = \frac{2}{1}$X, and (3) would indicate that $\frac{2}{1} = 2 - 1$X.

In the statement of these properties, it's worth reminding ourselves that the equal sign "works both ways," and we have $\log_b M + \log_b N = \log_b(MN)$. These properties are often used to write a sum or difference of logarithmic terms as a single expression.

EXAMPLE 5 ▶ **Rewriting Expressions Using Logarithmic Properties**

Use the properties of logarithms to write each expression as a single term.

a. $\log_2 7 + \log_2 5$ **b.** $2\ln x + \ln(x + 6)$ **c.** $\log(x + 2) - \log x$

Solution ▶

a. $\log_2 7 + \log_2 5 = \log_2(7 \cdot 5)$ product property
$= \log_2 35$ simplify

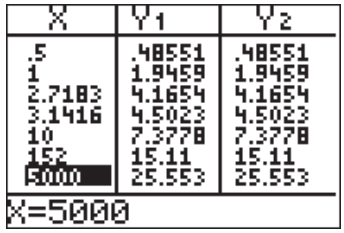
b. $2\ln x + \ln(x + 6) = \ln x^2 + \ln(x + 6)$ power property
$= \ln[x^2(x + 6)]$ product property
$= \ln[x^3 + 6x^2]$ simplify

c. $\log(x + 2) - \log x = \log\left(\frac{x + 2}{x}\right)$ quotient property

Now try Exercises 27 through 42 ▶

We can verify that these properties produce equivalent results by entering the original equation as Y_1, the result after applying the properties as Y_2, and viewing the results of various inputs on a **TABLE** screen. Results for Example 5(b) (power and product properties) and 5(c) (quotient property) are shown in Figures 5.42 and 5.43 respectively.

Figure 5.42
$2\ln x + \ln(x + 6) = \ln(x^3 + 6x^2)$



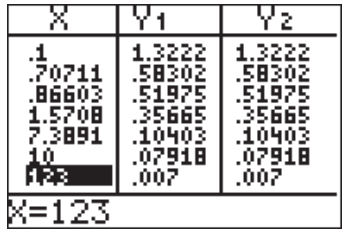


Figure 5.43
$\log(x + 2) - \log x = \log\left(\frac{x + 2}{x}\right)$

EXAMPLE 6 ▶ **Rewriting Logarithmic Expressions Using the Power Property**

Use the power property of logarithms to rewrite each term as a product.

a. $\ln 5^x$ **b.** $\log 32^{x+2}$ **c.** $\log \sqrt{x}$

Solution ▶

a. $\ln 5^x = x \ln 5$ power property

b. $\log 32^{x+2} = (x + 2) \log 32$ power property

c. $\log \sqrt{x} = \log x^{\frac{1}{2}}$ write radical using a rational exponent

$= \frac{1}{2} \log x$ power property

Now try Exercises 43 through 50 ▶

For examples of how these properties are used in context, **see Exercises 73 and 74.**

CAUTION ▶ Note from Example 6(b) that parentheses *must be used* whenever the exponent is a sum or difference. There is a huge difference between $(x + 2) \log 32$ and $x + 2 \log 32$.

Examples 5 and 6 illustrate how the properties of logarithms are used to *consolidate* logarithmic terms, primarily in preparation for equation solving. In other cases, the properties are used to rewrite or *expand* logarithmic expressions, so that certain other procedures can be applied more easily. Example 7 actually lays the foundation for more advanced mathematical work.

EXAMPLE 7 ▶ **Rewriting Expressions Using Logarithmic Properties**

Use the properties of logarithms to write the following expressions as sums or differences of simple logarithmic terms.

a. $\log(x^2 z)$ **b.** $\ln \sqrt{\frac{x}{x+5}}$

Solution ▶

a. $\log (x^2 z) = \log x^2 + \log z$ product property

$= 2 \log x + \log z$ power property

b. $\ln \sqrt{\frac{x}{x+5}} = \ln \left(\frac{x}{x+5}\right)^{\frac{1}{2}}$ write radical using a rational exponent

$= \frac{1}{2} \ln \left(\frac{x}{x+5}\right)$ power property

$= \frac{1}{2}[\ln x - \ln(x + 5)]$ quotient property

Now try Exercises 51 through 58 ▶

As you begin working with applications of logarithmic properties, it may help to have them written on a separate note card. This will enable you to compare each step and property as they are applied, remembering that "M" and "N" can represent any positive number or any positive, real-valued expression (see *Reinforcing Basic Concepts* on page 457). For Example 7(a) we then have

$$\log(M^2 N) = \log M^2 + \log N$$

B. You've just seen how we can apply the product, quotient, and power properties of logarithms

C. The Change-of-Base Formula

Although base-10 and base-e logarithms dominate the mathematical landscape, there are many practical applications of other bases. Fortunately, a formula exists that will convert any given base into either base 10 or base e. It's called the **change-of-base formula.**

Change-of-Base Formula

For the positive real numbers M, a, and b, with $a, b \neq 1$,

$$\log_b M = \frac{\log M}{\log b} \quad \text{base 10} \qquad \log_b M = \frac{\ln M}{\ln b} \quad \text{base } e \qquad \log_b M = \frac{\log_a M}{\log_a b} \quad \text{arbitrary base } a$$

Proof of the Change-of-Base Formula

For $y = \log_b M$, we have $b^y = M$ in exponential form. It follows that

$$\begin{aligned} \log_a(b^y) &= \log_a M && \text{take base-}a\text{ logarithm of both sides} \\ y \log_a b &= \log_a M && \text{power property of logarithms} \\ y &= \frac{\log_a M}{\log_a b} && \text{divide by } \log_a b \\ \log_b M &= \frac{\log_a M}{\log_a b} && \text{substitute } \log_b M \text{ for } y \end{aligned}$$

EXAMPLE 8 ▶ **Using the Change-of-Base Formula to Evaluate Expressions**

Find the value of each expression using the change-of-base formula. Answer in exact form and approximate form using nine digits, then *verify the result* using the original base. Note that either base 10 or base e can be used.

a. $\log_3 29$ **b.** $\log_5 3.6$

Solution ▶

a. $\log_3 29 = \dfrac{\log 29}{\log 3}$

≈ 3.065044752

Check: $3^{3.065044752} = 29$ ✓

b. $\log_5 3.6 = \dfrac{\ln 3.6}{\ln 5}$

≈ 0.795888947

Check: $5^{0.795888947} = 3.6$ ✓

Now try Exercises 59 through 66 ▶

C. You've just seen how we can apply the change-of-base formula

The change-of-base formula can also be used to study and graph logarithmic functions of *any* base. For $y = \log_b x$, the right-hand expression is simply rewritten using the formula and the equivalent function is $y = \dfrac{\log x}{\log b}$. The new function can then be evaluated as in Example 8, or used to study the graph of $y = \log_b x$ for any base b. **See Exercises 67 through 70.**

D. Solving Applications of Logarithms

We end this section with one additional application of logarithms. For all living things, the concentration of hydrogen ions in a solution plays an important role as their presence or absence alters the environment of other molecules in the solution. This can dramatically affect the functionality of the solution, or the ability of an organism to survive. The concentration of hydrogen ions (in moles per liter) is commonly expressed in terms of what is called the **pH scale.** A low pH number corresponds to high hydrogen ion concentration, and the solution is said to be acidic. A high pH corresponds to low hydrogen ion concentration, and the solution is said to be basic. Since the range of values is so large, the pH scale is logarithmic, meaning each unit change in the pH scale represents a 10-fold increase or decrease in the concentration of

hydrogen ions. For example, tomato juice, with a pH level of 2, is 10 times more acidic than orange juice, with a pH level of 3, and 100 times more acidic than grape juice (pH = 4; the lower the pH number, the higher the ion concentration). The pH values range from 0 to 14, with pure water at pH = 7 being deemed "neutral" (neither basic nor acidic). Measuring pH levels plays an important role in biology, chemistry, food science, environmental science, medicine, oceanography, personal care products, and many other areas. The number of hydrogen atoms is usually represented by the term H^+, with the pH number defined as $\text{pH} = -\log[H^+]$

EXAMPLE 9A ▶ The Concentration of Hydrogen Atoms in Ocean Water

Ocean water has a pH number of near 7.9. What is the concentration of hydrogen ions? Write the result in scientific notation.

Solution ▶ Begin with the basic formula and work from there.

$$\begin{aligned} \text{pH} &= -\log[H^+] && \text{pH formula} \\ 7.9 &= -\log[H^+] && \text{substitute 7.9 for pH} \\ -7.9 &= \log[H^+] && \text{multiply by } -1 \\ 10^{-7.9} &= H^+ && \text{exponential form} \\ 1.26 \times 10^{-8} &= H^+ && \text{result} \end{aligned}$$

The hydrogen ion concentration in ocean water is 1.26×10^{-8} moles/liter.

EXAMPLE 9B ▶ Finding the pH Level of an Apple

The concentration of hydrogen ions in an everyday apple is very near 7.94×10^{-4}. What is the pH level of an apple?

Solution ▶

$$\begin{aligned} \text{pH} &= -\log[H^+] && \text{pH formula} \\ &= -\log[7.94 \times 10^{-4}] && \text{substitute } 7.94 \times 10^{-4} \text{ for } H^+ \\ &\approx 3.1 && \text{result} \end{aligned}$$

An apple has a pH level near 3.1.

☑ **D.** You've just seen how we can solve applications of logarithms

Now try Exercises 73 through 78 ▶

5.4 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. For $e^{-0.02x+1} = 10$, the solution process is most efficient if we apply a base _____ logarithm to both sides.
2. To solve $\ln 2x - \ln(x + 3) = 0$, we can combine terms using the _____ property, or add $\ln(x + 3)$ to both sides and use the _____ property.
3. Since logarithmic functions are not defined for all real numbers, we should check all "solutions" for _____ roots.
4. The statement $\log_e 10 = \dfrac{\log 10}{\log e}$ is an example of the _____ -of- _____ formula.
5. Use all factor pairs of 36 to illustrate the product property of logarithms. For example, since $36 = 4 \cdot 9$, is $\log(4 \cdot 9) = \log 4 + \log 9$?
6. Use integer divisors of 24 to illustrate the quotient property of logarithms. For example, since $12 = \frac{24}{2}$, is $\log 12 = \log\left(\frac{24}{2}\right) = \log 24 - \log 2$?

▶ DEVELOPING YOUR SKILLS

Solve each equation by applying fundamental properties. Round to thousandths.

7. $\ln x = 3.4$ **8.** $\ln x = \frac{1}{2}$

9. $\log x = \frac{1}{4}$ **10.** $\log x = 1.6$

11. $e^x = 9.025$ **12.** $e^x = 0.343$

13. $10^x = 18.197$ **14.** $10^x = 0.024$

Solve each exponential equation. Write answers in exact form and in approximate form rounded to four decimal places.

15. $4e^{x-2} + 5 = 70$ **16.** $2 - 3e^{0.4x} = -7$

17. $10^{x+5} - 228 = -150$ **18.** $10^{2x} + 27 = 190$

19. $-150 = 290.8 - 190e^{-0.75x}$

20. $250e^{0.05x+1} + 175 = 1175$

Solve each logarithmic equation. Write answers in exact form and in approximate form rounded to four decimal places.

21. $3\ln(x + 4) - 5 = 3$ **22.** $-15 = -8\ln(3x) + 7$

23. $-1.5 = 2\log(5 - x) - 4$

24. $-4\log(2x) + 9 = 3.6$

25. $\frac{1}{2}\ln(2x + 5) + 3 = 3.2$

26. $\frac{3}{4}\ln(4x) - 6.9 = -5.1$

Use properties of logarithms to write each expression as a single term.

27. $\ln(2x) + \ln(x - 7)$ **28.** $\ln(x + 2) + \ln(3x)$

29. $\log(x + 1) + \log(x - 1)$

30. $\log(x - 3) + \log(x + 3)$

31. $\log_3 28 - \log_3 7$ **32.** $\log_6 30 - \log_6 10$

33. $\log x - \log(x + 1)$ **34.** $\log(x - 2) - \log x$

35. $\ln(x - 5) - \ln x$ **36.** $\ln(x + 3) - \ln(x - 1)$

37. $\ln(x^2 - 4) - \ln(x + 2)$

38. $\ln(x^2 - 25) - \ln(x + 5)$

39. $\log_2 7 + \log_2 6$ **40.** $\log_9 2 + \log_9 15$

41. $\log_5(x^2 - 2x) + \log_5 x^{-1}$

42. $\log_3(3x^2 + 5x) - \log_3 x$

Use the power property of logarithms to rewrite each term as the product of some quantity times a logarithmic term.

43. $\log 8^{x+2}$ **44.** $\log 15^{x-3}$

45. $\ln 5^{2x-1}$ **46.** $\ln 10^{3x+2}$

47. $\log\sqrt{22}$ **48.** $\log\sqrt[3]{34}$

49. $\log_5 81$ **50.** $\log_7 121$

Use the properties of logarithms to write the following expressions as sums or differences of simple logarithmic terms.

51. $\log(a^3 b)$ **52.** $\log(m^2 n)$

53. $\ln(x\sqrt[4]{y})$ **54.** $\ln(\sqrt[3]{pq})$

55. $\ln\left(\frac{x^2}{y}\right)$ **56.** $\ln\left(\frac{m^2}{n^3}\right)$

57. $\log\left(\sqrt{\frac{x-2}{x}}\right)$ **58.** $\log\left(\sqrt[3]{\frac{3-v}{2v}}\right)$

Evaluate each expression using the change-of-base formula and either base 10 or base *e*. Answer in exact form and in approximate form using nine decimal places, then verify the result using the original base.

59. $\log_7 60$ **60.** $\log_8 92$

61. $\log_5 152$ **62.** $\log_6 200$

63. $\log_3 1.73205$ **64.** $\log_2 1.41421$

65. $\log_{0.5} 0.125$ **66.** $\log_{0.2} 0.008$

Use the change-of-base formula to write an equivalent function, then evaluate the function as indicated (round to six decimal places). Investigate and discuss any patterns you notice in the output values, then determine the next input that will continue the pattern.

67. $f(x) = \log_3 x$; $f(5), f(15), f(45)$

68. $g(x) = \log_2 x$; $g(5), g(10), g(20)$

69. $h(x) = \log_9 x$; $h(2), h(4), h(8)$

70. $H(x) = \log_\pi x$; $H(\sqrt{2}), H(2), H(\sqrt{2^3})$

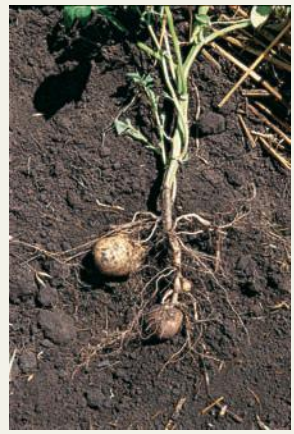
▶ WORKING WITH FORMULAS

71. $\log_b M = \dfrac{1}{\log_M b}$

Use the change-of-base formula to verify the "formula" shown.

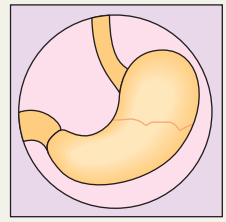
72. $\log_B A \cdot \log_C B \cdot \log_D C = \log_D A$

Use the change-of-base formula to verify the "formula" shown.



▶ APPLICATIONS

73. Pareto's 80/20 principle: After observing that 80% of the land in his native Italy was owned by 20% of the population, Italian economist Vilfredo Pareto (1848–1923) noted this disparity in many other areas (20% of the workers produce 80% of the output, 20% of the customers create 80% of the revenue, etc.) and developed a mathematical model for this phenomenon, called **Pareto's law.** If N represents the number of people with incomes greater than X, then $\log N = \log A - m \log X$, where A and m are predetermined constants. (a) Solve the equation for N and (b) given $m = 1.5$ and $A = 9900$, find the number of people earning over \$200,000. Assume X is in hundreds of thousands of dollars.



74. The species/area relationship: 
The study of what is now known as *island biogeography* originated with Robert McArthur and Edward O. Wilson in the 1960s. In general, they found that the relationship between island area and the number of species present could be modeled by the equation $\log S = \log C + k \log A$, where S represents the total number of species, A represents the area of the island, while C and k are predetermined constants that depend on the size and proximity of other land masses as well as other factors. This makes it possible to predict the number of species on an island, when little other information is available. (a) Solve the equation for S and (b) given $k = 0.81$ and $C = 8$, find the predicted number of species an island with area of $A = 2000$ km^2.

75. Blood plasma pH levels: 
To be safe and usable, the blood plasma held by blood banks must have a pH level between 7.35 and 7.45. Blood outside of this normal range can cause disorientation, behavioral changes, or even death. Using ion-sensitive electrodes, a sample of blood plasma is known to have a concentration of $H^+ = 4.786 \times 10^{-8}$. Is the plasma usable?

76. Fresh milk: 
As milk begins to sour, there is a corresponding decrease in pH level. Fresh milk has a pH level of near 6.5. After transport from farm to market, a sample of milk is tested using ion-sensitive electrodes and is found to have a concentration of $H^+ = 3.981 \times 10^{-5}$. Is this shipment of milk still suitable for market?

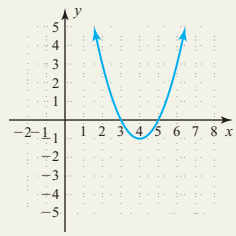
77. Soil acidity: 
Throughout many parts of the Midwest, surface soils are neutral to slightly alkaline. While a majority of crops might prefer a pH neutral soil (pH = 7), some crops thrive in more acidic soils (potatoes, strawberries, others). For these crops, elemental sulfur is applied to help decrease the pH level (the optimum pH level for potato crops is near 5.2). Measurements of the soil on a certain midwestern farm indicate a hydrogen ion concentration of $H^+ = 1.259 \times 10^{-6}$. Is the soil ready for a potato crop to be planted?

78. Acidity of gastric juices: The normal pH value of human gastric juice can vary from 1 to 3, depending on genetics, diet, and other factors. The acidity is designed to control various harmful microorganisms that a person may ingest as they eat. Drinking large quantities of water before a meal can have a dramatic effect on this pH value, sometimes raising it beyond the normal range to as high as 4 or 5, making it possible for some harmful bacteria to survive. If a hospital patient's stomach fluid has a hydrogen ion concentration of $H^+ = 3.981 \times 10^{-3}$, is the pH level within a normal range?

▶ EXTENDING THE CONCEPT

79. Logarithmic properties can also be used to compare the magnitude of very large numbers, numbers too large for a handheld calculator to manage. Use the power property of logarithms to compare the numbers 600^{601} and 601^{600}. Which number is larger?

80. Logarithmic properties can also be used to compare the magnitude of very small numbers, again numbers too small for a handheld calculator to manage. Use a negative exponent and the power property of logarithms to compare the numbers $\frac{1}{99^{100}}$ and $\frac{1}{100^{99}}$. Which number is smaller?



▶ MAINTAINING YOUR SKILLS

81. **(4.4/4.5)** State the zeroes of f and the equation of any horizontal or vertical asymptotes given $f(x) = \dfrac{x^2 - x - 6}{x^2 - 1}$.

82. **(1.4)** A sports shop can stock 36 cans of tennis balls on shelves that are 9 in. deep, and 54 cans on 12-in. shelves. Assuming the relationship is linear, (a) find the equation relating shelf size to number of cans, and (b) use it to determine what size shelf should be used to stock a full shipment of 72 cans.

83. **(Appendix A.4)** Find all values of x that make the equation true: $2x(x - 3) + 4 = (3x + 5)(x - 1)$.

84. **(2.2)** Determine the equation of the function shown in (a) shifted form and (b) standard form

MID-CHAPTER CHECK

1. Write the following in logarithmic form.

a. $27^{\frac{2}{3}} = 9$ **b.** $81^{\frac{5}{4}} = 243$

2. Write the following in exponential form.

a. $\log_8 32 = \frac{5}{3}$ **b.** $\log_{1296} 6 = 0.25$

3. Solve each equation for the unknown:

a. $4^{2x} = 32^{x-1}$ **b.** $(\frac{1}{3})^{4b} = 9^{2b-5}$

4. Solve each equation for the unknown:

a. $\log_{27} x = \frac{1}{3}$ **b.** $\log_b 125 = 3$

5. The homes in a popular neighborhood are growing in value according to the formula $V(t) = V_0(\frac{9}{8})^t$, where t is the time in years, V_0 is the purchase price of the home, and $V(t)$ is the current value of the home. (a) In 3 yr, how much will a $50,000 home be worth? (b) Use the TABLE feature of your calculator to estimate how many years (to the nearest year) until the home doubles in value.

6. The graph of the function $f(x) = 5^x$ has been shifted right 3 units, up 2 units, and stretched by a factor of 4. What is the equation of the resulting function?

7. State the domain and range for $f(x) = \sqrt{x - 3} + 1$, then find $f^{-1}(x)$ and state its domain and range. Verify the inverse relationship using composition.

8. Write the following equations in logarithmic form, then verify the result on a calculator.

a. $81 = 3^4$ **b.** $e^4 \approx 54.598$

9. Write the following equations in exponential form, then verify the result on a calculator.

a. $\frac{2}{3} = \log_{27} 9$ **b.** $1.4 \approx \ln 4.0552$

10. On August 15, 2007, an earthquake measuring 8.0 on the Richter scale struck coastal Peru. On October 17, 1989, right before Game 3 of the World Series between the Oakland A's and the San Francisco Giants, the Loma Prieta earthquake, measuring 7.1 on the Richter scale, struck the San Francisco Bay area. How much more intense was the Peruvian earthquake?

REINFORCING BASIC CONCEPTS

Understanding Properties of Logarithms

To effectively use the properties of logarithms as a mathematical tool, a student must attain some degree of comfort and fluency in their application. Otherwise we are resigned to using them as a template or formula, leaving little room for growth or insight. This feature is designed to promote an understanding of the product and quotient properties of logarithms, which play a role in the solution of logarithmic and exponential equations.

We begin by looking at some logarithmic expressions that are obviously true:

$$\log_2 2 = 1 \qquad \log_2 4 = 2 \qquad \log_2 8 = 3$$
$$\log_2 16 = 4 \qquad \log_2 32 = 5 \qquad \log_2 64 = 6$$

Next, we view the same expressions with their value *understood mentally,* illustrated by the numbers in the background, rather than expressly written.

$$\log_{\boxed{4}} 2 \quad \log_{\boxed{2}} 4 \quad \log_{\boxed{3}} 8 \quad \log_{\boxed{4}} 16 \quad \log_{\boxed{5}} 32 \quad \log_{\boxed{6}} 64$$

This will make the product and quotient properties of equality much easier to "see." Recall the product property states: $\log_b M + \log_b N = \log_b(MN)$ and the quotient property states: $\log_b M - \log_b N = \log_b\left(\frac{M}{N}\right)$. Consider the following.

$$\log_{\boxed{2}} 4 + \log_{\boxed{3}} 8 = \log_{\boxed{5}} 32 \qquad \log_{\boxed{6}} 64 - \log_{\boxed{5}} 32 = \log_{\boxed{4}} 2$$

which is the same as saying

$$\log_2 4 + \log_2 8 = \log_2(4 \cdot 8) \quad (\text{since } 4 \cdot 8 = 32)$$

which is the same as saying

$$\log_2 64 - \log_2 32 = \log_2\left(\tfrac{64}{32}\right) \quad (\text{since } \tfrac{64}{32} = 2)$$

$$\log_b M + \log_b N = \log_b(MN) \qquad \log_b M - \log_b N = \log_b\left(\frac{M}{N}\right)$$

Exercise 1: Repeat this exercise using logarithms of base 3 and various sums and differences.

Exercise 2: Use the basic concept behind these exercises to combine these expressions: (a) $\log(x) + \log(x + 3)$, (b) $\ln(x + 2) + \ln(x - 2)$, and (c) $\log(x) - \log(x + 3)$.

5.5 Solving Exponential and Logarithmic Equations

LEARNING OBJECTIVES

In Section 5.5 you will see how we can:

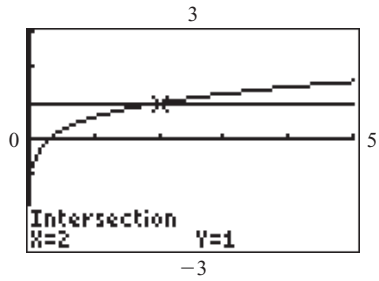
- ❑ **A.** Solve general logarithmic and exponential equations
- ❑ **B.** Solve applications involving logistic, exponential, and logarithmic functions

In this section, we'll develop the ability to solve more general logarithmic and exponential equations. A logarithmic equation has at least one term that involves the logarithm of a variable. Likewise, an exponential equation is one that involves a variable exponent on some base. In the same way that we might square both sides or divide both sides of an equation in the solution process, we'll show that we can also exponentiate both sides or take logarithms of both sides to help obtain a solution.

A. Solving Logarithmic and Exponential Equations

One of the most common mistakes in solving exponential and logarithmic equations is to apply the inverse function too early—before the equation has been simplified. Just as we would naturally try to combine like terms for the equation $2\sqrt{x} + 7\sqrt{x} = 69$ (prior to squaring both sides), the logarithmic terms in $\log x + \log(x + 3) = 1$ must be combined prior to applying the exponential form. In addition, since the domain of $y = \log_b x$ is $x > 0$, logarithmic equations can sometimes produce **extraneous roots,** and checking all answers is a good practice. We'll illustrate by solving the equation $\log x + \log(x + 3) = 1$.

EXAMPLE 1 ▶ Solving a Logarithmic Equation



Solve for x and check your answer: $\log x + \log(x + 3) = 1$.

▼ Algebraic Solution

$$\log x + \log(x + 3) = 1 \quad \text{original equation}$$
$$\log [x\,(x + 3)] = 1 \quad \text{product property}$$
$$x^2 + 3x = 10^1 \quad \text{exponential form, distribute } x$$
$$x^2 + 3x - 10 = 0 \quad \text{set equal to 0}$$
$$(x + 5)(x - 2) = 0 \quad \text{factor}$$
$$x = -5 \text{ or } x = 2 \quad \text{result}$$

▼ Graphical Solution

Using the intersection-of-graphs method, we enter $Y_1 = \log X + \log(X + 3)$ and $Y_2 = 1$. From the domain we know $x > 0$, indicating the solution will occur in QI. After graphing both functions using the window shown, the intersection method shows the only solution is $x = 2$.

Check: The "solution" $x = -5$ is outside the domain and is ignored. For $x = 2$,

$$\log x + \log(x + 3) = 1 \quad \text{original equation}$$
$$\log 2 + \log(2 + 3) = 1 \quad \text{substitute 2 for } x$$
$$\log 2 + \log 5 = 1 \quad \text{simplify}$$
$$\log(2 \cdot 5) = 1 \quad \text{product property}$$
$$\log 10 = 1 \quad \text{Property I}$$

You could also use a calculator to verify $\log 2 + \log 5 = 1$ directly.

Now try Exercises 7 through 14 ▶

If the simplified form of an equation yields a logarithmic term on both sides, the **uniqueness property of logarithms** provides an efficient way to work toward a solution. Since logarithmic functions are one-to-one, we have

The Uniqueness Property of Logarithms

For positive real numbers m, n, and $b \neq 1$,

1. If $\log_b m = \log_b n$, then $m = n$

2. If $m \neq n$, then $\log_b m \neq \log_b n$

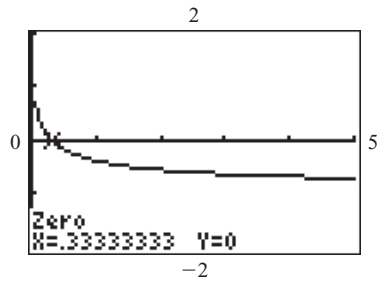
Equal bases imply equal arguments.

EXAMPLE 2 ▶ Solving Logarithmic Equations Using the Uniqueness Property

Solve each equation using the uniqueness property.

a. $\log(x + 2) = \log 7 + \log x$ **b.** $\ln 87 - \ln x = \ln 29$

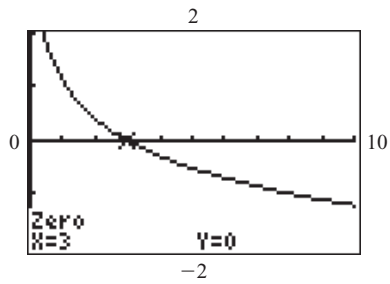
▼ Algebraic Solution



a.
$$\log(x + 2) = \log 7 + \log x$$
$$\log(x + 2) = \log 7x \quad \text{properties of logarithms}$$
$$x + 2 = 7x \quad \text{uniqueness property}$$
$$2 = 6x \quad \text{solve for } x$$
$$\frac{1}{3} = x \quad \text{result}$$

▼ Graphical Solution

Deciding which method to use (intersection or zeroes) can depend on the simplicity or complexity of the equation, how the equation is given, and/or which method gives the clearest view of the point(s) of intersection. Here, we opt to use the zeroes method.



a. After setting the equation equal to zero, we enter $Y_1 = \log(X + 2) - \log 7 - \log X$ and locate the x-intercept (if it exists) using 2nd TRACE **(CALC) 2:Zero.** The graph reveals an x-intercept between 0 and 1, and using these values as bounds we locate the zero at $x = \frac{1}{3}$ (Figure 5.44).

Figure 5.44

b. Once again setting the equation equal to zero, we enter $Y_1 = \ln 87 - \ln X - \ln 29$ to locate the x-intercept (if it exists). The graph shows an x-intercept near 3, with the calculator indicating the zero is exactly $x = 3$ (Figure 5.45).

Figure 5.45

b.
$$\ln 87 - \ln x = \ln 29$$
$$\ln\left(\frac{87}{x}\right) = \ln 29 \quad \text{quotient property}$$
$$\frac{87}{x} = 29 \quad \text{uniqueness property}$$
$$87 = 29x \quad \text{clear denominator}$$
$$3 = x \quad \text{result}$$

Now try Exercises 15 through 20 ▶

WORTHY OF NOTE

The uniqueness property can also be viewed as exponentiating both sides using the appropriate base, then applying Property IV.

Often the solution may depend on using a variety of algebraic skills in addition to logarithmic or exponential properties.

EXAMPLE 3 ▶ **Solving Logarithmic Equations**

Solve the equation and check your answer.

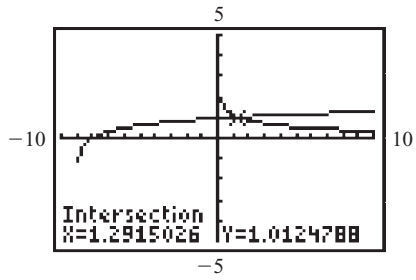
$$\log(x + 12) - \log x = \log(x + 9)$$

▼ Algebraic Solution

$$\log(x + 12) - \log x = \log(x + 9) \quad \text{given equation}$$
$$\log\left(\frac{x + 12}{x}\right) = \log(x + 9) \quad \text{quotient property}$$
$$\frac{x + 12}{x} = x + 9 \quad \text{uniqueness property}$$
$$x + 12 = x^2 + 9x \quad \text{clear denominator}$$
$$0 = x^2 + 8x - 12 \quad \text{set equal to 0}$$

▼ Graphical Solution

Using the intersection-of-graphs method, we enter $\log(X + 12) - \log x$ as Y_1 and $\log(X + 9)$ as Y_2 on the Y= screen. Using 2nd TRACE **(CALC) 5:intersect,** we find the graphs intersect at $x = 1.2915026$, and that *this is the only solution* (knowing the graphs' basic shape, we conclude they cannot intersect again).



The equation is not factorable, and the quadratic formula must be used.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$ quadratic formula

$$= \frac{-8 \pm \sqrt{(8)^2 - 4(1)(-12)}}{2(1)}$$ substitute 1 for a, 8 for b, -12 for c

$$= \frac{-8 \pm \sqrt{112}}{2} = \frac{-8 \pm 4\sqrt{7}}{2}$$ simplify

$$= -4 \pm 2\sqrt{7}$$ result

Substitution shows $x = -4 + 2\sqrt{7}$ ($x \approx 1.29150$) checks, but substituting $-4 - 2\sqrt{7}$ for x gives $\log(2.7085) - \log(-9.2915) = \log(-0.2915)$ and two of the three terms do not represent real numbers ($x = -4 - 2\sqrt{7}$ is an extraneous root).

Now try Exercises 21 through 36 ▶

CAUTION ▶ Be careful not to dismiss or discard a possible solution simply because it's negative. For the equation $\log(-6 - x) = 1, x = -16$ is the solution (the domain here allows negative numbers: $-6 - x > 0$ yields $x < -6$ as the domain). In general, when a logarithmic equation has multiple solutions, all solutions should be checked.

Solving an exponential equation likewise involves isolating an exponential term on one side, or writing the equation where exponential terms of like base occur on each side. The latter case can be solved using the uniqueness property. If the exponential base is neither 10 nor e, logarithms of base b can be used along with the change-of-base formula to solve the equation.

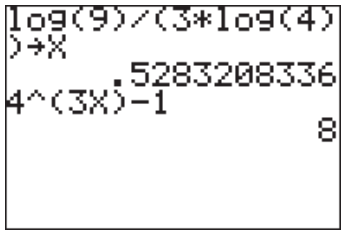
EXAMPLE 4 ▶ **Solving an Exponential Equation Using Base *b***

Solve the exponential equation. Answer in both exact form, and approximate form to four decimal places: $4^{3x} - 1 = 8$

Solution ▶

$$4^{3x} - 1 = 8$$ given equation

$$4^{3x} = 9$$ add 1



The left-hand side is neither base 10 or base e, so here we chose base 4 to solve.

$$\log_4 4^{3x} = \log_4 9$$ logarithms base 4

$$3x = \frac{\log 9}{\log 4}$$ Property III; change-of-base property

$$x = \frac{\log 9}{3 \log 4}$$ multiply by $\frac{1}{3}$ (exact form)

$$x \approx 0.5283$$ approximate form

A calculator check is shown here.

Now try Exercises 37 through 40 ▶

In some cases, two exponential terms with *unlike* bases may be involved. In this case, either common logs or natural logs can be used, but be sure to distinguish between constant terms like *ln 5* and variable terms like *x ln 5*. As with all equations, the goal is to isolate the *variable terms* on one side.

EXAMPLE 5 ▶ **Solving an Exponential Equation with Unlike Bases**

Solve the exponential equation $5^{x+1} = 6^{2x}$.

Algebraic Solution ▶

$5^{x+1} = 6^{2x}$ original equation

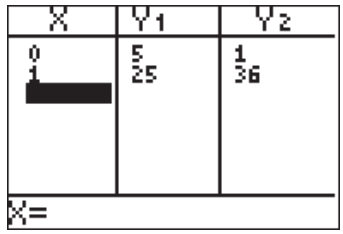
Begin by taking the natural log of both sides:

$$\begin{aligned}
\ln(5^{x+1}) &= \ln(6^{2x}) && \text{apply base-}e\text{ logarithms}\\
(x+1)\ln 5 &= 2x \ln 6 && \text{power property}\\
x \ln 5 + \ln 5 &= 2x \ln 6 && \text{distribute}\\
\ln 5 &= 2x \ln 6 - x \ln 5 && \text{variable terms to one side}\\
\ln 5 &= x(2 \ln 6 - \ln 5) && \text{factor out } x\\
\frac{\ln 5}{2 \ln 6 - \ln 5} &= x && \text{solve for } x \text{ (exact form)}\\
0.8153 &\approx x && \text{approximate form}
\end{aligned}$$

Graphical Solution ▶

In many cases, the quality of a graphical solution depends on the ability to determine an appropriate window size. Most often, this is accomplished using the domain of the functions involved, the context of the application, or a few test values. For $Y_1 = 5^{X+1}$ and $Y_2 = 6^{2X}$, we begin by observing that for $x = 0$, $Y_1 > Y_2$. However for $x = 2$, $Y_2 > Y_1$ (see Figure 5.46). This indicates that function values will be equal $[Y_1(X) = Y_2(X)]$ for some value of x between 0 and 1, and the window size for x must be set accordingly. These test values also show that y need not be greater than 36, though we may elect to use a higher value for both x and y to obtain a good window "frame." Using the window size indicated in Figure 5.47 reveals the solution to the equation (where the graphs intersect) is $x \approx 0.81528463$.

Figure 5.46



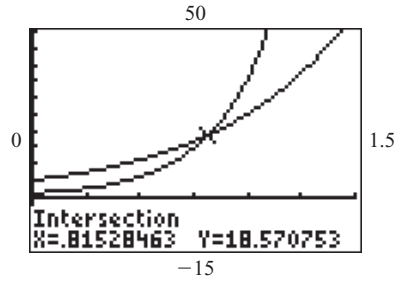


Figure 5.47

Now try Exercises 41 through 44 ▶

As an alternative to taking the natural log of both sides directly, we can use the properties of exponents to simplify and combine the exponential terms as follows.

$$\begin{aligned}
5^{x+1} &= 6^{2x} && \text{original equation}\\
5^x 5^1 &= (6^2)^x && \text{product and power properties}\\
5 \cdot 5^x &= 36^x && \text{rewrite factors; simplify}\\
5 &= \frac{36^x}{5^x} = \left(\frac{36}{5}\right)^x && \text{divide by } 5^x\text{, apply power property}\\
\ln 5 &= x \ln 7.2 && \text{take natural logs } \left(\tfrac{36}{5} = 7.2\right)\\
\frac{\ln 5}{\ln 7.2} &= x && \text{solve for } x
\end{aligned}$$

The result is equivalent to our original solution: $x \approx 0.8153$.

Logarithmic equations come in many different forms, and the following ideas summarize the basic approaches used in solving them. For this summary, recall that for any positive real number k, $\log_b k$ *is a constant*. Assume M, N, and X represent algebraic expressions in x.

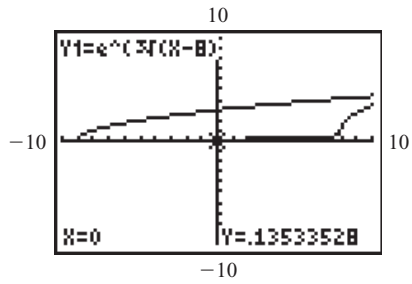
1. If the equation can be written in the form $\log_b M = \text{constant}$, use the exponential form and algebra to solve: $b^{\text{constant}} = M$.
2. If the equation can be written in the form $\log_b M = \log_b N$, use the uniqueness property and algebra to solve: $M = N$.
3. If the equation has an additional constant term as in $\log_b M = \log_b N + \text{constant}$, move all logarithmic terms to one side and consolidate using the product or quotient properties, then use the exponential form and algebra to solve:

$$\log_b M = \log_b N + \text{constant}$$
$$\log_b M - \log_b N = \text{constant}$$
$$\log_b\left(\frac{M}{N}\right) = \text{constant}$$
$$\frac{M}{N} = b^{\text{constant}}$$

4. If the equation has multiple logarithmic terms as in $\log_b X = \log_b M + \log_b N$, consolidate logarithmic terms using the product or quotient properties, then use the uniqueness property and algebra to solve:

$$\log_b X = \log_b M + \log_b N$$
$$\log_b X = \log_b (MN)$$
$$X = MN$$

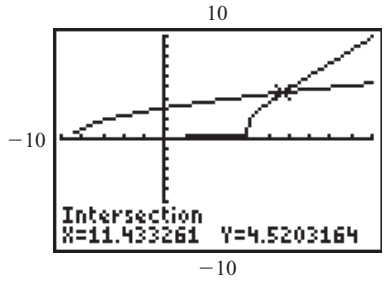
Many other forms and varieties are possible.



In advanced applications, the equations used are sometimes impossible to solve using inverse functions. This is often the case when logarithmic or exponential functions are mixed with other functions (polynomial, radical, rational, etc.). In these cases graphing and calculating technologies become indispensible tools, and the emphasis in working towards a solution shifts more to an understanding of the domain, the graphical attributes of the functions involved, and setting an appropriate window.

EXAMPLE 6 ▶ Solving Equations Using Technology

Find all solutions to $e^{\sqrt[3]{x-8}} = \sqrt{x+9}$.



Solution ▶ Begin by noting that the domain of the function on the left, call it Y_1, is all real numbers, since this is the domain of both $y = e^x$ and $y = \sqrt[3]{x}$. However, the domain of the function on the right (call it Y_2) is $x \geq -9$, and we expect that any solution(s) to the equation must occur to the right of -9, so we opt for a standard viewing window to begin (Figure 5.48). At first it appears the graphs do not intersect to the left, but our knowledge of the domain

Figure 5.48

indicates they must intersect near $x = -9$, since Y_1 and Y_2 are both positive. Using the intersection-of-graphs method, we find one solution is $x \approx -8.994$. To the right, no point of intersection is initially visible so we extend our window to explore whether the graphs intersect again. Using Xmax = 20 we note the graphs indeed intersect (Figure 5.49) and locate a second solution at $x \approx 11.433$.

Figure 5.49

☑ **A.** You've just seen how we can solve general logarithmic and exponential equations

Now try Exercises 45 through 48 ▶

B. Applications of Logistic, Exponential, and Logarithmic Functions

Applications of exponential and logarithmic functions take many different forms and it would be impossible to illustrate them all. As you work through the exercises, try to adopt a "big picture" approach, applying the general principles illustrated here to other applications. Some may have been introduced in previous sections. The difference here is that we can now *solve for the independent variable,* instead of simply evaluating the relationships.

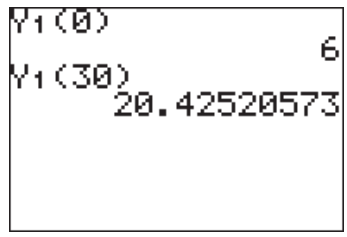
In applications involving the **logistic growth** of animal populations, the initial stage of growth is virtually exponential, but due to limitations on food, space, or other resources, growth slows and at some point it reaches a limit. In business, the same principle applies to the logistic growth of sales or profits, due to market saturation. In these cases, the exponential term appears in the denominator of a quotient, and we "clear denominators" to begin the solution process.

EXAMPLE 7 ▶ Solving a Logistic Equation

A small business makes a new discovery and begins an aggressive advertising campaign, confident they can capture 66% of the market in a short period of time. They anticipate their market share will be modeled by the function $M(t) = \dfrac{66}{1 + 10e^{-0.05t}}$, where $M(t)$ represents the percentage after t days. Use this function to answer the following.

a. What was the company's initial market share ($t = 0$)? What was their market share 30 days later?

b. How long will it take the company to reach a 60% market share?



▼ Algebraic Solution

a.
$$M(t) = \frac{66}{1 + 10e^{-0.05t}} \quad \text{given}$$
$$M(0) = \frac{66}{1 + 10e^{-0.05(0)}} \quad \text{substitute 0 for } t$$
$$= \frac{66}{11} \quad \text{simplify } (e^0 = 1)$$
$$= 6 \quad \text{result}$$

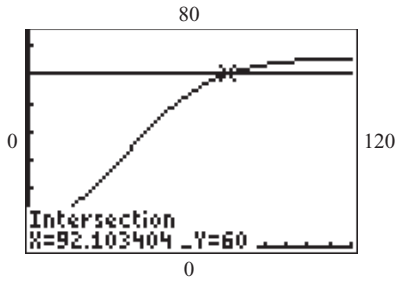
▼ Graphical Solution

a. After entering the function as Y_1, we can find $Y_1(0)$ and $Y_1(30)$ directly on the home screen (Figure 5.50). The company began the ad campaign with a 6% market share, and 30 days later they had secured over a 20.4% market share.

Figure 5.50

The company originally had only a 6% market share.

$$M(30) = \frac{66}{1 + 10e^{-0.05(30)}} \quad \text{substitute 30 for } t$$
$$= \frac{66}{1 + 10e^{-1.5}} \quad \text{simplify}$$
$$\approx 20.4 \quad \text{result}$$



After 30 days, they held a 20.4% market share.

b. For part (b), we replace $M(t)$ with 60 and solve for t.

$$60 = \frac{66}{1 + 10e^{-0.05t}} \quad \text{given}$$
$$60(1 + 10e^{-0.05t}) = 66 \quad \text{multiply by } 1 + 10e^{-0.05t}$$
$$1 + 10e^{-0.05t} = 1.1 \quad \text{divide by 60}$$
$$10e^{-0.05t} = 0.1 \quad \text{subtract 1}$$
$$e^{-0.05t} = 0.01 \quad \text{divide by 10}$$
$$\ln e^{-0.05t} = \ln 0.01 \quad \text{apply base-}e\text{ logarithms}$$
$$-0.05t = \ln 0.01 \quad \text{Property III}$$
$$t = \frac{\ln 0.01}{-0.05} \quad \text{solve for } t \text{ (exact form)}$$
$$\approx 92 \quad \text{approximate form}$$

b. Using the intersection-of-graphs method, we graph Y_1 with $Y_2 = 60$ to find any point(s) of intersection. For the window size, we reason that after 30 days, there is only a 20.4% market share (x must be much greater than 30), and a 60% market share is being explored (y must be greater than 60). Using the window indicated in Figure 5.51 reveals that a 60% market share will be attained shortly after the 92nd day.

Figure 5.51

The company will reach a 60% market share in about 92 days.

Now try Exercises 49 and 50 ▶

Earlier we used the barometric equation $H = (30T + 8000)\ln\left(\frac{P_0}{P}\right)$ to find an altitude H, given a temperature and the atmospheric (barometric) pressure in centimeters of mercury (cmHg). Using the tools from this section, we are now able to find the atmospheric pressure for a given altitude and temperature.

EXAMPLE 8 ▶ Using Logarithms to Determine Atmospheric Pressure

Suppose a group of climbers has just scaled Mt. Rainier, the highest mountain of the Cascade Range in western Washington State. If the mountain is about 4395 m high and the temperature at the summit is −22.5°C, what is the atmospheric pressure at this altitude? The pressure at sea level is $P_0 = 76$ cmHg.

▼ Algebraic Solution

$$H = (30T + 8000)\ln\left(\frac{P_0}{P}\right) \quad \text{given}$$

$$4395 = [30(-22.5) + 8000]\ln\left(\frac{76}{P}\right) \quad \text{substitute 4395 for } H\text{, 76 for } P_0\text{, and } -22.5 \text{ for } T$$

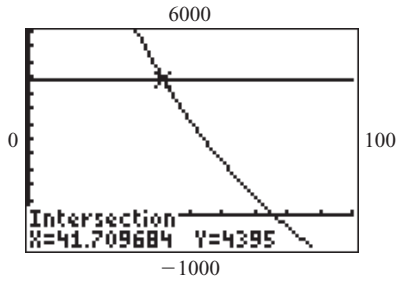
$$4395 = 7325\ln\left(\frac{76}{P}\right) \quad \text{simplify}$$

$$0.6 = \ln\left(\frac{76}{P}\right) \quad \text{divide by 7325}$$

$$e^{0.6} = \frac{76}{P} \quad \text{exponential form}$$

$$Pe^{0.6} = 76 \quad \text{multiply by } P$$

$$P = \frac{76}{e^{0.6}} \quad \text{divide by } e^{0.6} \text{ (exact form)}$$



$$\approx 41.7 \quad \text{approximate form}$$

▼ Graphical Solution

To ensure that no algebraic errors are introduced, we'll enter the function as it appears *after the substitutions are made:*

$$Y_1 = [30(-22.5) + 8000]\ln\left(\frac{76}{x}\right).$$

For the window size, we reason that since x must be between 0 and 76, and y is equal to 4395, we only need the first Quadrant and a "frame" around the window that allows a clear view of the intersection point. Using the window indicated shows that at an altitude of 4395 m and a temperature of −22.5°C, the atmospheric pressure is about 41.7 cmHg.

Now try Exercises 53 and 54 ▶

B. You've just seen how we can solve applications involving logistic, exponential, and logarithmic functions

Additional applications involving appreciation/depreciation, Newton's law of cooling, spaceship velocities and more, can be found in the Exercise Set. **See Exercises 55 through 66.**

5.5 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. The expression $\log_2 x$ represents a _____ term, while the expression $\log_2 9$ represents a _____ term.

2. To solve the equation $\ln(x + 3) - \ln x = 7$, we _____ like terms using logarithmic properties, prior to writing the equation in _____ form.

3. If certain conditions are met, we know if $\log_b M = \log_b N$, then $M = N$. This is a statement of the _____ property, which is valid since logarithmic functions are _____-to-_____.

4. Since the domain of $y = \log_b x$ is _____, solving logarithmic equations will sometimes produce _____ roots. Checking all solutions to logarithmic equations is a necessary step.

5. Answer true or false and explain your response:

$$\log_b(M + N) = \log_b(M) + \log_b(N)$$

6. Answer true or false and explain your response:

$$\log_b\left(\frac{M}{N}\right) = \frac{\log_b M}{\log_b N}$$

▶ DEVELOPING YOUR SKILLS

Solve each equation and check your answers.

7. $\log 4 + \log(x - 7) = 2$

8. $\log 5 + \log(x - 9) = 1$

9. $\log(2x - 5) - \log 78 = -1$

10. $\log(4 - 3x) - \log 145 = -2$

11. $\log(x - 15) - 2 = -\log x$

12. $\log x - 1 = -\log(x - 9)$

13. $\log(2x + 1) = 1 - \log x$

14. $\log(3x - 13) = 2 - \log x$

Solve each equation using the uniqueness property.

15. $\log(5x + 2) = \log 2$

16. $\log(2x - 3) = \log 3$

17. $\log_4(x + 2) - \log_4 3 = \log_4(x - 1)$

18. $\log_3(x + 6) - \log_3 x = \log_3 5$

19. $\ln(8x - 4) = \ln 2 + \ln x$

20. $\ln(x - 1) + \ln 6 = \ln(3x)$

Solve each equation using any appropriate method. State solutions in both exact form and in approximate form rounded to four decimal places. Clearly identify any extraneous roots. If there are no solutions, so state.

21. $\log(2x - 1) + \log 5 = 1$

22. $\log(x - 7) + \log 3 = 2$

23. $\log_2(9) + \log_2(x + 3) = 3$

24. $\log_3(x - 4) + \log_3(7) = 2$

25. $\ln(x + 7) + \ln 9 = 2$

26. $\ln 5 + \ln(x - 2) = 1$

27. $\log(x + 8) + \log x = \log(x + 18)$

28. $\log(x + 14) - \log x = \log(x + 6)$

29. $\ln(2x + 1) = 3 + \ln 6$

30. $\ln 21 = 1 + \ln(x - 2)$

31. $\log(-x - 1) = \log(5x) + \log x$

32. $\log(1 - x) + \log x = \log(x + 4)$

33. $\log(x - 1) - \log x = \log(x - 3)$

34. $\ln x + \ln(x - 2) = \ln 4$

35. $7^x = 231$

36. $6^x = 3589$

37. $5^{3x} - 2 = 128{,}965$

38. $9^{3x} - 3 = 78{,}462$

39. $2^{x+1} = 3^x$

40. $7^x = 4^{2x-1}$

Solve each equation using the zeroes method or the intersection-of-graphs method. Round approximate solutions to three decimal places.

41. $\sqrt[3]{x} = \ln(x + 5)$

42. $\dfrac{x^2 - 25}{x^2 - 9} = -\ln(x + 9) + 6$

43. $2^{x^2-x-6} = x^2 + x - 6$

44. $x^3 - 9x = \dfrac{1}{2}e^x$

45. $\dfrac{250}{1 + 4e^{-0.06x}} = 200$

46. $\dfrac{80}{1 + 15e^{-0.06x}} = 50$

▶ WORKING WITH FORMULAS

47. Logistic growth: $P(t) = \dfrac{C}{1 + ae^{-kt}}$

For populations that exhibit logistic growth, the population at time t is modeled by the function shown, where C is the carrying capacity of the population (the maximum population that can be supported over a long period of time), k is the growth constant, and $a = \frac{C - P(0)}{P(0)}$. Solve the formula for t, then use the result to find the value of t given $C = 450$, $a = 8$, $P = 400$, and $k = 0.075$.

48. Estimating time of death: $h = -3.9 \cdot \ln\left(\dfrac{T - T_R}{T_0 - T_R}\right)$

Using the formula shown, a forensic expert can compute the approximate time of death for a person found recently expired, where T is the body temperature when it was found, T_R is the (constant) temperature of the room, T_0 is the body temperature at the time of death ($T_0 = 98.6°\text{F}$), and h is the number of hours since death. If the body was discovered at 9:00 A.M. with a temperature of 86.2°F, in a room at 73°F, at approximately what time did the person expire? (Note this formula is a version of Newton's law of cooling.)

APPLICATIONS

Use the *barometric equation* $H = (30T + 8000)\ln\left(\frac{P_0}{P}\right)$ for exercises 49 and 50. Recall that $P_0 = 76$ cmHg.

49. Altitude and temperature: A sophisticated spy plane is cruising at an altitude of 18,250 m. If the temperature at this altitude is −75°C, what is the barometric pressure?

50. Altitude and temperature: A large weather balloon is released and takes altitude, pressure, and temperature readings as it climbs, and radios the information back to Earth. What is the pressure reading at an altitude of 5000 m, given the temperature is −18°C?

51. Stocking a lake: A farmer wants to stock a private lake on his property with catfish. A specialist studies the area and depth of the lake, along with other factors, and determines it can support a maximum population of around 750 fish, with growth modeled by the function $P(t) = \frac{750}{1 + 24e^{-0.075t}}$, where $P(t)$ gives the current population after t months. (a) How many catfish did the farmer initially put in the lake? (b) How many months until the population reaches 300 fish?

52. Increasing sales: After expanding their area of operations, a manufacturer of small storage buildings believes the larger area can support sales of 40 units per month. After increasing the advertising budget and enlarging the sales force, sales are expected to grow according to the model $S(t) = \frac{40}{1 + 1.5e^{-0.08t}}$, where $S(t)$ is the expected number of sales after t months. (a) How many sales were being made each month, prior to the expansion? (b) How many months until sales reach 25 units per month?

Use *Newton's law of cooling* $T = T_R + (T_0 - T_R)e^{kh}$ to complete Exercises 53 and 54. Recall that water freezes at 32°F and use $k = -0.012$. Refer to Section 5.2, page 428 as needed.

53. Making popsicles: On a hot summer day, Sean and his friends mix some Kool-Aid® and decide to freeze it in an ice tray to make popsicles. If the water used for the Kool-Aid® was 75°F and the freezer has a temperature of −20°F, how long will they have to wait to enjoy the treat?

54. Freezing time: Suppose the current temperature in Esconabe, Michigan, was 47°F when a 5°F arctic cold front moved over the state. How long would it take a puddle of water to freeze over?

Depreciation/appreciation: As time passes, the value of certain items decrease (appliances, automobiles, etc.), while the value of other items increase (collectibles, real estate, etc.). The time T in years for an item to reach a future value can be modeled by the formula $T = k\ln\left(\frac{V_n}{V_f}\right)$, where V_n is the purchase price when new, V_f is its future value, and k is a constant that depends on the item.

55. Automobile depreciation: If a new car is purchased for $28,500, find its value 3 yr later if $k = 5$.

56. Home appreciation: If a new home in an "upscale" neighborhood is purchased for $130,000, find its value 12 yr later if $k = -16$.

Drug absorption: The time required for a certain percentage of a drug to be *absorbed* by the body after injection depends on the drug's absorption rate. This can be modeled by the function $T(p) = \frac{-\ln p}{k}$, where p represents the percent of the drug that *remains unabsorbed* (expressed as a decimal), k is the absorption rate of the drug, and $T(p)$ represents the elapsed time.

57. For a drug with an absorption rate of 7.2%, (a) find the time required (to the nearest hour) for the body to *absorb* 35% of the drug, and (b) find the percent of this drug (to the nearest half percent) that remains unabsorbed after 24 hr.

58. For a drug with an absorption rate of 5.7%, (a) find the time required (to the nearest hour) for the body to *absorb* 50% of the drug, and (b) find the percent of this drug (to the nearest half percent) that remains unabsorbed after 24 hr.

Spaceship velocity: In space travel, the change in the velocity of a spaceship V_s (in km/sec) depends on the mass of the ship M_s (in tons), the mass of the fuel which has been burned M_f (in tons) and the escape velocity of the exhaust V_e (in km/sec). Disregarding frictional forces, these are related by the equation $V_s = V_e\ln\left(\frac{M_s}{M_s - M_f}\right)$.

59. For the Jupiter VII rocket, find the mass of the fuel M_f that has been burned if $V_s = 6$ km/sec when $V_e = 8$ km/sec, and the ship's mass is 100 tons.

60. For the Neptune X satellite booster, find the mass of the ship M_s if $M_f = 75$ tons of fuel has been burned when $V_s = 8$ km/sec and $V_e = 10$ km/sec.

Learning curve: The job performance of a new employee when learning a repetitive task (as on an assembly line) improves very quickly at first, then grows more slowly over time. This can be modeled by the function $P(t) = a + b \ln t$, where a and b are constants that depend on the type of task and the training of the employee.

61. The number of toy planes an employee can assemble from its component parts depends on the length of time the employee has been working. This output is modeled by $P(t) = 5.9 + 12.6 \ln t$, where $P(t)$ is the number of planes assembled daily after working t days. (a) How many planes is an employee making after 5 days on the job? (b) How many days until the employee is able to assemble 34 planes per day?

62. The number of circuit boards an associate can assemble from its component parts depends on the length of time the associate has been working. This output is modeled by $B(t) = 1 + 2.3 \ln t$, where $B(t)$ is the number of boards assembled daily after working t days. (a) How many boards is an employee completing after 9 days on the job? (b) How long will it take until the employee is able to complete 10 boards per day?

▶ EXTENDING THE CONCEPT

Solve the following equations. Note that equations Exercises 63 and 64 are in quadratic form.

63. $2e^{2x} - 7e^x = 15$

64. $3e^{2x} - 4e^x - 7 = -3$

65. Use the algebraic method to find the inverse function.

a. $f(x) = 2^{x+1}$ **b.** $y = 2 \ln(x - 3)$

66. Show that $g(x) = f^{-1}(x)$ by composing the functions.

a. $f(x) = 3^{x-2}$; $g(x) = \log_3 x + 2$

b. $f(x) = e^{x-1}$; $g(x) = \ln x + 1$

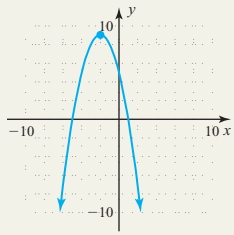
67. Use properties of logarithms and/or exponents to show

a. $y = 2^x$ is equivalent to $y = e^{x \ln 2}$.

b. $y = b^x$ is equivalent to $y = e^{rx}$, where $r = \ln b$.

68. Use test values for p and q to demonstrate that the following relationships are *false*.

a. $\ln(pq) = \ln p \ln q$ **b.** $\ln p + \ln q = \ln(p + q)$



c. $\ln\left(\frac{p}{q}\right) = \frac{\ln p}{\ln q}$

69. Match each equation with the most appropriate solution strategy, and justify/discuss why.

a. $e^{x+1} = 25$	_____	apply base-10 logarithm to both sides
b. $\log(2x + 3) = \log 53$	_____	rewrite and apply uniqueness property for exponentials
c. $\log(x^2 - 3x) = 2$	_____	apply uniqueness property for logarithms
d. $10^{2x} = 97$	_____	apply either base-10 or base-e logarithm
e. $2^{5x-3} = 32$	_____	apply base-e logarithm
f. $7^{x+2} = 23$	_____	write in exponential form

▶ MAINTAINING YOUR SKILLS

70. **(3.3)** Match the graph shown with its correct equation, without actually graphing the function.

a. $y = x^2 + 4x - 5$

b. $y = -x^2 - 4x + 5$

c. $y = -x^2 + 4x + 5$

d. $y = x^2 - 4x - 5$

71. **(2.3/2.4)** State the domain and range of the functions.

a. $y = \sqrt{2x + 3}$ **b.** $y = |x + 2| - 3$

72. **(4.5)** Graph the function $r(x) = \frac{x^2 - 4}{x - 1}$. Label all intercepts and asymptotes.

73. **(2.6)** Suppose the maximum load (in tons) that can be supported by a cylindrical post varies directly with its diameter raised to the fourth power and inversely as the square of its height. A post 8 ft high and 2 ft in diameter can support 6 tons. How many tons can be supported by a post 12 ft high and 3 ft in diameter?

5.6 Applications from Business, Finance, and Science

LEARNING OBJECTIVES

In Section 5.6 you will see how we can:

- ❑ **A.** Calculate simple interest and compound interest
- ❑ **B.** Calculate interest compounded continuously
- ❑ **C.** Solve applications of annuities and amortization
- ❑ **D.** Solve applications of exponential growth and decay

Would you pay $750,000 for a home worth only $250,000? Surprisingly, when a conventional mortgage is repaid over 30 years, this is not at all rare. Over time, the accumulated interest on the mortgage is easily more than two or three times the original value of the house. In this section we explore how interest is paid or charged, and look at other applications of exponential and logarithmic functions from business, finance, as well as the physical and social sciences.

A. Simple and Compound Interest

Simple interest is an amount of interest that is computed only once during the lifetime of an investment (or loan). In the world of finance, the initial deposit or base amount is referred to as the **principal *p*,** the **interest rate *r*** is given as a percentage and stated as an annual rate, with the term of the investment or loan most often given as *time t* in years. Simple interest is merely an application of the basic percent equation, with the additional element of time coming into play: *interest* = *principal* × *rate* × *time,* or $I = prt$. To find the total amount A that has accumulated (for deposits) or is due (for loans) after t years, we merely add the accumulated interest to the initial principal: $A = p + prt$.

WORTHY OF NOTE

If a loan is kept for only a certain number of months, weeks, or days, the time t should be stated as a fractional part of a year so the time period for the rate (years) matches the time period over which the loan is repaid.

Simple Interest Formula

If principal p is deposited or borrowed at interest rate r for a period of t years, the simple interest on this account will be

$$I = prt$$

The total amount A accumulated or due after this period will be

$$A = p + prt \quad \text{or} \quad A = p(1 + rt)$$

EXAMPLE 1 ▶ **Solving an Application of Simple Interest**

Many finance companies offer what have become known as *PayDay Loans*—a small $50 loan to help people get by until payday, usually no longer than 2 weeks. If the cost of this service is $12.50, determine the annual rate of interest charged by these companies.

Solution ▶ The interest charge is $12.50, the initial principal is $50.00, and the time period is 2 weeks or $\frac{2}{52} = \frac{1}{26}$ of a year. The simple interest formula yields

$$I = prt \qquad \text{simple interest formula}$$

$$12.50 = 50r\left(\frac{1}{26}\right) \qquad \text{substitute \$12.50 for } I\text{, \$50.00 for } p\text{, and } \tfrac{1}{26} \text{ for } t$$

$$6.5 = r \qquad \text{solve for } r$$

The annual interest rate on these loans is a whopping 650%!

Now try Exercises 7 through 16 ▶

Compound Interest

Many financial institutions pay **compound interest** on deposits they receive, which is interest paid on previously accumulated interest. The most common compounding periods are yearly, semiannually (two times per year), quarterly (four times per year), monthly (12 times per year), and daily (365 times per year). Applications of compound interest typically involve exponential functions. For convenience, consider \$1000 in principal, deposited at 8% for 3 yr. The simple interest calculation shows \$240 in interest is earned and there will be \$1240 in the account: $A = 1000[1 + (0.08)(3)] = \$1240$. If the interest is *compounded each year* $(t = 1)$ instead of once at the start of the 3-yr period, the interest calculation shows

$A_1 = 1000(1 + 0.08) = 1080$ in the account at the end of year 1,
$A_2 = 1080(1 + 0.08) = 1166.40$ in the account at the end of year 2,
$A_3 = 1166.40(1 + 0.08) \approx 1259.71$ in the account at the end of year 3.

The account has earned an additional \$19.71 interest. More important, notice that we're multiplying by $(1 + 0.08)$ each compounding period, meaning results can be computed more efficiently by simply applying the factor $(1 + 0.08)^t$ to the initial principal p. For example,

$$A_3 = 1000(1 + 0.08)^3 \approx \$1259.71.$$

In general, for interest compounded yearly the **accumulated value** is $A = p(1 + r)^t$. Notice that solving this equation for p will tell us the amount we need to deposit *now,* in order to accumulate A dollars in t years: $p = \frac{A}{(1 + r)^t}$. This is called the **present value equation.**

Interest Compounded Annually

If a principal p is deposited at interest rate r and compounded yearly for a period of t yr, the ***accumulated value*** is

$$A = p(1 + r)^t$$

If an accumulated value A is desired after t yr, and the money is deposited at interest rate r and compounded yearly, the ***present value*** is

$$p = \frac{A}{(1 + r)^t}$$

EXAMPLE 2 ▶ Finding the Doubling Time for Interest Compounded Yearly

An initial deposit of \$1000 is made into an account paying 6% compounded yearly. How long will it take for the money to double?

Solution ▶ Using the formula for interest compounded yearly we have

$A = p(1 + r)^t$		given
$2000 = 1000(1 + 0.06)^t$		substitute 2000 for A, 1000 for p, and 0.06 for r
$2 = 1.06^t$		isolate variable term
$\ln 2 = t \ln 1.06$		apply base-e logarithms; power property
$\frac{\ln 2}{\ln 1.06} = t$		solve for t
$11.9 \approx t$		approximate form

The money will double in just under 12 yr.

Now try Exercises 17 through 22 ▶

If interest is compounded monthly (12 times each year), the bank will divide the interest rate by 12 (the number of compoundings), but then pay you interest 12 times per year (interest is *compounded*). The net effect is an increased gain in the interest you earn, and the final compound interest formula takes this form:

$$\text{total amount} = \text{principal}\left(1 + \frac{\text{interest rate}}{\text{compoundings per year}}\right)^{(\text{years} \times \text{compoundings per year})}$$

Compounded Interest Formula

If principal p is deposited at interest rate r and compounded n times per year for a period of t yr, the *accumulated value* will be:

$$A = p\left(1 + \frac{r}{n}\right)^{nt}$$

EXAMPLE 3 ▶ **Solving an Application of Compound Interest**

Macalyn won $150,000 in the Missouri lottery and decides to invest the money for retirement in 20 yr. Of all the options available here, which one will produce the most money for retirement?

a. A certificate of deposit paying 5.4% compounded yearly.
b. A money market certificate paying 5.35% compounded semiannually.
c. A bank account paying 5.25% compounded quarterly.
d. A bond issue paying 5.2% compounded daily.

Solution ▶

a. $A = \$150{,}000\left(1 + \frac{0.054}{1}\right)^{(20\times 1)}$
$\approx \$429{,}440.97$

b. $A = \$150{,}000\left(1 + \frac{0.0535}{2}\right)^{(20\times 2)}$
$\approx \$431{,}200.96$

c. $A = \$150{,}000\left(1 + \frac{0.0525}{4}\right)^{(20\times 4)}$
$\approx \$425{,}729.59$

d. $A = \$150{,}000\left(1 + \frac{0.052}{365}\right)^{(20\times 365)}$
$\approx \$424{,}351.12$

The best choice is (b), semiannual compounding at 5.35% for 20 yr.

Now try Exercises 23 through 30 ▶

A. You've just seen how we can calculate simple interest and compound interest

B. Interest Compounded Continuously

It seems natural to wonder what happens to the interest accumulation as n (the number of compounding periods) becomes very large. It appears the interest rate becomes very small (because we're dividing it by n), but the exponent becomes very large (since we're multiplying it by n). To see the result of this interplay more clearly, it will help to rewrite the compound interest formula $A = p(1 + \frac{r}{n})^{nt}$ using the substitution $n = xr$. This gives $\frac{r}{n} = \frac{1}{x}$, and by direct substitution (xr for n and $\frac{1}{x}$ for $\frac{r}{n}$) we obtain the form

$$A = p\left[\left(1 + \frac{1}{x}\right)^{x}\right]^{rt}$$

by regrouping. This allows for a more careful study of the "denominator versus exponent" relationship using $(1 + \frac{1}{x})^x$, *the same expression we used in Section 5.2 to define the number e*. Once again, note what happens as $x \to \infty$ (meaning the number of compounding periods increase without bound).

x	1	10	100	1000	10,000	100,000	1,000,000
$\left(1 + \frac{1}{x}\right)^x$	2	2.59374	2.70481	2.71692	2.71815	2.71827	2.71828

As before, as $x \to \infty$, $(1 + \frac{1}{x})^x \to e$. The net result of this investigation is a formula for **interest compounded continuously,** derived by replacing $(1 + \frac{1}{x})^x$ with the number e in the formula for compound interest, where

$$A = p\left[\left(1 + \frac{1}{x}\right)^x\right]^{rt} = pe^{rt}$$

Interest Compounded Continuously

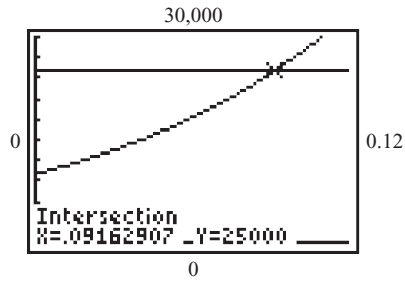
If a principal p is deposited at interest rate r and compounded continuously for a period of t years, the *accumulated value* will be

$$A = pe^{rt}$$

EXAMPLE 4 ▶ Solving an Application of Interest Compounded Continuously

Jaimin has $10,000 to invest and wants to have at least $25,000 in the account in 10 yr for his daughter's college education fund. If the account pays interest compounded continuously, what interest rate is required?

Solution ▶ In this case, $P = \$10{,}000$, $A = \$25{,}000$, and $t = 10$.



▼ Algebraic Solution

$A = pe^{rt}$		given
$25{,}000 = 10{,}000e^{10r}$		substitute given values
$2.5 = e^{10r}$		isolate variable term
$\ln 2.5 = 10r \ln e$		use natural logs; power property
$\frac{\ln 2.5}{10} = r$		solve for r ($\ln e = 1$)
$0.092 \approx r$		approximate form

Jaimin will need an interest rate of about 9.2% to meet his goal.

▼ Graphical Solution

Using $Y_1 = 10{,}000e^{10X}$ and $Y_2 = 25{,}000$, we look for their point of intersection. For the window size, since 25,000 is the goal, $y \in [0, 30{,}000]$ seems reasonable for y. Although 12% interest ($x = 0.12$) is too good to be true, $x \in [0, 0.12]$ will create a nice frame for the x-values. The point of intersection shows an interest rate of about 9.2% is required.

Now try Exercises 31 through 40 ▶

☑ **B.** You've just seen how we can calculate interest compounded continuously

C. Applications Involving Annuities and Amortization

Our previous calculations for simple and compound interest involved a single (lump) deposit (the principal) that accumulated interest over time. Many savings and investment plans involve a regular schedule of deposits (monthly, quarterly, or annual deposits) over the life of the investment. Such an investment plan is called an **annuity.**

Suppose that for 4 yr, $100 is deposited annually into an account paying 8% compounded yearly. Using the compound interest formula we can track the accumulated value A in the account:

$$A = 100 + 100(1.08)^1 + 100(1.08)^2 + 100(1.08)^3$$

WORTHY OF NOTE

It is often assumed that the first payment into an annuity is made *at the end of a compounding period,* and hence earns no interest. This is why the first \$100 deposit is not multiplied by the interest factor. These terms are actually the terms of a **geometric sequence,** which we will study later in Section 9.3.

To develop an annuity formula, we multiply the annuity equation by 1.08, then subtract the original equation. This leaves only the first and last terms, since the other (interior) terms add to zero:

$$\begin{aligned} 1.08A &= 100(1.08) + 100(1.08)^2 + 100(1.08)^3 + 100(1.08)^4 && \text{multiply by 1.08}\\ -A &= -[100 + 100(1.08)^1 + 100(1.08)^2 + 100(1.08)^3] && \text{original equation}\\ 1.08A - A &= 100(1.08)^4 - 100 && \text{subtract (“interior terms” sum to zero)}\\ 0.08A &= 100[(1.08)^4 - 1] && \text{factor out 100}\\ A &= \frac{100[(1.08)^4 - 1]}{0.08} && \text{solve for } A \end{aligned}$$

This result can be generalized for any periodic payment $\mathcal{P}$, interest rate r, number of compounding periods n, and number of years t. This would give

$$A = \frac{\mathcal{P}\left[\left(1 + \frac{r}{n}\right)^{nt} - 1\right]}{\frac{r}{n}}$$

The formula can be made less formidable using $R = \frac{r}{n}$, where R is the interest rate per compounding period.

Accumulated Value of an Annuity

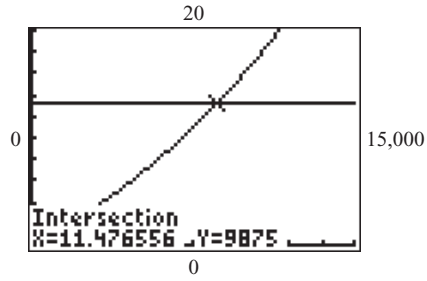
If a periodic payment $\mathcal{P}$ is deposited n times per year at an *annual interest rate* r with interest compounded n times per year for t years, the accumulated value is given by

$$A = \frac{\mathcal{P}}{R}[(1 + R)^{nt} - 1], \text{ where } R = \frac{r}{n}$$

This is also referred to as the **future value** of the account.

EXAMPLE 5 ▶ **Solving an Application of Annuities**

Since he was a young child, Fitisemanu's parents have been depositing \$50 each month into an annuity that pays 6% annually and is compounded monthly. If the account is now worth \$9875, how long has it been open?



Solution ▶ In this case $\mathcal{P} = 50$, $r = 0.06$, $n = 12$, $R = 0.005$, and $A = 9875$.

Algebraic Solution ▶

$$\begin{aligned} A &= \frac{\mathcal{P}}{R}[(1 + R)^{nt} - 1] && \text{future value formula}\\ 9875 &= \frac{50}{0.005}[(1.005)^{(12)(t)} - 1] && \text{substitute given values}\\ 1.9875 &= 1.005^{12t} && \text{simplify and isolate variable term}\\ \ln(1.9875) &= 12t(\ln 1.005) && \text{apply base-}e\text{ logarithms; power property}\\ \frac{\ln(1.9875)}{12\ln(1.005)} &= t && \text{solve for } t \text{ (exact form)}\\ 11.5 &\approx t && \text{approximate form} \end{aligned}$$

The account has been open approximately 11.5 yr.

Graphical Solution ▶ Here we'll use the intersection-of-graphs method. Entering $Y_1 = \left(\frac{50}{0.005}\right)(1.005^{12X} - 1)$ and $Y_2 = 9875$, we must next determine an appropriate window size. Since the goal is \$9875, we'll use [0, 15,000] for y, leaving a large frame around the window. If no interest were paid, it would take $\frac{9875}{50(12)} \approx 16.5$ yr to save 9875, so [0, 20] will also give a window size with plenty of room. The result is shown in the figure, and indicates the account has been open for about 11.5 yr.

Now try Exercises 41 through 44 ▶

The periodic payment required to meet a future goal or obligation can be computed by solving for $\mathcal{P}$ in the future value formula: $\mathcal{P} = \frac{AR}{[(1 + R)^{nt} - 1]}$. In this form, $\mathcal{P}$ is referred to as a **sinking fund.**

EXAMPLE 6 ▶ **Solving an Application of Sinking Funds**

Sheila is determined to stay out of debt and decides to save \$20,000 to pay cash for a new car in 4 yr. The best investment vehicle she can find pays 9% compounded monthly. If \$300 is the most she can invest each month, can she meet her "4-yr" goal?

Solution ▶ Here we have $\mathcal{P} = 300$, $A = 20{,}000$, $r = 0.09$, $n = 12$, and $R = 0.0075$. The sinking fund formula gives

$$\mathcal{P} = \frac{AR}{[(1 + R)^{nt} - 1]} \quad \text{sinking fund}$$

$$300 = \frac{(20{,}000)(0.0075)}{(1.0075)^{12t} - 1} \quad \text{substitute 300 for } \mathcal{P}\text{, 20,000 for } A\text{, 0.0075 for } R\text{, and 12 for } n$$

$$300(1.0075^{12t} - 1) = 150 \quad \text{multiply in numerator, clear denominators}$$

$$1.0075^{12t} = 1.5 \quad \text{isolate variable term}$$

$$12t \ln(1.0075) = \ln 1.5 \quad \text{apply base-}e\text{ logarithms; power property}$$

$$t = \frac{\ln(1.5)}{12 \ln(1.0075)} \quad \text{solve for } t \text{ (exact form)}$$

$$\approx 4.5 \quad \text{approximate form}$$

C. You've just seen how we can solve applications of annuities and amortization

No. She is close, but misses her original 4-yr goal.

Now try Exercises 45 and 46 ▶

For Example 6, we could have substituted 4 for t while leaving $\mathcal{P}$ and A unknown, to see if a payment of \$300 per month would be sufficient. Using $Y_1 = \frac{x(0.0075)}{1.0075^{48} - 1}$ and the **TABLE** feature of a calculator shows that just over \$17,000 would be saved for monthly deposits of \$300 (Figure 5.52), and that deposits of \$347.70 would be required to save \$20,000.

Figure 5.52

X	Y1
15000	260.78
16000	278.16
17000	295.55
18000	312.93
19000	330.32
20000	347.7
21000	365.09

Y1=347.700847479

For additional practice with the formulas for interest earned or paid, the *Working with Formulas* portion of this Exercise Set has been expanded. **See Exercises 47 through 54.**

WORTHY OF NOTE

Notice the formula for exponential growth is virtually identical to the formula for interest compounded continuously. In fact, both are based on the same principles. If we let $A(t)$ represent the amount in an account after t years and A_0 represent the initial deposit (instead of P), we have: $A(t) = A_0e^{rt}$ versus $Q(t) = Q_0e^{rt}$ and the two cannot be distinguished.

D. Applications Involving Exponential Growth and Decay

Closely related to interest compounded continuously are applications of **exponential growth** and **exponential decay.** If Q (quantity) and t (time) are variables, then Q grows exponentially as a function of t if $Q(t) = Q_0e^{rt}$ for positive constants Q_0 and r. Careful studies have shown that population growth, whether it be humans, bats, or bacteria, can be modeled by these "base-e" exponential growth functions. If $Q(t) = Q_0e^{-rt}$, then we say Q decreases or **decays exponentially** over time. The constant r determines how rapidly a quantity grows or decays and is known as the **growth rate** or **decay rate** constant.

EXAMPLE 7 ▶ Solving an Application of Exponential Growth

Because fruit flies multiply very quickly, they are often used in studies of genetics. Given the necessary space and food supply, a certain population of fruit flies is known to double every 12 days. If there were 100 flies to begin, find (a) the growth rate r and (b) the number of days until the population reaches 2000 flies.

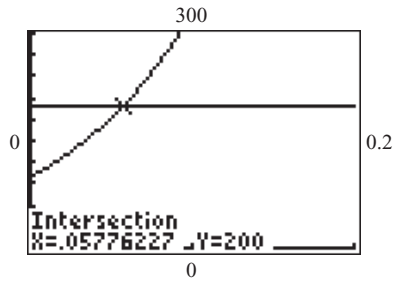
▼ Algebraic Solution

a. Using the formula for exponential growth with $Q_0 = 100$, $t = 12$, and $Q(t) = 200$, we can solve for the growth rate r.

$$\begin{aligned}
Q(t) &= Q_0e^{rt} && \text{exponential growth function}\\
200 &= 100e^{12r} && \text{substitute 200 for } Q(t), 100 \text{ for } Q_0, \text{ and 12 for } t\\
2 &= e^{12r} && \text{isolate variable term}\\
\ln 2 &= 12r \ln e && \text{apply base-}e \text{ logarithms; power property}\\
\frac{\ln 2}{12} &= r && \text{solve for } r \text{ (exact form)}\\
0.05776 &\approx r && \text{approximate form}
\end{aligned}$$

The growth rate is approximately 5.78%.

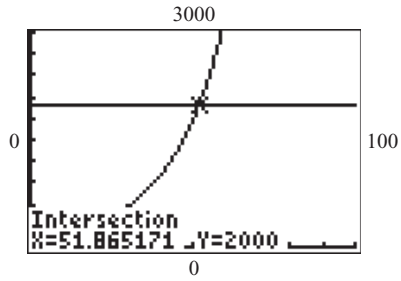
b. To find the number of days until the fly population reaches 2000, we substitute 0.05776 for r in the exponential growth function.



$$\begin{aligned}
Q(t) &= Q_0e^{rt} && \text{exponential growth function}\\
2000 &= 100e^{0.05776t} && \text{substitute 2000 for } Q(t), 100 \text{ for } Q_0, \text{ and 0.05776 for } r\\
20 &= e^{0.05776t} && \text{isolate variable term}\\
\ln 20 &= 0.05776t \ln e && \text{apply base-}e \text{ logarithms; power property}\\
\frac{\ln 20}{0.05776} &= t && \text{solve for } t \text{ (exact form)}\\
51.87 &\approx t && \text{approximate form}
\end{aligned}$$

The fruit fly population will reach 2000 on day 51.

▼ Graphical Solution



a. After substituting the values given, we input $Y_1 = 100e^{12x}$ and $Y_2 = 200$ to use the intersection-of-graphs method. While growth rates vary widely for animal populations, we might expect the growth rate to be a decimal between and 0 and 0.2 (0% to 20%), but can adjust the window afterward if needed. Since a population of 200 is the target, we can use [0, 300] for y and [0, 0.2] for x. As seen in Figure 5.53, the graphs intersect at $x \approx 0.05776$.

Figure 5.53

b. In part (a) we solved for the growth rate r. Here we'll use this growth rate and the intersection-of-graphs method to find the time t required for an initial population of 100 flies to grow to 2000. Begin by entering $100e^{0.05776X}$ as Y_1 and 2000 as Y_2. Setting the window for y is no problem, as we have a target population of 2000. For the x-values, consider the approximation $100e^{0.06t}$, and note that $t = 10$ gives too small a value ($100e^{0.6} \approx 182$), while $t = 100$ gives too large a value ($100e^{6.0} \approx 40{,}343$). Using the window $x \in [0, 100]$ and $y \in [0, 3000]$, we find the graphs intersect at $x \approx 51.87$, and the population of flies will reach 2000 in just less than 52 days. See Figure 5.54.

Figure 5.54

Now try Exercises 55 and 56 ▶

Perhaps the best-known examples of exponential decay involve radioactivity. Ever since the end of World War II, common citizens have been aware of the existence of **radioactive elements** and the power of atomic energy. Today, hundreds of additional applications have been found for these materials, from areas as diverse as biological research, radiology, medicine, and archeology. Radioactive elements decay of their own accord by emitting radiation. The rate of decay is measured using the **half-life** of the substance, which is the time required for a mass of radioactive material to decay until only one-half of its original mass remains. This half-life is used to find the rate of decay r, first mentioned in Section 5.5. In general, if h represents the half-life of the substance, one-half the initial amount remains when $t = h$.

$$Q(t) = Q_0e^{-rt} \quad \text{exponential decay function}$$

$$\frac{1}{2}Q_0 = Q_0e^{-rh} \quad \text{substitute } \tfrac{1}{2}Q_0 \text{ for } Q(t),\ h \text{ for } t$$

$$\frac{1}{2} = \frac{1}{e^{rh}} \quad \text{divide by } Q_0\text{; rewrite expression}$$

$$2 = e^{rh} \quad \text{property of ratios}$$

$$\ln 2 = rh \ln e \quad \text{apply base-}e\text{ logarithms; power property}$$

$$\frac{\ln 2}{h} = r \quad \text{solve for } r\ (\ln e = 1)$$

Radioactive Rate of Decay

If h represents the half-life of a radioactive substance per unit time, the nominal rate of decay per a like unit of time is given by

$$r = \frac{\ln 2}{h}$$

The rate of decay for known radioactive elements varies greatly. For example, the element carbon-14 has a half-life of about 5730 yr, while the element lead-211 has a half-life of only about 3.5 min. Radioactive elements can be detected in extremely small amounts. If a drug is "labeled" (mixed with) a radioactive element and injected into a living organism, its passage through the organism can be traced and information on the health of internal organs can be obtained.

EXAMPLE 8 ▶ Solving a Radioactive Rate of Decay Application

The radioactive element potassium-42 is often used in biological experiments, since it has a half-life of only about 12.4 hr.

a. How much of a 5-g sample will remain after 18 hr and 45 min?

b. Use the intersection-of-graphs method to find the number of hours until only 0.5 g remain.

Solution ▶

a. To begin we find the nominal rate of decay r and use this value in the exponential decay function.

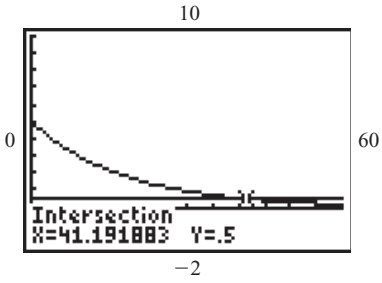
$$r = \frac{\ln 2}{h} \quad \text{radioactive rate of decay}$$

$$r = \frac{\ln 2}{12.4} \quad \text{substitute 12.4 for } h$$

$$r \approx 0.055899 \quad \text{result}$$

To determine how much of the sample remains after 18.75 hr, we use $r = 0.055899$ in the decay function and evaluate it at $t = 18.75$.

$$Q(t) = Q_0 e^{-rt} \quad \text{exponential decay function}$$



$$Q(18.75) = 5e^{(-0.055899)(18.75)} \quad \text{substitute 5 for } Q_0\text{, 0.055899 for } r\text{, and 18.75 for } t$$

$$Q(18.75) \approx 1.75 \quad \text{evaluate}$$

After 18 hr and 45 min, only 1.75 g of potassium-42 will remain.

b. With $r = 0.055899$, the decay function becomes $Q(t) = 5e^{0.055899t}$. For the intersection-of-graphs method, setting the window for y poses no challenge as we have a target of 0.5 g. For the x-values, reason that starting with 5 g and a half-life of about 12 hr, 2.5 g remain after 12 hr, 1.25 g remain after 24 hr, 0.625 g after 36 hr, and that the time required must be greater than (but close to) 36 hr. Using $[0, 60]$ for x and $[-2, 10]$ for y, we find the graphs intersect near $x \approx 41.19$ (Figure 5.55). There will be only 0.5 g remaining shortly after 41 hr.

Figure 5.55

Now try Exercises 57 through 62 ▶

5.6 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. _____ interest is interest paid to you on previously accumulated interest.

2. The formula for interest compounded _____ is $A = pe^{rt}$, where e is approximately _____.

3. Given constants Q_0 and r, and that Q decays exponentially as a function of t, the equation model is $Q(t) =$ _____.

4. Investment plans calling for regularly scheduled deposits are called _____. The annuity formula gives the _____ value of the account.

5. Explain/Describe the difference between the future value and present value of an annuity. Include an example.

6. Describe/Explain how you would find the rate of growth r, given that a population of ants grew from 250 to 3000 in 6 weeks.

▶ DEVELOPING YOUR SKILLS

For simple interest accounts, the interest earned or due depends on the principal p, interest rate r, and the time t in years according to the formula $I = prt$.

7. Find p given $I = \$229.50$, $r = 6.25\%$, and $t = 9$ months.
8. Find r given $I = \$1928.75$, $p = \$8500$, and $t = 3.75$ yr.
9. Larry came up a little short one month at bill-paying time and had to take out a title loan on his car at Check Casher's, Inc. He borrowed \$260, and 3 weeks later he paid off the note for \$297.50. What was the annual interest rate on this title loan? (*Hint:* How much *interest* was charged?)
10. Angela has \$750 in a passbook savings account that pays 2.5% simple interest. How long will it take the account balance to hit the \$1000 mark at this rate of interest, if she makes no further deposits? (*Hint:* How much *interest* will be paid?)

For simple interest accounts, the amount A accumulated or due depends on the principal p, interest rate r, and the time t in years according to the formula $A = p(1 + rt)$.

11. Find p given $A = \$2500$, $r = 6.25\%$, and $t = 31$ months.
12. Find r given $A = \$15{,}800$, $p = \$10{,}000$, and $t = 3.75$ yr.
13. Olivette Custom Auto Service borrowed \$120,000 at 4.75% simple interest to expand their facility from three service bays to four. If they repaid \$149,925, what was the term of the loan?
14. Healthy U sells nutritional supplements and borrows \$50,000 to expand their product line. When the note is due 3 yr later, they repay the lender \$62,500. If it was a simple interest note, what was the annual interest rate?
15. **Simple interest:** The owner of Paul's Pawn Shop loans Larry \$200.00 using his Toro riding mower as collateral. Thirteen weeks later Larry comes back to get his mower out of pawn and pays Paul \$240.00. What was the annual simple interest rate on this loan?
16. **Simple interest:** To open business in a new strip mall, Laurie's Custom Card Shoppe borrows \$50,000 from a group of investors at 4.55% simple interest. Business booms and blossoms, enabling Laurie to repay the loan fairly quickly. If Laurie repays \$62,500, how long did it take?

For accounts where interest is compounded annually, the amount A accumulated or due depends on the principal p, interest rate r, and the time t in years according to the formula $A = p(1 + r)^t$.

17. Find t given $A = \$48{,}428$, $p = \$38{,}000$, and $r = 6.25\%$.
18. Find p given $A = \$30{,}146$, $r = 5.3\%$, and $t = 7$ yr.
19. How long would it take \$1525 to triple if invested at 7.1%?
20. What interest rate will ensure a \$747.26 deposit will be worth \$1000 in 5 yr?

For accounts where interest is compounded annually, the principal P needed to ensure an amount A has been accumulated in the time period t when deposited at interest rate r is given by the formula $P = \frac{A}{(1 + r)^t}$.

21. The Stringers need to make a \$10,000 balloon payment in 5 yr. How much should be invested now at 5.75%, so that the money will be available?
22. Morgan is 8 yr old. If her mother wants to have \$25,000 for Morgan's first year of college (in 10 yr), how much should be invested now if the account pays a 6.375% fixed rate?

For compound interest accounts, the amount A accumulated or due depends on the principal p, interest rate r, number of compoundings per year n, and the time t in years according to the formula $A = p(1 + \frac{r}{n})^{nt}$.

23. Find t given $A = \$129{,}500$, $p = \$90{,}000$, and $r = 7.125\%$ compounded weekly.
24. Find r given $A = \$95{,}375$, $p = \$65{,}750$, and $t = 15$ yr with interest compounded monthly.
25. How long would it take a \$5000 deposit to double, if invested at a 9.25% rate and compounded daily?
26. What principal should be deposited at 8.375% compounded monthly to ensure the account will be worth \$20,000 in 10 yr?
27. **Compound interest:** As a curiosity, David decides to invest \$10 in an account paying 10% interest compounded 10 times per year for 10 yr. Is that enough time for the \$10 to triple in value?
28. **Compound interest:** As a follow-up experiment (see Exercise 27), David invests \$10 in an account paying 12% interest compounded 10 times per year for 10 yr, and another \$10 in an account paying 10% interest compounded 12 times per year for 10 yr. Which produces the better investment—more compounding periods or a higher interest rate?

29. **Compound interest:** Due to demand, Donovan's Dairy (Wisconsin, USA) plans to double its size in 4 yr and will need $250,000 to begin development. If they invest $175,000 in an account that pays 8.75% compounded semiannually, (a) will there be sufficient funds to break ground in 4 yr? (b) If not, find the *minimum interest rate* that will enable the dairy to meet its 4-yr goal.

30. **Compound interest:** To celebrate the birth of a new daughter, Helyn invests 6000 Swiss francs in a college savings plan to pay for her daughter's first year of college in 18 yr. She estimates that 25,000 francs will be needed. If the account pays 7.2% compounded daily, (a) will she meet her investment goal? (b) If not, find the *minimum rate of interest* that will enable her to meet this 18-yr goal.

For accounts where interest is compounded continuously, the amount A accumulated or due depends on the principal p, interest rate r, and the time t in years according to the formula $A = pe^{rt}$.

31. Find t given $A = \$2500$, $p = \$1750$, and $r = 4.5\%$.

32. Find r given $A = \$325{,}000$, $p = \$250{,}000$, and $t = 10$ yr.

33. How long would it take $5000 to double if it is invested at 9.25%? Compare the result to Exercise 25.

34. What principal should be deposited at 8.375% to ensure the account will be worth $20,000 in 10 yr? Compare the result to Exercise 26.

35. **Interest compounded continuously:** Valance wants to build an addition to his home outside Madrid (Spain) so he can watch over and help his parents in their old age. He hopes to have 20,000 euros put aside for this purpose within 5 yr. If he invests 12,500 euros in an account paying 8.6% interest compounded continuously, (a) will he meet his investment goal? (b) If not, find the *minimum rate of interest* that will enable him to meet this 5-yr goal.

36. **Interest compounded continuously:** Minh-Ho just inherited her father's farm near Mito (Japan), which badly needs a new barn. The estimated cost of the barn is 8,465,000 yen and she would like to begin construction in 4 yr. If she invests 6,250,000 yen in an account paying 6.5% interest compounded continuously, (a) will she meet her investment goal? (b) If not, find the *minimum rate of interest* that will enable her to meet this 4-yr goal.

37. **Interest compounded continuously:** William and Mary buy a small cottage in Dovershire (England), where they hope to move after retiring in 7 yr. The cottage needs about 20,000 euros worth of improvements to make it the retirement home they desire. If they invest 12,000 euros in an account paying 5.5% interest compounded continuously, (a) will they have enough to make the repairs? (b) If not, find the *minimum amount they need to deposit* that will enable them to meet this goal in 7 yr.

38. **Interest compounded continuously:** After living in Oslo (Norway) for 20 years, Kjell and Torill decide to move inland to help operate the family ski resort. They hope to make the move in 6 yr, after they have put aside 140,000 kroner. If they invest 85,000 kroner in an account paying 6.9% interest compounded continuously, (a) will they meet their 140,000 kroner goal? (b) If not, find the *minimum amount they need to deposit* that will enable them to meet this goal in 6 yr.

The length of time T (in years) required for an initial principal P to grow to an amount A at a given interest rate r is given by $T = \frac{1}{r}\ln\left(\frac{A}{P}\right)$.

39. **Investment growth:** A small business is planning to build a new $350,000 facility in 8 yr. If they deposit $200,000 in an account that pays 5% interest compounded continuously, will they have enough for the new facility in 8 yr? If not, what amount should be invested on these terms to meet the goal?

40. **Investment growth:** After the twins were born, Sasan deposited $25,000 in an account paying 7.5% compounded continuously, with the goal of having $120,000 available for their college education 20 yr later. Will Sasan meet the 20-yr goal? If not, what amount should be invested on these terms to meet the goal?

Ordinary annuities: If a periodic payment $\mathcal{P}$ is deposited n times per year, with annual interest rate r also compounded n times per year for t years, the future value of the account is given by $A = \frac{\mathcal{P}[(1+R)^{nt}-1]}{R}$, where $R = \frac{r}{n}$ (if the rate is 9% compounded monthly, $R = \frac{0.09}{12} = 0.0075$).

41. **Saving for a rainy day:** How long would it take Jasmine to save $10,000 if she deposits $90/month at an annual rate of 7.5 compounded monthly?

42. **Saving for a sunny day:** What quarterly investment amount is required to ensure that Larry can save $4700 in 4 yr at an annual rate of 8.5% compounded quarterly?

43. **Saving for college:** At the birth of their first child, Latasha and Terrance opened an annuity account and have been depositing $50 per month in the account ever since. If the account is now worth $30,000 and the interest on the account is 6.6% compounded monthly, how old is the child?

44. **Saving for a bequest:** When Cherie (Brandon's first granddaughter) was born, he purchased an annuity account for her and stipulated that she should receive the funds (in trust, if necessary) upon his death. The quarterly annuity payments were $250 and interest on the account was 7.6% compounded quarterly. The account balance of $17,500 was recently given to Cherie. How much longer did Brandon live?

45. **Saving for a down payment:** Tae-Hon is tired of renting and decides that within the next 5 yr he must save $22,500 for the down payment on a home. He finds an investment company that offers 9% interest compounded monthly and begins depositing $250 each month in the account. (a) Is this monthly amount sufficient to help him meet his 5 yr goal? (b) If not, find the *minimum amount he needs to deposit each month* that will enable him to meet his goal in 5 yr.

46. **Saving to open a business:** Madeline feels trapped in her current job and decides to save $75,000 over the next 7 yr to open up a Harley-Davidson franchise. To this end, she invests $145 every week in an account paying $7\frac{1}{2}\%$ interest compounded weekly. (a) Is this weekly amount sufficient to help her meet the seven-year goal? (b) If not, find the *minimum amount she needs to deposit each week* that will enable her to meet this goal in 7 yr.

▶ WORKING WITH FORMULAS

Solve for the indicated unknowns.

47. $A = p + prt$
   a. solve for t
   b. solve for p

48. $A = p(1 + r)^t$
   a. solve for t
   b. solve for r

49. $A = p\left(1 + \frac{r}{n}\right)^{nt}$
   a. solve for r
   b. solve for t

50. $A = pe^{rt}$
   a. solve for p
   b. solve for r

51. $Q(t) = Q_0e^{rt}$
   a. solve for Q_0
   b. solve for t

52. $p = \dfrac{AR}{[(1 + R)^{nt} - 1]}$
   a. solve for A
   b. solve for n

53. **Amount of a mortgage payment:** $\mathcal{P} = \dfrac{AR}{1 - (1 + R)^{-nt}}$

The mortgage payment required to pay off (or amortize) a loan is given by the formula shown, where $\mathcal{P}$ is the payment amount, A is the original amount of the loan, t is the time in years, r is the annual interest rate, n is the number of payments per year, and $R = \frac{r}{n}$. Find the *monthly payment* required to amortize a $125,000 home, if the interest rate is 5.5%/year and the home is financed over 30 yr.

54. **Time required to amortize a mortgage:** $t = 16.71 \ln\left(\dfrac{x}{x - 1000}\right), x > 1000.$

The number of years needed to amortize (pay off) a mortgage, depends on the amount of the regular monthly payment. The formula shown approximates the years t required to pay off a $200,000 mortgage at 6% interest, based on a monthly payment of x dollars.

a. Use a **TABLE** to find the payment required to pay off this mortgage in 30 yr, and the amount of interest paid ($30 \times 12 = 360$ payments).

b. Use the intersection-of-graphs method to find the payment required to pay off this mortgage in 20 yr, and the amount of interest that would be paid. How much interest was saved by making a higher payment?

c. Repeat part (b) for a complete payoff in 15 yr.

▶ APPLICATIONS

55. Bacterial growth: As part of a lab experiment, Luamata needs to grow a culture of 200,000 bacteria, which are known to double in number in 12 hr. If he begins with 1000 bacteria, (a) find the growth rate r and (b) find how many hours it takes for the culture to produce the 200,000 bacteria.

56. Rabbit populations: After the wolf population was decimated due to overhunting, the rabbit population in the Boluhti Game Reserve began to double every 6 months. If there were an estimated 120 rabbits to begin, (a) find the growth rate r and (b) find the number of months required for the population to reach 2500.

For Exercises 57–60, (a) solve by finding the growth rate and using the decay formula $Q(t) = Q_0e^{-rt}$.

57. Iodine-131, radioactive decay: The radioactive element iodine-131 has a half-life of 8 days and is often used to help diagnose patients with thyroid problems. If a certain thyroid procedure requires 0.5 g and is scheduled to take place in 3 days, what is the minimum amount that must be on hand now (to the nearest hundredth of a gram)?

58. Sodium-24, radioactive decay: The radioactive element sodium-24 has a half-life of 15 hr and is used to help locate obstructions in blood flow. If the procedure requires 0.75 g and is scheduled to take place in 2 days (48 hr), what minimum amount must be on hand *now* (to the nearest hundredth of a gram)?

59. Americium-241, radioactive decay: The radioactive element americium-241 has a half-life of 432 yr and although extremely small amounts are used (about 0.0002 g), it is the most vital component of standard household smoke detectors. How many years will it take a 10-g mass of americium-241 to decay to 2.7 g?

60. Carbon-14, radioactive decay: Carbon-14 is a radioactive compound that occurs naturally in all living organisms, with the amount in the organism constantly renewed. After death, no new carbon-14 is acquired and the amount in the organism begins to decay exponentially. If the half-life of carbon-14 is 5730 yr, how old is a mummy having only 45% of the normal amount of carbon-14?

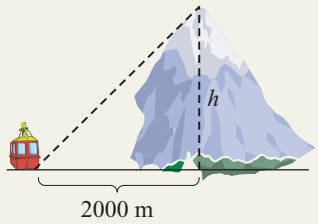
Carbon-14 dating: If the percentage p of carbon-14 that remains in a fossil can be determined, the formula $T = -8267 \ln p$ can be used to estimate the number of years T since the organism died.

61. Dating the Lascaux Cave dwellers: Bits of charcoal from Lascaux Cave (home of the prehistoric Lascaux Cave Paintings) were used to estimate that the fire had burned some 17,255 yr ago. What percent of the original amount of carbon-14 remained in the bits of charcoal?

62. Dating Stonehenge: Using organic fragments found near Stonehenge (England), scientists were able to determine that the organism that produced the fragments lived about 3925 yr ago. What percent of the original amount of carbon-14 remained in the organism?

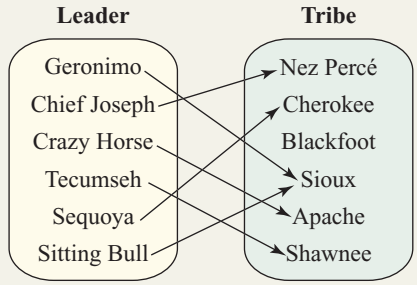
▶ EXTENDING THE CONCEPT

63. Many claim that inheritance taxes were put in place simply to prevent a massive accumulation of wealth by a select few. Suppose that in 1890, your great-grandfather deposited $10,000 in an account paying 6.2% compounded continuously. If the account were to pass to you untaxed, what would it be worth in 2010? Do some research on the inheritance tax laws in your state. In particular, what amounts can be inherited untaxed (i.e., before the inheritance tax kicks in)?



64. If you have not already completed Exercise 30, please do so. For *this* exercise, *solve the compound interest equation for r* to find the exact rate of interest that will enable Helyn to meet her 18-yr goal.

65. If you have not already completed Exercise 43, please do so. Suppose the final balance of the account was $35,100 with interest again being compounded monthly. For *this* exercise, use a graphing calculator to find r, the exact rate of interest the account would have been earning.



▶ MAINTAINING YOUR SKILLS

66. **(1.1)** In an effort to boost tourism, a trolley car is being built to carry sightseers from a strip mall to the top of Mt. Vernon, 1580-m high. Approximately how long will the trolley cables be?

67. **(2.2/2.4)** Name the toolbox functions that are (a) one-to-one, (b) even, (c) increasing for $x \in R$, and (d) asymptotic.

68. **(1.3)** Is the following relation a function? If not, state how the definition of a function is violated.

69. **(4.2)** A polynomial with real coefficients is known to have the zeroes $x = 3$, $x = -1$, and $x = 1 + 2i$. Find the equation of the polynomial, given it has degree 4 and a y-intercept of $(0, -15)$.

5.7 Exponential, Logarithmic, and Logistic Equation Models

LEARNING OBJECTIVES

In Section 5.7 you will see how we can

- ❑ **A.** Choose an appropriate form of regression for a set of data
- ❑ **B.** Use a calculator to obtain exponential and logarithmic regression models
- ❑ **C.** Determine when a logistic model is appropriate and apply a logistic model to a set of data
- ❑ **D.** Use a regression model to answer questions and solve applications

WORTHY OF NOTE

For more information on the use of residuals, see the *Calculator Exploration and Discovery* feature on Residuals at the end of Chapter 3.

The basic concepts involved in calculating a regression equation were presented in Section 1.6 and 3.4. In this section, we extend these concepts to data sets that are best modeled by power, exponential, logarithmic, or logistic functions. All data sets, while contextual and accurate, *have been carefully chosen* to provide a maximum focus on regression fundamentals and related mathematical concepts. In reality, data sets are often not so "well-behaved" and many require sophisticated statistical tests before any conclusions can be drawn.

A. Choosing an Appropriate Form of Regression

Most graphing calculators have the ability to perform several forms of regression, and selecting which of these to use is a critical issue. When various forms are applied to a given data set, some are easily discounted due to a poor fit. Others may fit very well for only a portion of the data, while still others may compete for being the "best-fit" equation. In a statistical study of regression, an in-depth look at the correlation coefficient (r), the coefficient of determination (r^2 or R^2), and a study of **residuals** are used to help make an appropriate choice. For our purposes, the correct or best choice will generally depend on two things: (1) how well the graph appears to fit the scatterplot, and (2) the context or situation that generated the data, coupled with a dose of common sense.

As we've noted previously, the final choice of regression can rarely be based on the scatterplot alone, although relying on the basic characteristics and end-behavior of certain graphs can be helpful **(see Exercise 67).** With an awareness of the toolbox functions, polynomial graphs, and applications of exponential and logarithmic functions, the context of the data can aid a decision.

EXAMPLE 1 ▶ **Choosing an Appropriate Form of Regression**

Suppose a set of data is generated from each context given. Use common sense, previous experience, or your own knowledge base to state whether a linear, quadratic, logarithmic, exponential, or power regression might be most appropriate. Justify your answers.

a. population growth of the United States since 1800

b. the distance covered by a jogger running at a constant speed

c. height of a baseball t seconds after it's thrown

d. the time it takes for a cup of hot coffee to cool to room temperature

Solution ▶

a. From examples in Section 5.6 and elsewhere, we've seen that animal and human populations tend to grow exponentially over time. Here, an exponential model is likely most appropriate.

b. Since the jogger is moving at a constant speed, the rate-of-change $\frac{\Delta\text{distance}}{\Delta\text{time}}$ is constant and a linear model would be most appropriate.

c. As seen in numerous places throughout the text, the height of a projectile is modeled by the equation $h(t) = -16t^2 + vt + k$, where $h(t)$ is the height in feet after t seconds. Here, a quadratic model would be most appropriate.

d. Many have had the experience of pouring a cup of hot chocolate, coffee, or tea, only to leave it on the counter as they turn their attention to other things. The hot drink seems to cool quickly at first, then slowly approach room temperature. This experience, perhaps coupled with our awareness of *Newton's law of cooling,* shows a logarithmic or exponential model might be appropriate here.

☑ **A.** You've just seen how we can choose an appropriate form of regression for a set of data

Now try Exercises 7 through 20 ▶

B. Exponential and Logarithmic Regression Models

We now focus our attention on regression models that involve exponential and logarithmic functions. Recall the process of developing a regression equation involves these five stages: (1) clearing old data, (2) entering new data, (3) displaying the data, (4) calculating the regression equation, and (5) displaying and using the regression graph and equation.

EXAMPLE 2 ▶ **Calculating an Exponential Regression Model**

The number of centenarians (people who are 100 yr of age or older) has been climbing steadily over the last half century. The table shows the number of centenarians (per million population) for selected years. Use the data and a graphing calculator to draw the scatterplot, then use the scatterplot and context to decide on an appropriate form of regression.

Source: Data from 2004 *Statistical Abstract of the United States,* Table 14; various other years

Year "t" (1950 $\rightarrow$ 0)	Number "N" (per million)
0	16
10	18
20	25
30	74
40	115
50	262

Solution ▶ After clearing any existing data in the data lists, enter the input values (years since 1950) in L1 and the output values (number of centenarians per million population) in L2 (Figure 5.56). For the viewing window, scale the x-axis (years since 1950) from -10 to 70 and the y-axis (number per million) from -50 to 300 to comfortably fit the data and allow room for the coordinates to be shown at the bottom of the screen (Figure 5.57). The scatterplot rules out a linear model. While a quadratic model may fit the data, we expect that the correct model should exhibit asymptotic behavior since extremely few people lived to be 100 yr of age prior to dramatic advances in hygiene, diet, and medical care. This would lead us toward an exponential equation model. The keystrokes STAT › brings up the **CALC** menu, with **ExpReg** (exponential regression) being option "0." The option can be selected by simply pressing "0," or by using the up arrow ^ or down arrow v to scroll to **0:ExpReg** then pressing ENTER. The exponential model seems to fit the data very well (Figures 5.58 and 5.59). To four decimal places the equation model is $y = (11.5090)1.0607^x$.

Figure 5.56

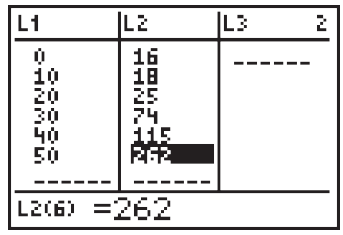


Figure 5.57

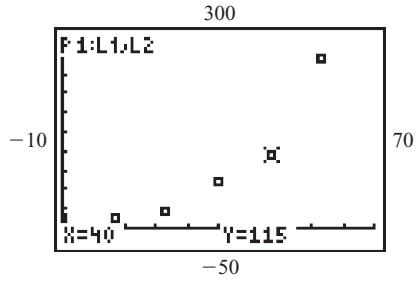

Figure 5.58

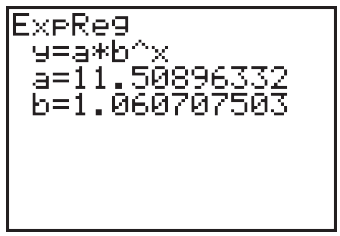

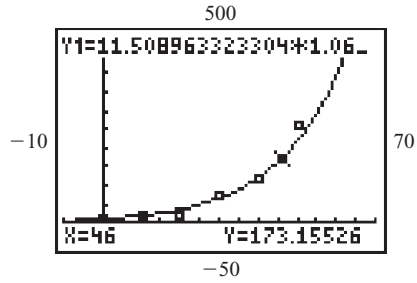

Figure 5.59

Now try Exercises 21 and 22 ▶

EXAMPLE 3 ▶ Calculating a Logarithmic Regression Model

One measure used in studies related to infant growth, nutrition, and development, is the relation between the circumference of a child's head and their age. The table to the right shows the average circumference of a female child's head for ages 0 to 36 months. Use the data and a graphing calculator to draw the scatterplot, then use the scatterplot and context to decide on an appropriate form of regression.

Source: *National Center for Health Statistics*

Age a (months)	Circumference C (cm)
0	34.8
6	43.0
12	45.2
18	46.5
24	47.5
30	48.2
36	48.6

Solution ▶ After clearing any existing data, enter the child's age (in months) as L1 and the circumference of the head (in cm) as L2. For the viewing window, scale the x-axis from -5 to 50 and the y-axis from 25 to 60 to comfortably fit the data (Figure 5.60). The scatterplot again rules out a linear model, and the context rules out a polynomial model due to end-behavior. As we expect the circumference of the head to continue increasing slightly for many more months, it appears a logarithmic model may be the best fit. Note that since ln(0) is undefined, $a = 0.1$ was used to represent the age at birth (rather than $a = 0$), prior to running the regression. The **LnReg** (logarithmic regression) option is option 9, and the keystrokes STAT ▸ **(CALC) 9** ENTER gives the equation shown in Figure 5.61, which fits the data very well (Figure 5.62).

Figure 5.60

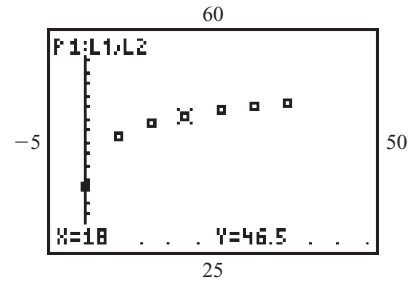

Figure 5.61

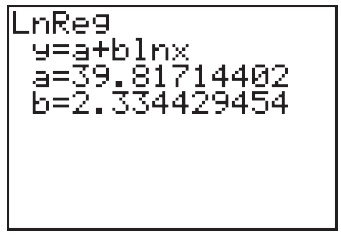

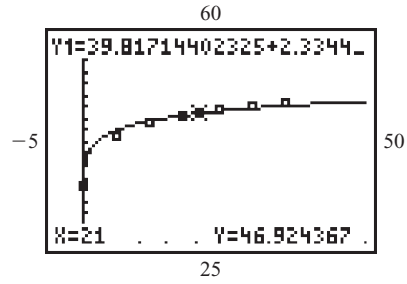

Figure 5.62

WORTHY OF NOTE

For applications involving exponential growth and logarithmic functions, it helps to remember that while both basic functions are increasing, a logarithmic function increases at a much slower rate.

B. You've just seen how we can use a calculator to obtain exponential and logarithmic regression models

Now try Exercises 23 and 24 ▶

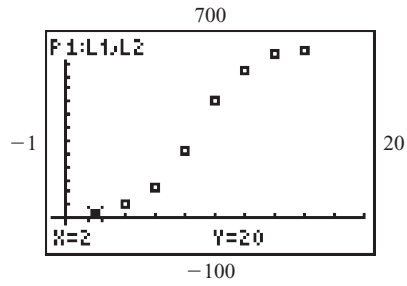
C. Logistic Equations and Regression Models

Many population growth models assume an unlimited supply of resources, nutrients, and room for growth, resulting in an exponential growth model. When resources become scarce or room for further expansion is limited, the result is often a **logistic growth model.** At first, growth is very rapid (like an exponential function), but this growth begins to taper off and slow down as nutrients are used up, living space becomes restricted, or due to other factors. Surprisingly, this type of growth can take many forms, including population growth, the spread of a disease, the growth of a tumor, or the spread of a stain in fabric. Specific logistic equations were encountered in Section 5.5. The general equation model for logistic growth is

Logistic Growth

Given constants a, b, and c, the logistic growth $P(t)$ of a population depends on time t according to the model

$$P(t) = \frac{c}{1 + ae^{-bt}}$$



The constant c is called the **carrying capacity** of the population, in that as $t \to \infty$, $P(t) \to c$. In words, as the elapsed time becomes very large, the population will approach (but not exceed) c.

EXAMPLE 4 ▶ Calculating a Logistic Regression Model

Yeast cultures have a number of applications that are a great benefit to civilization and have been an object of study for centuries. A certain strain of yeast is grown in a lab, with its population checked at 2-hr intervals, and the data gathered are given in the table. Use the data and a graphing calculator to draw a scatterplot, and decide on an appropriate form of regression. If a logistic regression is the best model, attempt to estimate the capacity coefficient c prior to using your calculator to find the regression equation. How close were you to the actual value?

Elapsed Time (hours)	Population (100s)
2	20
4	50
6	122
8	260
10	450
12	570
14	630
16	650

Solution ▶ After clearing the data lists, enter the input values (elapsed time) in L1 and the output values (population) in L2. For the viewing window, scale the t-axis from -1 to 20 and the P-axis from -100 to 700 to comfortably fit the data. From the context and scatterplot, it's apparent the data are best modeled by a logistic function. Noting that Ymax $=$ 700 and the data seem to level off near the top of the window, a good estimate for c would be about 675. Using logistic regression on the home screen (option **B:Logistic**), we obtain the equation $Y_1 = \dfrac{663}{1 + 123.9e^{-0.553X}}$ (rounded).

WORTHY OF NOTE
Notice that calculating a logistic regression model takes the calculator a few seconds longer than for other forms.

C. You've just seen how we can determine when a logistic model is appropriate, and how to apply a logistic model to a set of data

Now try Exercises 25 and 26 ▶

When a regression equation is used to gather information, many of the equation solving skills from prior sections are employed. **Exercises 27 through 34** offer a variety of these equations for practice and warm-up.

D. Applications of Regression

Once the equation model for a data set has been obtained, it can be used to **interpolate** or approximate values that might occur *between* those given in the data set. It can also be used to **extrapolate** or predict future values. In this case, the investigation extends *beyond* the values from the data set, and is based on the assumption that projected trends will continue for an extended period of time.

Regardless of the regression applied, interpolation and extrapolation involve substituting a given or known value, then solving for the remaining unknown. We'll demonstrate here using the regression model from Example 3. The Exercise Set offers a large variety of regression applications, including some power regressions and additional applications of linear and quadratic regression.

EXAMPLE 5 ▶ Using a Regression Equation to Interpolate or Extrapolate Information

Use the regression equation from Example 3 to answer the following questions:

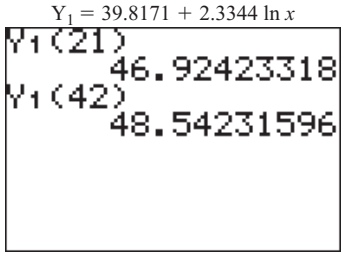
a. What is the average circumference of a female child's head, if the child is 21 months old?

b. According to the equation model, what will the average circumference be when the child turns $3\frac{1}{2}$ years old?

c. If the circumference of the child's head is 44 cm, about how old is the child?

Solution ▶

Figure 5.63



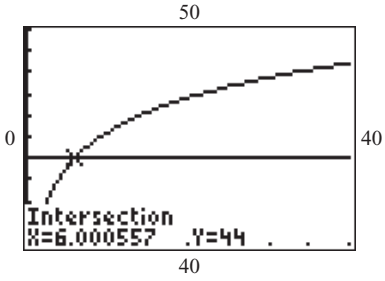


Figure 5.64

a. Using function notation we have $C(a) \approx 39.8171 + 2.3344 \ln(a)$. Substituting 21 for a gives:

$$C(21) \approx 39.8171 + 2.3344 \ln(21) \quad \text{substitute 21 for } a$$
$$\approx 46.9 \quad \text{result}$$

The circumference is approximately 46.9 cm. See Figure 5.63.

b. Substituting 3.5 yr $\times$ 12 = 42 months for a gives:

$$C(42) \approx 39.8171 + 2.3344 \ln(42) \quad \text{substitute 42 for } a$$
$$\approx 48.5 \quad \text{result}$$

The circumference will be approximately 48.5 cm. See Figure 5.63.

c. For part (c) we're given the circumference C and are asked to find the age a in which this circumference (44) occurs. Substituting 44 for $C(a)$ gives the equation $44 = 39.8171 + 2.3344 \ln X$, so we set $Y_1 = 39.8171 + 2.3344 \ln X$ and $Y_2 = 44$. For the window size, we know the formula is valid for female infants from 0 to 36 months, and from parts (a) and (b) a good range for the circumference will be from 40 to 50 cm. This indicates an appropriate window might be [0, 40] for x and [40, 50] for y. Using this window, we find the graphs intersect at about (6, 44), showing that a female child with a cranial circumference of 44 cm must be about 6 months old. See Figure 5.64.

Now try Exercises 37 through 44 ▶

☑ **D.** You've just seen how we can use a regression model to answer questions and solve applications

When extrapolating from a set of data, care and common sense must be used or results can be very misleading. For example, while the Olympic record for the 100-m dash has been steadily declining since the first Olympic Games, it would be foolish to think it will ever be run in 0 sec. There is a large variety of additional applications in the Exercise Set. **See Exercises 45 through 62.**

5.7 EXERCISES

▶ CONCEPTS AND VOCABULARY

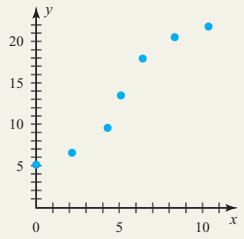
Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. The type of regression used often depends on (a) whether a particular graph appears to fit the _____ and (b) the _____ or _____ that generated the data.

2. The final choice of regression can rarely be based on the _____ alone. Relying on the basic _____ and _____ of certain graphs can be helpful.

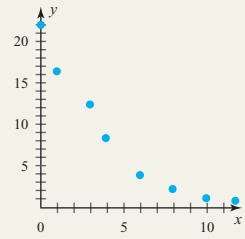
3. To extrapolate means to use the data to predict values _____ the given data.

4. To interpolate means to use the data to predict values _____ the given data.



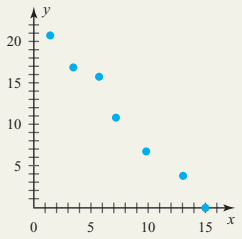
5. List the five steps used to find a regression equation using a calculator. Discuss possible errors that can occur if the first step is skipped. After the new data have been entered, what precautionary step should always be included?

6. Consider the eight toolbox functions and the exponential and logarithmic functions. How many of these satisfy the condition as $x \to \infty, y \to \infty$? For those that satisfy this condition, discuss/explain how you would choose between them judging from the scatterplot alone.

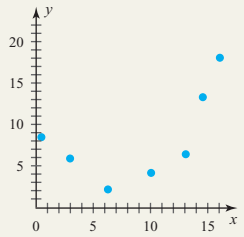


▶ DEVELOPING YOUR SKILLS

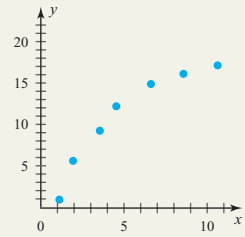
Match each scatterplot given with one of the following: (a) likely linear, (b) likely quadratic, (c) likely exponential, (d) likely logarithmic, (e) likely logistic, or (f) none of these.



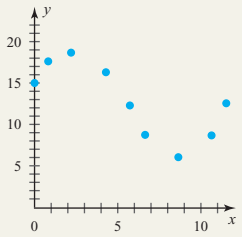
7.



8.



9.



10.

11.

12.

For Exercises 13 to 20, suppose a set of data is generated from the context indicated. Use common sense, previous experience, or your own knowledge base to state whether a linear, quadratic, logarithmic, exponential, power, or logistic regression might be most appropriate. Justify your answers.

13. total revenue and number of units sold

14. page count in a book and total number of words

15. years on the job and annual salary

16. time and population growth with unlimited resources

17. time and population growth with limited resources

18. elapsed time and the height of a projectile

19. the cost of a gallon of milk over time

20. elapsed time and radioactive decay

Graph the data sets, then discuss why an exponential model could be an appropriate form of regression. Then find the regression equation.

21. Radioactive Studies

Time in Hours	Grams of Material
0.1	1.0
1	0.6
2	0.3
3	0.2
4	0.1
5	0.06

22. Rabbit Population

Month	Population (in hundreds)
0	2.5
3	5.0
6	6.1
9	12.3
12	17.8
15	30.2

Graph the data sets, then discuss why a logarithmic model could be an appropriate form of regression. Then find the regression equation.

23. Total number of sales compared to the amount spent on advertising

Advertising Costs ($1000s)	Total Number of Sales
1	125
5	437
10	652
15	710
20	770
25	848
30	858
35	864

24. Cumulative weight of diamonds extracted from a diamond mine

Time (months)	Weight (carats)
1	500
3	1748
6	2263
9	2610
12	3158
15	3501
18	3689
21	3810

25. Spread of disease: Estimates of the cumulative number of SARS (sudden acute respiratory syndrome) cases reported in Hong-Kong during the spring of 2003 are shown in the table, with day 0 corresponding to February 20. (a) Use the data to draw a scatterplot, then use the context and scatterplot to decide on the best form of regression. (b) If a logistic model seems best, attempt to estimate the carrying capacity c, then (c) use your calculator to find the regression equation.

Days After Outbreak	Cumulative Total
0	100
14	560
21	870
35	1390
56	1660
70	1710
84	1750

Source: Center for Disease Control @ www.cdc.gov/ncidod/EID/vol9no12.

26. Cable television subscribers: The percentage of American households having cable television is given in the table for select years from 1976 to 2004. (a) Use the data to draw a scatterplot, then use the context and scatterplot to decide on the best form of regression. (b) If a logistic model seems best, attempt to estimate the carrying capacity c, then (c) use your calculator to find the regression equation (use 1976 $\rightarrow$ 0).

Source: Data pooled from the 2001 *New York Times Almanac,* p. 393; 2004 *Statistical Abstract of the United States,* Table 1120; various other years.

Year 1976 $\rightarrow$ 0	Percentage with Cable TV
0	16
4	22.6
8	43.7
12	53.8
16	61.5
20	66.7
24	68
28	70

The applications in this section require solving equations similar to those that follow. Solve each equation algebraically and graphically.

27. $96.35 = (9.4)1.6^x$

28. $(3.7)2.9^x = 1253.93$

29. $4.8x^{2.5} = 468.75$

30. $4375 = 1.4x^{-1.25}$

31. $52 = 63.9 - 6.8 \ln x$

32. $498.53 + 18.2 \ln x = 595.9$

33. $52 = \dfrac{67}{1 + 20e^{-0.62x}}$

34. $\dfrac{975}{1 + 82.3e^{-0.423x}} = 890$

▶ WORKING WITH FORMULAS

35. Learning curve: $C(t) = 4.1 + 9.5 \ln t$

The number of circuit boards a newly hired employee can assemble from its component parts, depends on the experience of the employee as measured by the length of employment. This relationship is modeled by the formula shown, where $C(t)$ represents the number of circuit boards assembled per day, t days after employment. (a) How many boards are being assembled after 5 days on the job? (b) How many days until the employee is able to assemble 30 boards per day?

36. Bicycle sales since 1920: $N(t) = 0.325(1.057)^t$

Despite the common use of automobiles and motorcycles, bicycle sales have continued to grow as a means of transportation as well as a form of recreation. The number of bicycles sold each year (in millions) can be approximated by the formula shown, where t is the number of years after 1920 (1920 $\rightarrow$ 0). According to this model, in what year did bicycle sales exceed 10 million?

Source: 1976/1992 *Statistical Abstract of the United States,* Tables 406/395; various other years

▶ APPLICATIONS

Answer the questions using the given data and the related regression equation. All extrapolations assume the mathematical model will continue to represent future trends.

37. Weight loss: Harold needed to lose weight and started on a new diet and exercise regimen. The number of pounds he's lost since the diet began is given in the table. Draw the scatterplot, decide on an appropriate form of regression, and find an equation that models the data.

a. What was Harold's total weight loss after 15 days?

b. Approximately how many days did it take to lose a total of 18 pounds?

c. According to the model, what is the projected weight loss for 100 days?

Time (days)	Pounds Lost
10	2
20	14
30	20
40	23
50	25.5
60	27.6
70	29.2
80	30.7

38. Depletion of resources: The longer an area is mined for gold, the more difficult and expensive it gets to obtain. The cumulative total of the ounces produced by a particular mine is shown in the table. Draw the scatterplot, use the scatterplot and context to determine whether an exponential or logarithmic model is more appropriate, then find an equation that models the data.

Time (months)	Ounces Mined
5	275
10	1890
15	2610
20	3158
25	3501
30	3789
35	4109
40	4309

a. What was the total number of ounces mined after 18 months?

b. About how many months did it take to mine a total of 4000 oz?

c. According to the model, what is the projected total after 50 months?

39. Number of U.S. post offices: Due in large part to the ease of travel and increased use of telephones, e-mail and instant messaging, the number of post offices in the United States has been on the decline since the twentieth century. The data given show number of post offices (in thousands) for selected years. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation (use $1900 \rightarrow 0$).

Year ($1900 \rightarrow 0$)	Offices (1000s)
1	77
20	52
40	43
60	37
80	32
100	28

Source: Statistical Abstract of the United States; The First Measured Century

a. Approximately how many post offices were there in 1915?

b. In what year did the number of post offices drop below 34,000?

c. According to the model, how many post offices will there be in the year 2015?

40. Telephone use: The number of telephone calls per capita has been rising dramatically since the invention of the telephone in 1876. The table shows the number of phone calls per capita per year for selected years. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation.

Year ($1900 \rightarrow 0$)	Number (per capita/ per year)
0	38
20	180
40	260
60	590
80	1250
97	2325

Source: The First Measured Century by Theodore Caplow, Louis Hicks, and Ben J. Wattenberg, The AEI Press, Washington, D.C., 2001.

a. What was the approximate number of calls per capita in 1970?

b. Approximately how many calls per capita will there be in 2015?

c. In what year did the number of calls per capita exceed 4000?

41. Milk production: Since 1980, the number of family farms with milk cows for commercial production has been decreasing. Use the data from the table given to draw a scatterplot, then use the context and scatterplot to find the regression equation.

Year ($1980 \rightarrow 0$)	Number (in 1000s)
0	334
5	269
10	193
15	140
17	124
18	117
19	111

Source: Statistical Abstract of the United States, 2000.

a. What was the approximate number of farms with milk cows in 1993?

b. Approximately how many farms will have milk cows in 2010?

c. In what year will this number of farms drop below 45 thousand?

42. Froth height—carbonated beverages: The height of the froth on carbonated drinks and other beverages can be manipulated by the ingredients used in making the beverage and lends itself very well to the modeling process. The data in the table given show the froth height of a certain beverage as a function of time, after the froth has reached a maximum height. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation.

Time (seconds)	Height of Froth (in.)
0	0.90
2	0.65
4	0.40
6	0.21
8	0.15
10	0.12
12	0.08

a. What was the approximate height of the froth after 6.5 sec?

b. How long does it take for the height of the froth to reach one-half of its maximum height?

c. According to the model, how many seconds until the froth height is 0.02 in.?

43. Chicken production: In 1980, the production of chickens in the United States was about 392 million. In the next decade, the demand for chicken first dropped, then rose dramatically. The number of chickens produced is given in the table to the right for selected years. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation.

Year (1980 → 0)	Number (millions)
0	392
5	370
9	356
14	386
16	393
17	410
18	424

Source: Statistical Abstract of the United States, 2000.

a. What was the approximate number of chickens produced in 1987?

b. Approximately how many chickens will be produced in 2004?

c. According to the model, for what years was the production of chickens below 365 million?

44. Veterans in civilian life: The number of military veterans in civilian life fluctuates with the number of persons inducted into the military (higher in times of war) and the passing of time. The number of living veterans is given in the table for selected years from 1950 to 1999. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation.

Year (1950 → 0)	Number (millions)
0	19.1
10	22.5
20	27.6
30	28.6
40	27
48	25.1
49	24.6

Source: Statistical Abstract of the United States, 2000.

a. What was the approximate number of living military veterans in 1995?

b. Approximately how many living veterans will there be in 2015?

c. According to the model, in what years did the number of veterans exceed 26 million?

45. Use of debit cards: Since 1990, the use of debit cards to obtain cash and pay for purchases has become very common. The number of debit cards nationwide is given in the table for selected years. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation.

Year (1990 → 0)	Number of Cards (millions)
0	164
5	201
8	217
10	230

Source: Statistical Abstract of the United States, 2000.

a. Approximately how many debit cards were there in 1999?

b. Approximately how many debit cards will there be in 2015?

c. In what year did the number of debit cards exceed 300 million?

46. Quiz grade versus study time: To determine the value of doing homework, a student in college algebra records the time spent by classmates in preparation for a quiz the next day. Then she records their scores, which are shown in the table. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation. According to the model, what grade can I expect if I study for 120 min?

x (min study)	y (score)
45	70
30	63
10	59
20	67
60	73
70	85
90	82
75	90

47. Population of coastal areas: The percentage of the U.S. population that can be categorized as living in *Pacific coastal areas* (minimum of 15% of the state's land area is a coastal watershed) has been growing steadily for decades, as indicated by the data given for selected years. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation. According to the model, what is the predicted percentage of the population living in Pacific coastal areas in 2005, 2010 and 2015?

Year (1970 → 0)	Percentage
0	22.8
10	27.0
20	33.2
25	35.2
30	37.8
31	38.5
32	38.9
33	39.4

Source: 2004 Statistical Abstract of the United States, Table 23.

48. Water depth and pressure: As anyone who's been swimming knows, the deeper you dive, the more pressure you feel on your body and eardrums. This pressure (in pounds per square inch or psi) is shown in the table for selected depths. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation. According to the model, what pressure can be expected at a depth of 100 ft?

Depth (ft)	Pressure (psi)
15	6.94
25	11.85
35	15.64
45	19.58
55	24.35
65	28.27
75	32.68

49. Musical notes: The table shown gives the frequency (vibrations per second for each of the twelve notes in a selected octave) from the standard chromatic scale. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation.

#	Note	Frequency
1	A	110.00
2	A#	116.54
3	B	123.48
4	C	130.82
5	C#	138.60
6	D	146.84
7	D#	155.56
8	E	164.82
9	F	174.62
10	F#	185.00
11	G	196.00
12	G#	207.66

a. What is the frequency of the "A" note that is an octave higher than the one shown? [*Hint:* The names repeat every 12 notes (one octave), so this would be the 13th note in this sequence.]

b. If the frequency is 370.00 what note is being played?

c. What pattern do you notice for the F#'s in each octave (the 10th, 22nd, 34th, and 46th notes in sequence)? Does the pattern hold for all notes?

50. Basketball salaries: In 1970, the average player salary for a professional basketball player was about $43,000. Since that time player salaries have risen dramatically. The average player salary for a professional player is given in the table shown for selected years. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation.

Year (1970 → 0)	Salary ($1000s)
0	43
10	260
15	325
20	750
25	1900
27	2200
28	2600

Source: Wall Street Journal Almanac.

a. What was the approximate salary for a player in 1993?

b. Approximately how much was the average salary in 2005?

c. In what year did the average salary exceed $5,000,000?

51. Cost of cable service: The average monthly cost of cable TV has been rising steadily since it became very popular in the early 1980s. The data given shows the average monthly rate for selected years (1980 → 0). Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation. According to the model, what will be the cost of cable service in 2010? 2015?

Year (1980 → 0)	Monthly Charge
0	$7.69
5	$9.73
10	$16.78
20	$23.07
25	$30.70

Source: 2004–2005 *Statistical Abstract of the United States,* page 725, Table 1138.

52. Research and development expenditures: The development of new products, improved health care, greater scientific achievement, and other advances is fueled by huge investments in research and development (R & D). Since 1960, total R & D expenditures in the United States have shown a distinct pattern of growth, and the data are given in the table for selected years from 1960 to 1999. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation. According to the model, what was spent on R & D in 1992? In what year did expenditures for R & D exceed 450 billion?

Year (1960 → 0)	R & D (billion $)
0	13.7
5	20.3
10	26.3
15	35.7
20	63.3
25	114.7
30	152.0
35	183.2
39	247.0

53. Business start-up costs: As many new businesses open, they experience a period where little or no profit is realized due to start-up expenses, equipment purchases, and so on. The data given shows the profit of a new company for the first 6 months of business. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation. According to the model, what is the first month that a profit will be earned?

Month	Profit ($1000s)
1	−5
2	−13
3	−18
4	−20
5	−21
6	−19

54. Low birth weight: For many years, the association between low birth weight (less than 2500 g or about 5.5 lb) and a mother's age has been well documented. The data given are grouped by age and give the percent of total births with low birth weight.

Source: National Vital Statistics Report, Vol. 50, No. 5, February 12, 2002.

Ages	Percent
15–19	8.5
20–24	6.5
25–29	5.2
30–34	5
35–39	6
40–44	8
45–54	10

a. Using the data and the median age of each group, draw a scatterplot and decide on an appropriate form of regression.

b. Find a regression equation that models the data. According to the model, what percent of births will have a low birth weight if the mother was 58 years old?

55. Growth of cell phone use: The tremendous surge in cell phone use that began in the early nineties has continued unabated into the new century. The total number of subscriptions is shown in the table for selected years, with $1990 \rightarrow 0$ and the number of subscriptions in millions. Use the data to draw a scatterplot. Does the data seem to follow an exponential or logistic pattern? Find the regression equation. According to the model, how many subscriptions were there in 1997? How many subscriptions does your model project for 2005? 2010? In what year will the subscriptions exceed 220 million?

Year ($1990 \rightarrow 0$)	Subscriptions (millions)
0	5.3
3	16.0
6	44.0
8	69.2
12	140.0
13	158.7

Source: 2000/2004 *Statistical Abstracts of the United States,* Tables 919/1144.

56. Absorption rates of fabric: Using time lapse photography, the spread of a liquid is tracked in one-fifth of a second intervals, as a small amount of liquid is dropped on a piece of fabric. Use the data to draw a scatterplot, then use the context and scatterplot to find the regression equation. To the nearest hundredth of a second, how long did it take the stain to reach a size of 15 mm?

Time (sec)	Size (mm)
0.2	0.39
0.4	1.27
0.6	3.90
0.8	10.60
1.0	21.50
1.2	31.30
1.4	36.30
1.6	38.10
1.8	39.00

57. Planetary orbits: The table shown gives the time required for the first five planets to make one complete revolution around the Sun (in years), along with the average orbital radius of the planet in astronomical units (1 AU = 92.96 million miles). Use a graphing calculator to draw the scatterplot, then use the scatterplot, the context, and any previous experience to decide whether a polynomial, exponential, logarithmic, or power regression is most appropriate. Then (a) find the regression equation and use it to estimate the average orbital radius of Saturn, given it orbits the Sun every 29.46 yr, and (b) estimate how many years it takes Uranus to orbit the Sun, given it has an average orbital radius of 19.2 AU.

Planet	Years	Radius
Mercury	0.24	0.39
Venus	0.62	0.72
Earth	1.00	1.00
Mars	1.88	1.52
Jupiter	11.86	5.20

58. Ocean temperatures: The temperature of ocean water depends on several factors, including salinity, latitude, depth, and density. However, between depths of 125 m and 2000 m, ocean temperatures are relatively predictable, as indicated by the data shown for tropical oceans in the table. Use a graphing calculator to draw the scatterplot, then use the scatterplot, the context, and any previous experience to decide whether a polynomial, exponential, logarithmic, or power regression is

Depth (meters)	Temp (°C)
125	13.0
250	9.0
500	6.0
750	5.0
1000	4.4
1250	3.8
1500	3.1
1750	2.8
2000	2.5

most appropriate (end-behavior rules out linear and quadratic models as possibilities).

Source: UCLA at www.msc.ucla.oceanglobe/pdf/ thermo_plot_lab

a. Find the regression equation and use it to estimate the water temperature at a depth of 2850 m.

b. If the model were still valid at greater depths, what is the ocean temperature at the bottom of the Marianas Trench, some 10,900 m below sea level?

59. Predater/prey model: In the wild, some rodent populations vary inversely with the number of predators in the area. Over a period of time, a conservation team does an extensive study on this relationship and gathers the data shown. Draw a scatterplot of the data and (a) find a regression equation that models the data. According to the model, (b) if there are 150 predators in the area, what is the rodent population? (c) How many predators are in the area if studies show a rodent population of 3000 animals?

Predators	Rodents
10	5100
20	2500
30	1600
40	1200
50	950
60	775
70	660
80	575
90	500
100	450

60. Children and AIDS: Largely due to research, education, prevention, and better health care, estimates of the number of AIDS (acquired immune deficiency syndrome) cases diagnosed in children less than 13 yr of age have been declining. Data for the years 1995 through 2002 is given in the table.

Source: National Center for Disease Control and Prevention.

Years Since 1990	Cases
5	686
6	518
7	328
8	238
9	183
10	118
11	110
12	92

a. Use the data to draw a scatterplot and decide on an appropriate form of regression.

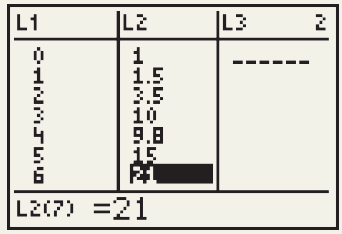
b. Find a regression equation that models the data. According to the model, how many cases of AIDS in children are projected for 2010?

c. In what year did the number of cases fall below 50?

61. Growth rates of children: After reading a report from The National Center for Health Statistics regarding the growth of children from age 0 to 36 months, Maryann decides to track the relationships (length in inches, weight in pounds) and (age in months, circumference of head in centimeters) for her newborn child, a beautiful baby girl—Morgan.

a. Use the (length, weight) data to draw a scatterplot, then use the context and scatterplot to find the regression equation. According to the model, how much will Morgan weigh when she reaches a height (length) of 39 in.? What will her length be when she weighs 28 lb?

b. Use the (age, circumference) data to draw a scatterplot, then use the context and scatterplot to find the regression equation. According to the model, what is the circumference of Morgan's head when she is 27 months old? How old will she be when the circumference of her head is 50 cm?



Exercise 61a

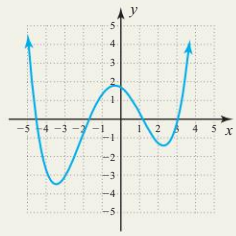
Length (in.)	Weight (lb)
17.5	5.50
21	10.75
25.5	16.25
28.5	19.00
33	25.25

Exercise 61b

Age (months)	Circumference (cm)
1	38.0
6	44.0
12	46.5
18	48.0
21	48.3

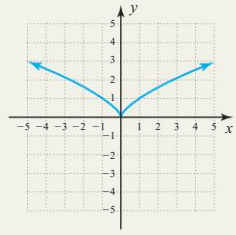
62. Correlation coefficients: Although correlation coefficients can be very helpful, other factors must also be considered when selecting the most appropriate equation model for a set of data. To see why, use the data given to (a) find a linear regression equation and note its correlation coefficient, and (b) find an exponential regression equation and note its correlation coefficient. What do you notice? Without knowing the context of the data, would you be able to tell which model might be more suitable? (c) Use your calculator to graph the scatterplot and both functions. Which function appears to be a better fit?

▶ MAINTAINING YOUR SKILLS



63. **(4.4)** State the domain of the function, then write it in lowest terms:

$$h(x) = \frac{x^2 - 6x + 5}{x^3 - 4x^2 - 7x + 10}$$

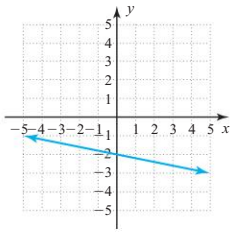


64. **(2.5)** Find a linear function that will make $p(x)$ continuous.

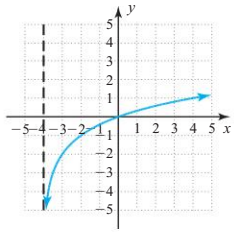
$$p(x) = \begin{cases} x^2 & -2 \le x < 2 \\ ?? & ? \le x < ? \\ \sqrt{x-4} + 1 & x \ge 4 \end{cases}$$

65. **(2.1)** For the graph of $f(x)$ given, estimate max/min values to the nearest tenth and state intervals where $f(x)\uparrow$ and $f(x)\downarrow$.

66. **(2.2)** The graph of $f(x) = x^{\frac{2}{3}}$ is given. Use it to sketch the graph of $F(x) = (x-2)^{\frac{2}{3}} + 3$, and use the graph to state the domain and range of F.

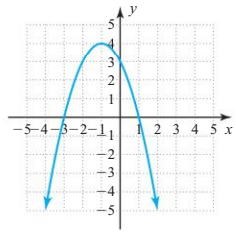


MAKING CONNECTIONS

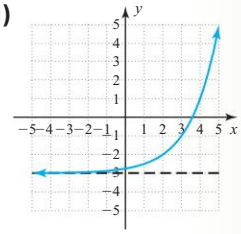


Making Connections: Graphically, Symbolically, Numerically, and Verbally

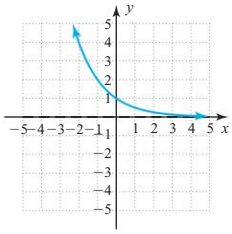
Eight graphs (a) through (h) are given. Match the characteristics or equations shown in 1 through 16 to one of the eight graphs.



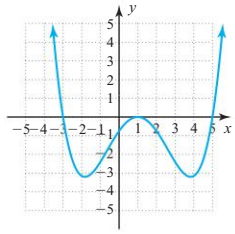
(a)



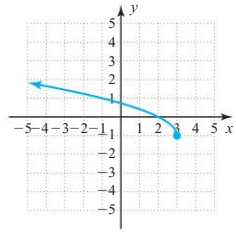
(b)



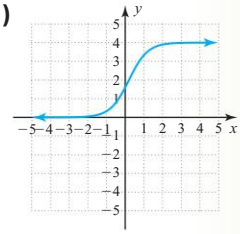
(c)



(d)



(e)



(f)

(g)

(h)

1. ____ $y = -\frac{1}{5}x - 2$

2. ____ domain: $x \in (-\infty, 3]$

3. ____ as $x \to \infty, y \to 0$

4. ____ $y = \log_2(x+4) - 2$

5. ____ $y = -(x+1)^2 + 4$

6. ____ as $x \to \infty, y \to 4$

7. ____ $f(0) = 1, f(-2) = 4$

8. ____ $f(x)\uparrow$ for $x \in (-\infty, \infty)$

9. ____ range: $y \in (-\infty, \infty), f(-2) = -1$

10. ____ $y = \frac{4}{1 + 1.5e^{-2x}}$

11. ____ $y = \sqrt{3 - x} - 1$

12. ____ $y = \frac{1}{20}(x+3)(x-1)^2(x-5)$

13. ____ axis of symmetry $x = -1$

14. ____ $y = 2^{-x}$

15. ____ $y = 2^{x-2} - 3$

16. ____ $f(x) \le 0$ for $x \in [-3, 5]$

SUMMARY AND CONCEPT REVIEW

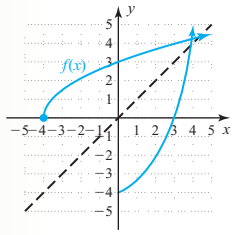
SECTION 5.1 One-to-One and Inverse Functions

KEY CONCEPTS

- A function is one-to-one if each element of the range corresponds to a unique element of the domain.
- If every horizontal line intersects the graph of a function in at most one point, the function is one-to-one.
- If f is a one-to-one function with ordered pairs (a, b), then the inverse of f exists and is that one-to-one function f^{-1} with ordered pairs of the form (b, a).
- The range of f becomes the domain of f^{-1}, and the domain of f becomes the range of f^{-1}.
- To find f^{-1} using the algebraic method:
  1. Use y instead of $f(x)$.
  2. Interchange x and y.
  3. Solve the equation for y.
  4. Substitute $f^{-1}(x)$ for y.
- If f is a one-to-one function, the inverse f^{-1} exists, where $(f \circ f^{-1})(x) = x$ and $(f^{-1} \circ f)(x) = x$.
- The graphs of f and f^{-1} are symmetric to the identity function $y = x$.

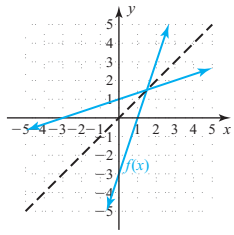
EXERCISES

Determine whether the functions given are one-to-one by noting the function family to which each belongs and mentally picturing the shape of the graph.



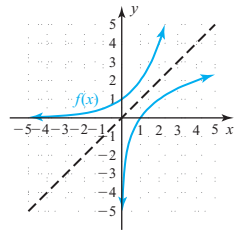
1. $h(x) = -|x - 2| + 3$ **2.** $p(x) = 2x^2 + 7$ **3.** $s(x) = \sqrt{x - 1} + 5$

Find the inverse of each function given. Then show using composition that your inverse function is correct. State any necessary restrictions.



4. $f(x) = -3x + 2$ **5.** $f(x) = x^2 - 2, x \geq 0$ **6.** $f(x) = \sqrt{x - 1}$

Determine the domain and range for each function whose graph is given, and use this information to state the domain and range of the inverse function. Then use the line $y = x$ to estimate the location of three points on the graph, and use these to graph $f^{-1}(x)$ on the same grid.



7.

8.

9.

10. Fines for overdue material: Some libraries have set fees and penalties to discourage patrons from holding borrowed materials for an extended period. Suppose the fine for overdue DVDs is given by the function $f(t) = 0.15t + 2$, where $f(t)$ is the amount of the fine t days after it is due. (a) What is the fine for keeping a DVD seven (7) extra days? (b) Find $f^{-1}(t)$, then input your answer from part (a) and comment on the result. (c) If a fine of \$3.80 was assessed, how many days was the DVD overdue?

SECTION 5.2 Exponential Functions

KEY CONCEPTS

- An exponential function is defined as $f(x) = b^x$, where $b > 0$, $b \neq 1$, and b, x are real numbers.
- The natural exponential function is $f(x) = e^x$, where $e \approx 2.71828182846$.
- For exponential functions, we have
- one-to-one function
- y-intercept $(0, 1)$
- domain: $x \in \mathbb{R}$
- range: $y \in (0, \infty)$
- increasing if $b > 1$
- decreasing if $0 < b < 1$
- asymptotic to x-axis

- The graph of $y = b^{x \pm h} \pm k$ is a translation of the basic graph of $y = b^x$, horizontally h units opposite the sign and vertically k units in the same direction as the sign.
- If an equation can be written with like bases on each side, we solve it using the uniqueness property: If $b^m = b^n$, then $m = n$ (equal bases imply equal exponents).
- All previous properties of exponents also apply to exponential functions.

EXERCISES

Graph each function using *transformations of the basic function,* then strategically plot a few points to check your work and round out the graph. Draw and label the asymptote.

11. $y = 2^x + 3$ **12.** $y = 2^{-x} - 1$ **13.** $y = -e^{x+1} - 2$

Solve using the uniqueness property.

14. $3^{2x-1} = 27$ **15.** $4^x = \frac{1}{16}$ **16.** $e^x \cdot e^{x+1} = e^6$

17. A ballast machine is purchased new for \$142,000 by the AT & SF Railroad. The machine loses 15% of its value each year and must be replaced when its value drops below \$20,000. How many years will the machine be in service?

SECTION 5.3 Logarithms and Logarithmic Functions

KEY CONCEPTS

- A logarithm is an exponent. For $x, b > 0$, and $b \neq 1$, the expression $\log_b x$ represents the exponent that goes on base b to obtain x: If $y = \log_b x$, then $b^y = x \Rightarrow b^{\log_b x} = x$ (by substitution).
- The equations $x = b^y$ and $y = \log_b x$ are equivalent. We say $x = b^y$ is the *exponential* form and $y = \log_b x$ is the *logarithmic* form of the equation.
- The value of $\log_b x$ can sometimes be determined by writing the expression in exponential form. If $b = 10$ or $b = e$, the value of $\log_b x$ can be found directly using a calculator.
- A logarithmic *function* is defined as $f(x) = \log_b x$, where $x, b > 0$, and $b \neq 1$.
  - $y = \log_{10} x = \log x$ is called the *common* logarithmic function.
  - $y = \log_e x = \ln x$ is called the *natural* logarithmic function.
- For $f(x) = \log_b x$ as defined we have
  - one-to-one function
  - x-intercept $(1, 0)$
  - domain: $x \in (0, \infty)$
  - range: $y \in \mathbb{R}$
  - increasing if $b > 1$
  - decreasing if $0 < b < 1$
  - asymptotic to y-axis
- The graph of $y = \log_b(x \pm h) \pm k$ is a translation of the graph of $y = \log_b x$, horizontally h units opposite the sign and vertically k units in the same direction as the sign.

EXERCISES

Write each expression in *exponential* form.

18. $\log_3 9 = 2$ **19.** $\log_{5\frac{1}{125}} = -3$ **20.** $\ln 43 \approx 3.7612$

Write each expression in *logarithmic* form.

21. $5^2 = 25$ **22.** $e^{-0.25} \approx 0.7788$ **23.** $3^4 = 81$

Find the value of each expression without using a calculator.

24. $\log_2 32$ **25.** $\ln\left(\frac{1}{e}\right)$ **26.** $\log_9 3$

Graph each function using *transformations of the basic function,* then strategically plot a few points to check your work and round out the graph. Draw and label the asymptote.

27. $f(x) = \log_2 x$ **28.** $f(x) = \log_2(x + 3)$ **29.** $f(x) = 2 + \ln(x - 1)$

Find the domain of the following functions.

30. $g(x) = \log \sqrt{2x + 3}$ **31.** $f(x) = \ln(x^2 - 6x)$

32. The magnitude of an earthquake is given by $M(I) = \log\frac{I}{I_0}$, where I is the intensity and I_0 is the reference intensity. (a) Find $M(I)$ given $I = 62{,}000I_0$ and (b) find the intensity I given $M(I) = 7.3$.

SECTION 5.4 Properties of Logarithms

KEY CONCEPTS

- The basic definition of a logarithm gives rise to the following properties: For any base $b > 0$, $b \neq 1$,
  1. $\log_b b = 1$ (since $b^1 = b$) **2.** $\log_b 1 = 0$ (since $b^0 = 1$)
  3. $\log_b b^x = x$ (since $b^x = b^x$) **4.** $b^{\log_b x} = x$
- Since a logarithm is an exponent, they have properties that parallel those of exponents.

Product Property	**Quotient Property**	**Power Property**
like base and multiplication, add exponents:	like base and division, subtract exponents:	exponent raised to a power, multiply exponents:
$\log_b(MN) = \log_b M + \log_b N$	$\log_b\left(\frac{M}{N}\right) = \log_b M - \log_b N$	$\log_b M^p = p\log_b M$

- The logarithmic properties can be used to expand an expression: $\log(2x) = \log 2 + \log x$.
- The logarithmic properties can be used to contract an expression: $\ln(2x) - \ln(x + 3) = \ln\left(\frac{2x}{x + 3}\right)$.
- To evaluate logarithms with bases other than 10 or e, use the change-of-base formula:

$$\log_b M = \frac{\log M}{\log b} = \frac{\ln M}{\ln b}$$

- If an equation can be written with like bases on each side, we solve it using the uniqueness property: if $\log_b m = \log_b n$, then $m = n$ (equal bases imply equal arguments).
- If a single exponential or logarithmic term can be isolated on one side, then for any base b:

$$\text{If } b^x = k, \text{ then } x = \frac{\log k}{\log b} \qquad \text{If } \log_b x = k, \text{ then } x = b^k.$$

EXERCISES

33. Solve each equation by applying fundamental properties.

a. $\ln x = 32$ **b.** $\log x = 2.38$ **c.** $e^x = 9.8$ **d.** $10^x = \sqrt{7}$

34. Solve each equation. Write answers in exact form and in approximate form to four decimal places.

a. $15 = 7 + 2e^{0.5x}$ **b.** $10^{0.2x} = 19$ **c.** $-2\log(3x) + 1 = -5$ **d.** $-2\ln x + 1 = 6.5$

35. Use the product or quotient property of logarithms to write each sum or difference as a single term.

a. $\ln 7 + \ln 6$ **b.** $\log_9 2 + \log_9 15$ **c.** $\ln(x + 3) - \ln(x - 1)$ **d.** $\log x + \log(x + 1)$

36. Use the power property of logarithms to rewrite each term as a product.

a. $\log_5 9^2$ **b.** $\log_7 4^2$ **c.** $\ln 5^{2x-1}$ **d.** $\ln 10^{3x+2}$

37. Use the properties of logarithms to write the following expressions as sums or differences of simple logarithmic terms.

a. $\ln(x\sqrt[4]{y})$ **b.** $\ln(\sqrt[3]{pq})$ **c.** $\log\left(\frac{\sqrt[3]{x^5 \cdot y^4}}{\sqrt{x^5y^3}}\right)$ **d.** $\log\left(\frac{4\sqrt[3]{p^5q^4}}{\sqrt{p^3q^2}}\right)$

38. Evaluate using a change-of-base formula. Answer in exact form and approximate form to thousandths.

a. $\log_6 45$ **b.** $\log_3 128$ **c.** $\log_2 124$ **d.** $\log_5 0.42$

SECTION 5.5 Solving Exponential and Logarithmic Equations

KEY CONCEPTS

- If an exponential equation uses base 10, isolate the exponential term, apply the common logarithm, then solve for x using algebra.
- If an exponential equation uses base e, isolate the exponential term, apply the natural logarithm, then solve for x using algebra.
- For a general base b, isolate the exponential term, apply the base-b logarithm, then solve for x using algebra and the change-of-base formula.
- If a logarithmic equation has a constant term as in $\log_b M = \log_b N +$ constant, move all logarithmic terms to one side and consolidate using the product or quotient properties, then use the exponential form and algebra to solve.
- If a logarithmic equation has multiple logarithmic terms as in $\log_b X = \log_b M + \log_b N$, consolidate logarithmic terms using the product or quotient properties, then use the uniqueness property and algebra to solve.

EXERCISES

Solve each equation. Answer in both exact form and approximate form.

39. $2^x = 7$ **40.** $3^{x+1} = 5$ **41.** $e^{x-2} = 3^{-x}$

42. $\ln(x + 1) = 2$ **43.** $\log x + \log(x - 3) = 1$ **44.** $\log_{25}(x + 2) - \log_{25}(x - 3) = \frac{1}{2}$

45. The rate of decay for radioactive material is related to its half-life by the formula $R(h) = \frac{\ln 2}{h}$, where h represents the half-life of the material and $R(h)$ is the rate of decay expressed as a decimal. The element radon-222 has a half-life of approximately 3.9 days. (a) Find its rate of decay to the nearest hundredth of a percent. (b) Find the half-life of thorium-234 if its rate of decay is 2.89% per day.

46. The *barometric equation* $H = (30T + 8000)\ln(\frac{P_0}{P})$ relates the altitude H to atmospheric pressure P, where $P_0 = 76$ cmHg. Find the atmospheric pressure at the summit of Mount Pico de Orizaba (Mexico), whose summit is at 5657 m. Assume the temperature at the summit is $T = 12°$C.

SECTION 5.6 Applications from Business, Finance, and Science

KEY CONCEPTS

- Simple interest: $I = prt$; p is the initial principal, r is the interest rate per year, and t is the time in years.
- Amount in an account after t years: $A = p + prt$ or $A = p(1 + rt)$.
- Interest compounded n times per year: $A = p\left(1 + \frac{r}{n}\right)^{nt}$; p is the initial principal, r is the interest rate per year, t is the time in years, and n is the times per year interest is compounded.
- Interest compounded continuously: $A = pe^{rt}$; p is the initial principal, r is the interest rate per year, and t is the time in years.
- If a loan or savings plan calls for a regular schedule of deposits, the plan is called an annuity.
- For periodic payment $\mathcal{P}$, deposited or paid n times per year, at annual interest rate r, with interest compounded or calculated n times per year for t years, and $R = \frac{r}{n}$:
  - The accumulated value of the account is $A = \frac{\mathcal{P}}{R}[(1 + R)^{nt} - 1]$.
  - The payment required to meet a future goal is $\mathcal{P} = \frac{AR}{[(1 + R)^{nt} - 1]}$
  - The payment required to amortize an amount A is $\mathcal{P} = \frac{AR}{1 - (1 + R)^{-nt}}$.
  - The general formulas for exponential growth and decay are $Q(t) = Q_0 e^{rt}$ and $Q(t) = Q_0 e^{-rt}$, respectively.

EXERCISES

Solve each application.

47. Jeffery borrows \$600.00 from his dad, who decides it's best to charge him interest. Three months later Jeff repays the loan plus interest, a total of \$627.75. What was the annual interest rate on the loan?

48. To save money for her first car, Cheryl invests the \$7500 she inherited in an account paying 7.8% interest compounded monthly. She hopes to buy the car in 6 yr and needs \$12,000. Is this possible?

49. To save up for the vacation of a lifetime, Al-Harwi decides to save \$15,000 over the next 4 yr. For this purpose he invests \$260 every month in an account paying $7\frac{1}{2}\%$ interest compounded monthly. (a) Is this monthly amount sufficient to meet the four-year goal? (b) If not, find the *minimum amount he needs to deposit each month* that will enable him to meet this goal in 4 yr.

50. Eighty prairie dogs are released in a wilderness area in an effort to repopulate the species. Five years later a statistical survey reveals the population has reached 1250 dogs. Assuming the growth was exponential, approximate the growth rate to the nearest tenth of a percent.

SECTION 5.7 Exponential, Logarithmic, and Logistic Equation Models

KEY CONCEPTS

- The choice of regression models generally depends on: (a) whether the graph appears to fit the data, (b) the context or situation that generated the data, and (c) certain tests applied to the data.
- The regression equation can be used to *extrapolate* or predict future values or occurrences. When using extrapolation, values are projected *beyond* the given set of data.
- The regression equation can be used to *interpolate* or approximate intermediate values. When using interpolation, the values occur *between* those given in the data set.

EXERCISES

51. Vehicle fuel economy: While the average fuel economy of light trucks rose significantly in the late 1970s and early 1980s, this growth seemed to slow significantly thereafter, and increased at a much slower rate through the 1990s and beyond. The fuel economy for selected years is shown in the table (1975 $\rightarrow$ 0). Draw a scatterplot of the data then complete the following.

Year (1975 → 0)	Average Miles per Gal
1	12.5
5	15.5
10	16.8
15	17.5
20	17.6
25	17.6
30	17.8

Source: Data from the Pew Charitable Trusts.

a. Decide on an appropriate form of regression and find a regression equation.

b. Use the regression equation to estimate the average fuel economy for light trucks in the year 1988.

c. If current trends continue, in what year will average fuel economy surpass 18.5 mi/gal?

52. Biological studies—cell division: The relationship between cell size and cell division (mitosis) is a common object of biological research. In many cells, a natural mechanism exists that triggers cell division only after the cell has reached a certain size. If the supply of nutrients is scarce, cell growth slows after an initial spurt, and the time between cell divisions is lengthened. Suppose the normal size of a certain cell is 4 microns (four millionths of a meter), and the data in the table track the growth of this cell over time. Draw a scatterplot for the data and complete the following.

Time t (hr)	Cell Growth G (microns)
0	4
1	5.3
2	6.4
3	7.1
4	7.5
5	7.8
6	7.9

a. Decide on an appropriate form of regression and find a regression equation.

b. Use the regression equation to estimate the size of the cell after 2.5 hr.

c. If mitosis (cell division) begins when the cell has grown to 196% of its original size, how long until mitosis occurs?

PRACTICE TEST

1. Write the expression $\log_3 81 = 4$ in exponential form.

2. Write the expression $25^{1/2} = 5$ in logarithmic form.

3. Write the expression $\log_b\left(\dfrac{\sqrt{x^5}y^3}{z}\right)$ as a sum or difference of logarithmic terms.

4. Write the expression $\log_b m + (\frac{3}{2})\log_b n - \frac{1}{2}\log_b p$ as a single logarithm.

Solve for x using the uniqueness property.

5. $5^{x-7} = 125$

6. $2 \cdot 4^{3x} = \dfrac{8^x}{16}$

Given $\log_a 3 \approx 0.48$ and $\log_a 5 \approx 1.72$, evaluate the following without the use of a calculator:

7. $\log_a 45$

8. $\log_a 0.6$

Graph using transformations of the parent function. Verify answers using a graphing calculator.

9. $g(x) = -2^{x-1} + 3$

10. $h(x) = \log_2(x - 2) + 1$

11. Use the change-of-base formula to evaluate. Verify results using a calculator.

a. $\log_3 100$ **b.** $\log_6 0.235$

12. State the domain and range of $f(x) = (x - 2)^2 - 3$ and determine if f is a one-to-one function. If so, find its inverse. If not, restrict the domain of f to create a one-to-one function, then find the inverse of this new function, including the domain and range.

Solve each equation.

13. $3^{x-1} = 89$

14. $\log_5 x + \log_5(x + 4) = 1$

15. A copier is purchased new for \$8000. The machine loses 18% of its value each year and must be replaced when its value drops below \$3000. How many years will the machine be in service?

16. In 1957, scientist Stanley Stevens proposed a mathematical model that attempted to compare the actual strength of a physical stimulus with the human perception (dead-reckoning) of its strength. The model has been widely applied in comparisons of weight, sound, pressure, and other areas. If M represents the measured strength of the stimulus, and P the human perception of its strength, **Stevens' law** can be written as $\log P = \log k + \alpha \log M$, where α and k are constants determined by the type of stimulation applied. In a controlled experiment, subjects were given a known amount of weight to lift, then asked to select an unmarked weight they felt was equal to half the known weight. (a) Solve the equation for P and (b) use the result to determine what was perceived to be half of a 40-lb weight (assume $k = 0.89$ and $\alpha = 0.95$).

17. The number of ounces of unrefined platinum drawn from a mine is modeled by $Q(t) = -2600 + 1900 \ln(t)$, where $Q(t)$ represents the number of ounces mined in t months. How many months did it take for the number of ounces mined to exceed 3000?

18. Jacob decides to save \$4000 over the next 5 yr so that he can present his wife with a new diamond ring for their 20th anniversary. He invests \$50 every month in an account paying $8\frac{1}{4}\%$ interest compounded monthly. (a) Is this amount sufficient to meet the 5-yr goal? (b) If not, find the *minimum amount he needs to save monthly* that will enable him to meet this goal.

19. Chaucer is a typical Welsh Corgi puppy. During his first year of life, his weight very closely follows the model $W(t) = 6.79 \ln t - 11.97$, where $W(t)$ is his weight in pounds after t weeks and $8 \le t \le 52$.

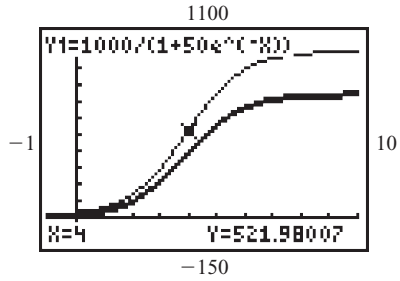
a. How much will Chaucer weigh when he is 26 weeks old (to the nearest one-tenth pound)?

b. To the nearest week, how old is Chaucer when he weighs 12 lb?

20. Using time-lapse photography, the growth of a stain is tracked in 0.2 second intervals, as a small amount of liquid is dropped on various fabrics. Use the data given to draw a scatterplot and decide on an appropriate regression model. How long, to the nearest hundredth of a second, did it take the stain to reach a size of 15 mm?

Exercise 20

Time (sec)	Size (mm)
0.2	0.39
0.4	1.27
0.6	3.90
0.8	10.60
1.0	21.50
1.2	31.30
1.4	36.30
1.6	38.10
1.8	39.00



CALCULATOR EXPLORATION AND DISCOVERY

Investigating Logistic Equations

As we saw in Section 5.5, logistic models have the form $P(t) = \dfrac{c}{1 + ae^{-bt}}$, where a, b, and c are constants and $P(t)$ represents the population at time t. For populations modeled by a logistic curve (sometimes called an "S" curve), growth is very rapid at first (like an exponential function), but this growth begins to slow down and level off due to various factors. This *Calculator Exploration and Discovery* is designed to investigate the effects that a and c have on the resulting graph.

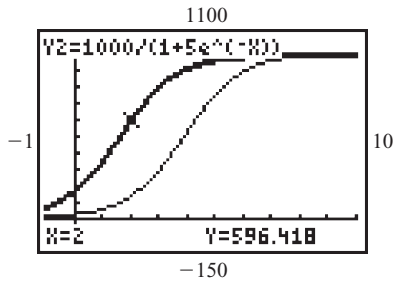
I. Investigating a: From our earlier observation, as t becomes larger and larger, the term ae^{-bt} becomes smaller and smaller (approaching 0) because it is a decreasing function: as $t \to \infty$, $ae^{-bt} \to 0$. If we allow that the term eventually becomes so small it can be disregarded, what remains is $P(t) = \dfrac{c}{1}$ or c. This is why c is called the capacity constant and the population can get no larger than c. In Figure 5.65, the graph of $P(t) = \dfrac{1000}{1 + 50e^{-1x}}$ ($a = 50$, $b = 1$, and $c = 1000$) is shown using a lighter line, while the graph of $P(t) = \dfrac{750}{1 + 50e^{-1x}}$ ($a = 50$, $b = 1$, and $c = 750$), is given in bold.

Figure 5.65

Also note that if a is held constant, smaller values of c cause the "interior" of the S curve to grow at a slower rate than larger values, a concept studied in some detail in a Calculus I class.

II. Investigating c: If $t = 0$, $ae^{-bt} = ae^0 = a$, and we note the ratio $P(0) = \dfrac{c}{1 + a}$ represents the *initial population.* This also means for constant values of c, larger values of a make the ratio $\dfrac{c}{1 + a}$ smaller; while smaller values of a make the ratio $\dfrac{c}{1 + a}$ larger. From this we conclude that a primarily affects the initial population. In Figures 5.66 and 5.67 shown next, $P(t) = \dfrac{1000}{1 + 50e^{-1x}}$ (from I) is graphed using a lighter line, while the graph of $P(t) = \dfrac{1000}{1 + 5e^{-1x}}$ ($a = 5$) and $P(t) = \dfrac{1000}{1 + 500e^{-1x}}$ ($a = 500$) are shown in bold.

Figure 5.66



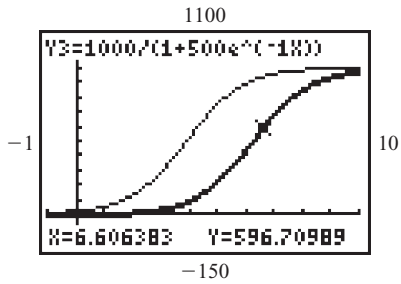


Figure 5.67

Note that changes in a appear to have no effect on the rate of growth in the interior of the S curve.

The following exercises are based on the population of an ant colony, modeled by the logistic function $P(t) = \dfrac{2500}{1 + 25e^{-0.5x}}$. Respond to Exercises 1 through 5 without the use of a calculator.

Exercise 1: Identify the values of a, b, and c for this logistics curve.

Exercise 2: What was the approximate initial population of the colony?

Exercise 3: Which gives a larger initial population:(a) $c = 2500$ and $a = 25$ or (b) $c = 3000$ and $a = 15$?

Exercise 4: What is the maximum population capacity for this colony?

Exercise 5: Which causes a slower population growth: (a) $c = 2000$ and $a = 25$ or (b) $c = 3000$ and $a = 25$?

Exercise 6: Verify your responses to Exercises 1 through 5 using a graphing calculator.

STRENGTHENING CORE SKILLS

The HerdBurn Scale—What's Hot and What's Not

The human mouth can easily distinguish between heat levels (the burning sensation) when eating foods "spiced" with various peppers. The level of "heat" is generally given in *Scoville units*, which is a measure of the element capsaicin that causes the burn. Sweet bell peppers and others have no capsaicin and a Scoville rating of 0, while red habanero peppers have a Scoville rating of near 500,000. Although inedible, laboratory grades of capsaicin can have a Scoville rating of near 16,000,000! This range of values makes a unit scale impractical for common use, and a logarithmic scale once again becomes more desirable. Using the newly developed *HerdBurn scale (hb)*, we have the following measures of "heat" for well known peppers of various types.

The HerdBurn Scale

HerdBurn Units (hb)	Chili Pepper	General Sensation	Caustic Power
0	sweet banana peppers	not sensed	none
1	cherry peppers	delicate warmth	none
2	pepperoncini peppers	strong warmth	none
2.5	Sonora peppers	slight burn	some reaction
3	ancho peppers	moderate burn	fanning the mouth
3.5	jalapeno peppers	strong burn	eyes water
4	hidalgo peppers	sizzling burn	pain threshold
4.5	cayenne peppers	scorching burn	painful
5	Bahamian peppers	blistering burn	very painful
5.5	habanero peppers	ruthless burn	intense pain
6	naga jolokia peppers	merciless burn	debilitating
6.5	military grade pepper spray	*inedible*	incapacitating
7	laboratory grade capsaicin	*inedible*	ruinous
7.2	pure capsaicin	*inedible*	deadly

Similar to working with decibel levels or the Richter scale, we compare how many times hotter one pepper is than another by recognizing the values given are powers of 10. For example, a red habanero (5.7 hb), is about two times as hot as an orange habanero (5.4 hb): $\frac{10^{5.7}}{10^{5.4}} = 10^{0.3} \approx 2$, but nearly 100 times hotter than a red jalapeno pepper (3.7 hb): $\frac{10^{5.7}}{10^{3.7}} = 10^{2}$. Use this information to complete the following exercises.

Exercise 1: The "heat" in a rocotillo pepper measures about 3.4 on the HerdBurn scale, while a Jamaican hot pepper measures near 5.5. How many times hotter is the Jamaican pepper?

Exercise 2: A naga jolokia (6.0 hb) pepper is about 63 times as hot as a serrano pepper. What is the HerdBurn number for a serrano pepper?

CUMULATIVE REVIEW CHAPTERS 1–5

Use the quadratic formula to solve for x.

1. $x^2 - 4x + 53 = 0$

2. $6x^2 + 19x = 36$

3. Use substitution to show that $4 + 5i$ is a zero of $f(x) = x^2 - 8x + 41$.

4. Graph using transformations of a basic function: $y = 2\sqrt{x+2} - 3$.

5. Find $(f \circ g)(x)$ and $(g \circ f)(x)$ and comment on what you notice: $f(x) = x^3 - 2$; $g(x) = \sqrt[3]{x+2}$.

6. State the domain of $h(x)$ in interval notation:

$$h(x) = \frac{\sqrt{x+3}}{x^2 + 6x + 8}.$$

7. According to the 2002 *National Vital Statistics Report* (Vol. 50, No. 5, page 19) there were 3100 sets of triplets born in the United States in 1991, and 6740 sets of triplets born in 1999. Assuming the relationship (year, sets of triplets) is linear: (a) find an equation of the line, (b) explain the meaning of the slope in this context, and (c) use the equation to estimate the number of sets born in 1996, and to project the number of sets that will be born in 2007 if this trend continues.

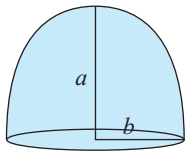
8. State the following geometric formulas:

a. area of a circle **c.** perimeter of a rectangle

b. Pythagorean theorem **d.** area of a trapezoid

9. Graph the following piecewise-defined function and state its domain, range, and intervals where it is increasing and decreasing.

$$h(x) = \begin{cases} -4 & -10 \le x < -2 \\ -x^2 & -2 \le x < 3 \\ 3x - 18 & x \ge 3 \end{cases}$$



10. Solve the inequality and write the solution in interval notation: $\dfrac{2x+1}{x-3} \ge 0$.

11. Use the rational roots theorem to find all zeroes of $f(x) = x^4 - 3x^3 - 12x^2 + 52x - 48$.

12. Given $f(c) = \dfrac{9}{5}c + 32$, find k, where $k = f(25)$.

Then find the inverse function using the algebraic method, and verify that $f^{-1}(k) = 25$.

13. Solve the formula $V = \dfrac{1}{2}\pi b^2 a$ (the volume of a paraboloid) for the variable b.

14. Use the *Guidelines for Graphing* to graph

a. $p(x) = x^3 - 4x^2 + x + 6$. **b.** $r(x) = \dfrac{5x^2}{x^2 + 4}$.

15. For $f(x) = \dfrac{2x+3}{5}$, (a) find f^{-1}, (b) graph both functions and verify they are symmetric to the line $y = x$, and (c) show they are inverses using composition.

16. Solve for x: $10 = -2e^{-0.05x} + 25$.

17. Solve for x: $\ln(x+3) + \ln(x-2) = \ln(24)$.

18. Once in orbit, satellites are often powered by radioactive isotopes. From the natural process of radioactive decay, the power output declines over a period of time. For an initial amount of 50 g, suppose the power output is modeled by the function $p(t) = 50e^{-0.002t}$, where $p(t)$ is the power output in watts, t days after the satellite has been put into service. (a) Approximately how much power remains 6 *months* later (assume 1 mo. ≈ 30.5 days)? (b) How many *years* until only one-fourth of the original power remains?

19. Simon and Christine own a sport wagon and a minivan. The sport wagon has a power curve that is closely modeled by $H(r) = 123 \ln r - 897$, where $H(r)$ is the horsepower at r rpm, with $2200 \le r \le 5600$. The power curve for the minivan is $h(r) = 193 \ln r - 1464$, for $2600 < r \le 5800$.

a. How much horsepower is generated by each engine at 3000 rpm?

b. At what rpm are the engines generating the same horsepower?

c. If Christine wants the maximum horsepower available, which vehicle should she drive? What is the maximum horsepower?

20. Wilson's disease is a hereditary disease that causes the body to retain copper. Radioactive copper, ^{64}Cu, has been used extensively to study and understand this disease. ^{64}Cu has a relatively short half-life of 12.7 hr. How many hours will it take for a 5-g mass of ^{64}Cu to decay to 1 g?

Solve using a graphing calculator.

21. $e^{\frac{x}{2}} - 9.2 = 5 - \ln x$

22. $5.2 - e^{0.25x} = 4 - \ln(x+6)$

23. $e^{\sqrt[3]{x}} = \sqrt{x+5}$

24. $\dfrac{x^2 - 25}{x^2 - 9} = \ln(x+9) + 33$

25. $2^{x^2 - x - 6} = x^2 + x - 6$

CONNECTIONS TO CALCULUS

While exponents and logarithms will continue to help us solve noteworthy applications in the calculus sequence, the *properties* of logarithms and exponentials also play a significant role outside of their use in the equation-solving process. Here we'll see how these properties are applied in the context of exercises seen in a first-semester calculus course. We'll also explore the concept of an **area function,** a simple idea with some profound consequences in a study of calculus. The area functions we'll use, while not logarithmic, can also be applied to logarithmic functions, where it provides what we might call a "missing link."

Properties of Logarithms

In calculus, the properties of logarithms play an important role in *logarithmic differentiation*, the *derivative of composite functions,* and other areas. Regarding the first, some calculus concepts are more easily applied to sums and differences, rather than products or quotients, making the properties of logarithms an invaluable tool.

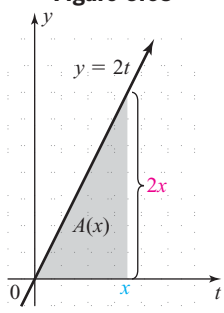
EXAMPLE 1 ▶ **Rewriting Expressions Using the Properties of Logarithms**

Use properties of logarithms to rewrite the expression $\ln\left[\dfrac{x^{\frac{2}{3}}\sqrt{x^2+2}}{(2x+3)^4}\right]$ as the sum or difference of simple logarithmic terms.

Solution ▶ Applying the quotient, product, and power properties, respectively, gives

$$\ln\left[\frac{x^{\frac{2}{3}}\sqrt{x^2+2}}{(2x+3)^4}\right] = \ln\left(x^{\frac{2}{3}}\sqrt{x^2+2}\right) - \ln(2x+3)^4 \qquad \text{quotient property}$$

$$= \ln x^{\frac{2}{3}} + \ln(x^2+2)^{\frac{1}{2}} - \ln(2x+3)^4 \qquad \text{product property}$$



$$= \frac{2}{3}\ln x + \frac{1}{2}\ln(x^2+2) - 4\ln(2x+3) \qquad \text{power property}$$

Now try Exercises 1 through 4 ▶

Area Functions

An area function $A(x)$ is defined to be the area under the graph of a function $f(t)$, between a fixed point a and a variable point x on the t-axis (for now we'll assume $x > a$). The basic ideas are illustrated in Figure 5.68 for the function $y = 2t$, using $a = 0$. At this point, the primary goal is to collect values of $A(x)$ for various x-values to see if we can detect a pattern and actually come up with an expression for $A(x)$. For this illustration, a triangle $\left(A = \frac{1}{2}bh\right)$ is formed at each value of x, where $b = x$ and $h = 2x$.

Figure 5.68

EXAMPLE 2 ▶ **Developing an Area Function**

For the area function illustrated in Figure 5.68, evaluate $A(x)$ for integer values 1 through 5, then try to name an expression for $A(x)$.

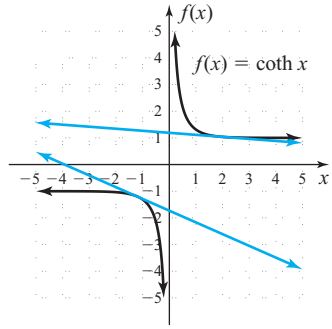
Solution ▶ For clarity, we'll organize the information as follows:

Base of Triangle	Height of Triangle	Area of Triangle $= \frac{1}{2}bh$
1	2	$\frac{1}{2}(1)(2) = 1$
2	4	$\frac{1}{2}(2)(4) = 4$
3	6	$\frac{1}{2}(3)(6) = 9$
4	8	$\frac{1}{2}(4)(8) = 16$
5	10	$\frac{1}{2}(5)(10) = 25$

We note the results are all perfect squares, and we find that the area function for $y = 2t$ is $A(x) = x^2$ for any x.

Now try Exercises 5 and 6 ▶

Expressions Involving e^x



Because of some extraordinary properties, the function $y = e^x$ is one of the most commonly seen functions in calculus and its applications. Here we'll simplify expressions containing e^x to gain some facility for their application in a calculus context. Essentially, it will be a reminder that the standard properties of exponents also apply to these base-e exponential expressions.

EXAMPLE 3 ▶ **Simplifying Expressions Involving *e***

A function called the *hyperbolic cotangent* $(y = \coth x)$ is defined by $f(x) = \dfrac{e^x + e^{-x}}{e^x - e^{-x}}$. Using the tools of calculus, it can be shown that the slope of a line drawn tangent to the curve at x, is given by

$$f'(x) = \frac{(e^x - e^{-x})(e^x - e^{-x}) - (e^x + e^{-x})(e^x + e^{-x})}{(e^x - e^{-x})^2}.$$

Simplify the expression to show that slope of the tangent line is always negative.

Solution ▶ The products in the numerator can be expanded using the FOIL process, giving

$$\frac{(e^x - e^{-x})(e^x - e^{-x}) - (e^x + e^{-x})(e^x + e^{-x})}{(e^x - e^{-x})^2} = \frac{(e^{2x} - 2 + e^{-2x}) - (e^{2x} + 2 + e^{-2x})}{(e^x - e^{-x})^2} \quad \text{FOIL}$$

$$= \frac{e^{2x} - 2 + e^{-2x} - e^{2x} - 2 - e^{-2x}}{(e^x - e^{-x})^2} \quad \text{distribute}$$

$$= \frac{-4}{(e^x - e^{-x})^2} \quad \text{result}$$

Notice that $x = 0$ is not in the domain of f'. Since the square of any quantity is nonnegative and the numerator is a negative constant, the slope of the tangent line will always be negative (see graph).

Now try Exercises 7 through 10 ▶

Connections to Calculus Exercises

Rewrite the following expressions using properties of logarithms.

1. $\ln(e^{5x}x^{\frac{3}{2}})$

2. $\log_b\left[\dfrac{x^3\sqrt{y}}{(z+1)^4}\right]$

3. $\log\left(\dfrac{x^5}{y^3\sqrt{z}}\right)$

4. $\ln\left[\dfrac{x^2\sqrt[3]{x-1}}{\sqrt{(x+1)^3}}\right]$

5. Find the area function $A(x)$ for the function $y = t$ with $a = 0$. Include a graph with your solution.

6. Find the area function $A(x)$ for the function $y = 2t + 1$ with $a = 0$. Include a graph with your solution.

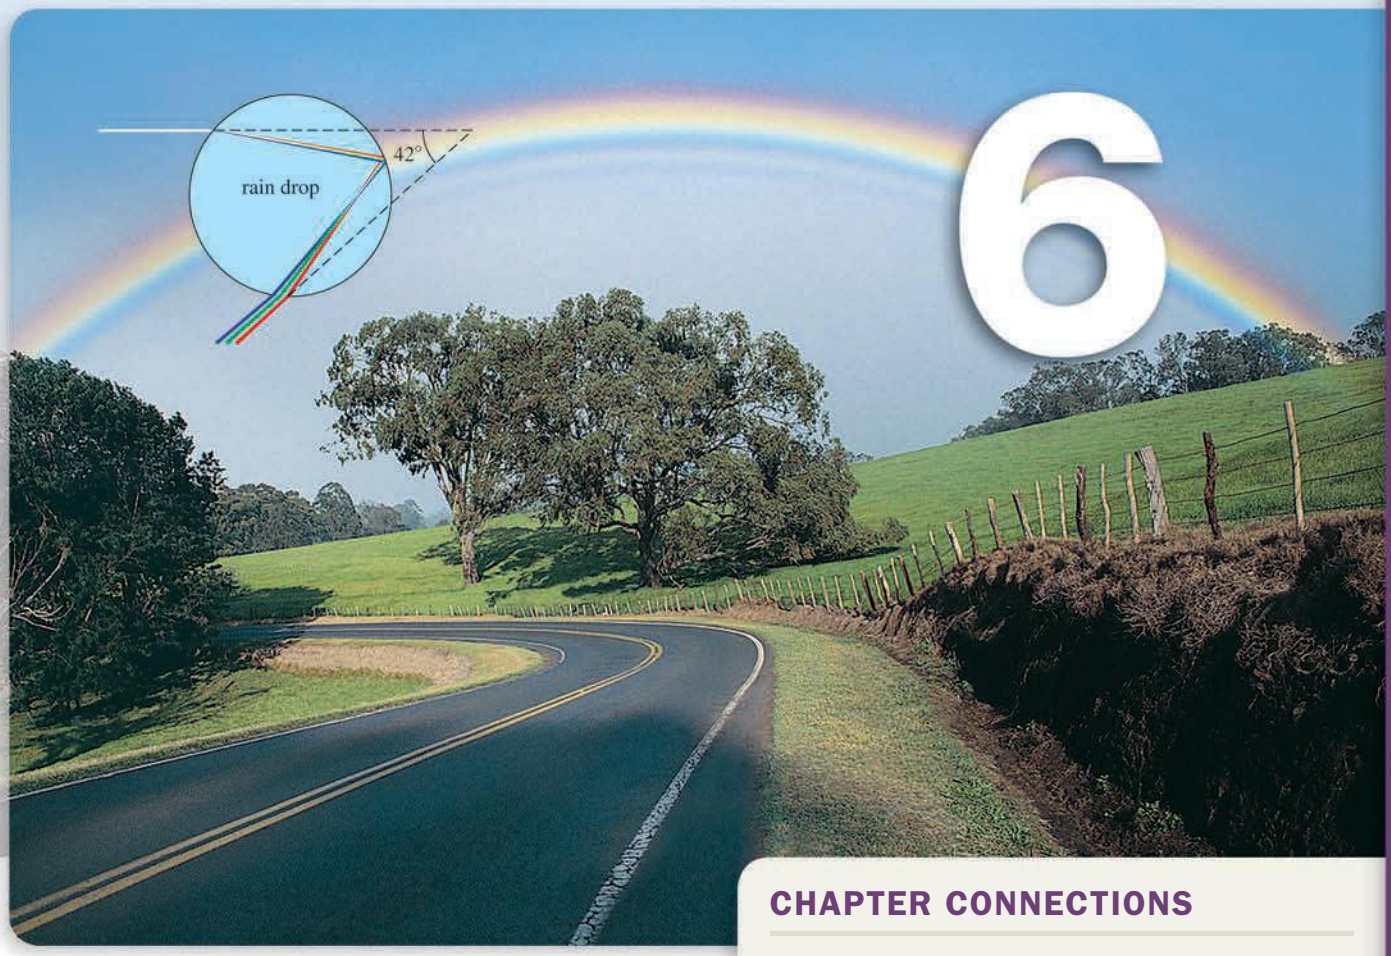
The expressions and equations that follow are taken from the area of calculus noted in *italics*. Simplify, solve, or verify as indicated.

7. *Identities:* Verify that

$$\frac{\frac{1}{2}(e^x + e^{-x}) + \frac{1}{2}(e^x - e^{-x})}{\frac{1}{2}(e^x + e^{-x}) - \frac{1}{2}(e^x - e^{-x})} = e^{2x}$$

8. *Hyperbolic functions:* Verify that

$$\left(\frac{e^x + e^{-x}}{2}\right)^2 - \left(\frac{e^x - e^{-x}}{2}\right)^2 = 1$$



9. *Inverse hyperbolic functions:* Solve for t:

$$xe^{2t} + x = e^{2t} - 1$$

10. *Graphing:* It can be shown that the maximum value of $f(x) = \sqrt{1 + xe^{-3x}}$ is located at the zero of

$$f'(x) = \frac{1}{2}(1 + xe^{-3x})^{-\frac{1}{2}}[x(-3e^{-3x}) + e^{-3x}].$$

Find the x-coordinate of the maximum value.

CHAPTER CONNECTIONS

While the beauty and color of rainbows have been admired for centuries, understanding the physics of rainbows is of fairly recent origin. Answers to questions regarding their seven-color constitution, the order the colors appear, the circular shape of the bow, and their relationship to moisture are all deeply rooted in mathematics. The relationship between light and color can be understood in terms of trigonometry, with questions regarding the apparent height of the rainbow, as well as the height of other natural and man-made phenomena, found using the trigonometry of right triangles.

▶ This application appears as Exercise 87 in Section 6.6

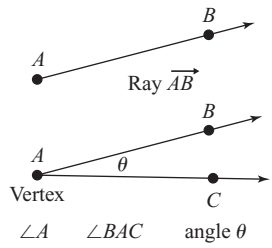
Connections to Calculus

The trigonometry of right triangles plays an important role in a study of calculus, as we seek to simplify certain expressions, or convert from one system of graphing to another. The *Connections to Calculus* feature following Chapter 6 offers additional practice and insight in preparation for a study of calculus.

6.1 Angle Measure, Special Triangles, and Special Angles

LEARNING OBJECTIVES

In Section 6.1 you will see how we can:



- ❑ **A.** Use the vocabulary associated with a study of angles and triangles
- ❑ **B.** Find fixed ratios of the sides of special triangles
- ❑ **C.** Use radians for angle measure and compute circular arc length and area using radians
- ❑ **D.** Convert between degrees and radians for nonstandard angles
- ❑ **E.** Solve applications involving angular velocity and linear velocity

Trigonometry, like her sister science geometry, has its origins deeply rooted in the practical use of measurement and proportion. In this section, we'll look at the fundamental concepts on which trigonometry is based, which we hope will lead to a better understanding and a greater appreciation of the wonderful study that trigonometry has become.

A. Angle Measure in Degrees

Beginning with the common notion of a straight line, a **ray** is a half line, or all points extending from a single point, in a single direction. An **angle** is the joining of two rays at a common endpoint called the **vertex.** Arrowheads are used to indicate the half lines continue forever and can be extended if necessary. Angles can be named using a single letter at the vertex, the letters from the rays forming the sides, or by a single Greek letter, with the favorites being **alpha** α, **beta** β, **gamma** γ, and **theta** θ. The symbol $\angle$ is often used to designate an angle (see Figure 6.1).

Figure 6.1

Euclid (325–265 B.C.), often thought of as the father of geometry, described an angle as "the inclination of one to another of two lines which meet in a plane." This *amount of inclination* gives rise to the common notion of angle measure in degrees, often measured with a semicircular **protractor** like the one shown in Figure 6.2. The notation for degrees is the ° symbol. By definition 1° is $\frac{1}{360}$ of a full rotation, so this protractor can be used to measure any angle from 0° (where the two rays are coincident), to 180° (where they form a straight line). An angle measuring 180° is called a **straight angle,** while an angle that measures 90° is called a **right angle.** An angle greater than 0° but less than 90° is called an **acute** angle (Figure 6.3). An angle greater than 90° but less than 180° is called an **obtuse** angle (Figure 6.4). Two angles that sum to 90° are said to be **complementary** (Figure 6.5), while two that sum to 180° are **supplementary** angles (Figure 6.6). Recall the "¬" symbol represents a 90° angle.

Figure 6.2

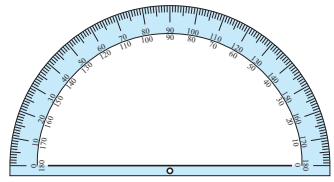


Figure 6.3

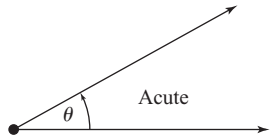

Figure 6.4

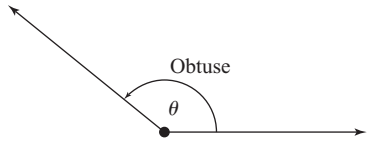

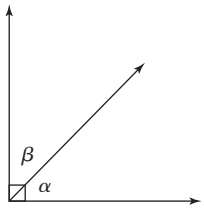

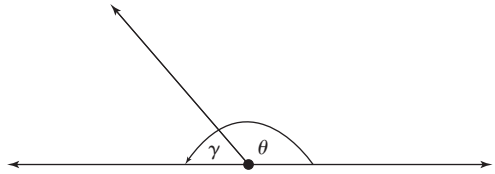

Figure 6.5

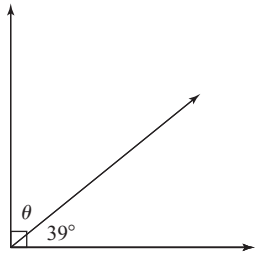
$\alpha + \beta = 90°$

α and β are complementary
or
α and β are complements

Figure 6.6

$\theta + \gamma = 180°$



θ and γ are supplementary
or
θ and γ are supplements

EXAMPLE 1 ▶ **Finding the Complement and Supplement of an Angle**

Determine the measure of each angle described.

a. the complement of a 57° angle **b.** the supplement of a 132° angle

c. the measure of angle θ shown in the figure

Solution ▶

a. The complement of 57° is 33° since $90° - 57° = 33° \Rightarrow 33° + 57° = 90°$.

b. The supplement of 132° is 48° since $180° - 132° = 48° \Rightarrow 48° + 132° = 180°$.

c. Since θ and 39° are complements, $\theta = 90° - 39° = 51°$.

Now try Exercises 7 through 10 ▶

In the study of trigonometry and its applications, degree measure alone does not provide the precision we often need. For very fine measurements, each degree is divided into 60 smaller parts called **minutes,** and each minute into 60 smaller parts called **seconds.** This means that a minute is $\frac{1}{60}$ of a degree, while a second is $\frac{1}{60}$ of a minute or $\frac{1}{3600}$ of a degree. The angle whose measure is "sixty-one degrees, eighteen minutes, and forty-five seconds" is written as $61° 18' 45''$. The degrees-minutes-seconds (DMS) method of measuring angles is commonly used in aviation and navigation, while in other areas **decimal degrees** such as 61.3125° are preferred. You will sometimes be asked to convert between the two.

EXAMPLE 2 ▶ **Converting Between Decimal Degrees and Degrees/Minutes/Seconds**

Convert as indicated.

a. $61° 18' 45''$ to decimal degrees

b. 142.2075° to DMS

Solution ▶

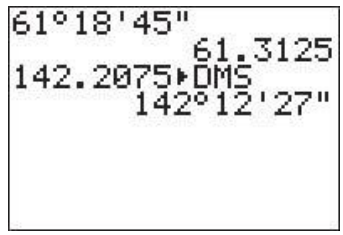
a. Since $1' = \frac{1}{60}$ of a degree and $1'' = \frac{1}{3600}$ of a degree, we have

$$\begin{aligned} 61° 18' 45'' &= \left[61 + 18\left(\frac{1}{60}\right) + 45\left(\frac{1}{3600}\right)\right]° \\ &= 61.3125° \end{aligned}$$

b. For the conversion to DMS we write the fractional part separate from the whole number part to compute the number of degrees and minutes represented, then repeat the process to find the number of degrees, minutes, and seconds.

$$\begin{aligned} 142.2075° &= 142° + 0.2075° && \text{separate fractional part from the whole} \\ &= 142° + 0.2075(60)' && 0.2075° = 0.2075 \cdot 1°\text{; substitute } 60' \text{ for } 1° \\ &= 142° \; 12.45' && \text{result in degrees and minutes} \\ &= 142° \; 12' + 0.45' && \text{separate fractional part from the whole} \\ &= 142° \; 12' + 0.45(60)'' && 0.45' = 0.45 \cdot 1'\text{; substitute } 60'' \text{ for } 1' \\ &= 142° \; 12' \; 27'' && \text{result in degrees, minutes, and seconds} \end{aligned}$$

Now try Exercises 11 through 26 ▶



The results from Example 2 can be quickly verified using a graphing calculator. Make sure the calculator is in degree MODE, as shown in Figure 6.7. For part (a), the degree and minute symbols can be found in the 2nd APPS **(ANGLE)** menu, while the seconds symbol is accessed with the keystrokes ALPHA + **(″).** Pressing ENTER will give

the decimal form of the angle (see Figure 6.8). With the keystrokes 142.2075 2nd APPS 4 ENTER, the results for part (b) are likewise confirmed in Figure 6.8.

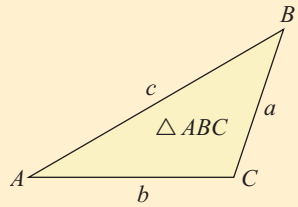
Figure 6.7

Figure 6.8

☑ **A.** You've just seen how we can use the vocabulary associated with a study of angles and triangles

B. Triangles and Properties of Triangles

A triangle is a closed plane figure with three straight sides and three angles. It is customary to name each angle using a capital letter and the side opposite the angle using the corresponding lowercase letter. Regardless of their size or orientation, triangles have the following properties.

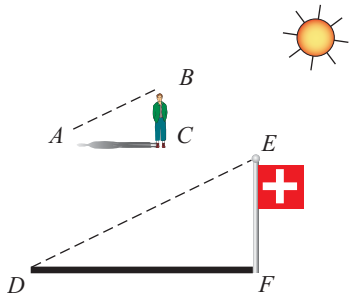


Properties of Triangles

Given triangle ABC with sides a, b, and c respectively,

I. The sum of the angles is 180°:
$A + B + C = 180°$

II. The combined length of any two sides exceeds that of the third side:
$a + b > c$, $a + c > b$, and $b + c > a$.



III. Larger angles are opposite larger sides:
If $C > B$, then $c > b$.

Two triangles are **similar triangles** if corresponding angles are equal, meaning for $\triangle ABC$ and $\triangle DEF$, $A = D$, $B = E$, and $C = F$. Since antiquity it's been known that *if two triangles are similar, corresponding sides are proportional* (corresponding sides are those opposite the equal angles from each triangle). This relationship, used extensively by the engineers of virtually all ancient civilizations, is very important to our study of trigonometry. Example 3 illustrates how proportions and similar triangles are often used.

EXAMPLE 3 ▶ **Using Similar Triangles to Find Heights**

To estimate the height of a flagpole, Carrie reasons that $\triangle ABC$ formed by her height and shadow must be similar to $\triangle DEF$ formed by the flagpole. She is 5 ft 6 in. tall and casts an 8-ft shadow, while the shadow of the flagpole measures 44 ft. How tall is the pole?

Solution ▶ Let H represent the height of the flagpole.

$$\frac{\text{Height}}{\text{Shadow Length}}: \frac{5.5}{8} = \frac{H}{44} \qquad \text{original proportion, } 5' 6'' = 5.5 \text{ ft}$$

$$8H = 242 \qquad \text{cross multiply}$$

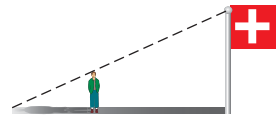
$$H = 30.25 \qquad \text{result}$$

The flagpole is $30\frac{1}{4}$ ft tall (30 ft 3 in.).

Now try Exercises 27 through 34 ▶

Figure 6.9 shows Carrie standing along the shadow of the flagpole, again illustrating the proportional relationships that exist. Early mathematicians recognized the power of these relationships, realizing that if the triangles were similar and the related fixed proportions were known, they had the ability to find mountain heights, the widths of lakes, and even the ability to estimate the distance to the Sun and Moon. In support of this search, two special triangles were used. These triangles, commonly called **45-45-90** and **30-60-90** triangles, are *special* because no estimation or interpolation is needed to find the relationships between their sides. For the first, consider an isosceles right triangle—a right triangle with two equal sides and two 45° angles (Figure 6.10). After naming the equal sides x and the hypotenuse h, we can apply the Pythagorean theorem to find a relationship between the sides and the hypotenuse in terms of x.

Figure 6.9



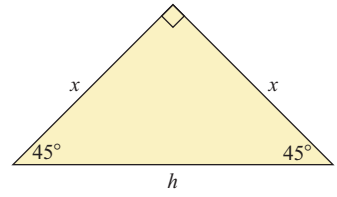


Figure 6.10

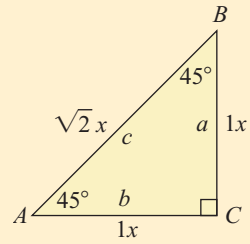
$$\begin{aligned} c^2 &= a^2 + b^2 && \text{Pythagorean theorem} \\ h^2 &= x^2 + x^2 && \text{substitute } x \text{ for } a, x \text{ for } b, \text{ and } h \text{ for } c \\ &= 2x^2 && \text{combine like terms} \\ h &= \sqrt{2}x && \text{solve for } h\ (h > 0) \end{aligned}$$

This important result is summarized in the following box.

WORTHY OF NOTE

Recall that the Pythagorean theorem states that for any right triangle, the sum of the squares of the two legs, is equal to the square of the hypotenuse: $a^2 + b^2 = c^2$.

45-45-90 Triangles



Given a 45-45-90 triangle with one leg of length x, the relationship between the side lengths is:

$$1x : 1x : \sqrt{2}\,x$$

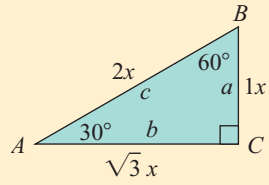
(1) The two legs are equal;

(2) The hypotenuse is $\sqrt{2}$ times the length of either leg;

$$a = b \quad c = \sqrt{2}\,a \quad c = \sqrt{2}\,b$$

The proportional relationship for a 30-60-90 triangle is developed in **Exercise 107,** and the result is stated here.

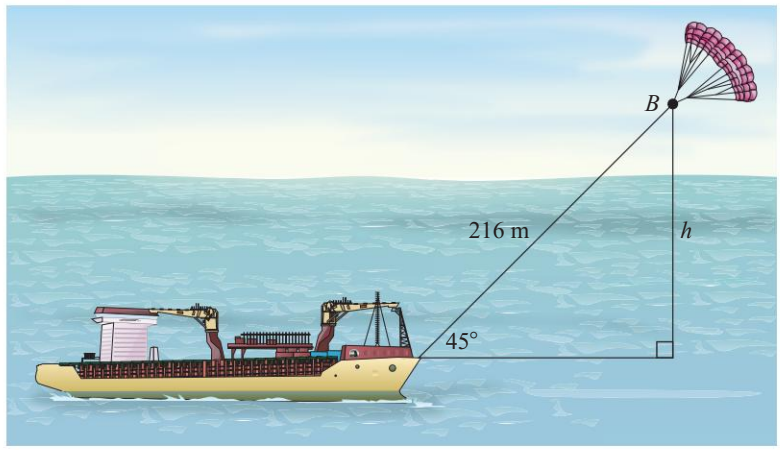
30-60-90 Triangles



Given a 30-60-90 triangle with the shortest side of length x, the relationship between the side lengths is:

$$1x : \sqrt{3}\,x : 2x$$

(1) The hypotenuse is 2 times the length of the shorter leg;



(2) The longer leg is $\sqrt{3}$ times the length of the shorter leg;

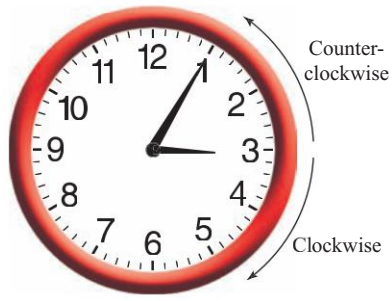
$$b = \sqrt{3}\,a \qquad c = 2a$$

EXAMPLE 4 ▶ **Applications of 45-45-90 Triangles: The Height of a Kite**

Seeking to reduce energy consumption and carbon emissions, many shipping companies are harnessing wind power using specialized kites. If such a kite is flying at a 45° angle, and 216 m of cable has been let out, what is the height h of the kite's bridle point B (see illustration)?

Solution ▶ In the 45-45-90 triangle, the hypotenuse is formed by the cable: $c = 216$ m. The height of the kite will be the length of one of the legs.

$$c = \sqrt{2}\,a \qquad \text{45-45-90 triangle property (2)}$$
$$216 = \sqrt{2}\,a \qquad \text{substitute 216 for } c$$
$$\frac{216}{\sqrt{2}} = a \qquad \text{solve for } a$$
$$a = \frac{216\sqrt{2}}{2} \qquad \text{rewrite equation and rationalize denominator}$$
$$= 108\sqrt{2} \qquad \text{simplify: exact form}$$
$$\approx 152.7 \text{ m} \qquad \text{approximate form (rounded to tenths)}$$



The bridle point of the kite is $108\sqrt{2}$ m (about 152.7 m) higher than the deck of the ship.

Now try Exercises 35 and 36 ▶

B. You've just seen how we can find fixed ratios of the sides of special triangles

C. Angle Measure in Radians; Arc Length and Area

Figure 6.11

As an alternative to viewing angles as "the amount of inclination" between two rays, angle measure can also be considered as the *amount of rotation* from a fixed ray called the **initial side,** to a rotated ray called the **terminal side.** This enables angle measure to be free from the context of a triangle, and allows for positive or negative angles, depending on the direction of rotation. Angles formed by a counterclockwise rotation are considered **positive angles,** and angles formed by a clockwise rotation are **negative angles** (see Figure 6.11). We can then name an angle of any size, including those greater than 360° where the amount of rotation exceeds one revolution. See Figures 6.12 through 6.16.

Figure 6.12

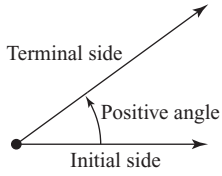


Figure 6.13

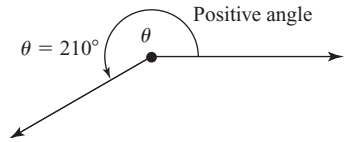

Figure 6.14

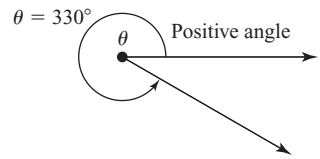

Figure 6.15

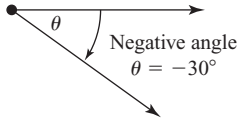

Figure 6.16

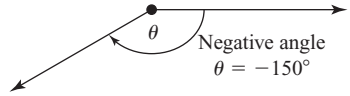

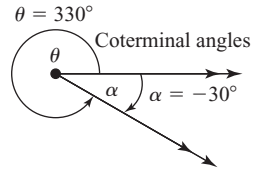

Figure 6.17

Note in Figure 6.17 that angle $\theta = 330°$ and angle $\alpha = -30°$ share the same initial and terminal sides and are called **coterminal angles.** Coterminal angles will always differ by multiples of 360°, meaning that for any integer k, angles θ and $\theta + 360°k$ will be coterminal.

EXAMPLE 5 ▶ **Finding Coterminal Angles**

Find two positive angles and two negative angles that are coterminal with 60°.

▼ Algebraic Solution

For $k = -2$,
$60° + 360°(-2) = -660°$.
For $k = -1$,
$60° + 360°(-1) = -300°$.
For $k = 1$,
$60° + 360°(1) = 420°$.
For $k = 2$,
$60° + 360°(2) = 780°$.

▼ Graphical Solution

With $\theta = 60°$, we enter 60 + 360X as Y_1 on the Y= screen of a graphing calculator and use the **TABLE** feature. The table shown starts at −3 with a step size of 1 and includes all the coterminal angles found in the algebraic solution.

X	Y1
-3	-1020
-2	-660
-1	-300
0	60
1	420
2	780
3	1140

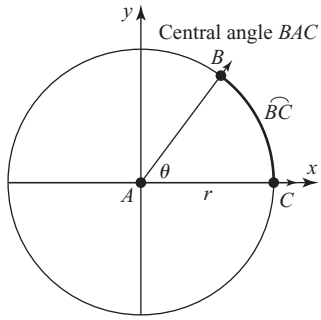
Y1=60+360X

As the table indicates, many other answers are possible.

Now try Exercises 37 through 40 ▶

An angle is said to be in **standard position** in the rectangular coordinate system if its vertex is at the origin and the initial side is along the positive x-axis. In standard position, the terminal sides of 90°, 180°, 270°, and 360° angles coincide with one of the axes and are called **quadrantal angles.** To further develop ideas related to angles, we use a **central circle,** which is a circle in the xy-plane with its center at the origin. A **central angle** is an angle whose vertex is at the center of the circle. For a central angle θ intersecting the circle at points B and C, we say circular arc BC (denoted $\overset{\frown}{BC}$), **subtends**

Figure 6.18



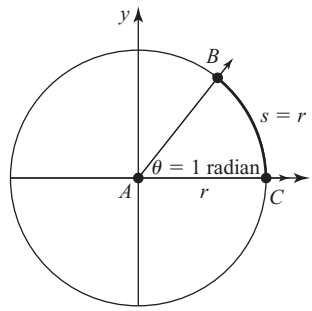


Figure 6.19

$\angle BAC$, as shown in Figure 6.18. The relationship between an arc and the angle it subtends leads us to a new unit for measuring angles that will simplify many formulas and procedures. The letter s is commonly used to represent arc length, and if we define **1 radian** (abbreviated *rad*) to be the measure of an angle subtended by an arc equal in length to the radius, then $\theta = 1$ rad when $s = r$ (see Figure 6.19).

Radians

If central angle θ is subtended by an arc that is equal in length to the radius, then

$$\theta = 1 \text{ radian}.$$

WORTHY OF NOTE

Using the properties of ratios, we note that since both r (radius) and s (arc length) are measured in like units, the units actually "cancel" making radians a unitless measure:

$$\theta = \frac{s \text{ units}}{r \text{ units}} = \frac{s}{r}.$$

We can then find the radian measure of any central angle by dividing the length of the subtended arc by r: $\frac{s}{r} = \theta$ radians. Multiplying both sides by r gives a formula for the length of any arc subtended on a circle of radius r: $s = r\theta$ if θ is in radians.

Arc Length

If θ is a central angle in a circle of radius r, then the length of the subtended arc s is

$$s = r\theta,$$

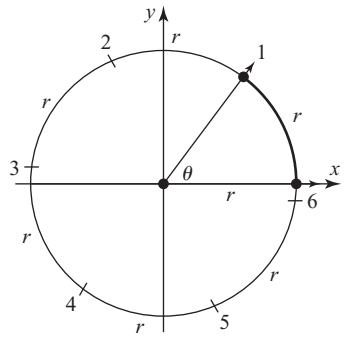
provided θ is expressed in radians.

EXAMPLE 6 ▶ **Using the Formula for Arc Length**

If the circle in Figure 6.19 has a radius of $r = 10$ cm, what is the length of the arc subtended by an angle of 3.5 rad?

Solution ▶ Using the formula $s = r\theta$ with $r = 10$ and $\theta = 3.5$ gives

$$s = 10(3.5) \quad \text{substitute 10 for } r \text{ and 3.5 for } \theta$$
$$s = 35 \quad \text{result}$$



The subtended arc has a length of 35 cm.

Now try Exercises 41 through 50 ▶

Using a central angle θ measured in radians, we can also develop a formula for the **area of a circular sector** (a pie slice) using a proportion. Recall the circumference of a circle is $C = 2\pi r$. While you may not have considered this before, note the formula can be written as $C = 2\pi \cdot r$, which implies that the radius can be wrapped around

the circumference of the circle $2\pi \approx 6.28$ times, as illustrated in Figure 6.20. This shows the radian measure of a full 360° rotation is 2π: 2π *rad* $= 360°$. This can be verified as before, using the relation $\theta \text{ radians} = \frac{s}{r} = \frac{2\pi r}{r} = 2\pi$. The ratio of the area of a sector to the total area will be identical to the ratio of the subtended angle to one full rotation. Using $\mathcal{A}$ to represent the area of the sector, we have $\frac{\mathcal{A}}{\pi r^2} = \frac{\theta}{2\pi}$ and solving for $\mathcal{A}$ gives $\mathcal{A} = \frac{1}{2}r^2\theta$.

Figure 6.20

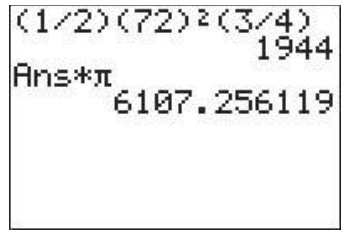
Area of a Sector

If θ is a central angle in a circle of radius r, the area of the sector formed is

$$\mathcal{A} = \frac{1}{2}r^2\theta,$$

provided θ is expressed in radians.

EXAMPLE 7 ▶ **Using the Formula for the Area of a Sector**



What is the area of the circular sector formed by a central angle of $\frac{3\pi}{4}$, if the radius of the circle is 72 ft? Round to tenths.

Solution ▶ Using the formula $\mathcal{A} = \frac{1}{2}r^2\theta$ we have

$$\mathcal{A} = \left(\frac{1}{2}\right)(72)^2\left(\frac{3\pi}{4}\right) \quad \text{substitute 72 for } r \text{, and } \frac{3\pi}{4} \text{ for } \theta$$

$$= 1944\pi \text{ ft}^2 \quad \text{result}$$

The area of this sector is approximately 6107.3 ft^2, as shown in the figure.

Now try Exercises 51 through 62 ▶

C. You've just seen how we can use radians for angle measure and compute circular arc length and area using radians

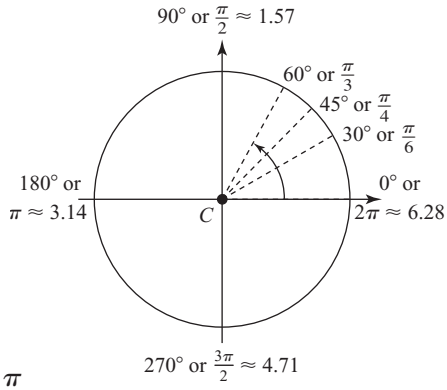
D. Converting Between Degrees and Radians

In addition to its use in developing formulas for arc length and the area of a sector, the relation 2π rad $= 360°$ enables us to state the radian measure of standard angles using a simple division. For π rad $= 180°$ we have

$$\text{division by 2: } \frac{\pi}{2} = 90° \qquad \text{division by 3: } \frac{\pi}{3} = 60°$$

$$\text{division by 4: } \frac{\pi}{4} = 45° \qquad \text{division by 6: } \frac{\pi}{6} = 30°.$$

WORTHY OF NOTE



We will often use the convention that unless degree measure is explicitly implied or noted with the ° symbol, radian measure is being used. In other words,

$\theta = \frac{\pi}{2}$, $\theta = 2$, and $\theta = 32.76$

all indicate angles measured in radians.

The radian measure of these standard angles play a major role in this chapter, and you are encouraged to become very familiar with them (see Figure 6.21). Additional conversions can quickly be found using multiples of these four. For example, multiplying both sides of $\frac{\pi}{3} = 60°$ by two gives $\frac{2\pi}{3} = 120°$. The relationship $\pi = 180°$ also gives the factors needed for converting from degrees to radians or from radians to degrees, even if θ is a nonstandard angle. Dividing by π we have $1 = \frac{180°}{\pi}$, while division by 180° shows $1 = \frac{\pi}{180°}$. Multiplying a given angle by the appropriate conversion factor gives the equivalent measure.

Figure 6.21

Degrees/Radians Conversion Factors

To convert from radians to degrees: multiply by $\frac{180°}{\pi}$.

To convert from degrees to radians: multiply by $\frac{\pi}{180°}$.

Most graphing calculators are programmed to compute conversions involving angle measure. This is accomplished using the "°" feature for degree-to-radian conversions *while in radian* MODE, and the "*r*" feature for radian-to-degree conversions *while in degree* MODE. Both are found on the **ANGLE** submenu located at 2nd APPS.

EXAMPLE 8 ▶ **Converting Between Radians and Degrees**

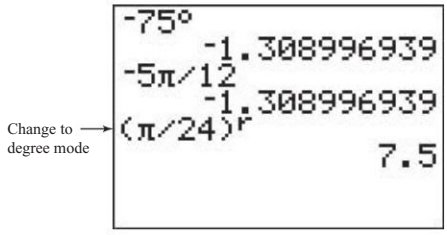
Convert each angle as indicated:

a. $-75°$ to radians. **b.** $\frac{\pi}{24}$ to degrees.

Algebraic Solution ▶

a. For degrees to radians, use the conversion factor $\frac{\pi}{180°}$.

$$-75° = -75° \cdot \frac{\pi}{180°} = -\frac{5\pi}{12} \qquad \frac{75}{180} = \frac{5}{12}$$

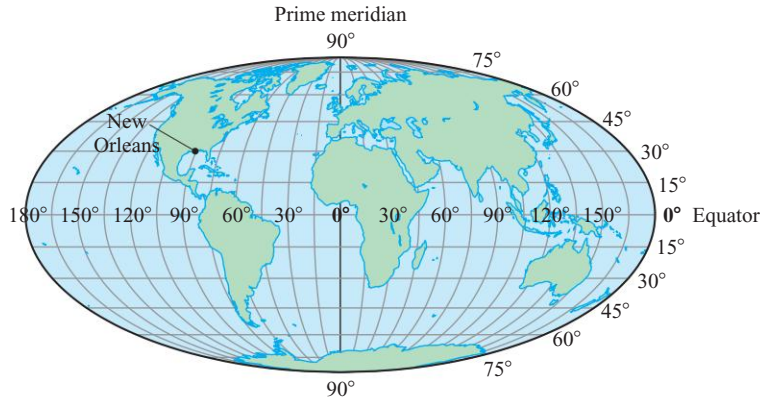


b. For radians to degrees, use the conversion factor $\frac{180°}{\pi}$.

$$\frac{\pi}{24} = \frac{\pi}{24} \cdot \left(\frac{180°}{\pi}\right) = 7.5° \qquad \frac{\pi}{\pi} = 1, \frac{180}{24} = 7.5$$

Graphical Solution ▶

a. While in radian MODE, enter -75 on the calculator's home screen and use the keystrokes 2nd APPS ENTER ENTER. The result is shown in the figure, along with a calculator approximation of $-\frac{5\pi}{12}$ [from the algebraic solution to part (a)].



b. After changing the calculator to degree MODE, entering $(\pi/24)$ 2nd APPS 3 ENTER will perform the radians-to-degrees conversion, as seen in the third entry of the figure. Note that here the parentheses around $\pi/24$ are necessary as both the "r" and "°" operators follow the order of operations for exponents.

Now try Exercises 62 through 86 ▶

One example where these conversions are useful is in applications involving longitude and latitude (see Figure 6.22). The **latitude** of a fixed point on the Earth's surface tells how many degrees north or south of the equator the point is, as measured from the center of the Earth. The **longitude** of a fixed point on the Earth's surface tells how many degrees east or west of the Prime Meridian (through Greenwich, England) the point is, as measured along the equator to the longitude line going through the point. For example, the city of New Orleans, Louisiana, is located at 30°N latitude, 90°W longitude (see Figure 6.22).

Figure 6.22

EXAMPLE 9 ▶ Applying the Arc Length Formula: Distances Between Cities

The cities of Quito, Ecuador, and Macapá, Brazil, both lie very near the equator, at a latitude of 0°. However, Quito is at approximately 78° west longitude, while Macapá is at 51° west longitude. Assuming the Earth has a radius of 3960 mi, how far apart are these cities?

Solution ▶ First we note that $(78 - 51)° = 27°$ of longitude separate the two cities. Using the conversion factor $1 = \dfrac{\pi}{180°}$ we find the equivalent radian measure

WORTHY OF NOTE

Note that $r = 3960$ mi was used because Quito and Macapá *are both on the equator.* For other cities sharing the same latitude but not on the equator, the radius of the Earth *at that latitude* must be used. **See Section 6.6, Exercise 93.**

is $27°\left(\frac{\pi}{180°}\right) = \frac{3\pi}{20}$. The arc length formula gives

$$\begin{aligned} s &= r\theta && \text{arc length formula; } \theta \text{ in radians} \\ &= 3960\left(\frac{3\pi}{20}\right) && \text{substitute 3960 for } r \text{ and } \tfrac{3\pi}{20} \text{ for } \theta \\ &= 594\pi && \text{result} \end{aligned}$$

Quito and Macapá are approximately 1866 mi apart (see *Worthy of Note* in the margin).

Now try Exercises 89 and 90 ▶

D. You've just seen how we can convert between degrees and radians for nonstandard angles

E. Angular and Linear Velocity

The **angular velocity** of an object is defined as the *amount of rotation* per unit time. Here, we often use the symbol ω (omega) to represent the angular velocity, and θ to represent the angle through which the terminal side has rotated, measured in radians: $\omega = \frac{\theta}{t}$. For instance, a Ferris wheel turning at 10 revolutions per minute has an angular velocity of

$$\begin{aligned} \omega &= \frac{10 \text{ revolutions}}{1 \text{ min}} && \omega = \tfrac{\theta}{t} \\ &= \frac{10(2\pi)}{1 \text{ min}} && \text{substitute } 2\pi \text{ for 1 revolution} \\ &= \frac{20\pi \text{ rad}}{1 \text{ min}} && 10(2) = 20 \end{aligned}$$

WORTHY OF NOTE

Generally speaking, the *velocity* of an object is its change in position per unit time, and can be either positive or negative. The *rate* or *speed* of an object is the magnitude of the velocity, regardless of direction.

The **linear velocity** of an object is defined as a *change of position* or *distance traveled* per unit time: $V = \frac{s}{t}$. In the context of angular motion, we consider the distance traveled by a point on the circumference of the Ferris wheel, *which is equivalent to the length of the resulting arc s*. This formula can be written directly in terms of the angular velocity since $s = r\theta$: $V = \frac{r\theta}{t} = r\left(\frac{\theta}{t}\right) = r\omega$.

Angular and Linear Velocity

Given a circle of radius r with point P on the circumference, and central angle θ in radians with P on the terminal side. If P moves along the circumference at a uniform rate:

1. The rate at which θ changes is called the *angular velocity* ω,
$$\omega = \frac{\theta}{t}.$$
2. The rate at which the position of P changes is called the *linear velocity* V,
$$V = \frac{r\theta}{t} \quad \Rightarrow \quad V = r\omega.$$

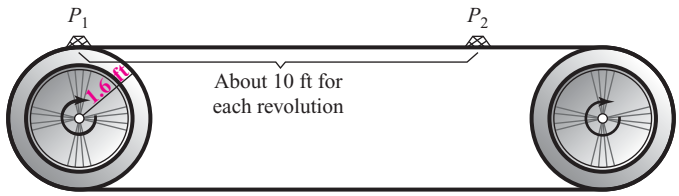
EXAMPLE 10 ▶ **Using Angular Velocity to Determine Linear Velocity**

The wheels on a racing bicycle have a radius of 13 in. How fast is the cyclist traveling in miles per hour, if the wheels are turning at 300 rpm?

Solution ▶ Note that $\omega = \dfrac{300 \text{ rev}}{1 \text{ min}} = \dfrac{300(2\pi)}{1 \text{ min}} = \dfrac{600\pi}{1 \text{ min}}$.

Using the formula $V = r\omega$ gives a linear velocity of

$$V = (13 \text{ in.})\frac{600\pi}{1 \text{ min}} \approx \frac{24{,}504.4 \text{ in.}}{1 \text{ min}}.$$



To convert this to miles per hour we convert minutes to hours (1 hr = 60 min) and inches to miles (1 mi = 5280 × 12 in.):

$$\left(\frac{24{,}504.4 \text{ in.}}{1 \text{ min}}\right)\left(\frac{60 \text{ min}}{1 \text{ hr}}\right)\left(\frac{1 \text{ mi}}{63{,}360 \text{ in.}}\right) \approx 23.2 \text{ mph}.$$

The bicycle is traveling about 23.2 mph.

Now try Exercises 93 through 98 ▶

To help understand the relationship between angular velocity and linear velocity, consider two large rollers, both with a radius of 1.6 ft, used to move an industrial conveyor belt. The rollers both have circumferences of $C = 2\pi(1.6 \text{ ft}) \approx 10.05$ ft, meaning that for each revolution of the rollers, an object on the belt will move 10.05 ft (from P_1 to P_2).

If the rollers are rotating at 20 rpm, an object on the belt (or a point on the circumference of a roller), will be moving at a rate of $20 \cdot 10.05 = 201$ ft/min (about 2.3 miles per hour). Take the time to verify this using the formula $V = r\omega$.

☑ **E.** You've just seen how we can solve applications involving angular velocity and linear velocity using radians

6.1 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. _____ angles sum to 90°. Supplementary angles sum to ____°. Acute angles are _____ than 90°. Obtuse angles are _____ than 90°.

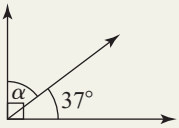
2. The expression "theta equals two degrees" is written _____ using the "°" notation. The expression, "theta equals two radians" is simply written _____.

3. The formula for arc length is $s =$ ____. The area of a sector is $\mathcal{A} =$ _____. For both formulas, θ must be in _____.

4. If θ is not a special angle, multiply by _____ to convert radians to degrees. To convert degrees to radians, multiply by _____.

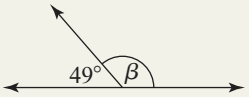
5. Discuss/Explain the difference between angular velocity and linear velocity. In particular, why does one depend on the radius while the other does not?

6. Discuss/Explain the difference between 1° and 1 radian. Exactly what is a radian? Without any conversions, explain why an angle of 4 rad terminates in QIII.



▶ DEVELOPING YOUR SKILLS

Determine the measure of the angle described.



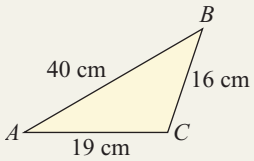
7. **a.** The complement of a 12.5° angle
b. The supplement of a 149.2° angle

8. **a.** The complement of a 62.4° angle
b. The supplement of a 74.7° angle

9. The measure of angle α

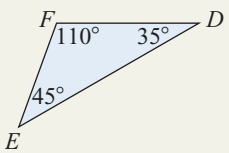
10. The measure of angle β

Convert from DMS (degree/minute/seconds) notation to decimal degrees. Use a graphing calculator to verify your results.



11. 42° 30′
12. 125° 45′
13. 67° 33′ 18″
14. 9° 15′ 36″
15. 285° 00′ 09″
16. 312° 00′ 54″
17. 45° 45′ 45″
18. 30° 30′ 27″

Convert the angles from decimal degrees to DMS (degree/minute/sec) notation. Use a graphing calculator to verify your results.



19. 20.25°
20. 40.75°
21. 67.307°

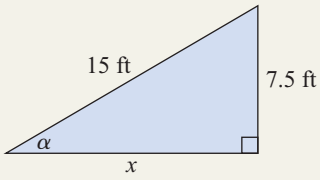
33. **Similar triangles:** A helicopter is hovering over a crowd of people watching a police standoff in a parking garage across the street. Stewart notices the shadow of the helicopter is lagging approximately 50 m behind a point directly below the helicopter. If he is 2 m tall and casts a shadow of 1.6 m at this time, what is the altitude of the helicopter?



34. **Similar triangles:** Near Fort Macloud, Alberta (Canada), there is a famous cliff known as *Head Smashed in Buffalo Jump.* The area is now a Canadian National Park, but at one time the Native Americans hunted buffalo by steering a part of the herd over the cliff. While visiting the park late one afternoon, Denise notices that its shadow reaches 201 ft from the foot of the cliff, at the same time she is casting a shadow of 12′1″. If Denise is 5′4″. tall, what is the height of the cliff?

Solve using special triangles. Answer in both exact and approximate form.

35. **Special triangles:** A ladder-truck arrives at a high-rise apartment complex where a fire has broken out. If the maximum length the ladder extends is 82 ft and the angle of inclination is 45°, how high up the side of the building does the ladder reach? Assume the ladder is mounted atop a 10 ft high truck.

36. Special triangles: A heavy-duty ramp is used to winch heavy appliances from street level up to a warehouse loading dock. If the ramp is 7.5 ft high and the incline is 15 ft long, (a) what angle α does the dock make with the street? (b) How long is the base of the ramp?

Use the TABLE feature on a graphing calculator to find two positive angles and two negative angles that are coterminal with the angle given. Answers may vary.

37. $\theta = 75°$

38. $\theta = 225°$

39. $\theta = -45°$

40. $\theta = -60°$

Use the formula for arc length to find the value of the unknown quantity: $s = r\theta$. Round to the nearest hundredth when necessary.

41. $\theta = 3.5$; $r = 280$ m

42. $\theta = 2.3$; $r = 129$ cm

43. $s = 2007$ mi; $r = 2676$ mi

44. $s = 4435.2$ km; $r = 12{,}320$ km

45. $\theta = \dfrac{3\pi}{4}$; $s = 4146.9$ yd

46. $\theta = \dfrac{11\pi}{6}$; $s = 28.8$ nautical miles

47. $\theta = \dfrac{4\pi}{3}$; $r = 2$ mi

48. $\theta = \dfrac{3\pi}{2}$; $r = 424$ in.

49. $\theta = \dfrac{16\pi}{9}$; $s = 52.5$ km

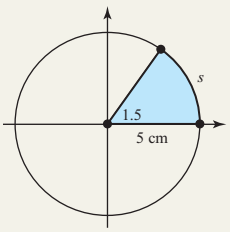
50. $\theta = 1.225\pi$; $s = 7627$ m

Use the formula for area of a circular sector to find the value of the unknown quantity: $\mathcal{A} = \frac{1}{2}r^2\theta$. Round to the nearest tenth when necessary.

51. $\theta = 5$; $r = 6.8$ km

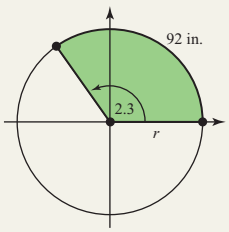
52. $\theta = 3$; $r = 45$ mi

53. $\mathcal{A} = 1080$ mi^2; $r = 60$ mi



54. $\mathcal{A} = 437.5$ cm^2; $r = 12.5$ cm

55. $\theta = \dfrac{7\pi}{6}$; $\mathcal{A} = 16.5$ m^2



56. $\theta = \dfrac{19\pi}{12}$; $\mathcal{A} = 753$ cm^2

Find the angle, radius, arc length, and/or area as needed, until all values are known.

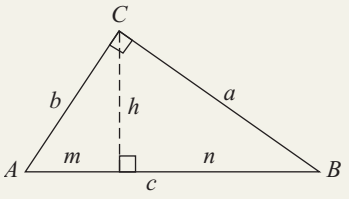
79. $\theta = \dfrac{2\pi}{3}$

80. $\theta = \dfrac{5\pi}{6}$

81. $\theta = 4\pi$

82. $\theta = 6\pi$



Convert each radian measure to degrees. Round to the nearest tenth.

83. $\theta = \dfrac{11\pi}{12}$ **84.** $\theta = \dfrac{17\pi}{36}$ **85.** $\theta = 3.2541$ **86.** $\theta = 1.0257$

▶ WORKING WITH FORMULAS

87. Relationships in a right triangle: $h = \dfrac{ab}{c}$, $m = \dfrac{b^2}{c}$, and $n = \dfrac{a^2}{c}$

Given $\angle C$ is a right angle, and h is the altitude of $\triangle ABC$, then h, m, and n can all be expressed directly in terms of a, b, and c by the relationships shown here. Compute the value of h, m, and n for a right triangle with sides of 8, 15, and 17 cm.

88. The height of an equilateral triangle: $H = \dfrac{\sqrt{3}}{2}S$

Given an equilateral triangle with sides of length S, the height of the triangle is given by the formula shown. Once the height is known the area of the triangle can easily be found (also see Exercise 87). The Gateway Arch in St. Louis, Missouri, is actually composed of stainless steel sections that are equilateral triangles. At the base of the arch the length of the sides is 54 ft. The smallest cross section at the top of the arch has sides of 17 ft. Find the areas of these cross sections.

▶ APPLICATIONS

89. Distance between cities: The city of Pittsburgh, Pennsylvania, is directly north of West Palm Beach, Florida. Pittsburg is at 40.3° north latitude, while West Palm Beach is at 26.4° north latitude. Assuming the Earth has a radius of 3960 mi, how far apart are these cities?

90. Width of Africa: Both Libreville, Gabon, and Jamame, Somalia, lie near the equator, but on opposite ends of the African continent. If Libreville is at 9.3° east longitude and Jamame is 42.5° east longitude, how wide is the continent of Africa at the equator?

91. Watering a lawn: A water sprinkler is set to shoot a stream of water a distance of 12 m and rotate through an angle of 40°. (a) What is the area of the lawn it waters? (b) For $r = 12$ m, what angle is required to water twice as much area? (c) For $\theta = 40°$, what range for the water stream is required to water twice as much area?

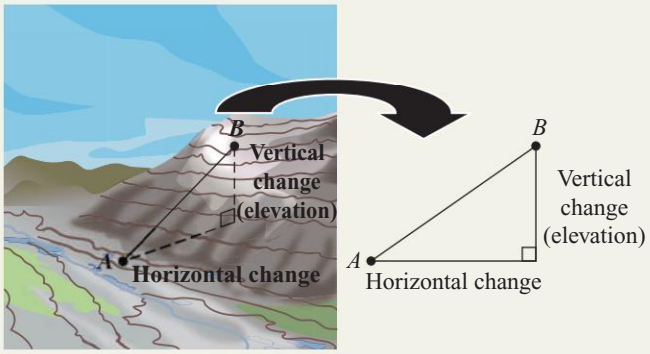
92. Motion detectors: A motion detector can detect movement up to 25 m away through an angle of 75°. (a) What area can the motion detector monitor? (b) For $r = 25$ m, what angle is required to monitor 50% more area? (c) For $\theta = 75°$, what range is required for the detector to monitor 50% more area?

93. Riding a round-a-bout: At the park two blocks from our home, the kids' round-a-bout has a radius of 56 in. About the time the kids stop screaming, "Faster, Daddy, faster!" I estimate the round-a-bout is turning at $\frac{3}{4}$ revolutions per second. (a) What is the related angular velocity in radians per second? (b) What is the linear velocity (in miles per hour) of Eli and Reno, who are "hanging on for dear life" at the rim of the round-a-bout?

94. Carnival rides: At carnivals and fairs, the *Gravity Drum* is a popular ride. People stand along the wall of a circular drum with radius 12 ft, which begins spinning very fast, pinning them against the wall. The drum is then turned on its side by an armature, with the riders screaming and squealing with delight. As the drum is raised to a near-vertical position, it is spinning at a rate of 35 rpm. (a) What is the angular velocity in radians per minute? (b) What is the linear velocity (in miles per hour) of a person on this ride?

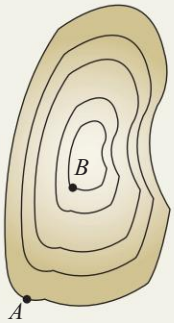
95. Speed of a winch: A winch is being used to lift a turbine off the ground so that a tractor-trailer can back under it and load it up for transport. The winch drum has a radius of 3 in. and is turning at 20 rpm. Find (a) the angular velocity of the drum in radians per minute, (b) the linear velocity of the turbine in feet per second as it is being raised, and (c) how long it will take to get the load to the desired height of 6 ft (ignore the fact that the cable may wind over itself on the drum).

96. Speed of a current: An instrument called a flowmeter is used to measure the speed of flowing water, like that in a river or stream. A cruder method involves placing a paddle wheel in the current, and using the wheel's radius and angular velocity to calculate the speed of water flow. If the paddle wheel has a radius of 5.6 ft and is turning at 30 rpm, find (a) the angular velocity of the wheel in radians per minute and (b) the linear velocity of the water current in miles per hour.



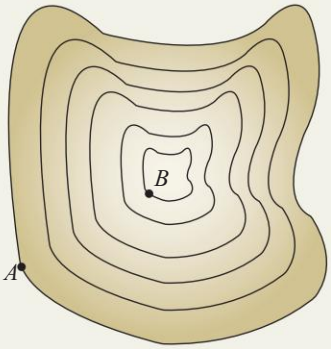
97. Baking: So long rolling pins! While flattening pie crust dough, the large rollers on the assembly line at Shay's bakery are continuously turning at 500 rpm. Given the radius of each roller is 2 in., find (a) the angular velocity of the rollers in radians per minute, (b) the linear velocity of the dough-supplying conveyor belt in feet per minute, and (c) how many seconds it would take to roll out a football field's length of dough (300 ft). Round to the nearest integer when necessary.

98. Unicycle racing: In 2008, the four man team "German Speeders" won the 800 km "Ride the Lobster" unicycle race in Nova Scotia, Canada. During the five day race, their one wheel was spinning at an average of 154 rpm. If each of the riders only used unicycles with a 38 cm radius wheel, find (a) the average angular velocity of the wheel in radians per minute, (b) their average linear velocity in kph, and (c) how long it would take them to complete the final 160 km of the race. Round to the nearest integer and second when necessary.



Topographical maps are two-dimensional representations of three-dimensional terrains. Each closed figure on the map represents a fixed elevation, according to a given *contour interval*. By carefully counting these closed figures, we can determine the vertical change between two points *A* and *B*. To find the horizontal change between point *A* and a location directly beneath point *B*, we measure the distance between the two points on the map and use the given *scale of distances*.

Exercises 99 and 100



99. Special triangles: In the figure shown, the *contour interval* is 1:250 (each figure indicates a change of 250 m in elevation) and the scale of distances is 1 cm = 625 m. (a) Find the change of elevation from *A* to *B*; (b) use a proportion to find the horizontal distance between points *A* and *B* if the measured distance on the map is 1.6 cm; and (c) draw the corresponding right triangle and use a special triangle relationship to find the length of the trail up the mountainside that connects *A* and *B*.

Exercise 99

100. Special triangles: As part of park maintenance, the 2 by 4 handrail alongside a mountain trail leading to the summit of Mount Marilyn must be replaced. In the figure, the *contour interval* is 1:200 (each figure indicates a change of 200 m in elevation) and the scale of distances is 1 cm = 400 m. (a) Find the change of elevation from *A* to *B*; (b) use a proportion to find the horizontal distance between *A* and *B* if the measured distance on the map is 4.33 cm; and (c) draw the corresponding right triangle and use a special triangle relationship to find the length needed to replace the handrail (recall that $\sqrt{3} \approx 1.732$).

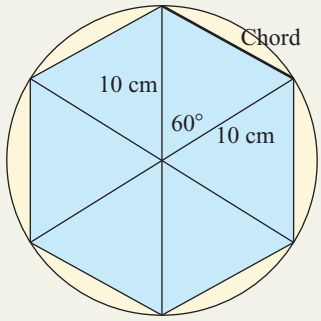
Exercise 100

101. Special triangles: Two light planes are flying in formation at 100 mph, doing some reconnaissance work. At a designated instant, one pilot breaks to the left at an angle of 90° to the other plane. Assuming they keep the same altitude and continue to fly at 100 mph, use a special triangle to find the distance between them after 0.5 hr.

102. Special triangles: Two ships are cruising together on the open ocean at 10 nautical miles per hour. One of them turns to make a 90° angle with the first and increases speed, heading for port. Assuming the first ship continues traveling at 10 knots, use a special triangle to find the speed of the other ship if they are 20 mi apart after 1 hr.

103. Angular and linear velocity: The planet Jupiter's largest moon, Ganymede, rotates around the planet at a distance of about 656,000 miles, in an orbit that is perfectly circular. If the moon completes one rotation about Jupiter in 7.15 days, (a) find the angle θ that the moon moves through in 1 day, in both degrees and radians, (b) find the angular velocity of the moon in radians per hour, and (c) find the moon's linear velocity in miles per second as it orbits Jupiter.

104. Angular and linear velocity: The planet Neptune has an orbit that is nearly circular. It orbits the Sun at a distance of 4497 million kilometers and completes one revolution every 165 yr. (a) Find the angle θ that the planet moves through in one year in both degrees and radians and (b) find the linear velocity (km/hr) as it orbits the Sun.



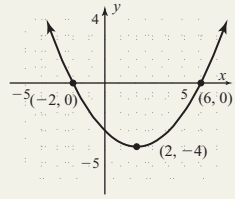
105. Center-pivot irrigation: A standard ¼-mi irrigation system has a radius of 400 m and rotates once every 3 days. Find the linear velocity of the outside set of wheels to the nearest tenth of a meter per hour.

106. Area of crop field: If a center-pivot irrigation system with radius of 500 m rotates once every 100 hr, find the area of a crop field irrigated in 1 day. Round to the nearest square meter.

▶ EXTENDING THE CONCEPT

107. Ancient geometers knew that a hexagon (six sides) could be inscribed in a circle by laying out six consecutive chords equal in length to the radius ($r = 10$ cm for illustration). After connecting the diagonals of the hexagon, six equilateral triangles are formed with sides of 10 cm. Use the diagram given to develop the fixed ratios for the sides of a 30-60-90 triangle. (*Hint:* Use a perpendicular bisector.)

108. The Duvall family is out on a family bicycle ride around Creve Coeur Lake. The adult bikes have a pedal sprocket with a 4-in. radius, wheel sprocket with 2-in. radius, and tires with a 13-in. radius. The kids' bikes have pedal sprockets with a 2.5-in. radius, wheel sprockets with 1.5-in. radius, and tires with a 9-in. radius. (a) If adults and kids all pedal at 50 rpm, how far ahead (in yards) are the adults after 2 min? (b) If adults pedal at 50 rpm, how fast do the kids have to pedal to keep up?



▶ MAINTAINING YOUR SKILLS

109. (2.2) Describe how the graph of $g(x) = -2\sqrt{x+3} - 1$ can be obtained from transformations of $y = \sqrt{x}$.

110. (5.6) Find the interest rate required for \$1000 to grow to \$1500 if the money is compounded monthly and remains on deposit for 5 yr.

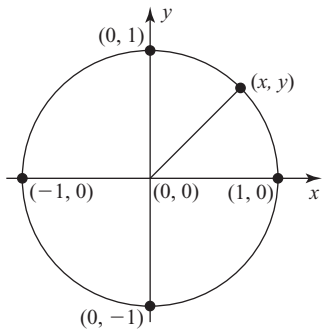
111. (1.4) Given a line segment with endpoints $(-2, 3)$ and $(6, -1)$, find the equation of the line that bisects and is perpendicular to this segment.

112. (2.2) Find the equation of the function whose graph is shown.

6.2 Unit Circles and the Trigonometry of Real Numbers

LEARNING OBJECTIVES

In Section 6.2 you will see how we can:



- ❑ **A.** Locate points on a unit circle and use symmetry to locate other points
- ❑ **B.** Use special triangles to find points on a unit circle and locate other points using symmetry
- ❑ **C.** Define the six trig functions in terms of a point on the unit circle
- ❑ **D.** Define the six trig functions in terms of a real number t
- ❑ **E.** Find the real number t corresponding to given values of sin t, cos t, and tan t

In this section, we introduce the **trigonometry of real numbers,** a view of trigonometry that can exist free of its historical roots in a study of right triangles. In fact, the ultimate value of these functions is not in their classical study, but in the implications and applications that follow from understanding them as functions of a real number, rather than simply as functions of a given angle.

A. The Unit Circle

Recall that a circle is defined as the set of all points in a plane that are a *fixed distance*, called the radius, from a *fixed point* called the center. In Chapter 1, we used the distance formula to find the equation of a circle of radius r with center at (h, k): $(x - h)^2 + (y - k)^2 = r^2$. For central circles both h and k are zero, and the result is the equation for a central circle of radius r: $x^2 + y^2 = r^2\,(r > 0)$. The **unit circle** is defined as a central circle with radius 1 unit: $x^2 + y^2 = 1$. As such, the figure can easily be graphed by drawing a circle through the four **quadrantal points** $(1, 0)$, $(-1, 0)$, $(0, 1)$, and $(0, -1)$ as in Figure 6.23. To algebraically find other points on the circle, we simply select any value of x, where $|x| < 1$, then substitute and solve for y; or any value of y, where $|y| < 1$, then solve for x.

Figure 6.23

Circles and Their Equations

General Circle	Central Circle	Unit Circle
$(x - h)^2 + (y - k)^2 = r^2$	$x^2 + y^2 = r^2$	$x^2 + y^2 = 1$
radius $= r$, center at (h, k)	radius $= r$, center at $(0, 0)$	radius $= 1$, center at $(0, 0)$

EXAMPLE 1 ▶ **Finding Points on the Unit Circle**

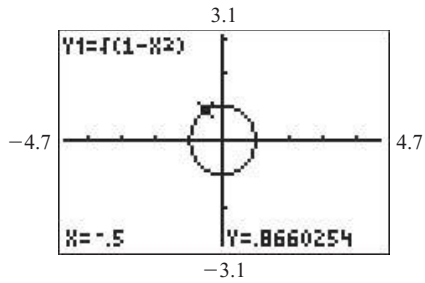
Find a point on the unit circle given $x = -\frac{1}{2}$ with (x, y) in QII.

Algebraic Solution ▶ Using the equation of a unit circle, we have

$$x^2 + y^2 = 1 \qquad \text{unit circle equation}$$

$$\left(-\frac{1}{2}\right)^2 + y^2 = 1 \qquad \text{substitute } -\frac{1}{2} \text{ for } x$$

$$\frac{1}{4} + y^2 = 1 \qquad \left(-\frac{1}{2}\right)^2 = \frac{1}{4}$$



$$y^2 = \frac{3}{4} \qquad \text{subtract } \frac{1}{4}$$

$$y = \pm\frac{\sqrt{3}}{2} \qquad \text{result}$$

Since (x, y) is in QII, $y = \frac{\sqrt{3}}{2}$. The point is $\left(-\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$.

Graphical Solution ▶ Recall in Section 1.1 we graphed circles on a calculator by separating the equation into two parts. For the unit circle, we enter the equation of the "upper half" as $Y_1 = \sqrt{1 - X^2}$ and the "lower half" as $Y_2 = -\sqrt{1 - X^2}$. With the unit circle displayed in the WINDOW shown, we TRACE Y_1 (the upper half-circle) since (x, y) is in QII. After moving the cursor to $x = -0.5$, we observe $y \approx 0.866$, the decimal equivalent of $\frac{\sqrt{3}}{2}$ (see Figure 6.24).

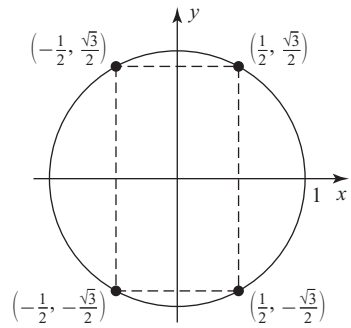


Figure 6.24

Now try Exercises 7 through 18 ▶

Additional points on the unit circle can be found using symmetry. The simplest examples come from the quadrantal points, where $(1, 0)$ and $(-1, 0)$ are on opposite sides of the y-axis, and $(0, 1)$ and $(0, -1)$ are on opposite sides of the x-axis. In general, if a and b are positive real numbers and (a, b) is on the unit circle, then $(-a, b)$, $(a, -b)$, and $(-a, -b)$ are also on the circle *because a circle is symmetric to both axes and the origin*! For the point $\left(-\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$ from Example 1, three other points are $\left(-\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$ in QIII, $\left(\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$ in QIV, and $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$ in QI. See Figure 6.25.

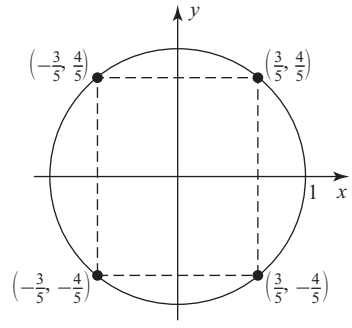
Figure 6.25

EXAMPLE 2 ▶ **Using Symmetry to Locate Points on the Unit Circle**

Name the quadrant containing $(-\frac{3}{5}, -\frac{4}{5})$ and verify it's on the unit circle. Then use symmetry to find three other points on the circle.

Solution ▶ Since both coordinates are negative, $(-\frac{3}{5}, -\frac{4}{5})$ is in QIII. Substituting into the equation for the unit circle yields

$$x^2 + y^2 = 1 \quad \text{unit circle equation}$$



$$\left(\frac{-3}{5}\right)^2 + \left(\frac{-4}{5}\right)^2 \stackrel{?}{=} 1 \quad \text{substitute } \tfrac{-3}{5} \text{ for } x \text{ and } \tfrac{-4}{5} \text{ for } y$$

$$\frac{9}{25} + \frac{16}{25} \stackrel{?}{=} 1 \quad \text{simplify}$$

$$\frac{25}{25} = 1 \quad \text{result checks}$$

Since $(\frac{-3}{5}, \frac{-4}{5})$ is on the unit circle, $(\frac{3}{5}, \frac{-4}{5})$, $(\frac{-3}{5}, \frac{4}{5})$, and $(\frac{3}{5}, \frac{4}{5})$ are also on the circle due to symmetry (see Figure 6.26).

Figure 6.26

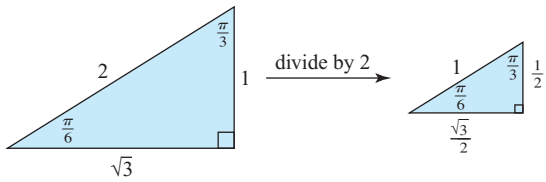
☑ **A.** You've just seen how we can locate points on a unit circle and use symmetry to locate other points

Now try Exercises 19 through 26 ▶

B. Special Triangles and the Unit Circle

The special triangles from Section 6.1 can also be used to find points on the unit circle. As usually written, the triangles state a proportional relationship between their sides after assigning a value of 1 to the shortest side. However, precisely due to this proportional relationship, *we can divide all sides by the length of the hypotenuse,* giving *it* a length of 1 unit (see Figures 6.27 and 6.28).

Figure 6.27



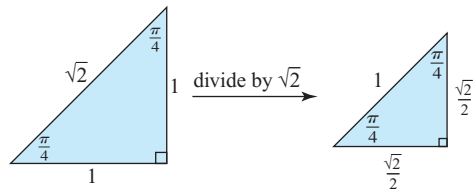


Figure 6.28

We then place the triangle within the unit circle, and reflect it from quadrant to quadrant to find additional points. The *sides* of the triangle are used to determine the absolute value of each coordinate, and the *quadrant* to give each coordinate the appropriate sign. Note the angles in these special triangles are now expressed in radians.

EXAMPLE 3 ▶ Using a Special Triangle and Symmetry to Locate Points on a Unit Circle

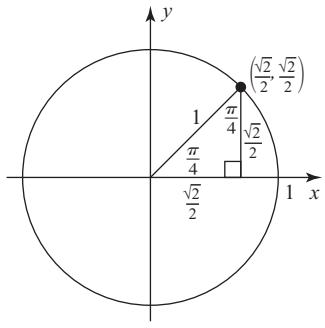
Use the $\frac{\pi}{4}:\frac{\pi}{4}:\frac{\pi}{2}$ triangle from Figure 6.28 to find four points on the unit circle.

Solution ▶ Begin by superimposing the triangle in QI, noting it gives the point $\left(\frac{\sqrt{2}}{2},\frac{\sqrt{2}}{2}\right)$ shown in Figure 6.29. By reflecting the triangle into QII, we find the additional point $\left(-\frac{\sqrt{2}}{2},\frac{\sqrt{2}}{2}\right)$ on this circle. Realizing we can simply apply the circle's remaining symmetries, we obtain the two additional points $\left(-\frac{\sqrt{2}}{2},-\frac{\sqrt{2}}{2}\right)$ and $\left(\frac{\sqrt{2}}{2},-\frac{\sqrt{2}}{2}\right)$ shown in Figure 6.30.

WORTHY OF NOTE

Applying the same idea to a $\frac{\pi}{6}:\frac{\pi}{3}:\frac{\pi}{2}$ triangle would give the points $\left(\frac{\sqrt{3}}{2},\frac{1}{2}\right),\left(-\frac{\sqrt{3}}{2},\frac{1}{2}\right),\left(-\frac{\sqrt{3}}{2},-\frac{1}{2}\right)$ and $\left(\frac{\sqrt{3}}{2},-\frac{1}{2}\right)$.

Figure 6.29



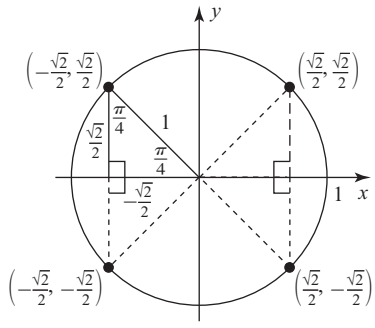


Figure 6.30

Now try Exercises 27 and 28 ▶

To graphically verify the results of Example 3, we begin by noting that the slope of the line coincident with the hypotenuse of the triangle in Figure 6.29 must be $m = \dfrac{\sqrt{2}/2}{\sqrt{2}/2} = 1$. The equation of this line is then $y = 1x$, and similarly the line coincident with the hypotenuse of the triangle's QII reflection is $y = -1x$ (see Figure 6.30). Using a graphing calculator, enter $Y_1 = \sqrt{1 - X^2}$ (the upper half of the unit circle), $Y_2 = 1X$, $Y_3 = -\sqrt{1 - X^2}$ (the lower half of the unit circle), and $Y_4 = -1X$ (see Figure 6.31). Graphing the functions using the ZOOM **4:ZDecimal** feature will produce a "friendly" and square viewing window, but with a relatively small unit circle. Using the ZOOM **2:Zoom In** feature will give a better view, with the final window size depending on the settings of your zoom factors. Our settings were at XFactor = 2 and YFactor = 2, which produced the screen shown in Figure 6.32 (to access the zoom factors, press ZOOM ▸ **4:SetFactors).** To find a point on the unit circle using the $\dfrac{\pi}{4}$: $\dfrac{\pi}{4}$: $\dfrac{\pi}{2}$ triangle, we need only find where the line $Y_2 = 1X$ intersects the unit circle in QI. This is accomplished using the keystrokes 2nd TRACE **(CALC) 5:Intersect,** and identifying the graphs we're interested in. After doing so, the calculator returns the values shown in Figure 6.33, which are indeed the equivalent of $\left(\dfrac{\sqrt{2}}{2}, \dfrac{\sqrt{2}}{2}\right)$. Using the down arrow ▾ at this point will "jump the cursor" to the point where $Y_3 = -\sqrt{1 - X^2}$ and $Y_4 = -1X$ intersect, where we note the output values remain the same except that in QIV, the y-coordinate is negative (see Figure 6.34). In addition, since the calculator stores the last used x-value in the temporary location X,T,θ,n, we can find the point of intersection in QIII by simply using the keystrokes (−) X,T,θ,n, and then the point of intersection in QII by pressing the up arrow ▴ twice.

Figure 6.31

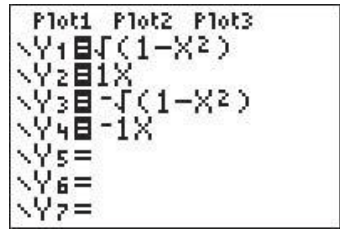

Figure 6.32

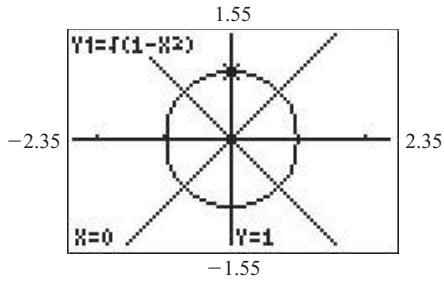

Figure 6.33

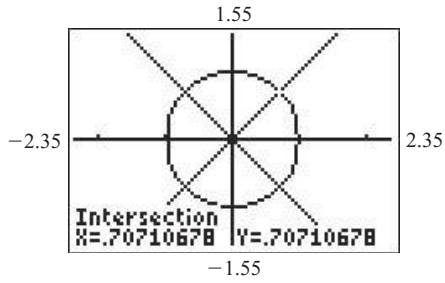

Figure 6.34

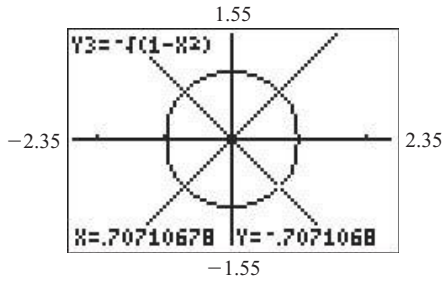

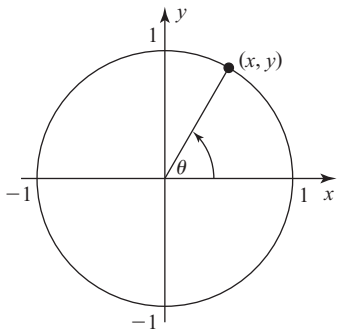

Figure 6.35

When a central angle θ is viewed as a rotation, each rotation can be associated with a unique point (x, y) on the terminal side, where it intersects the unit circle (see Figure 6.35). For the quadrantal angles $\dfrac{\pi}{2}$, π, $\dfrac{3\pi}{2}$, and 2π, we associate the points $(0, 1)$, $(-1, 0)$, $(0, -1)$, and $(1, 0)$, respectively. When this rotation results in a special angle θ, the association can be found using a special triangle in a manner similar to Example 3.

Figure 6.36

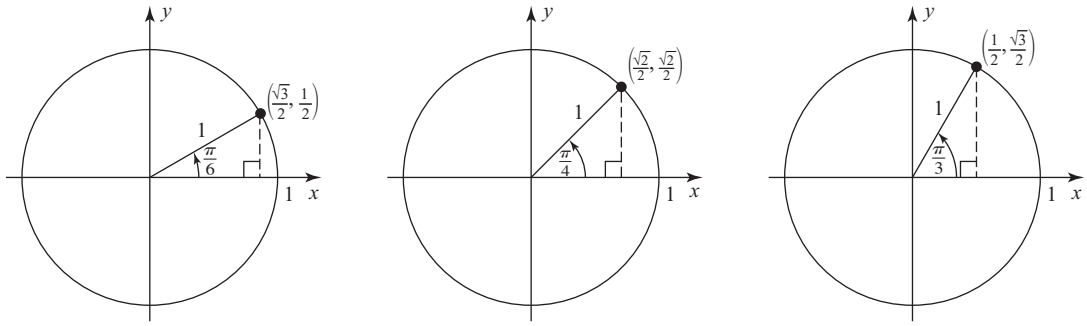

Figure 6.36 shows we associate the point $\left(\frac{\sqrt{3}}{2}, \frac{1}{2}\right)$ with $\theta = \frac{\pi}{6}$, $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$ with $\theta = \frac{\pi}{4}$, and by reorienting the $\frac{\pi}{6}$: $\frac{\pi}{3}$: $\frac{\pi}{2}$ triangle, $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$ is associated with a rotation of $\theta = \frac{\pi}{3}$.

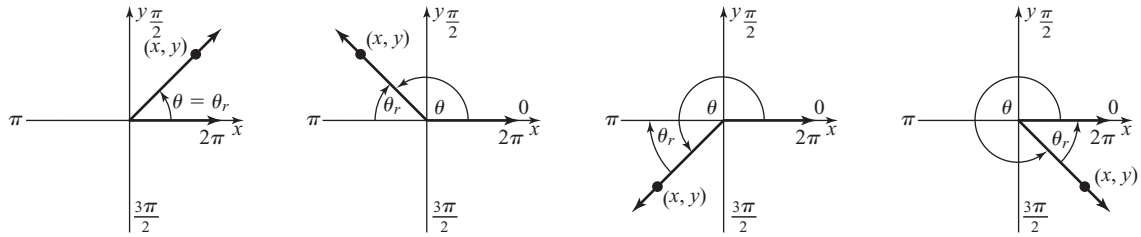
For standard rotations from $\theta = 0$ to $\theta = \frac{\pi}{2}$ we have the following:

Rotation θ	**0**	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
Associated point (x, y)	$(1, 0)$	$\left(\frac{\sqrt{3}}{2}, \frac{1}{2}\right)$	$\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$	$\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$	$(0, 1)$



Each of these points give rise to three others using the symmetry of the circle. By defining a reference angle θ_r, we can associate these points with the related rotation $\theta > \frac{\pi}{2}$.

Reference Angles

For any angle θ in standard position, the acute angle θ_r formed by the terminal side and the x-axis is called the *reference angle* for θ.

Several examples of the reference angle concept are shown in Figure 6.37 for $\theta > 0$ in radians.

Figure 6.37

$0 < \theta < \frac{\pi}{2}$, $\theta_r = \theta$

$\frac{\pi}{2} < \theta < \pi$, $\theta_r = \pi - \theta$

$\pi < \theta < \frac{3\pi}{2}$, $\theta_r = \theta - \pi$

$\frac{3\pi}{2} < \theta < 2\pi$, $\theta_r = 2\pi - \theta$

Due to the symmetries of the circle, reference angles of $\frac{\pi}{6}$, $\frac{\pi}{4}$, and $\frac{\pi}{3}$ serve to fix the absolute values of the coordinates for x and y, and we simply *use the appropriate sign for each coordinate* to name the point. As before this depends solely on the quadrant of the terminal side.

EXAMPLE 4 ▶ **Finding Points on a Unit Circle Associated with a Rotation θ**

Determine the reference angle for each rotation given, then find the associated point (x, y) on the unit circle.

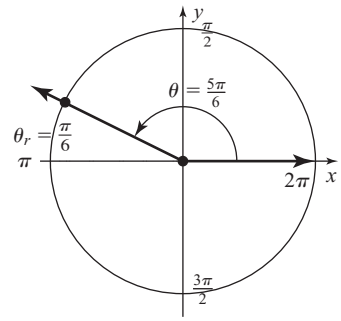
a. $\theta = \frac{5\pi}{6}$ **b.** $\theta = \frac{7\pi}{4}$

Solution ▶

a. A rotation of $\frac{5\pi}{6}$ terminates in QII:

$\theta_r = \pi - \frac{5\pi}{6} = \frac{\pi}{6}$. The associated point is $\left(-\frac{\sqrt{3}}{2}, \frac{1}{2}\right)$ since $x < 0$ in QII. See Figure 6.38.

Figure 6.38



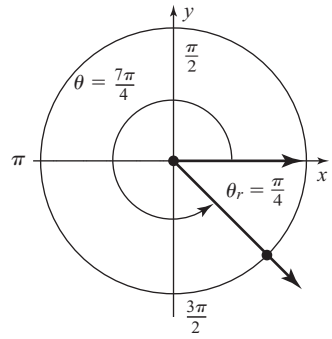


Figure 6.39

b. A rotation of $\frac{7\pi}{4}$ terminates in QIV:

$\theta_r = 2\pi - \frac{7\pi}{4} = \frac{\pi}{4}$. The associated point is $\left(\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}\right)$ since $y < 0$ in QIV. See Figure 6.39.

Now try Exercises 29 through 36 ▶

B. You've just seen how we can use special triangles to find points on a unit circle and locate other points using symmetry

C. Trigonometric Functions and Points on the Unit Circle

While this focus on the relationship between an angle θ and points on the unit circle may seem arbitrary, the connection actually leads to an entirely new branch of mathematics called **trigonometry**, with applications beyond any of those presented in earlier chapters. Since the terminal side of any central angle θ intersects the unit circle at a *unique* point (x, y), a function relationship exists between θ and the coordinates of that point. To capitalize on these relationships, each is given a name as follows:

$$\text{cosine } \theta = x \qquad \text{sine } \theta = y \qquad \text{tangent } \theta = \frac{y}{x}$$

The reciprocals of these functions also play a significant role in the development of trigonometry, and are likewise given names:

$$\text{secant } \theta = \frac{1}{x} \qquad \text{cosecant } \theta = \frac{1}{y} \qquad \text{cotangent } \theta = \frac{x}{y}$$

In actual use, each function name is written in abbreviated form as cos θ, sin θ, tan θ, sec θ, csc θ, and cot θ, respectively, and are collectively called the **trigonometric functions** (or simply the **trig functions**). Over the course of this study, you will see many connections between this view of trigonometry and the alternative approaches that follow. In summary, we have

The Trigonometric Functions

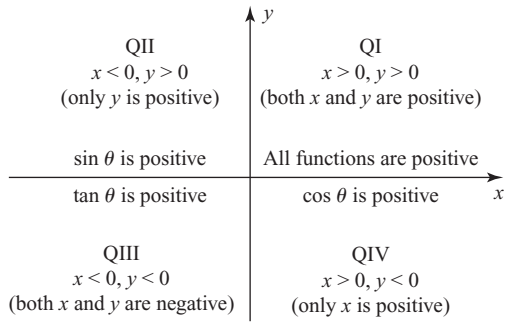
For any rotation θ and point $P(x, y)$ on the unit circle associated with θ,

$$\cos\theta = x \qquad \sin\theta = y \qquad \tan\theta = \frac{y}{x};\ x \neq 0$$

$$\sec\theta = \frac{1}{x};\ x \neq 0 \qquad \csc\theta = \frac{1}{y};\ y \neq 0 \qquad \cot\theta = \frac{x}{y};\ y \neq 0$$

In a study of trigonometry, a number of useful relationships result directly from the way these six functions are defined. For instance, since $\cos\theta = x$ and $\sec\theta = \frac{1}{x}$, the relationship $\sec\theta = \frac{1}{\cos\theta}$ follows immediately from a direct substitution (substitute $\cos\theta$ for x). These reciprocal relationships are summarized in the following box.

The Reciprocal Relationships



For any rotation θ where both functions are defined,

$$\sec\theta = \frac{1}{\cos\theta} \qquad \csc\theta = \frac{1}{\sin\theta} \qquad \cot\theta = \frac{1}{\tan\theta}$$

$$\cos\theta = \frac{1}{\sec\theta} \qquad \sin\theta = \frac{1}{\csc\theta} \qquad \tan\theta = \frac{1}{\cot\theta}$$

Note that once sin θ, cos θ, and tan θ are known, the values of csc θ, sec θ, and cot θ follow automatically since a number and its reciprocal always have the same sign. See Figure 6.40.

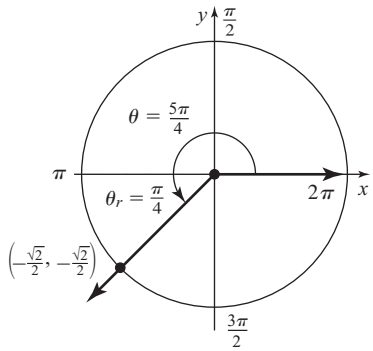


Figure 6.40

EXAMPLE 5 ▶ **Evaluating Trig Functions for a Rotation θ**

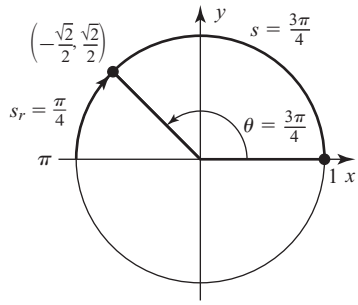
Evaluate the six trig functions for $\theta = \frac{5\pi}{4}$.

Solution ▶ A rotation of $\frac{5\pi}{4}$ terminates in QIII, so $\theta_r = \frac{5\pi}{4} - \pi = \frac{\pi}{4}$. The associated point is $\left(-\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}\right)$ since $x < 0$ and $y < 0$ in QIII.

This yields

$$\cos\left(\frac{5\pi}{4}\right) = -\frac{\sqrt{2}}{2} \qquad \sin\left(\frac{5\pi}{4}\right) = -\frac{\sqrt{2}}{2} \qquad \tan\left(\frac{5\pi}{4}\right) = 1$$

Noting the reciprocal of $-\frac{\sqrt{2}}{2}$ is $-\sqrt{2}$ after rationalizing, we have



$$\sec\left(\frac{5\pi}{4}\right) = -\sqrt{2} \qquad \csc\left(\frac{5\pi}{4}\right) = -\sqrt{2} \qquad \cot\left(\frac{5\pi}{4}\right) = 1$$

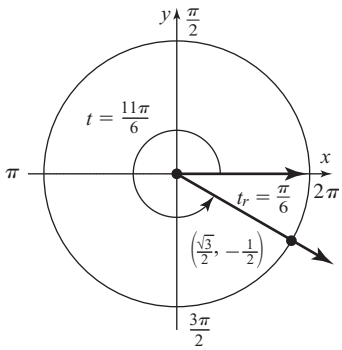
C. You've just seen how we can define the six trig functions in terms of a point on the unit circle

Now try Exercises 37 through 40 ▶

D. The Trigonometry of Real Numbers

Figure 6.41

Defining the trig functions in terms of a point on the unit circle is precisely what we needed to work with them as functions of real numbers. This is because when $r = 1$ and θ is in radians, *the length of the subtended arc is numerically the same as the measure of the angle:* $s = (1)\theta \Rightarrow s = \theta$! This means we can view any function of θ as a like function of arc length s, where $s \in \mathbb{R}$ (see the *Reinforcing Basic Concepts* feature following Section 6.4). As a compromise the variable t is commonly used, with t representing *either* the amount of rotation *or* the length of the arc. As such we will assume t is a unitless quantity, although there are other reasons for this assumption. In Figure 6.41, a rotation of $\theta = \frac{3\pi}{4}$ is subtended by an arc length of $s = \frac{3\pi}{4}$ (about 2.356 units). The reference angle for θ is $\frac{\pi}{4}$, which we will now refer to as a **reference arc.** As you work through the remaining examples and the exercises that follow, it will often help to draw a quick sketch similar to that in Figure 6.41 to determine the quadrant of the terminal side, the reference arc, and the sign of each function.



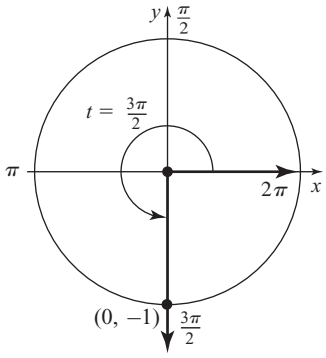
EXAMPLE 6 ▶ Evaluating Trig Functions for a Real Number t

Evaluate the six trig functions for the given value of t.

a. $t = \frac{11\pi}{6}$ **b.** $t = \frac{3\pi}{2}$

Solution ▶

Figure 6.42



a. For $t = \frac{11\pi}{6}$, the arc terminates in QIV where $x > 0$ and $y < 0$. The reference arc is $2\pi - \frac{11/\pi}{6} = \frac{\pi}{6}$ and from our previous work we know the corresponding point (x, y) is $\left(\frac{\sqrt{3}}{2}, -\frac{1}{2}\right)$. See Figure 6.42. This gives

$$\cos\left(\frac{11\pi}{6}\right) = \frac{\sqrt{3}}{2} \qquad \sin\left(\frac{11\pi}{6}\right) = -\frac{1}{2} \qquad \tan\left(\frac{11\pi}{6}\right) = -\frac{\sqrt{3}}{3}$$

$$\sec\left(\frac{11\pi}{6}\right) = \frac{2\sqrt{3}}{3} \qquad \csc\left(\frac{11\pi}{6}\right) = -2 \qquad \cot\left(\frac{11\pi}{6}\right) = -\sqrt{3}$$

Figure 6.43

b. $t = \dfrac{3\pi}{2}$ is a quadrantal angle and the associated point is $(0, -1)$.

See Figure 6.43. This yields

$$\cos\left(\frac{3\pi}{2}\right) = 0 \qquad \sin\left(\frac{3\pi}{2}\right) = -1 \qquad \tan\left(\frac{3\pi}{2}\right) = \text{undefined}$$

$$\sec\left(\frac{3\pi}{2}\right) = \text{undefined} \qquad \csc\left(\frac{3\pi}{2}\right) = -1 \qquad \cot\left(\frac{3\pi}{2}\right) = 0$$

Now try Exercises 41 through 44 ▶

As Example 6(b) indicates, as functions of a real number the concept of domain comes into play. From their definition it is apparent there are no restrictions on the domains of cosine and sine, but the domains of the other functions must be restricted to exclude division by zero. For functions with x in the denominator, we cast out the odd multiples of $\dfrac{\pi}{2}$, since the x-coordinate of the related quadrantal points is zero: $\dfrac{\pi}{2} \to (0, 1)$, $\dfrac{3\pi}{2} \to (0, -1)$, and so on. The excluded values can be stated as $t \neq \dfrac{\pi}{2} + \pi k$ for all integers k. For functions with y in the denominator, we cast out all multiples of π ($t \neq \pi k$ for all integers k) since the y-coordinate of these points is zero: $0 \to (1, 0)$, $\pi \to (-1, 0)$, $2\pi \to (1, 0)$, and so on.

The Domains of the Trig Functions as Functions of a Real Number

For $t \in \mathbb{R}$ and $k \in \mathbb{Z}$, the domains of the trig functions are:

$$\cos t = x \quad t \in \mathbb{R} \qquad \sin t = y \quad t \in \mathbb{R} \qquad \tan t = \frac{y}{x};\ x \neq 0 \quad t \neq \frac{\pi}{2} + \pi k$$

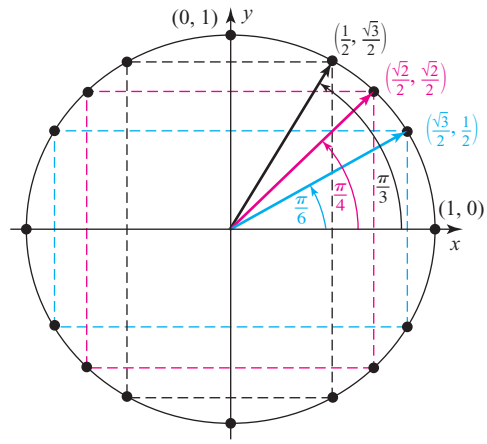
$$\sec t = \frac{1}{x};\ x \neq 0 \quad t \neq \frac{\pi}{2} + \pi k \qquad \csc t = \frac{1}{y};\ y \neq 0 \quad t \neq \pi k \qquad \cot t = \frac{x}{y};\ y \neq 0 \quad t \neq \pi k$$

For a given point (x, y) on the unit circle associated with the real number t, the value of each function at t can still be determined even if t is unknown.

EXAMPLE 7 ▶ **Finding Function Values Given a Point on the Unit Circle**

Given $\left(\frac{-7}{25}, \frac{24}{25}\right)$ is a point on the unit circle corresponding to a real number t, find the value of all six trig functions of t.

Solution ▶ Using the definitions from the previous box we have $\cos t = \frac{-7}{25}$, $\sin t = \frac{24}{25}$, and $\tan t = \frac{\sin t}{\cos t} = \frac{24}{-7}$. The values of the reciprocal functions are then $\sec t = \frac{25}{-7}$, $\csc t = \frac{25}{24}$, and $\cot t = \frac{-7}{24}$.



Now try Exercises 45 through 60 ▶

☑ **D.** You've just seen how we can define the six trig functions in terms of a real number t

E. Finding a Real Number *t* Whose Function Value Is Known

In Example 7, we were able to determine the values of the trig functions even though t was unknown. In many cases, however, we need to *find* the value of t. For instance, what is the value of t given $\cos t = -\dfrac{\sqrt{3}}{2}$ with t in QII? Exercises of this type fall into two broad categories: (1) you recognize the given number as one of the special values: $\pm\left\{0, \dfrac{1}{2}, \dfrac{\sqrt{2}}{2}, \dfrac{\sqrt{3}}{2}, \dfrac{\sqrt{3}}{3}, \sqrt{3}, 1\right\}$; or (2) you don't. If you recognize a special value, you can often name the real number t after a careful consideration of the related quadrant and required sign. The diagram in Figure 6.44 reviews these special values for $0 \le t \le \dfrac{\pi}{2}$ but remember—all other special values can be found using reference arcs and the symmetry of the circle.

Figure 6.44

EXAMPLE 8 ▶ **Finding *t* for Given Values and Conditions**

Find the value of t that corresponds to the given function values.

a. $\cos t = -\dfrac{\sqrt{2}}{2}$; t in QII **b.** $\tan t = \sqrt{3}$; t in QIII

Solution ▶

a. The cosine function is negative in QII and QIII, where $x < 0$. We recognize $-\dfrac{\sqrt{2}}{2}$ as a standard value for sine and cosine, related to certain multiples of $t = \dfrac{\pi}{4}$. In QII, we have $t = \dfrac{3\pi}{4}$.

b. The tangent function is positive in QI and QIII, where x and y have like signs. We recognize $\sqrt{3}$ as a standard value for tangent and cotangent, related to certain multiples of $t = \dfrac{\pi}{6}$. For tangent in QIII, we have $t = \dfrac{4\pi}{3}\left(= \dfrac{8\pi}{6}\right)$.

Now try Exercises 61 through 84 ▶

If the given function value is not one of the special values, properties of the inverse trigonometric functions must be used to find the associated value of t. The inverse functions are fully developed in Section 7.5.

Using radian measure and the unit circle is much more than a simple convenience to trigonometry and its applications. Whether the unit is 1 cm, 1 m, 1 km, or even 1 light-year, using 1 unit designations serves to simplify a great many practical applications, including those involving the arc length formula, $s = r\theta$. **See Exercises 95 through 102.**

The following table summarizes the relationship between a special arc t (t in QI) and the value of each trig function at t. Due to the frequent use of these relationships, students are encouraged to commit them to memory.

E. You've just seen how we can find the real number t corresponding to given values of sin t, cos t, and tan t

t	sin t	cos t	tan t	csc t	sec t	cot t
0	0	1	0	undefined	1	undefined
$\frac{\pi}{6}$	$\frac{1}{2}$	$\frac{\sqrt{3}}{2}$	$\frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3}$	2	$\frac{2}{\sqrt{3}} = \frac{2\sqrt{3}}{3}$	$\sqrt{3}$
$\frac{\pi}{4}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{2}}{2}$	1	$\sqrt{2}$	$\sqrt{2}$	1
$\frac{\pi}{3}$	$\frac{\sqrt{3}}{2}$	$\frac{1}{2}$	$\sqrt{3}$	$\frac{2}{\sqrt{3}} = \frac{2\sqrt{3}}{3}$	2	$\frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3}$
$\frac{\pi}{2}$	1	0	undefined	1	undefined	0

6.2 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. A central circle is symmetric to the _____ axis, the _____ axis and to the _____.

2. Since $(\frac{5}{13}, -\frac{12}{13})$ is on the unit circle, the point _____ in QII is also on the circle.

3. On the unit circle, cos t = _____, sin t = _____, and tan t = __; while $\frac{1}{x}$ = _____, $\frac{1}{y}$ = _____, and $\frac{x}{y}$ = _____.

4. On a unit circle with θ in radians, the length of a(n) _____ is numerically the same as the measure of the _____, since for $s = r\theta$, $s = \theta$ when $r = 1$.

5. Discuss/Explain how knowing only one point on the unit circle, actually gives the location of four points. Why is this helpful to a study of the circular functions?

6. A student is asked to find t using a calculator, given sin $t \approx 0.5592$ with t in QII. The answer submitted is $t = \sin^{-1} 0.5592 \approx 34°$. Discuss/Explain why this answer is not correct. What is the correct response?

▶ DEVELOPING YOUR SKILLS

Given the point is on the unit circle, complete the ordered pair (x, y) for the quadrant indicated. Answer in radical form as needed.

7. $(x, -0.8)$; QIII

8. $(-0.6, y)$; QII

9. $\left(\frac{5}{13}, y\right)$; QIV

10. $\left(x, -\frac{8}{17}\right)$; QIV

11. $\left(\frac{\sqrt{11}}{6}, y\right)$; QI

12. $\left(x, -\frac{\sqrt{13}}{7}\right)$; QIII

13. $\left(-\frac{\sqrt{11}}{4}, y\right)$; QII

14. $\left(x, \frac{\sqrt{6}}{5}\right)$; QI

Given the point is on the unit circle, complete the ordered pair (x, y) for the quadrant indicated. Round results to four decimal places. Check your answer using 2nd TRACE (CALC) with a graph of the unit circle.

15. $(x, -0.2137)$; QIII

16. $(0.9909, y)$; QIV

17. $(x, 0.1198)$; QII

18. $(0.5449, y)$; QI

Verify the point given is on the unit circle, then use symmetry to find three more points on the circle. Coordinates for Exercises 19 to 22 are exact, coordinates for Exercises 23 to 26 are approximate.

19. $\left(-\frac{\sqrt{3}}{2}, \frac{1}{2}\right)$

20. $\left(\frac{\sqrt{7}}{4}, -\frac{3}{4}\right)$

21. $\left(\frac{\sqrt{11}}{6}, -\frac{5}{6}\right)$

22. $\left(-\frac{\sqrt{6}}{3}, -\frac{\sqrt{3}}{3}\right)$

23. (0.3325, 0.9431)

24. (0.7707, −0.6372)

25. (0.9937, −0.1121)

26. (−0.2029, 0.9792)

27. Use a $\frac{\pi}{6}:\frac{\pi}{3}:\frac{\pi}{2}$ triangle with a hypotenuse of length 1 to verify that $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$ is a point on the unit circle.

28. Use the results from Exercise 27 to find three additional points on the circle and name the quadrant of each point.

Find the reference angle associated with each rotation, then find the associated point (x, y) on the unit circle.

29. $\theta = \frac{5\pi}{4}$

30. $\theta = \frac{5\pi}{3}$

31. $\theta = -\frac{5\pi}{6}$

32. $\theta = -\frac{7\pi}{4}$

33. $\theta = \frac{11\pi}{4}$

34. $\theta = \frac{11\pi}{3}$

35. $\theta = \frac{25\pi}{6}$

36. $\theta = \frac{39\pi}{4}$

Without the use of a calculator, state the exact value of the trig functions for the given angles. A diagram may help.

37. a. $\sin\left(\frac{\pi}{4}\right)$ **b.** $\sin\left(\frac{3\pi}{4}\right)$
c. $\sin\left(\frac{5\pi}{4}\right)$ **d.** $\sin\left(\frac{7\pi}{4}\right)$
e. $\sin\left(\frac{9\pi}{4}\right)$ **f.** $\sin\left(-\frac{\pi}{4}\right)$
g. $\sin\left(-\frac{5\pi}{4}\right)$ **h.** $\sin\left(-\frac{11\pi}{4}\right)$

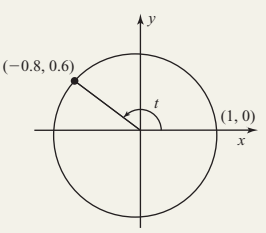
38. a. $\tan\left(\frac{\pi}{3}\right)$ **b.** $\tan\left(\frac{2\pi}{3}\right)$
c. $\tan\left(\frac{4\pi}{3}\right)$ **d.** $\tan\left(\frac{5\pi}{3}\right)$
e. $\tan\left(\frac{7\pi}{3}\right)$ **f.** $\tan\left(-\frac{\pi}{3}\right)$
g. $\tan\left(-\frac{4\pi}{3}\right)$ **h.** $\tan\left(-\frac{10\pi}{3}\right)$

39. a. $\cos\pi$ **b.** $\cos 0$
c. $\cos\left(\frac{\pi}{2}\right)$ **d.** $\cos\left(\frac{3\pi}{2}\right)$

40. a. $\sin\pi$ **b.** $\sin 0$
c. $\sin\left(\frac{\pi}{2}\right)$ **d.** $\sin\left(\frac{3\pi}{2}\right)$

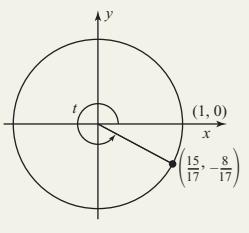
Use the symmetry of the circle and reference arcs as needed to state the exact value of the trig functions for the given real numbers without the use of a calculator. A diagram may help.

41. a. $\cos\left(\frac{\pi}{6}\right)$ **b.** $\cos\left(\frac{5\pi}{6}\right)$
c. $\cos\left(\frac{7\pi}{6}\right)$ **d.** $\cos\left(\frac{11\pi}{6}\right)$
e. $\cos\left(\frac{13\pi}{6}\right)$ **f.** $\cos\left(-\frac{\pi}{6}\right)$
g. $\cos\left(-\frac{5\pi}{6}\right)$ **h.** $\cos\left(-\frac{23\pi}{6}\right)$



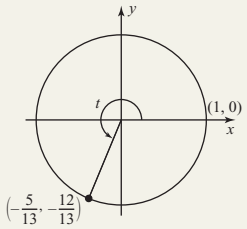
42. a. $\csc\left(\frac{\pi}{6}\right)$ **b.** $\csc\left(\frac{5\pi}{6}\right)$
c. $\csc\left(\frac{7\pi}{6}\right)$ **d.** $\csc\left(\frac{11\pi}{6}\right)$
e. $\csc\left(\frac{13\pi}{6}\right)$ **f.** $\csc\left(-\frac{\pi}{6}\right)$
g. $\csc\left(-\frac{11\pi}{6}\right)$ **h.** $\csc\left(-\frac{17\pi}{6}\right)$

43. a. $\tan\pi$ **b.** $\tan 0$
c. $\tan\left(\frac{\pi}{2}\right)$ **d.** $\tan\left(\frac{3\pi}{2}\right)$

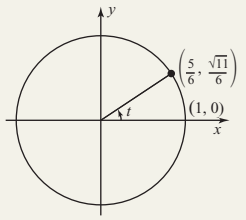


44. a. $\cot\pi$ **b.** $\cot 0$
c. $\cot\left(\frac{\pi}{2}\right)$ **d.** $\cot\left(\frac{3\pi}{2}\right)$

Given (x, y) is a point on the unit circle corresponding to t, find the value of all six trig functions of t.



45.

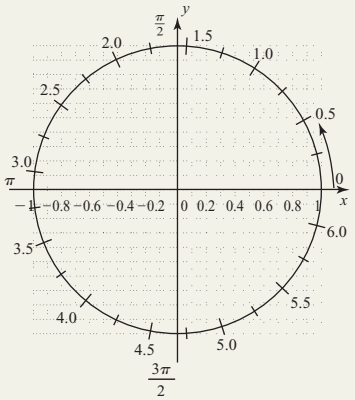


46.

47.

48.

49. $\left(-\frac{2}{5}, \frac{\sqrt{21}}{5}\right)$



50. $\left(\frac{\sqrt{7}}{4}, -\frac{3}{4}\right)$

51. $\left(-\frac{1}{3}, -\frac{2\sqrt{2}}{3}\right)$

52. $\left(-\frac{2\sqrt{6}}{5}, -\frac{1}{5}\right)$

On the unit circle, the real number *t* can represent either the amount of rotation or the *length of the arc* when we associate *t* with a point (*x*, *y*) on the circle. In the circle diagram shown, the real number *t* in radians is marked off along the circumference. For Exercises 53 through 60, name the quadrant in which *t* terminates and use the figure to estimate function values to one decimal place (use a straightedge). Check results using a calculator.

Exercises 53 to 60

53. sin 0.75

54. cos 2.75

55. cos 5.5

56. sin 4.0

57. tan 0.8

58. sec 3.75

59. csc 2.0

60. cot 0.5

Without using a calculator, find the value of *t* in [0, 2π) that corresponds to the following functions.

61. $\sin t = \frac{\sqrt{3}}{2}$; *t* in QII

62. $\cos t = \frac{1}{2}$; *t* in QIV

63. $\cos t = -\frac{\sqrt{3}}{2}$; *t* in QIII

64. $\sin t = -\frac{1}{2}$; *t* in QIV

65. $\tan t = -\sqrt{3}$; *t* in QII

66. $\sec t = -2$; *t* in QIII

67. $\sin t = 1$

68. $\cos t = -1$

Without using a calculator, find the two values of *t* (where possible) in [0, 2π) that make each equation true.

69. $\sec t = -\sqrt{2}$

70. $\csc t = -\frac{2}{\sqrt{3}}$

71. tan *t* undefined

72. csc *t* undefined

73. $\cos t = -\frac{\sqrt{2}}{2}$

74. $\sin t = \frac{\sqrt{2}}{2}$

75. $\sin t = 0$

76. $\cos t = -1$

77. Given $(\frac{3}{5}, -\frac{4}{5})$ is a point on the unit circle that corresponds to *t*. Find the coordinates of the point corresponding to (a) $-t$ and (b) $t + \pi$.

78. Given $(-\frac{7}{25}, \frac{24}{25})$ is a point on the unit circle that corresponds to *t*. Find the coordinates of the point corresponding to (a) $-t + \pi$ and (b) $t - \pi$.

Find an additional value of *t* in [0, 2π) that makes the equation true.

79. $\sin 0.8 \approx 0.7174$

80. $\cos 2.12 \approx -0.5220$

81. $\cos 4.5 \approx -0.2108$

82. $\sin 5.23 \approx -0.8690$

83. $\tan 0.4 \approx 0.4228$

84. $\sec 5.7 \approx 1.1980$

▶ WORKING WITH FORMULAS

85. From Pythagorean triples to points on the unit circle: $(x, y, r) \rightarrow \left(\frac{x}{r}, \frac{y}{r}, 1\right)$

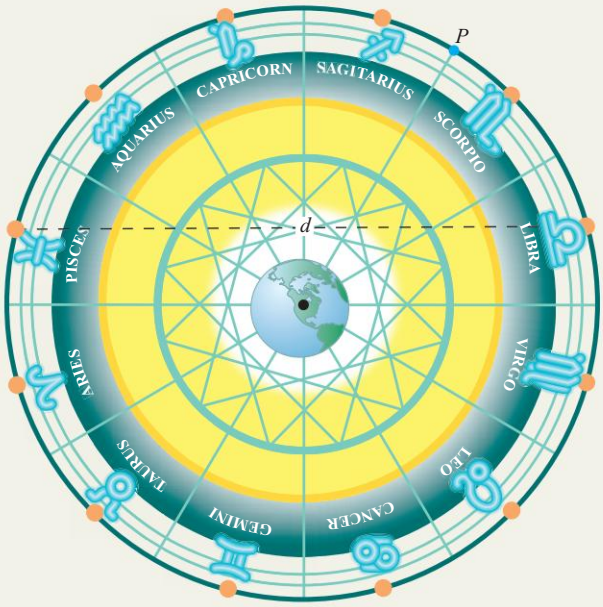
While not strictly a "formula," dividing a Pythagorean triple by r is a simple algorithm for rewriting any Pythagorean triple as a triple with hypotenuse 1. This enables us to identify certain points on the unit circle, and to evaluate the six trig functions of the related acute angle. Rewrite each triple as a triple with hypotenuse 1, verify $\left(\frac{x}{r}, \frac{y}{r}\right)$ is a point on the unit circle, and evaluate the six trig functions using this point.

a. (5, 12, 13) **b.** (7, 24, 25)

c. (12, 35, 37) **d.** (9, 40, 41)

86. The sine and cosine of $(2k + 1)\frac{\pi}{4}$; $k \in \mathbb{Z}$

In the solution to Example 8(a), we mentioned $\pm\frac{\sqrt{2}}{2}$ were standard values for sine and cosine, "related to certain multiples of $\frac{\pi}{4}$." Actually, we meant "odd multiples of $\frac{\pi}{4}$." The odd multiples of $\frac{\pi}{4}$ are given by the "formula" shown, where k is any integer. (a) What multiples of $\frac{\pi}{4}$ are generated by $k = -3, -2, -1, 0, 1, 2, 3$? (b) Find similar formulas for Example 8(b), where $\sqrt{3}$ is a standard value for tangent and cotangent, "related to certain multiples of $\frac{\pi}{6}$."



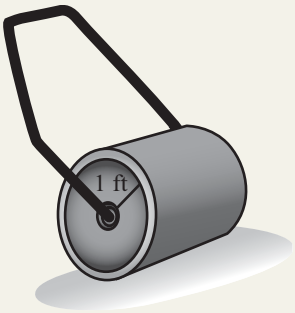
▶ APPLICATIONS

Unit circle points: In Exercises 23 through 26, four decimal approximations of unit circle points were given. Find such unit circle points that are on the terminal side of the following angles in standard position. (*Hint:* Use the definitions of the trig functions.)

87. $\theta = 2$ **88.** $\theta = 1$ **89.** $\theta = 5$ **90.** $\theta = 4$

Mosaic design: The floor of a local museum contains a mosaic zodiac circle as shown. The circle is 1 m (= 100 cm) in radius, with all 12 zodiac signs represented by small, evenly spaced bronze disks on the circumference.

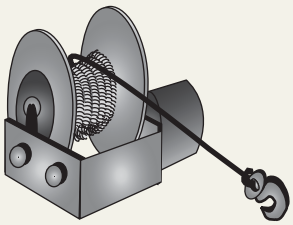
Exercises 91 to 94



91. If the disk representing Libra is 96.6 cm to the right of and 25.9 cm above the center of the zodiac, what is the distance d (see illustration) from Libra's disk to Pisces' disk? What is the distance from Libra's disk to Virgo's disk?

92. If the disk representing Taurus is 70.7 cm to the left of and 70.7 cm below the center of the zodiac, what is the distance from Taurus' disk to Leo's disk? What is the distance from Taurus' disk to Scorpio's disk?

93. Using a special triangle, identify (in relation to the center of the zodiac) the location of the point P (see illustration) where the steel rod separating Scorpio and Sagittarius intersects the circumference. Round to the nearest tenth of a centimeter.



94. Using a special triangle, identify (in relation to the center of the zodiac) the location of the point where the steel rod separating Aquarius and Pisces intersects the circumference. Round to the nearest tenth of a centimeter.

95. Laying new sod: When new sod is laid, a heavy roller is used to press the sod down to ensure good contact with the ground beneath. The radius of the roller is 1 ft. (a) Through what angle (in radians) has the roller turned after being pulled across 5 ft of yard? (b) What angle must the roller turn through to press a length of 30 ft?

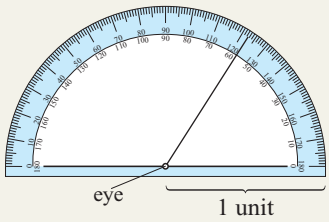
96. Cable winch: A large winch with a radius of 1 ft winds in 3 ft of cable. (a) Through what angle (in radians) has it turned? (b) What angle must it turn through in order to winch in 12.5 ft of cable?

Exercise 96

97. Wiring an apartment: In the wiring of an apartment complex, electrical wire is being pulled from a spool with radius 1 decimeter (1 dm = 10 cm). (a) What length (in decimeters) is removed as the spool turns through 5 rad? (b) How many decimeters are removed in one complete turn ($t = 2\pi$) of the spool?

98. Barrel races: In the barrel races popular at some family reunions, contestants stand on a hard rubber barrel with a radius of 1 cubit (1 cubit = 18 in.), and try to "walk the barrel" from the start line to the finish line without falling. (a) What distance (in cubits) is traveled as the barrel is walked through an angle of 4.5 rad? (b) If the race is 25 cubits long, through what angle will the winning barrel walker walk the barrel?

Interplanetary measurement: In the year 1905, astronomers began using astronomical units or AU to study the distances between the celestial bodies of our solar system. One AU represents the average distance between the Earth and the Sun, which is about 93 million miles. Pluto is roughly 39.24 AU from the Sun.



99. If the Earth travels through an angle of 2.5 rad about the Sun, (a) what distance in astronomical units (AU) has it traveled? (b) How many AU does it take for one complete orbit around the Sun?

100. If you include the dwarf planet Pluto, Jupiter is the middle (fifth of nine) planet from the Sun. Suppose astronomers had decided to use *its* average distance from the Sun as 1 AU. In this case, 1 AU would be 480 million miles. If Jupiter travels through an angle of 4 rad about the Sun, (a) what distance in the "new" astronomical units (AU) has it traveled? (b) How many of the new AU does it take to complete one-half an orbit about the Sun? (c) What distance in the new AU is the dwarf planet Pluto from the Sun?

101. Compact disk circumference: A standard compact disk has a radius of 6 cm. Call this length "1 unit." Mark a starting point on any large surface, then carefully roll the compact disk along this line without slippage, through one full revolution (2π rad) and mark this spot. Take an accurate measurement of the resulting line segment. Is the result close to 2π "units" ($2\pi \times 6$ cm)?

102. Verifying $s = r\theta$: On a protractor, carefully measure the distance from the middle of the protractor's eye to the edge of the protractor along the 0° mark, to the nearest half-millimeter. Call this length "1 unit." Then use a ruler to draw a straight line on a blank sheet of paper, and with the protractor on edge, start the zero degree mark at one end of the line, carefully roll the protractor until it reaches 1 radian (57.3°), and mark this spot. Now measure the length of the line segment created. Is it very close to 1 "unit" long?

Exercise 102

▶ EXTENDING THE CONCEPT

103. In this section, we discussed the *domain* of the circular functions, but said very little about their *range*. Review the concepts presented here and determine the range of $y = \cos t$ and $y = \sin t$. In other words, what are the smallest and largest output values we can expect?

104. Since $\tan t = \dfrac{\sin t}{\cos t}$, what can you say about the range of the tangent function?

Use the radian grid given with Exercises 53–60 to answer Exercises 105 and 106.

105. Given $\cos(2t) = -0.6$ with the terminal side of the arc in QII, (a) what is the value of $2t$? (b) What quadrant is t in? (c) What is the value of $\cos t$? (d) Does $\cos(2t) = 2\cos t$?

106. Given $\sin(2t) = -0.8$ with the terminal side of the arc in QIII, (a) what is the value of $2t$? (b) What quadrant is t in? (c) What is the value of $\sin t$? (d) Does $\sin(2t) = 2\sin t$?

▶ MAINTAINING YOUR SKILLS

107. (1.3) Given the points $(-3, -4)$ and $(5, 2)$ find

a. the distance between them

b. the midpoint between them

c. the slope of the line through them.

108. (5.4) Use a calculator to find the value of each expression, then explain the results.

a. $\log 2 + \log 5 =$ _____

b. $\log 20 - \log 2 =$ _____

109. (2.3, R.6) Solve each equation:

a. $2|x + 1| - 3 = 7$

b. $2\sqrt{x + 1} - 3 = 7$

110. (4.2) Use the rational zeroes theorem to solve the equation completely, given $x = -3$ is one root.

$$x^4 + x^3 - 3x^2 + 3x - 18 = 0$$

6.3 Graphs of the Sine and Cosine Functions

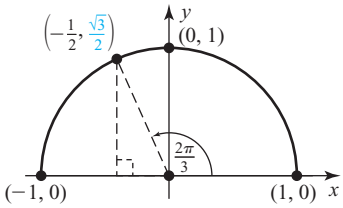
LEARNING OBJECTIVES

In Section 6.3 you will see how we can:

- ❑ **A.** Graph $f(t) = \sin t$ using special values and symmetry
- ❑ **B.** Graph $f(t) = \cos t$ using special values and symmetry
- ❑ **C.** Graph sine and cosine functions with various amplitudes and periods
- ❑ **D.** Write the equation for a given graph

As with the graphs of other functions, trigonometric graphs contribute a great deal toward the understanding of each function and its applications. For now, our primary interest is the general shape of each basic graph and some of the transformations that can be applied. We will also learn to analyze each graph, and to capitalize on the features that enable us to apply the functions as real-world models.

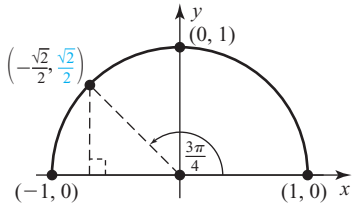
A. Graphing $f(t) = \sin t$



Consider the following table of values (Table 6.1) for $\sin t$ and the special angles in QI.

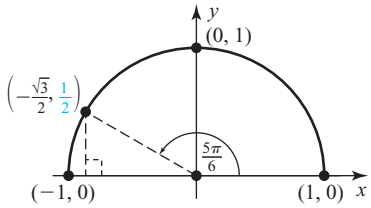
Table 6.1

t	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
$\sin t$	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	1



Observe that in this interval, sine values are increasing from 0 to 1. From $\frac{\pi}{2}$ to π (QII), special values taken from the unit circle show sine values are decreasing from 1 to 0, *but through the same output values as in* QI. See Figures 6.45 through 6.47.

Figure 6.45



$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2}$$

Figure 6.46

$$\sin\left(\frac{3\pi}{4}\right) = \frac{\sqrt{2}}{2}$$

Figure 6.47

$$\sin\left(\frac{5\pi}{6}\right) = \frac{1}{2}$$

With this information we can extend our table of values through π, noting that $\sin \pi = 0$ (see Table 6.2).

Table 6.2

t	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π
$\sin t$	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0

Using the symmetry of the circle and the fact that y is negative in QIII and QIV, we can complete the table for values between π and 2π.

EXAMPLE 1 ▶ **Finding Function Values Using Symmetry**

Use the symmetry of the unit circle and reference arcs of special values to complete Table 6.3. Recall that y is negative in QIII and QIV.

Table 6.3

t	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
$\sin t$									

Solution ▶ Symmetry shows that for any odd multiple of $t = \frac{\pi}{4}$, $\sin t = \pm\frac{\sqrt{2}}{2}$ depending on the quadrant of the terminal side. Similarly, for any reference arc of $\frac{\pi}{6}$, $\sin t = \pm\frac{1}{2}$, while any reference arc of $\frac{\pi}{3}$ will give $\sin t = \pm\frac{\sqrt{3}}{2}$. The completed table is shown in Table 6.4.

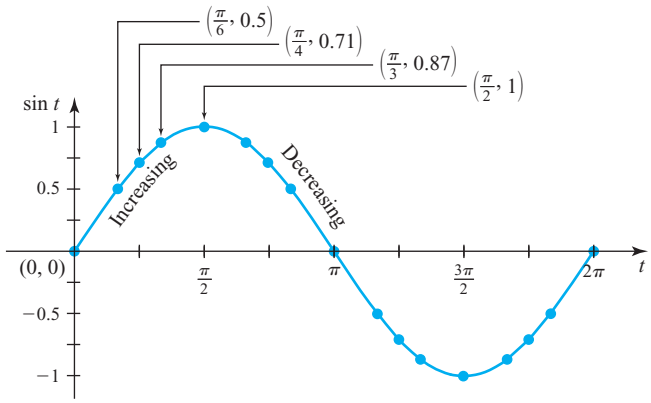


Table 6.4

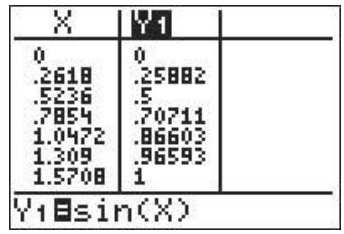
t	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
$\sin t$	0	$-\frac{1}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{\sqrt{3}}{2}$	-1	$-\frac{\sqrt{3}}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{1}{2}$	0

Now try Exercises 7 and 8 ▶

Noting that $\frac{1}{2} = 0.5$, $\frac{\sqrt{2}}{2} \approx 0.71$, and $\frac{\sqrt{3}}{2} \approx 0.87$, we plot these points and connect them with a smooth curve to graph $y = \sin t$ in the interval $[0, 2\pi]$. The first five plotted points are labeled in Figure 6.48.

Figure 6.48



These approximate values can be quickly generated using the table feature of a graphing calculator set in radian MODE. Begin by noticing the least common denominator of the standard values $\frac{\pi}{6}$, $\frac{\pi}{4}$, $\frac{\pi}{3}$, and $\frac{\pi}{2}$ is 12. After entering $Y_1 = \sin X$, we use this observation and the keystrokes 2nd WINDOW **(TBLSET)** to set the table as shown in Figure 6.49. Note after pressing ENTER, the calculator automatically replaces the exact value $\frac{\pi}{12}$ with a decimal approximation (0.261...). Pressing the keys 2nd GRAPH **(TABLE)** results in the table shown in Figure 6.50, and we quickly recognize the Figure 6.48 decimal approximations in the Y_1 column. **Exercises 9 and 10** explore the two additional values that appear in this column.

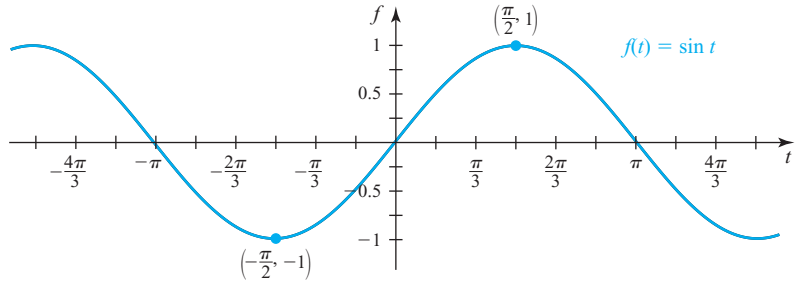
Figure 6.49

Figure 6.50

Expanding the table from 2π to 4π using reference arcs and the unit circle shows that function values begin to repeat. For example, $\sin\left(\frac{13\pi}{6}\right) = \sin\left(\frac{\pi}{6}\right)$ since $\theta_r = \frac{\pi}{6}$, $\sin\left(\frac{9\pi}{4}\right) = \sin\left(\frac{\pi}{4}\right)$ since $\theta_r = \frac{\pi}{4}$, and so on. Functions that cycle through a set pattern of values are said to be **periodic functions.** Using the down arrow to scroll through the table in Figure 6.50, *while observing the graph in Figure 6.48,* helps highlight these concepts.

Periodic Functions

A function f is said to be periodic if there is a positive number P such that



$$f(t + P) = f(t)$$

for all t in the domain. The smallest number P for which this occurs is called the **period** of f.

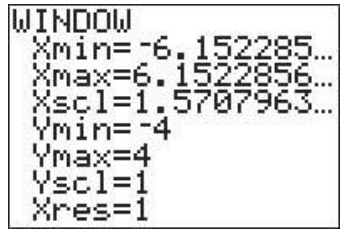
For the sine function note $\sin t = \sin(t + 2\pi)$, as in $\sin\left(\frac{13\pi}{6}\right) = \sin\left(\frac{\pi}{6} + 2\pi\right)$ and $\sin\left(\frac{9\pi}{4}\right) = \sin\left(\frac{\pi}{4} + 2\pi\right)$, with the idea extending to all other real numbers t: $\sin t = \sin(t + 2\pi k)$ for all integers k. The sine function is periodic with period $P = 2\pi$.

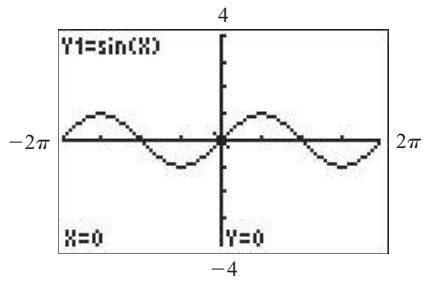
Although we initially focused on positive values of t in $[0, 2\pi]$, $t < 0$ and $k < 0$ are certainly possibilities and we note the graph of $f(t) = \sin t$ extends infinitely in both directions (see Figure 6.51).

Figure 6.51

To see even more of this graph, we can use a graphing calculator and a preset ZOOM option that automatically sets a window size convenient to many trigonometric graphs. The resulting WINDOW after pressing ZOOM **7:ZTrig** is shown in Figure 6.52 for a calculator set in radian MODE. Pressing GRAPH with $Y_1 = \sin X$ displays the graph of $f(t) = \sin t$ in this predefined window (see Figure 6.53).

Figure 6.52





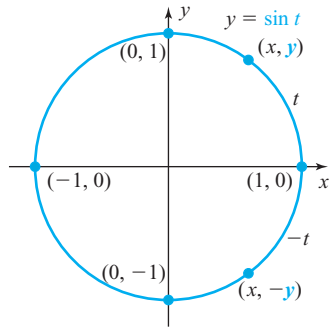


Figure 6.53

Finally, the table, graph, and unit circle all confirm that the range of $f(t) = \sin t$ is $[-1, 1]$, and that $f(t) = \sin t$ is an odd function. In particular, the graph shows $\sin\left(-\frac{\pi}{2}\right) = -\sin\left(\frac{\pi}{2}\right)$, and the unit circle shows $\sin t = y$, and $\sin(-t) = -y$ (see Figure 6.54), from which we obtain $\sin(-t) = -\sin t$ by substitution. As a handy reference, the following box summarizes the main characteristics of $f(t) = \sin t$.

Figure 6.54

Characteristics of $f(t) = \sin t$

For all real numbers t and integers k,

Domain	Range	Period
$(-\infty, \infty)$	$[-1, 1]$	2π
Symmetry	**Maximum value**	**Minimum value**
odd	$\sin t = 1$	$\sin t = -1$
$\sin(-t) = -\sin t$	at $t = \frac{\pi}{2} + 2\pi k$	at $t = \frac{3\pi}{2} + 2\pi k$
Increasing	**Decreasing**	**Zeroes**
$\left(0, \frac{\pi}{2}\right) \cup \left(\frac{3\pi}{2}, 2\pi\right)$	$\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$	$t = k\pi$

EXAMPLE 2 ▶ Using the Period of sin t to Find Function Values

Use the characteristics of $f(t) = \sin t$ to match the given value of t to the correct value of $\sin t$.

a. $t = \frac{\pi}{4} + 8\pi$ **b.** $t = -\frac{\pi}{6}$ **c.** $t = \frac{17\pi}{2}$ **d.** $t = 21\pi$ **e.** $t = \frac{11\pi}{2}$

I. $\sin t = 1$ **II.** $\sin t = -\frac{1}{2}$ **III.** $\sin t = -1$ **IV.** $\sin t = \frac{\sqrt{2}}{2}$ **V.** $\sin t = 0$

Solution ▶

a. Since $\sin\left(\frac{\pi}{4} + 8\pi\right) = \sin\frac{\pi}{4}$, the correct match is (IV).

b. Since $\sin\left(-\frac{\pi}{6}\right) = -\sin\frac{\pi}{6}$, the correct match is (II).

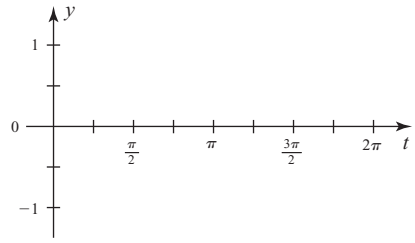
c. Since $\sin\left(\frac{17\pi}{2}\right) = \sin\left(\frac{\pi}{2} + 8\pi\right) = \sin\frac{\pi}{2}$, the correct match is (I).

d. Since $\sin(21\pi) = \sin(\pi + 20\pi) = \sin\pi$, the correct match is (V).

e. Since $\sin\left(\frac{11\pi}{2}\right) = \sin\left(\frac{3\pi}{2} + 4\pi\right) = \sin\left(\frac{3\pi}{2}\right)$, the correct match is (III).

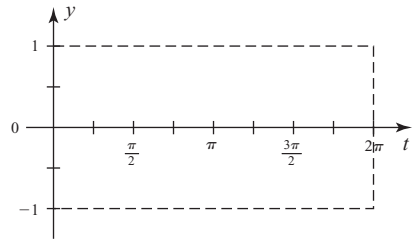
Now try Exercises 11 and 12 ▶

Many of the transformations applied to algebraic graphs can also be applied to trigonometric graphs. These transformations may stretch, reflect, or translate the graph, but it will still retain its basic shape. In numerous applications, it will help if you're able to draw a quick, accurate sketch of the transformations involving $f(t) = \sin t$. To assist this effort, we'll begin with the interval $[0, 2\pi]$, combine the characteristics just listed with some simple geometry, and offer the following four-step process.



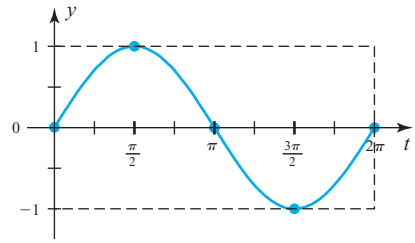
Step I: Draw the y-axis, mark zero halfway up, with -1 and 1 an equal distance from this zero. Then draw an extended t-axis and tick mark 2π to the extreme right (Figure 6.55).

Figure 6.55



Step II: On the t-axis, mark halfway between 0 and 2π and label it "π," mark halfway between π on either side and label the marks $\frac{\pi}{2}$ and $\frac{3\pi}{2}$. Halfway between these you can draw additional tick marks to represent the remaining multiples of $\frac{\pi}{4}$ (Figure 6.56).

Figure 6.56

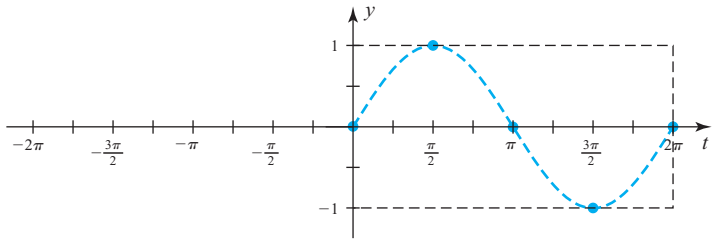


Step III: Next, lightly draw a rectangular frame, which we'll call the **reference rectangle,** $P = 2\pi$ units wide and 2 units tall, centered on the t-axis and with the y-axis along the left side (Figure 6.57).

Figure 6.57

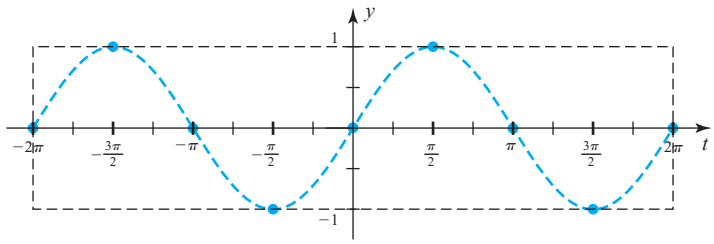
Step IV: Knowing $y = \sin t$ is positive and increasing in QI, that the range is $[-1, 1]$, that the zeroes are 0, π, and 2π, and that maximum and minimum values *occur halfway between the zeroes* (since there is no horizontal shift), we can draw a reliable graph of $y = \sin t$ by partitioning the rectangle into four equal parts to locate these values (note **bold** tick-marks). We will call this partitioning of the reference rectangle the **rule of fourths,** since we are then scaling the t-axis in increments of $\frac{P}{4}$ (Figure 6.58).

Figure 6.58



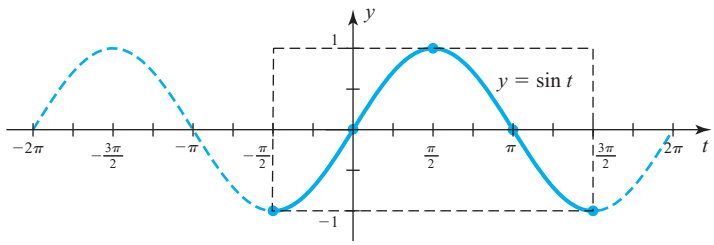
EXAMPLE 3 ▶ Graphing $y = \sin t$ Using a Reference Rectangle

Use steps I through IV to draw a sketch of $y = \sin t$ for the interval $\left[-\frac{\pi}{2}, \frac{3\pi}{2}\right]$.



Solution ▶ Start by completing steps I and II, then extend the t-axis to include -2π. Beginning at $t = 0$, draw a reference rectangle 2π units wide and 2 units tall, centered on the t-axis. After applying the rule of fourths, we note the zeroes occur at $t = 0$, $t = \pi$, and $t = 2\pi$, while the max/min values fall halfway between them at $t = \frac{\pi}{2}$ and $t = \frac{3\pi}{2}$ (see Figure 6.59). Plot these points and connect them with a smooth, dashed curve. This is the primary period of the sine curve.

Figure 6.59



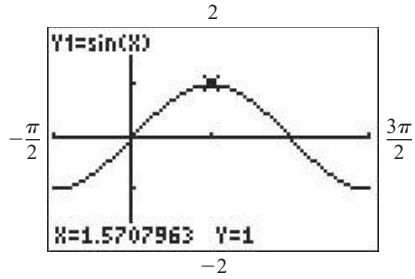
Using the periodic nature of the sine function, we can also graph the sine curve on the interval $[-2\pi, 0]$, as shown in Figure 6.60. The rule of fourths again helps to locate the zeroes and max/min values (note the bold tick-marks) over this interval.

Figure 6.60

For the graph of $y = \sin t$ in $\left[-\frac{\pi}{2}, \frac{3\pi}{2}\right]$, we simply highlight the graph in this interval using a solid curve, as shown in Figure 6.61.

Figure 6.61

WORTHY OF NOTE



Since the interval $\left[-\frac{\pi}{2}, \frac{3\pi}{2}\right]$ is $P = 2\pi$ units wide, this section of the graph can generate the entire graph of $y = \sin t$.

Now try Exercises 13 and 14 ▶

☑ **A.** You've just seen how we can graph $f(t) = \sin t$ using special values and symmetry

We can verify the results of Example 3 by changing the WINDOW settings from the predefined ZOOM **7:ZTrig** to Xmin $= -\frac{\pi}{2}$, Xmax $= \frac{3\pi}{2}$, Ymin $= -2$, and Ymax $= 2$. The GRAPH of $Y_1 = \sin X$ with these window settings is shown in Figure 6.62.

Figure 6.62

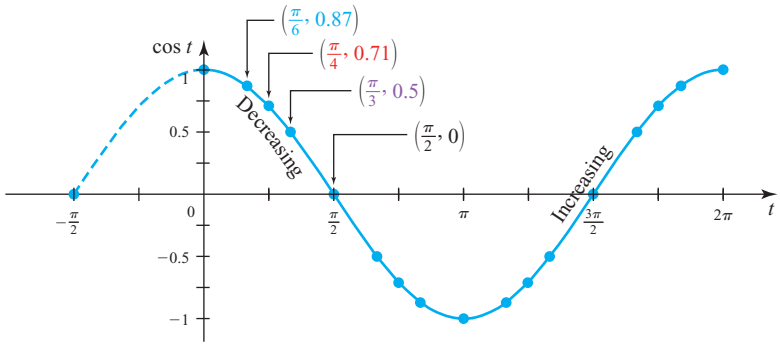
B. Graphing $f(t) = \cos t$

With the graph of $f(t) = \sin t$ established, sketching the graph of $f(t) = \cos t$ is a very natural next step. First, note that when $t = 0$, $\cos t = 1$ so the graph of $y = \cos t$ will begin at $(0, 1)$ in the interval $[0, 2\pi]$. Second, we've seen $\left(\pm\frac{1}{2}, \pm\frac{\sqrt{3}}{2}\right)$, $\left(\pm\frac{\sqrt{3}}{2}, \pm\frac{1}{2}\right)$ and $\left(\pm\frac{\sqrt{2}}{2}, \pm\frac{\sqrt{2}}{2}\right)$ are all points on the unit circle since they satisfy $x^2 + y^2 = 1$. Since $\cos t = x$ and $\sin t = y$, the Pythagorean identity $\cos^2 t + \sin^2 t = 1$ can be obtained by direct substitution. This means if $\sin t = \pm\frac{1}{2}$, then $\cos t = \pm\frac{\sqrt{3}}{2}$ and vice versa, with the signs taken from the appropriate quadrant. Similarly, if $\sin t = 0$, then $\cos t = \pm 1$ and vice versa. The table of values for cosine then becomes a simple variation of the table for sine, as shown in Table 6.5 for $t \in [0, \pi]$.

Table 6.5

t	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π
$\sin t$	0	$\frac{1}{2} = 0.5$	$\frac{\sqrt{2}}{2} \approx 0.71$	$\frac{\sqrt{3}}{2} \approx 0.87$	1	$\frac{\sqrt{3}}{2} \approx 0.87$	$\frac{\sqrt{2}}{2} \approx 0.71$	$\frac{1}{2} = 0.5$	0
$\cos t$	**1**	$\frac{\sqrt{3}}{2} \approx 0.87$	$\frac{\sqrt{2}}{2} \approx 0.71$	$\frac{1}{2} = 0.5$	**0**	$-\frac{1}{2} = -0.5$	$-\frac{\sqrt{2}}{2} \approx -0.71$	$-\frac{\sqrt{3}}{2} \approx -0.87$	**−1**

WORTHY OF NOTE



As with the sine function, a graphing calculator can quickly produce a table of points on the graph of the cosine function. With the independent variable in the table set to **Ask** mode, we generate the following special values, which also appear in Table 6.5 and Figure 6.63.

X	Y1
0	1
.5236	.86603
.7854	.70711
1.0472	.5
1.5708	0
2.0944	-.5
2.3562	-.7071

Y1=cos(X)

The same values can be taken from the unit circle, but this view requires much less effort and easily extends to values of t in $[\pi, 2\pi]$. Using the points from Table 6.5 and its extension through $[\pi, 2\pi]$, we can draw the graph of $y = \cos t$ in $[0, 2\pi]$ and identify where the function is increasing and decreasing in this interval. See Figure 6.63.

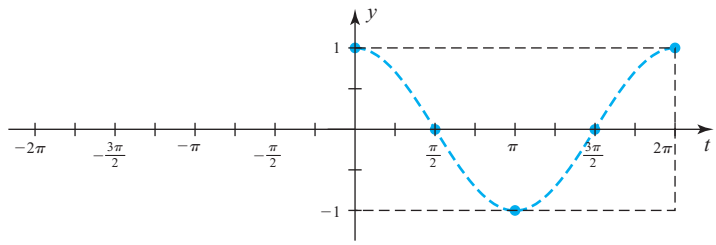
Figure 6.63

The function is decreasing for t in $(0, \pi)$, and increasing for t in $(\pi, 2\pi)$. The end result appears to be the graph of $y = \sin t$ shifted to the left $\frac{\pi}{2}$ units, a fact more easily seen if we extend the graph to $-\frac{\pi}{2}$ as shown. This is in fact the case, and is a relationship we will later prove in Chapter 7. Like $y = \sin t$, the function $y = \cos t$ is periodic with period $P = 2\pi$, with the graph extending infinitely in both directions.

Finally, we note that cosine is an **even function,** meaning $\cos(-t) = \cos t$ for all t in the domain. For instance, $\cos\left(-\frac{\pi}{2}\right) = \cos\left(\frac{\pi}{2}\right) = 0$ (see Figure 6.63). Here is a summary of important characteristics of the cosine function.

Characteristics of $f(t) = \cos t$

For all real numbers t and integers k,



Domain	Range	Period
$(-\infty, \infty)$	$[-1, 1]$	2π
Symmetry	**Maximum value**	**Minimum value**
even $\cos(-t) = \cos t$	$\cos t = 1$ at $t = 2\pi k$	$\cos t = -1$ at $t = \pi + 2\pi k$
Increasing	**Decreasing**	**Zeroes**
$(\pi, 2\pi)$	$(0, \pi)$	$t = \frac{\pi}{2} + \pi k$

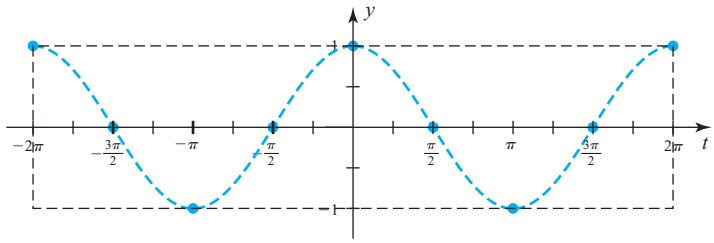
EXAMPLE 4 ▶ Graphing $y = \cos t$ Using a Reference Rectangle

Draw a sketch of $y = \cos t$ for t in $\left[-\frac{\pi}{2}, \frac{3\pi}{2}\right]$ and use a graphing calculator to check your graph.

Solution ▶ As with the graph of $y = \sin t$, begin by completing steps I and II, then extend the t-axis to include -2π. Beginning at $t = 0$, draw a reference rectangle 2π units wide and 2 units tall, centered on the t-axis. After applying the rule of fourths, we note the zeroes occur at $t = \frac{\pi}{2}$ and $t = \frac{3\pi}{2}$ with the max/min values at $t = 0$, $t = \pi$, and $t = 2\pi$. Plot these points and connect them with a smooth, dashed curve (see Figure 6.64). This is the primary period of the cosine curve.

Figure 6.64

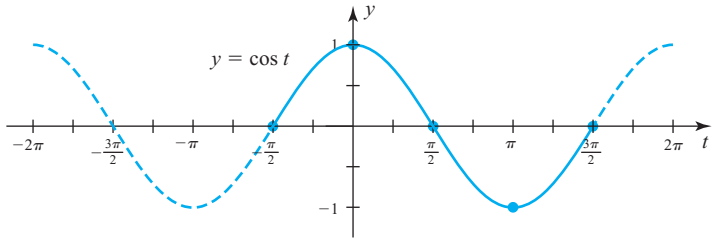
WORTHY OF NOTE



We also could have graphed the cosine curve in this interval using the table

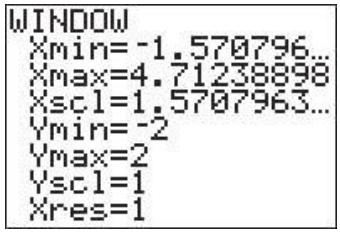
t	$\cos t$
$-\frac{\pi}{2}$	0
0	1
$\frac{\pi}{2}$	0
π	-1
$\frac{3\pi}{2}$	0

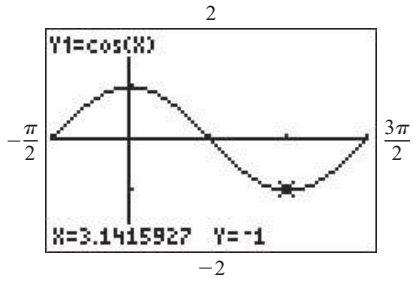
and connecting these points with a smooth curve.



Using the periodic nature of the cosine function, we can also graph the cosine curve on the interval $[-2\pi, 0]$, as shown in Figure 6.65. The rule of fourths again helps to locate the zeroes and max/min values (note the bold tick-marks) over this interval.

Figure 6.65





For the graph of $y = \cos t$ in $\left[-\frac{\pi}{2}, \frac{3\pi}{2}\right]$, we simply highlight the graph in this interval using a solid curve, as shown in Figure 6.66.

Figure 6.66

Check ▶ With the WINDOW settings shown, the graphs are identical. ✓

B. You've just seen how we can graph $f(t) = \cos t$ using special values and symmetry

Now try Exercises 15 and 16 ▶

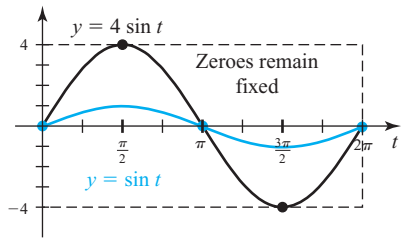
C. Graphing $y = A\sin(Bt)$ and $y = A\cos(Bt)$

In many applications, trig functions have maximum and minimum values other than 1 and -1, and periods other than 2π. For instance, in tropical regions the daily maximum and minimum temperatures may vary by no more than 20°, while for desert regions this difference may be 40° or more. This variation is modeled by the *amplitude* of the sine and cosine functions.

WORTHY OF NOTE

Because the functions $\sin t$ and $\cos t$ take on both positive and negative values, we can use the graphs of $y = |A \sin t|$ and $y = |A \cos t|$ to emphasize the role of amplitude $|A|$ as the *maximum* displacement. **See Exercises 17 through 20.**

Amplitude and the Coefficient A (assume $B = 1$)

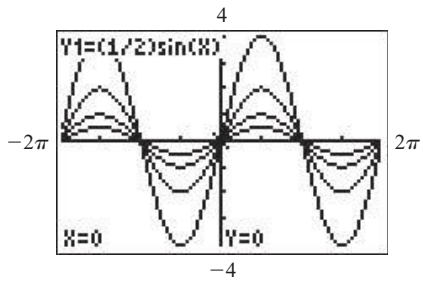


For functions of the form $y = A \sin t$ and $y = A \cos t$, let M represent the *M*aximum value and m the *m*inimum value of the functions. Then the quantity $\frac{M + m}{2}$ gives the

average value of the function, while $\frac{M-m}{2}$ gives the **amplitude** of the function. Amplitude is the maximum displacement from the average value in the positive or negative direction. It is represented by $|A|$, with A playing a role similar to that seen for algebraic graphs [$Af(t)$ vertically stretches or compresses the graph of f, and reflects it across the t-axis if $A < 0$]. Graphs of the form $y = \sin t$ (and $y = \cos t$) can quickly be sketched with any amplitude by noting (1) the *zeroes of the function remain fixed* since $\sin t = 0$ implies $A \sin t = 0$, and (2) the *maximum and minimum values are A and* $-A$, respectively, since $\sin t = 1$ or -1 implies $A \sin t = A$ or $-A$. Note this implies the reference rectangle will be $2A$ units tall and P units wide. Connecting the points that result with a smooth curve will complete the graph.

EXAMPLE 5 ▶ **Graphing $y = A \sin t$ Where $A \neq 1$**

Draw a sketch of $y = 4 \sin t$ in the interval $[0, 2\pi]$.



Solution ▶ With an amplitude of $|A| = 4$, the reference rectangle will be $2(4) = 8$ units tall, by 2π units wide. Using the rule of fourths, the zeroes are still $t = 0$, $t = \pi$, and $t = 2\pi$, with the max/min values spaced equally between. The maximum value is $4 \sin\left(\frac{\pi}{2}\right) = 4(1) = 4$, with a minimum value of $4 \sin\left(\frac{3\pi}{2}\right) = 4(-1) = -4$. Connecting these points with a "sine curve" gives the graph shown ($y = \sin t$ is also shown for comparison).

Now try Exercises 21 through 26 ▶

In the graph for Example 5, we note the zeroes of $y = A \sin t$ remained fixed for $A = 1$ and $A = 4$. Additionally, it appears the max/min values occur at the same t-values. We can use a graphing calculator to further investigate these observations. On the Y= screen, enter $Y_1 = \frac{1}{2} \sin X$, $Y_2 = \sin X$, $Y_3 = 2 \sin X$, and $Y_4 = 4 \sin X$, then use ZOOM **7:ZTrig** to graph the functions (note Y_2 and Y_4 were graphed in Example 5). As you see in Figure 6.67, each graph "holds on" to the zeroes, while rising to the expected amplitude $|A|$ halfway between these zeroes.

Figure 6.67

Period and the Coefficient *B*

While basic sine and cosine functions have a period of 2π, in many applications the period may be very long (tsunamis) or very short (electromagnetic waves). For the equations $y = A \sin(Bt)$ and $y = A \cos(Bt)$, the period depends on the value of B. To see why, consider the function $y = \cos(2t)$ and Table 6.6. Multiplying input values by 2 means each cycle will be completed twice as fast. The table shows that $y = \cos(2t)$

completes a full cycle in $[0, \pi]$, giving a period of $P = \pi$. Figure 6.68 verifies these observations, with the graphs of $Y_1 = \cos(X)$ and $Y_2 = \cos(2X)$ displayed over the interval $[0, 2\pi]$.

Figure 6.68

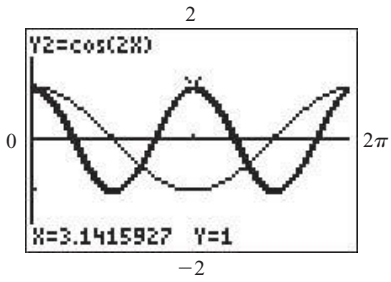


Table 6.6

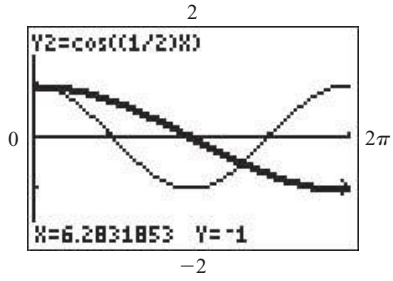
t	0	$\frac{\pi}{4}$	$\frac{\pi}{2}$	$\frac{3\pi}{4}$	π
$2t$	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$	2π
$\cos(2t)$	1	0	-1	0	1

Dividing input values by 2 (or multiplying by $\frac{1}{2}$) will cause the function to complete a cycle only half as fast, doubling the time required to complete a full cycle. Table 6.7 shows $y = \cos(\frac{1}{2}t)$ completes only one-half cycle in 2π. Figure 6.69 shows the graphs of $Y_1 = \cos(X)$ and $Y_2 = \cos((1/2)X)$.

Figure 6.69



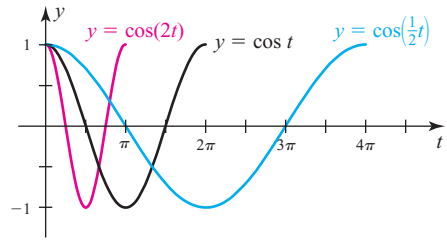


Table 6.7
(values in blue are approximate)

t	0	$\frac{\pi}{4}$	$\frac{\pi}{2}$	$\frac{3\pi}{4}$	π	$\frac{5\pi}{4}$	$\frac{3\pi}{2}$	$\frac{7\pi}{4}$	2π
$\frac{1}{2}t$	0	$\frac{\pi}{8}$	$\frac{\pi}{4}$	$\frac{3\pi}{8}$	$\frac{\pi}{2}$	$\frac{5\pi}{8}$	$\frac{3\pi}{4}$	$\frac{7\pi}{8}$	π
$\cos\left(\frac{1}{2}t\right)$	1	0.92	$\frac{\sqrt{2}}{2}$	0.38	0	-0.38	$-\frac{\sqrt{2}}{2}$	-0.92	-1

The graphs of $y = \cos t$, $y = \cos(2t)$, and $y = \cos(\frac{1}{2}t)$ shown in Figure 6.70 clearly illustrate this relationship and how the value of B affects the period of a graph.

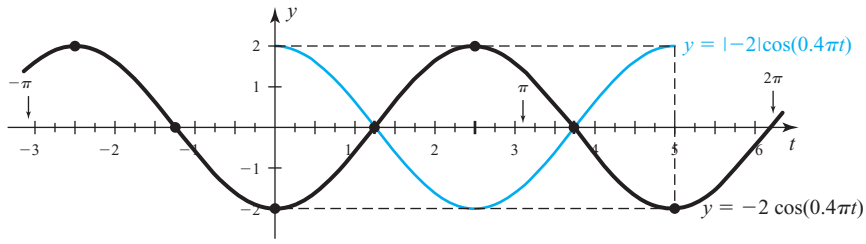
Figure 6.70

To find the period for arbitrary values of B, the formula $P = \dfrac{2\pi}{|B|}$ is used. Note for $y = \cos(2t)$, $B = 2$ and $P = \dfrac{2\pi}{2} = \pi$, as shown. For $y = \cos\left(\dfrac{1}{2}t\right)$, $|B| = \dfrac{1}{2}$, and $P = \dfrac{2\pi}{1/2} = 4\pi$.

Period Formula for Sine and Cosine

For B a real number and functions $y = A\sin(Bt)$ and $y = A\cos(Bt)$,

$$P = \frac{2\pi}{|B|}.$$



To sketch these functions for periods other than 2π, we still use a reference rectangle of height $2A$ and length P, then break the enclosed t-axis into four equal parts to help draw the graph. In general, if the period is "very large" one full cycle is appropriate for the graph. If the period is "very small," graph at least two cycles.

Note the value of B in Example 6 includes a factor of π. This actually happens quite frequently in applications of the trig functions.

EXAMPLE 6 ▶ **Graphing $y = A\cos(Bt)$, Where $A, B \neq 1$**

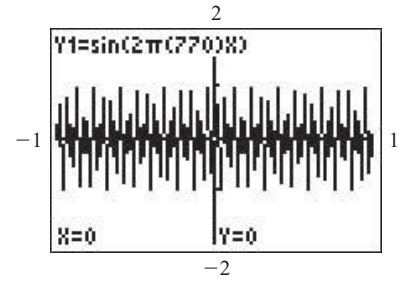
Draw a sketch of $y = -2\cos(0.4\pi t)$ for t in $[-\pi, 2\pi]$.

Solution ▶ The amplitude is $|A| = 2$, so the reference rectangle will be $2(2) = 4$ units high. Since $A < 0$, the *graph will be vertically reflected across the t-axis*. The period is $P = \dfrac{2\pi}{0.4\pi} = 5$ (note the factors of π reduce to 1), so the reference rectangle will be 5 units in length. Breaking the t-axis into four parts within the frame (rule of fourths) gives $(\frac{1}{4})5 = \frac{5}{4}$ units, indicating that we should scale the t-axis in multiples of $\frac{1}{4}$. Note the zeroes occur at $\frac{5}{4}$ and $\frac{15}{4}$, with a maximum value at $\frac{10}{4}$. In cases where the π factor reduces, we scale the t-axis as a "standard" number line, and *estimate the location of multiples of* π. For practical reasons, we first draw the unreflected graph (shown in blue) for guidance in drawing the reflected graph, which is then extended to fit the given interval.

Now try Exercises 27 through 38 ▶

While graphing calculators can quickly and easily graph functions over a given interval, understanding the analytical solution presented remains essential. A true test of effective calculator use comes when the amplitude or period is a very large or a very small number. For instance, the tone you hear while pressing "5" on your telephone is actually a combination of the tones modeled by $Y_1 = \sin[2\pi(770)X]$ and $Y_2 = \sin[2\pi(1336)X]$. Graphing these functions requires a careful analysis of the period, otherwise the graph can appear garbled, misleading, or difficult to read (try graphing Y_1 on the ZOOM **7:ZTrig** screen). Firstnote for Y_1, $A = 1$ and $P = \dfrac{2\pi}{2\pi(770)}$ or $\dfrac{1}{770}$. With a period this short, even graphing the function from Xmin $= -1$ to Xmax $= 1$ gives a distorted graph (see Figure 6.71). Because of the calculated period of this function, we set Xmin to $-1/770$, Xmax to $1/770$ and Xscl to $(1/770)/10$. This gives the graph in Figure 6.72, which can then be used to investigate characteristics of the function. **See Exercises 39 and 40.**

Figure 6.71



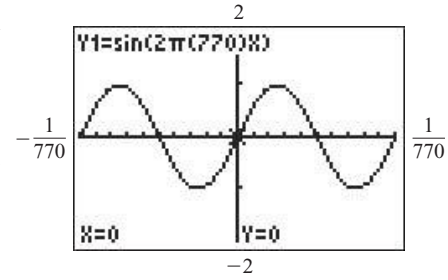


Figure 6.72

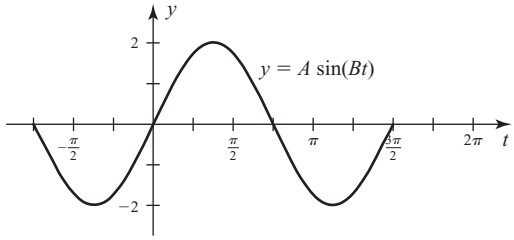
☑ **C.** You've just seen how we can graph sine and cosine functions with various amplitudes and periods



D. Writing Equations from Graphs

Mathematical concepts are best reinforced by working with them in both "forward and reverse." Where graphs are concerned, this means we should attempt to find the equation of a given graph, rather than only using an equation to sketch the graph. Exercises

of this type require that you become very familiar with the graph's basic characteristics and how each is expressed as part of the equation.

EXAMPLE 7 ▶ Determining the Equation of a Given Graph

The graph shown here is of the form $y = A\sin(Bt)$. Find the values of A and B.

Solution ▶ By inspection, the graph has an amplitude of $A = 2$ and a period of $P = \frac{3\pi}{2}$. To find B we used the period formula $P = \frac{2\pi}{|B|}$, substituting $\frac{3\pi}{2}$ for P and solving.

$$P = \frac{2\pi}{|B|} \quad \text{period formula}$$

$$\frac{3\pi}{2} = \frac{2\pi}{B} \quad \text{substitute } \tfrac{3\pi}{2} \text{ for } P;\ B > 0$$

$$3\pi B = 4\pi \quad \text{multiply by } 2B$$

$$B = \frac{4}{3} \quad \text{solve for } B$$

The result is $B = \frac{4}{3}$, which gives us the equation $y = 2\sin(\frac{4}{3}t)$.

D. You've just seen how we can write the equation for a given graph

Now try Exercises 41 through 60 ▶

There are a number of interesting applications of this "graph to equation" process in the exercise set. **See Exercises 63 to 74.**

6.3 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. For the sine function, output values are _____ in the interval $\left[0, \frac{\pi}{2}\right]$.

2. For the cosine function, output values are _____ in the interval $\left[0, \frac{\pi}{2}\right]$.

3. For the sine and cosine functions, the domain is _____ and the range is _____.

4. The amplitude of sine and cosine is defined to be the maximum _____ from the _____ value in the positive and negative directions.

5. Discuss/Explain how the values generated by the unit circle can be used to graph the function $f(t) = \sin t$. Be sure to include the domain and range of this function in your discussion.

6. Discuss/Describe the four-step process outlined in this section for the graphing of basic trig functions. Include a worked-out example and a detailed explanation.

▶ DEVELOPING YOUR SKILLS

7. Use the symmetry of the unit circle and reference arcs of standard values to complete a table of values for $y = \cos t$ in the interval $t \in [\pi, 2\pi]$.

8. Use the standard values for $y = \cos t$ for $t \in [\pi, 2\pi]$ to create a table of values for $y = \sin t$ on the same interval.

For the following, (a) simplify the given values, (b) use a calculator to evaluate the sine of any nonstandard value, and (c) compare your results to Figure 6.50 on page 544.

9. $\frac{1\pi}{12}, \frac{2\pi}{12}, \frac{3\pi}{12}$

10. $\frac{4\pi}{12}, \frac{5\pi}{12}, \frac{6\pi}{12}$

Use the characteristics of $f(t) = \sin t$ to match the given value of t to the correct value of $\sin t$.

11. **a.** $t = \frac{\pi}{6} + 10\pi$ **b.** $t = -\frac{\pi}{4}$ **c.** $t = \frac{-15\pi}{4}$ **d.** $t = 13\pi$ **e.** $t = \frac{21\pi}{2}$

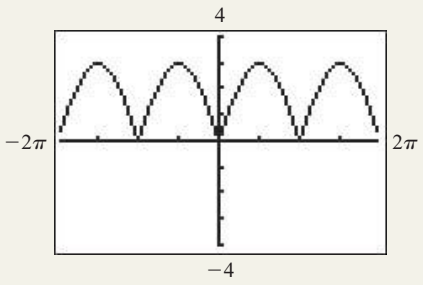
I. $\sin t = 0$ **II.** $\sin t = \frac{1}{2}$ **III.** $\sin t = 1$ **IV.** $\sin t = \frac{\sqrt{2}}{2}$ **V.** $\sin t = -\frac{\sqrt{2}}{2}$

12. **a.** $t = \frac{\pi}{4} - 12\pi$ **b.** $t = \frac{11\pi}{6}$ **c.** $t = \frac{23\pi}{2}$ **d.** $t = -19\pi$ **e.** $t = -\frac{25\pi}{4}$

I. $\sin t = -\frac{1}{2}$ **II.** $\sin t = -\frac{\sqrt{2}}{2}$ **III.** $\sin t = 0$ **IV.** $\sin t = \frac{\sqrt{2}}{2}$ **V.** $\sin t = -1$

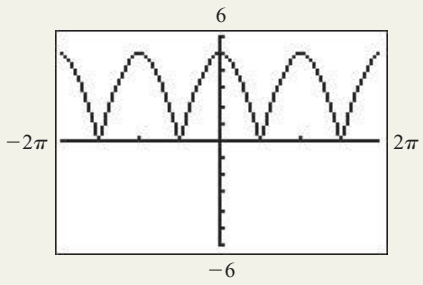
Use steps I through IV given in this section to draw a sketch of each graph. Verify your results with a graphing calculator.

13. $y = \sin t$ for $t \in \left[-\frac{3\pi}{2}, \frac{\pi}{2}\right]$



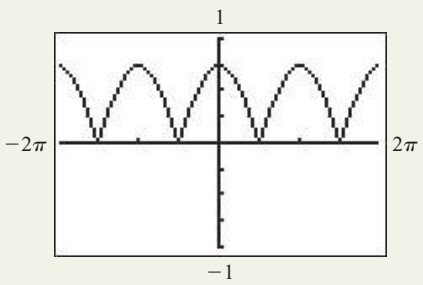
14. $y = \sin t$ for $t \in [-\pi, \pi]$

15. $y = \cos t$ for $t \in \left[-\frac{\pi}{2}, 2\pi\right]$

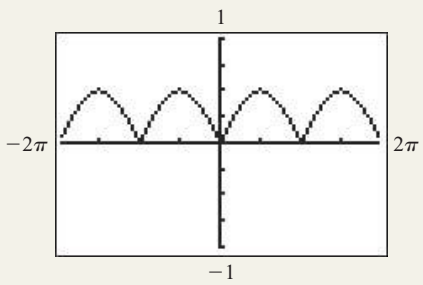


16. $y = \cos t$ for $t \in \left[-\frac{\pi}{2}, \frac{5\pi}{2}\right]$

Earlier we defined the amplitude of the sine and cosine functions as the maximum displacement from the average value. When the average value is 0 (no vertical translation), this "maximum displacement" can more clearly be seen using the concept of absolute value. The graphs shown in Exercises 17 to 20 are of the form $y = |A \sin t|$ or $y = |A \cos t|$, where A is the amplitude of the function. Use the graphs to state the value of A.



17.



18.

19.

20.

Use a reference rectangle and the *rule of fourths* to draw an accurate sketch of the following functions through two complete cycles—one where $t > 0$, and one where $t < 0$. Clearly state the amplitude and period as you begin.

21. $y = 3 \sin t$

22. $y = 4 \sin t$

23. $y = -2 \cos t$

24. $y = -3 \cos t$

25. $y = \frac{1}{2} \sin t$

26. $y = \frac{3}{4} \sin t$

27. $y = -\sin(2t)$

28. $y = -\cos(2t)$

29. $y = 0.8 \cos(2t)$

30. $y = 1.7 \sin(4t)$

31. $f(t) = 4 \cos\left(\frac{1}{2}t\right)$

32. $y = -3 \cos\left(\frac{3}{4}t\right)$

33. $f(t) = 3 \sin(4\pi t)$

34. $g(t) = 5 \cos(8\pi t)$

35. $y = 4 \sin\left(\frac{5\pi}{3}t\right)$

36. $y = 2.5 \cos\left(\frac{2\pi}{5}t\right)$

37. $f(t) = 2 \sin(256\pi t)$

38. $g(t) = 3 \cos(184\pi t)$

39. Graph the tone $Y_2 = \sin[2\pi(1336)X]$ and find its value at $X = 0.00025$. Identify the settings of your "friendly" viewing window.

40. Graph the function $Y_3 = 950 \sin(0.005X)$ and find the value at $X = 550$. Identify the settings of your "friendly" viewing window.

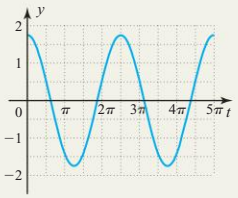
Clearly state the amplitude and period of each function, then match it with the corresponding graph.

41. $y = -2 \cos(4t)$

42. $y = 2 \sin(4t)$

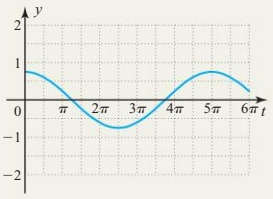
43. $y = 3 \sin(2t)$

44. $y = -3 \cos(2t)$



45. $f(t) = \frac{3}{4} \cos(0.4t)$

46. $g(t) = \frac{7}{4} \cos(0.8t)$



47. $y = 4 \sin(144\pi t)$

48. $y = 4 \cos(72\pi t)$

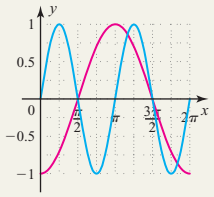
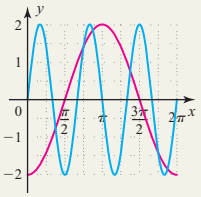
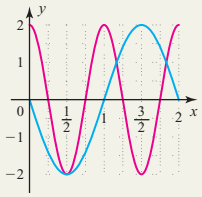
56.



Match each graph to its equation, then graphically estimate the points of intersection. Confirm or contradict your estimate(s) by substituting the values into the given equations using a calculator.



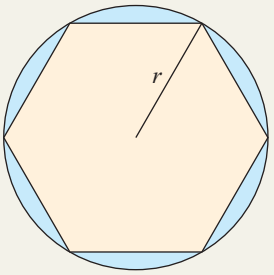
57. $y = -\cos x$; $y = \sin x$



58. $y = -\cos x$; $y = \sin(2x)$

59. $y = -2\cos x$; $y = 2\sin(3x)$

60. $y = 2\cos(2\pi x)$; $y = -2\sin(\pi x)$

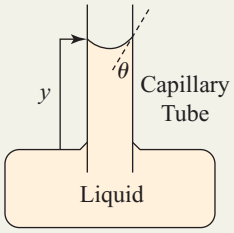


▶ WORKING WITH FORMULAS

61. Area of a regular polygon inscribed in a circle: $\mathcal{A} = \dfrac{nr^2}{2}\sin\left(\dfrac{2\pi}{n}\right)$

The formula shown gives the area of a regular polygon inscribed in a circle, where n is the number of sides ($n \geq 3$) and r is the radius of the circle. Given $r = 10$ cm,

Exercise 61

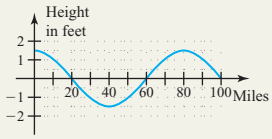


a. What is the area of the circle?

b. What is the area of the polygon when $n = 4$? Find the length of the sides of the polygon using two different methods.

c. Calculate the area of the polygon for $n = 10$, 20, 30, and 100. What do you notice?

62. Hydrostatics, surface tension, and contact angles: $y = \dfrac{2\gamma\cos\theta}{kr}$

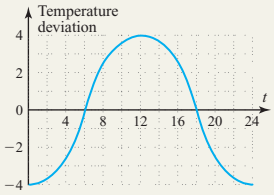


The height that a liquid will rise in a capillary tube is given by the formula shown, where r is the radius of the tube, θ is the contact angle of the liquid (the meniscus), γ is the surface tension of the liquid-vapor film, and k is a constant that depends on the weight-density of the liquid. How high will the liquid rise given that the surface tension $\gamma = 0.2706$, the tube has radius $r = 0.2$ cm, the contact angle $\theta = 22.5°$, and $k = 1.25$?

▶ APPLICATIONS

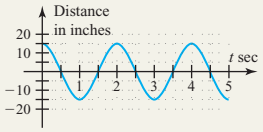
Tidal waves: Tsunamis, also known as tidal waves, are ocean waves produced by earthquakes or other upheavals in the Earth's crust and can move through the water undetected for hundreds of miles at great speed. While traveling in the open ocean, these waves can be represented by a sine graph with a very long wavelength (period) and a very small amplitude. Tsunami waves only attain a monstrous size as they approach the shore, and represent a very different phenomenon than the ocean swells created by heavy winds over an extended period of time.

63. A graph modeling a tsunami wave is given in the figure. (a) What is the height of the tsunami wave (from crest to trough)? Note that $h = 0$ is considered the level of a calm ocean. (b) What is the tsunami's wavelength (period)? (c) Find an equation for this wave.



64. A heavy wind is kicking up ocean swells approximately 10 ft high (from crest to trough), with wavelengths (periods) of 250 ft. (a) Find an equation that models these swells. (b) Graph the equation. (c) Determine the height of a wave measured 200 ft from the trough of the previous wave.

Sinusoidal models: The sine and cosine functions are of great importance to meteorological studies, as when modeling the temperature based on the time of day, the illumination of the moon as it goes through its phases, or even the prediction of tidal motion.

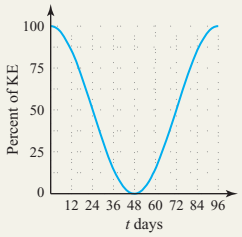


65. The graph given shows the deviation from the average daily temperature for the hours of a given day, with $t = 0$ corresponding to 6 A.M. (a) Use the graph to determine the related equation. (b) Use the equation to find the deviation at $t = 11$ (5 P.M.) and confirm that this point is on the graph. (c) If the average temperature for this day was 72°, what was the temperature at midnight?

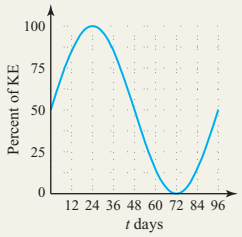
66. The equation $y = 7 \sin\left(\frac{\pi}{6}t\right)$ models the height of the tide along a certain coastal area, as compared to average sea level. Assuming $t = 0$ is midnight,
(a) graph this function over a 12-hr period.
(b) What will the height of the tide be at 5 A.M.?
(c) Is the tide rising or falling at this time?

Sinusoidal movements: Many animals exhibit a wavelike motion in their movements, as in the tail of a shark as it swims in a straight line or the wingtips of a large bird in flight. Such movements can be modeled by a sine or cosine function and will vary depending on the animal's size, speed, and other factors.

67. The graph shown models the position of a shark's tail at time t, as measured to the left (negative) and right (positive) of a straight line along its length. (a) Use the graph to determine the related equation. (b) Is the tail to the right, left, or at center when $t = 6.5$ sec? How far? (c) Would you say the shark is "swimming leisurely," or "chasing its prey"? Justify your answer.



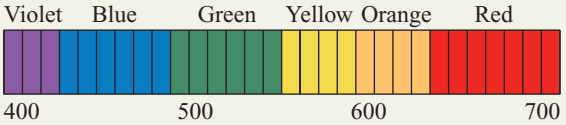
68. The State Fish of Hawaii is the *humuhumunukunukuapua'a*, a small colorful fish found abundantly in coastal waters. Suppose the tail motion of an adult fish is modeled by the equation $d(t) = \sin(15\pi t)$ with $d(t)$ representing the position of the fish's tail at time t, as measured in inches to the left (negative) or right (positive) of a straight line along its length. (a) Graph the equation over two periods. (b) Is the tail to the left or right of center at $t = 2.7$ sec? How far? (c) Would you say this fish is "swimming leisurely," or "running for cover"? Justify your answer.



Kinetic energy: The kinetic energy a planet possesses as it orbits the Sun can be modeled by a cosine function. When the planet is at its apogee (greatest distance from the Sun), its kinetic energy is at its lowest point as it slows down and "turns around" to head back toward the Sun. The kinetic energy is at its highest when the planet "whips around the Sun" to begin a new orbit.

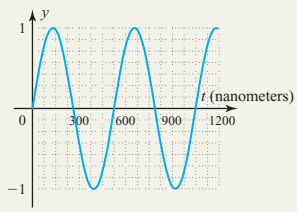
69. Two graphs are given here. (a) Which of the graphs could represent the kinetic energy of a planet orbiting the Sun if the planet is at its perigee (closest distance to the Sun) when $t = 0$? (b) For what value(s) of t does this planet possess 62.5% of its maximum kinetic energy with the kinetic energy increasing? (c) What is the orbital period of this planet?

a.

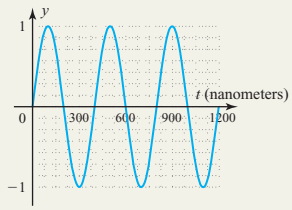


b.

70. The *potential energy* of the planet is the antipode of its kinetic energy, meaning when kinetic energy is at 100%, the potential energy is 0%, and when kinetic energy is at 0% the potential energy is at 100%. (a) How is the graph of the kinetic energy related to the graph of the potential energy? In other words, what transformation could be applied to the kinetic energy graph to obtain the potential energy graph? (b) If the kinetic energy is at 62.5% and increasing, what can be said about the potential energy in the planet's orbit at this time?



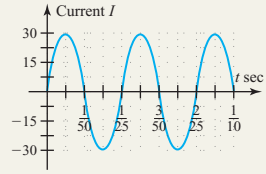
Visible light: One of the narrowest bands in the electromagnetic spectrum is the region involving visible light. The wavelengths (periods) of visible light vary from 400 nanometers (purple/violet colors) to 700 nanometers (bright red). The approximate wavelengths of the other colors are shown in the diagram.



71. The equations for the colors in this spectrum have the form $y = \sin(\gamma t)$, where $\frac{2\pi}{\gamma}$ gives the length of the sine wave. (a) What color is represented by the equation $y = \sin\left(\frac{\pi}{240}t\right)$? (b) What color is represented by the equation $y = \sin\left(\frac{\pi}{310}t\right)$?

72. Name the color represented by each of the graphs (a) and (b) and write the related equation.

a.



b.

Alternating current: Surprisingly, even characteristics of the electric current supplied to your home can be modeled by sine or cosine functions. For alternating current (AC), the amount of current I (in amps) at time t can be modeled by $I = A\sin(\omega t)$, where A represents the maximum current that is produced, and ω is related to the frequency at which the generators turn to produce the current.

73. Find an equation of the household current modeled by the graph, then use the equation to determine I when $t = 0.045$ sec. Verify that the resulting ordered pair is on the graph.

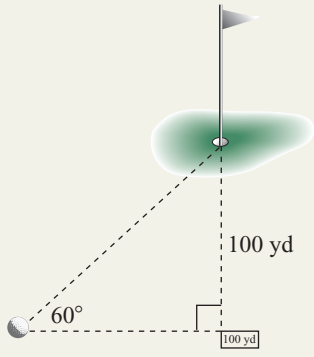
Exercise 73

74. If the *voltage* produced by an AC circuit is modeled by the equation $E = 155\sin(120\pi t)$, (a) what is the period and amplitude of the related graph? (b) What voltage is produced when $t = 0.2$?

▶ EXTENDING THE CONCEPT

75. For $y = A\sin(Bx)$ and $y = A\cos(Bx)$, the expression $\dfrac{M + m}{2}$ gives the average value of the function, where M and m represent the maximum and minimum values, respectively. What was the average value of every function graphed in this section? Compute a table of values for $y = 2\sin t + 3$, and note its maximum and minimum values. What is the average value of this function? What transformation has been applied to change the average value of the function? Can you name the average value of $y = -2\cos t + 1$ by inspection?

76. To understand where the period formula $P = \dfrac{2\pi}{B}$ came from, consider that if $B = 1$, the graph of $y = \sin(Bt) = \sin(1t)$ completes one cycle from $1t = 0$ to $1t = 2\pi$. If $B \neq 1$, $y = \sin(Bt)$ completes one cycle from $Bt = 0$ to $Bt = 2\pi$. Discuss how this observation validates the period formula.



77. The tone you hear when pressing the digit "9" on your telephone is actually a combination of two separate tones, which can be modeled by the functions $f(t) = \sin[2\pi(852)t]$ and $g(t) = \sin[2\pi(1477)t]$. Which of the two functions has the shorter period? By carefully scaling the axes, graph the function having the shorter period using the steps I through IV discussed in this section.

▶ MAINTAINING YOUR SKILLS

78. (6.2) Given $\sin 1.12 \approx 0.9$, find an additional value of t in $[0, 2\pi)$ that makes the equation $\sin t \approx 0.9$ true.

79. (6.1) Use a special triangle to calculate the distance from the ball to the pin on the seventh hole, given the ball is in a straight line with the 100-yd plate, as shown in the figure.

Exercise 79

80. (6.1) Invercargill, New Zealand, is at 46° 14′ 24″ south latitude. If the Earth has a radius of 3960 mi, how far is Invercargill from the equator?

81. (3.1) Given $z_1 = 1 + i$ and $z_2 = 2 - 5i$, compute the following:

a. $z_1 + z_2$

b. $z_1 - z_2$

c. $z_1 z_2$

d. $\dfrac{z_2}{z_1}$

6.4 Graphs of the Cosecant, Secant, Tangent, and Cotangent Functions

LEARNING OBJECTIVES

In Section 6.4 you will see how we can:

- ❑ **A.** Graph the functions $y = A\csc(Bt)$ and $y = A\sec(Bt)$
- ❑ **B.** Graph $y = \tan t$ using asymptotes, zeroes, and the ratio $\frac{\sin t}{\cos t}$
- ❑ **C.** Graph $y = \cot t$ using asymptotes, zeroes, and the ratio $\frac{\cos t}{\sin t}$
- ❑ **D.** Identify and discuss important characteristics of $y = \tan t$ and $y = \cot t$
- ❑ **E.** Graph $y = A\tan(Bt)$ and $y = A\cot(Bt)$ with various values of A and B

Unlike sine and cosine, the cosecant, secant, tangent, and cotangent functions have no maximum or minimum values over their domains. However, it is precisely this unique feature that adds to their value as mathematical models. Collectively, these six trig functions give scientists the tools they need to study, explore, and investigate a wide range of phenomena, extending our understanding of the world around us.

A. Graphs of $y = A\csc(Bt)$ and $y = A\sec(Bt)$

From our earlier work, we know that $y = \sin t$ and $y = \csc t$ are reciprocal functions: $\csc t = \frac{1}{\sin t}$. Likewise, we have $\sec t = \frac{1}{\cos t}$. The graphs of these reciprocal functions follow quite naturally from the graphs of $y = A\sin(Bt)$ and $y = A\cos(Bt)$ by using these observations:

1. You cannot divide by zero.
2. The reciprocal of a very small number ($|x| < 1$) is a very large number (and vice versa).
3. The reciprocal of ± 1 is ± 1.

Just as with rational functions, division by zero creates a vertical asymptote, so the graph of $y = \csc t = \frac{1}{\sin t}$ will have a vertical asymptote at every point where $\sin t = 0$. This occurs at $t = \pi k$, where k is an integer ($\ldots, -2\pi, -\pi, 0, \pi, 2\pi, \ldots$). The table shown in Figure 6.73 shows that as $x \to \pi$, $Y_1 = \sin x$ approaches zero, while $Y_2 = \frac{1}{Y_1} = \csc X$ becomes infinitely large. Further, when $\sin(Bt) = \pm 1$, $\csc(Bt) = \pm 1$ since the reciprocals of 1 and -1 are still 1 and -1, respectively. Finally, due to observation 2, the graph of the cosecant function will be increasing when the sine function is decreasing, and decreasing when the sine function is increasing.

Figure 6.73

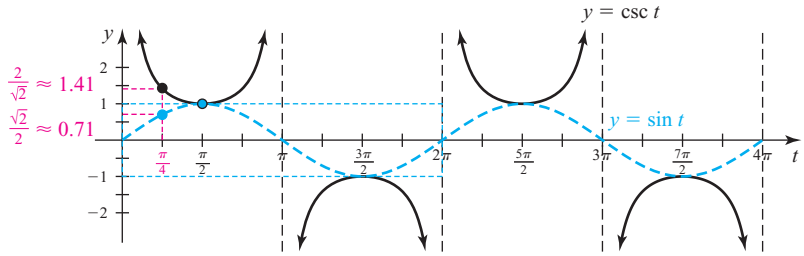
X=π

Considering the case where $A = 1$, we can graph $y = \csc(Bt)$ by first drawing a sketch of $y = \sin(Bt)$. Then using the previous observations and a few well-known values, we can accurately complete the graph. From this graph, we discover that the period of the cosecant function is also $\frac{2\pi}{|B|}$ and that $y = \csc(Bt)$ is an *odd* function.

EXAMPLE 1 ▶ **Graphing $y = A\csc(Bt)$ for $A = 1$**



Graph the function $y = \csc t$ over the interval $[0, 4\pi]$.

Solution ▶ Begin by sketching the function $y = \sin t$, using a standard reference rectangle $2A = 2(1) = 2$ units high by $\frac{2\pi}{B} = \frac{2\pi}{1} = 2\pi$ units in length. Since $\csc t = \frac{1}{\sin t}$, the graph of $y = \csc t$ will be asymptotic at the zeroes of $y = \sin t$ ($t = 0$, π, and 2π). As in Section 6.3, we can then extend the graph

t	$\sin t$	$\csc t$
0	0	$\frac{1}{0} \to$ undefined
$\frac{\pi}{6}$	$\frac{1}{2} = 0.5$	$\frac{2}{1} = 2$
$\frac{\pi}{4}$	$\frac{\sqrt{2}}{2} \approx 0.71$	$\frac{2}{\sqrt{2}} \approx 1.41$
$\frac{\pi}{3}$	$\frac{\sqrt{3}}{2} \approx 0.87$	$\frac{2}{\sqrt{3}} \approx 1.15$
$\frac{\pi}{2}$	1	1

into the interval $[2\pi, 4\pi]$ by reproducing the graph from $[0, 2\pi]$. A partial table and the resulting graph are shown.

- Vertical asymptotes where $\sin(Bt)$ is zero
- When $\sin(Bt) = \pm 1$, $\csc(Bt) = \pm 1$
- Output values are reciprocated

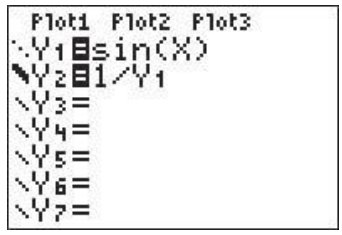
Now try Exercises 7 through 10 ▶

WORTHY OF NOTE

Due to technological limitations, some older graphing calculators may draw what appears to be the asymptotes of $y = \csc t$. It is important to realize these are *not* part of the graph.

With Y_1 and Y_2 entered as shown in Figure 6.74, a graphing calculator set in radian MODE will confirm the results of Example 1 (Figure 6.75).

Figure 6.74



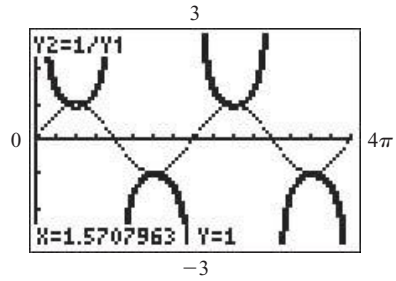


Figure 6.75

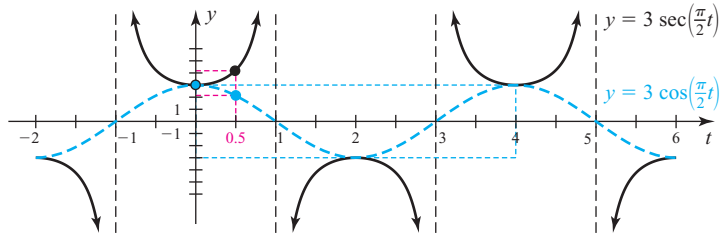
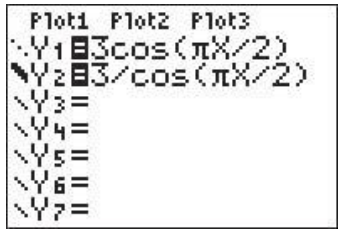
Similar to Example 1, the graph of $y = \sec t = \dfrac{1}{\cos t}$ will have vertical asymptotes where $\cos t = 0 \left(t = \dfrac{\pi}{2} \text{ and } \dfrac{3\pi}{2}\right)$. Note that if $A \neq 1$, we would then use the graph of $y = A\cos(Bt)$ to graph $y = A\sec(Bt)$, as in Example 2.

EXAMPLE 2 ▶ Graphing $y = A\sec(Bt)$ for $A, B \neq 1$

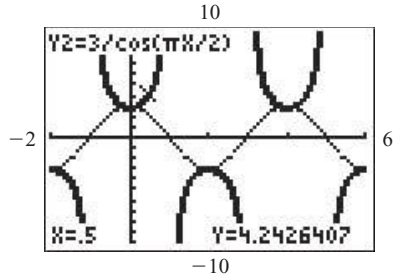


Graph the function $y = 3\sec\left(\dfrac{\pi}{2}t\right)$ over the interval $[-2, 6]$ and use a graphing calculator to check your graph.

Solution ▶ Begin by sketching the function $y = 3\cos\left(\dfrac{\pi}{2}t\right)$ using a reference rectangle 6 units high by $\dfrac{2\pi}{B} = \dfrac{2\pi}{\pi/2} = 4$ units long as a guide. Within the rectangle, each special feature will be 1 unit apart (rule of fourths), with the asymptotes occurring at the zeroes of $y = 3\cos\left(\dfrac{\pi}{2}t\right)$ $(t = 1 \text{ and } t = 3)$. We then extend the graph to cover the interval $[-2, 6]$ by reproducing the



t	$3\cos\left(\frac{\pi}{2}t\right)$	$3\sec\left(\frac{\pi}{2}t\right)$
0	3	3
$\frac{1}{3}$	$3 \cdot \frac{\sqrt{3}}{2} \approx 2.60$	$3 \cdot \frac{2}{\sqrt{3}} \approx 3.46$
$\frac{1}{2}$	$3 \cdot \frac{\sqrt{2}}{2} \approx 2.12$	$3 \cdot \frac{2}{\sqrt{2}} \approx 4.24$
$\frac{2}{3}$	$3 \cdot \frac{1}{2} = 1.5$	$3 \cdot \frac{2}{1} = 6$
1	0	$\frac{1}{0} \rightarrow$ undefined



appropriate sections of the graph. A partial table and the resulting graph are shown.

- Vertical asymptotes where $\cos(Bt)$ is zero
- When $A\cos(Bt) = \pm A$, $A\sec(Bt) = \pm A$

Check ▶ With Y_1 and Y_2 entered as shown, the graphs match. ✓

Now try Exercises 11 through 14 ▶

From the graph, we discover that the period of the secant function is also $\frac{2\pi}{B}$, and that $y = A\sec(Bt)$ is an *even* function. The most important characteristics of the cosecant and secant functions are summarized in the following box. Note that for these functions, there is no discussion of amplitude, and no mention is made of their zeroes since neither graph intersects the t-axis.

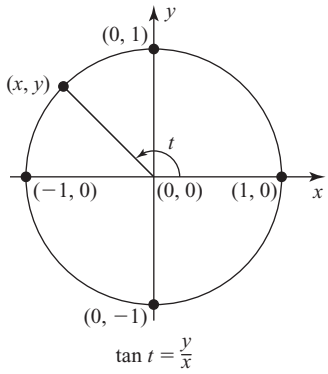
☑ **A.** You've just seen how we can graph the functions $y = A\csc(Bt)$ and $y = A\sec(Bt)$

Characteristics of $f(t) = \csc t$ and $f(t) = \sec t$

For all real numbers t and integers k,

$y = \csc t$

Domain	Range	Asymptotes	Period	Symmetry
$t \neq k\pi$	$(-\infty, -1] \cup [1, \infty)$	$t = k\pi$	2π	odd $\csc(-t) = -\csc t$



$y = \sec t$

Domain	Range	Asymptotes	Period	Symmetry
$t \neq \frac{\pi}{2} + \pi k$	$(-\infty, -1] \cup [1, \infty)$	$t = \frac{\pi}{2} + \pi k$	2π	even $\sec(-t) = \sec t$

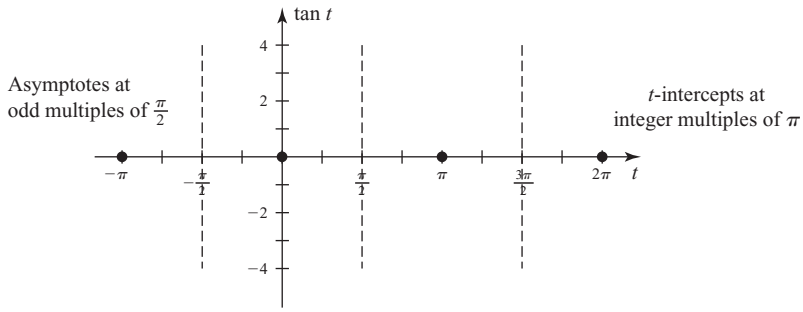
B. The Graph of $y = \tan t$

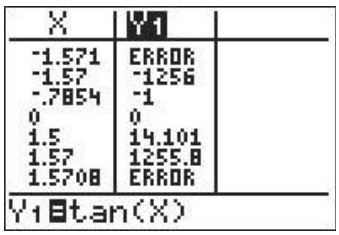
Like the secant and cosecant functions, tangent is defined in terms of a ratio, creating asymptotic behavior at the zeroes of the denominator. In terms of the unit circle, $\tan t = \frac{y}{x}$, which means in $[-\pi, 2\pi]$, vertical asymptotes occur at $t = -\frac{\pi}{2}$, $t = \frac{\pi}{2}$,

Figure 6.76

and $\frac{3\pi}{2}$, since the x-coordinate on the unit circle is zero (see Figure 6.76). We further note $\tan t = 0$ when the y-coordinate is zero, so the function will have t-intercepts at $t = -\pi$, 0, π, and 2π in the same interval. This produces the following framework for graphing the tangent function shown in Figure 6.77.

Figure 6.77





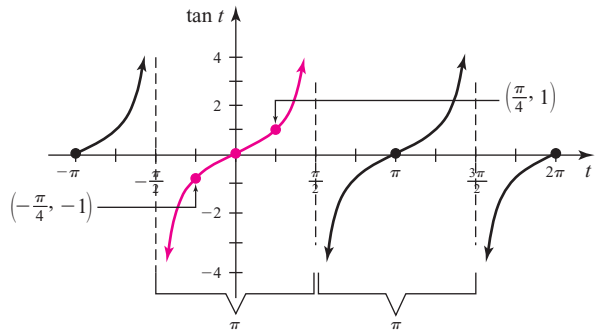


Figure 6.78

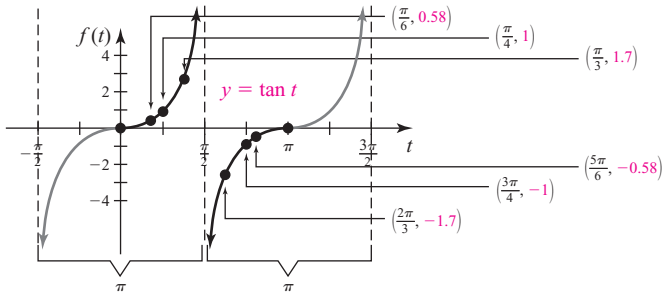
Knowing the graph must go through these zeroes and approach the asymptotes, we are left with determining the *direction of the approach.* This can be discovered by noting that in QI, the y-coordinates of points on the unit circle start at 0 and increase, while the x-values start at 1 and decrease. This means the ratio $\frac{y}{x}$ defining $\tan t$ is increasing, and in fact becomes infinitely large as t gets very close to $\frac{\pi}{2}$. (Figure 6.78). Using the additional points provided by $\tan\left(-\frac{\pi}{4}\right) = -1$ and $\tan\left(\frac{\pi}{4}\right) = 1$, we find the graph of $\tan t$ is increasing throughout the interval $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ and that the function has a period of π. We also note $y = \tan t$ is an odd function (symmetric about the origin), since $\tan(-t) = -\tan t$ as evidenced by the two points just computed. The completed graph is shown in Figure 6.79 with the primary interval in red.

Figure 6.79

The graph can also be developed by noting $\sin t = y$, $\cos t = x$, and $\tan t = \frac{y}{x}$. This gives $\tan t = \frac{\sin t}{\cos t}$ by direct substitution and we can quickly complete a table of values for $\tan t$, as shown in Example 3.

EXAMPLE 3 ▶ **Constructing a Table of Values for $f(t) = \tan t$**

Complete Table 6.8 shown for $\tan t = \dfrac{y}{x}$ using the values given for $\sin t$ and $\cos t$, then graph the function by plotting points.



Solution ▶ The completed table is shown here.

Table 6.8

t	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π
$\sin t = y$	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0
$\cos t = x$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0	$-\frac{1}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{\sqrt{3}}{2}$	-1
$\tan t = \frac{y}{x}$	0	$\frac{1}{\sqrt{3}} \approx 0.58$	1	$\sqrt{3} \approx 1.7$	undefined	$-\sqrt{3}$	-1	$-\frac{1}{\sqrt{3}}$	0

For the noninteger values of x and y, the "twos will cancel" each time we compute $\dfrac{y}{x}$. This means we can simply list the ratio of numerators. The resulting values are shown in red in Table 6.8, along with the corresponding plotted points. The graph shown in Figure 6.80 was completed using symmetry and the previous observations.

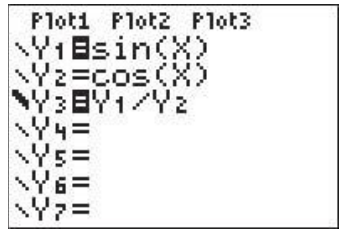


Figure 6.80

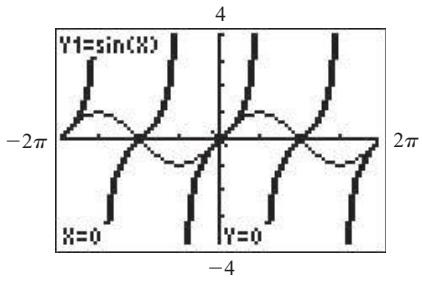
Now try Exercises 15 and 16 ▶

Additional values can be found using a calculator as needed. For future use and reference, it will help to recognize the approximate decimal equivalent of all special values and radian angles. In particular, note that $\sqrt{3} \approx 1.73$ and $\dfrac{1}{\sqrt{3}} \approx 0.58$. **See Exercises 17 through 22.** While we could easily use $Y_1 = \tan X$ on a graphing calculator to generate the graph shown in Figure 6.80, we would miss an opportunity to reinforce the previous observations using the ratio definition $\tan x = \dfrac{\sin x}{\cos x}$. To begin, enter $Y_1 = \sin X$, $Y_2 = \cos X$, and $Y_3 = \dfrac{Y_1}{Y_2}$, as shown in Figure 6.81 [recall that function variables are accessed using VARS ▸ **(Y-VARS)** ENTER **(1:Function)**].

Figure 6.81

Note that Y_2 has been disabled by overlaying the cursor on the equal sign and pressing ENTER. Pressing ZOOM **7:ZTrig** at this point produces the screen shown in Figure 6.82, where we note that $\tan x$ is zero everywhere that $\sin x$ is zero. Similarly, disabling Y_1 while Y_2 is enabled emphasizes that the asymptotes of $y = \tan x$ occur everywhere $\cos x$ is zero (see Figure 6.83).

Figure 6.82



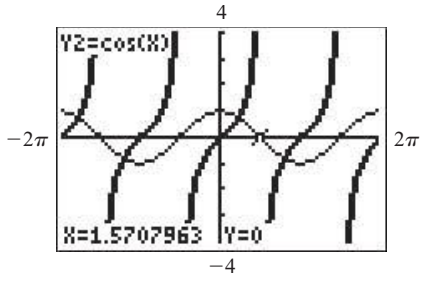


Figure 6.83

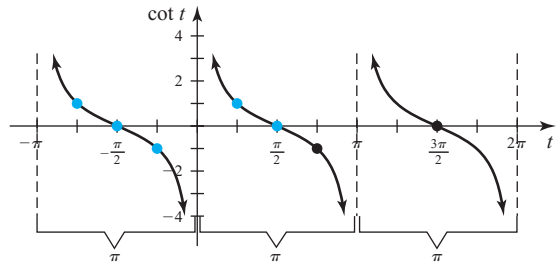
☑ **B.** You've just seen how we can graph $y = \tan t$ using asymptotes, zeroes, and the ratio $\dfrac{\sin t}{\cos t}$

C. The Graph of $y = \cot t$

Since the cotangent function is also defined in terms of a ratio, it too displays asymptotic behavior at the zeroes of the denominator, with t-intercepts at the zeroes of the numerator. Like the tangent function, $\cot t = \dfrac{x}{y}$ can be written in terms of $\cos t = x$ and $\sin t = y$: $\cot t = \dfrac{\cos t}{\sin t}$, and the graph obtained by plotting points.

EXAMPLE 4 ▶ **Constructing a Table of Values for $f(t) = \cot t$**

Complete Table 6.9 for $\cot t = \dfrac{x}{y}$ for t in $[0, \pi]$ using its ratio relationship with $\cos t$ and $\sin t$. Use the results to graph the function for t in $(-\pi, 2\pi)$.



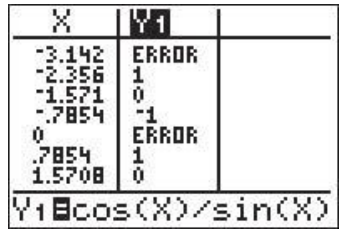
Solution ▶ The completed table is shown here, with the computed values displayed in red.

Table 6.9

t	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π
$\sin t = y$	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0
$\cos t = x$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0	$-\frac{1}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{\sqrt{3}}{2}$	-1
$\cot t = \frac{x}{y}$	undefined	$\sqrt{3}$	1	$\frac{1}{\sqrt{3}}$	0	$-\frac{1}{\sqrt{3}}$	-1	$-\sqrt{3}$	undefined

In this interval, the cotangent function has asymptotes at 0 and π since $y = 0$ at these points, and has a t-intercept at $\frac{\pi}{2}$ since $x = 0$. The graph shown in Figure 6.84 was completed using the period of $y = \cot t$, $P = \pi$. Note that due to how it is defined, the function $y = \cot t$ is a decreasing function.

Figure 6.84



Now try Exercises 23 and 24 ▶

C. You've just seen how we can graph $y = \cot t$ using asymptotes, zeroes, and the ratio $\frac{\cos t}{\sin t}$

Because the cotangent (and tangent) of integer multiples of $\frac{\pi}{4}$ will always be undefined, -1, 0, or 1, these values are often used to generate the graph of the function. By entering $Y_1 = \frac{\cos X}{\sin X}$ and setting TblStart $= -\pi$ and ΔTbl $= \frac{\pi}{4}$, we can quickly generate these standard values (see Figure 6.85). Note the five points calculated in Figure 6.85 have been colored blue in Figure 6.84.

Figure 6.85

D. Characteristics of $y = \tan t$ and $y = \cot t$

The most important characteristics of the tangent and cotangent functions are summarized in the following box. There is no discussion of amplitude, maximum, or minimum values, since maximum or minimum values do not exist. For future use and reference, perhaps the most significant characteristic distinguishing tan t from cot t is that *tan t increases,* while *cot t decreases* over their respective domains. Also note that due to symmetry, the zeroes of each function are always located halfway between the asymptotes.

Characteristics of $f(t) = \tan t$ and $f(t) = \cot t$

For all real numbers t and integers k,

$y = \tan t$			$y = \cot t$		
Domain	**Range**	**Asymptotes**	**Domain**	**Range**	**Asymptotes**
$t \neq \frac{\pi}{2} + \pi k$	$(-\infty, \infty)$	$t = \frac{\pi}{2} + \pi k$	$t \neq k\pi$	$(-\infty, \infty)$	$t = k\pi$
Period	**Behavior**	**Symmetry**	**Period**	**Behavior**	**Symmetry**
π	increasing	odd $\tan(-t) = -\tan t$	π	decreasing	odd $\cot(-t) = -\cot t$

EXAMPLE 5 ▶ **Using the Period of $f(t) = \tan t$ to Find Additional Points**

Given $\tan\left(\frac{\pi}{6}\right) = \frac{1}{\sqrt{3}}$, what can you say about $\tan\left(\frac{7\pi}{6}\right)$, $\tan\left(\frac{13\pi}{6}\right)$, and $\tan\left(-\frac{5\pi}{6}\right)$?

Solution ▶ Each value of t differs from $\frac{\pi}{6}$ by a multiple of π: $\tan\left(\frac{7\pi}{6}\right) = \tan\left(\frac{\pi}{6} + \pi\right)$, $\tan\left(\frac{13\pi}{6}\right) = \tan\left(\frac{\pi}{6} + 2\pi\right)$, and $\tan\left(-\frac{5\pi}{6}\right) = \tan\left(\frac{\pi}{6} - \pi\right)$. Since the period of the tangent function is $P = \pi$, all of these expressions have a value of $\frac{1}{\sqrt{3}}$.

Now try Exercises 25 through 30 ▶

Since the tangent function is more common than the cotangent, many needed calculations will first be done using the tangent function and its properties, then reciprocated. For instance, to evaluate $\cot\left(-\frac{\pi}{6}\right)$ we reason that cot t is an odd function, so $\cot\left(-\frac{\pi}{6}\right) = -\cot\left(\frac{\pi}{6}\right)$. Since cotangent is the reciprocal of tangent and $\tan\left(\frac{\pi}{6}\right) = \frac{1}{\sqrt{3}}$, $-\cot\left(\frac{\pi}{6}\right) = -\sqrt{3}$. **See Exercises 31 and 32.**

☑ **D.** You've just seen how we can identify and discuss important characteristics of $y = \tan t$ and $y = \cot t$

E. Graphing $y = A\tan(Bt)$ and $y = A\cot(Bt)$

The Coefficient A: Vertical Stretches and Compressions

For the tangent and cotangent functions, the role of coefficient A is best seen through an analogy from basic algebra (the concept of amplitude is foreign to these functions). Consider the graph of $y = x^3$ (Figure 6.86). Comparing the parent function $y = x^3$ with functions $y = Ax^3$, the graph is stretched vertically if $|A| > 1$ (see Figure 6.87) and compressed if $0 < |A| < 1$. In the latter case the graph becomes very "flat" near the zeroes, as shown in Figure 6.88.

Figure 6.86

$y = x^3$

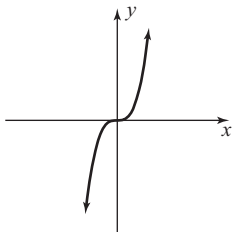


Figure 6.87

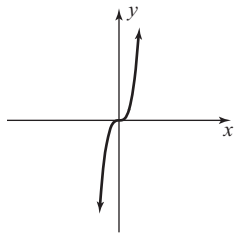
$y = 4x^3$; $A = 4$



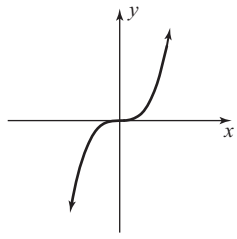


Figure 6.88

$y = \frac{1}{4}x^3$; $A = \frac{1}{4}$

While ***cubic functions are not asymptotic,*** they are a good illustration of A's effect on the tangent and cotangent functions. Fractional values of A ($|A| < 1$) compress the graph, flattening it out near its zeroes. Numerically, this is because a fractional part of a small quantity is an even smaller quantity. For instance, compare $\tan\left(\frac{\pi}{6}\right)$ with $\frac{1}{4}\tan\left(\frac{\pi}{6}\right)$. Rounded to two decimal places, $\tan\left(\frac{\pi}{6}\right) \approx 0.57$, while $\frac{1}{4}\tan\left(\frac{\pi}{6}\right) \approx 0.14$, so the graph must be "nearer the t-axis" at this value.

EXAMPLE 6 ▶ **Comparing the Graph of $f(t) = \tan t$ and $g(t) = A \tan t$**

Draw a "comparative sketch" of $y = \tan t$ and $y = \frac{1}{4}\tan t$ on the same axis and discuss similarities and differences. Use the interval $[-\pi, 2\pi]$.

Solution ▶ Both graphs will maintain their essential features (zeroes, asymptotes, period, increasing, and so on). However, the graph of $y = \frac{1}{4}\tan t$ is vertically compressed, causing it to flatten out near its zeroes and changing how the graph approaches its asymptotes in each interval. See Figure 6.89. The table feature of a graphing calculator with $Y_1 = \tan X$ and $Y_2 = \left(\frac{1}{4}\right)\tan(X)$ reinforces these observations (Figure 6.90).

Figure 6.89

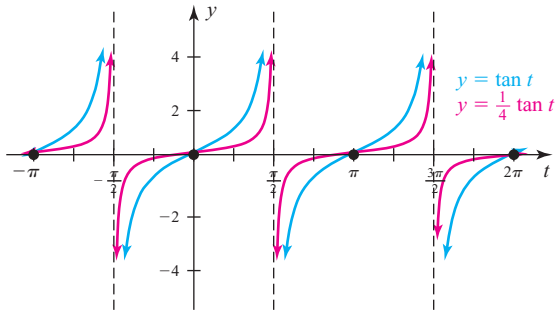

Figure 6.90

Now try Exercises 33 through 36 ▶

The Coefficient B: The Period of Tangent and Cotangent

Like the other trig functions, the value of B has a material impact on the period of the function, and with the same effect. The graph of $y = \cot(2t)$ completes a cycle twice as fast as $y = \cot t \left(P = \frac{\pi}{2} \text{ versus } P = \pi\right)$, while $y = \cot\left(\frac{1}{2}t\right)$ completes a cycle one-half as fast ($P = 2\pi$ versus $P = \pi$).

WORTHY OF NOTE

It may be easier to interpret the phrase "twice as fast" as $2P = \pi$ and "one-half as fast" as $\frac{1}{2}P = \pi$. In each case, solving for P gives the correct interval for the period of the new function.

This reasoning leads us to a **period formula** for tangent and cotangent, namely, $P = \frac{\pi}{|B|}$, where B is the coefficient of the input variable.

Similar to the four-step process used to graph sine and cosine functions, we can graph tangent and cotangent functions using a rectangle $P = \frac{\pi}{B}$ units in length and $2A$ units high, centered on the primary interval. After dividing the length of the rectangle into fourths, the t-intercept will always be the halfway point, with y-values of $|A|$ occurring at the $\frac{1}{4}$ and $\frac{3}{4}$ marks. See Example 7.

EXAMPLE 7 ▶ **Graphing $y = A\cot(Bt)$ for $A, B \neq 1$**

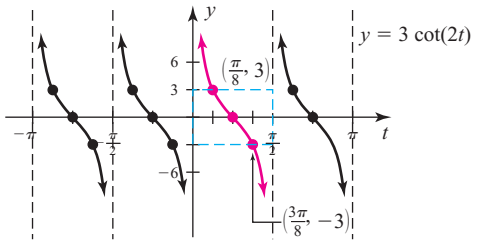
Sketch the graph of $y = 3\cot(2t)$ over the interval $[-\pi, \pi]$.

Solution ▶ For $y = 3\cot(2t)$, $|A| = 3$, which results in a vertical stretch, and $|B| = 2$, which gives a period of $\frac{\pi}{2}$. The function is still undefined (asymptotic) at $t = 0$ and then at all integer multiples of $P = \frac{\pi}{2}$. We also know the graph is decreasing, with zeroes of the function halfway between the asymptotes. The inputs $t = \frac{\pi}{8}$ and $t = \frac{3\pi}{8}$

$\left(\text{the } \frac{1}{4} \text{ and } \frac{3}{4} \text{ marks between 0 and } \frac{\pi}{2}\right)$ yield the points $\left(\frac{\pi}{8}, 3\right)$ and $\left(\frac{3\pi}{8}, -3\right)$, which we'll use along with the period and symmetry of the function to complete the graph in Figure 6.91.

A graphing calculator check is shown in Figure 6.92 (note $\frac{\pi}{8} \approx 0.39$).

Figure 6.91



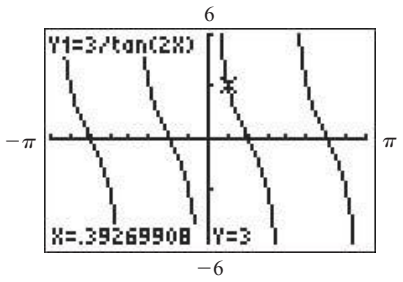


Figure 6.92

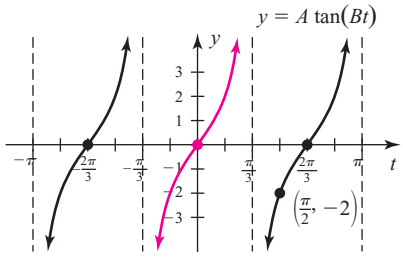


Now try Exercises 37 through 48 ▶

As with the trig functions from Section 6.3, it is possible to determine the equation of a tangent or cotangent function from a given graph. Where previously we used the amplitude, period, and max/min values to obtain our equation, here we first determine the period of the function by calculating the "distance" between asymptotes, then choose any convenient point on the graph (other than a t-intercept) and substitute the x- and y- values into the general equation to solve for A.

EXAMPLE 8 ▶ Constructing the Equation for a Given Graph

Find the equation of the graph shown in Figure 6.93, given it's of the form $y = A\tan(Bt)$. Check your answer with a graphing calculator.

Figure 6.93

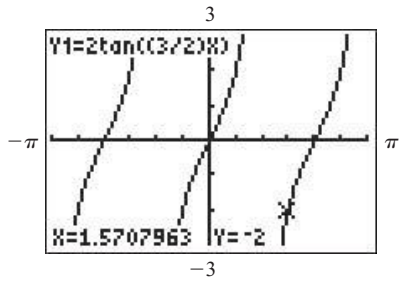
Solution ▶ Using the primary interval and the asymptotes at $t = -\frac{\pi}{3}$ and $t = \frac{\pi}{3}$, we find the period is $P = \frac{\pi}{3} - \left(-\frac{\pi}{3}\right) = \frac{2\pi}{3}$. To find the value of B we substitute $\frac{2\pi}{3}$ for P in $P = \frac{\pi}{B}$ and find $B = \frac{3}{2}$ (verify). This gives the equation $y = A\tan\left(\frac{3}{2}t\right)$.

To find A, we take the point $\left(\frac{\pi}{2}, -2\right)$ shown, and use $t = \frac{\pi}{2}$ with $y = -2$ to solve for A:

$$y = A\tan\left(\frac{3}{2}t\right) \qquad \text{substitute } \tfrac{3}{2} \text{ for } B$$

$$-2 = A\tan\left[\left(\frac{3}{2}\right)\left(\frac{\pi}{2}\right)\right] \qquad \text{substitute } -2 \text{ for } y \text{ and } \tfrac{\pi}{2} \text{ for } t$$

$$-2 = A\tan\left(\frac{3\pi}{4}\right) \qquad \text{multiply}$$



$$A = \frac{-2}{\tan\left(\frac{3\pi}{4}\right)} \qquad \text{solve for } A$$

$$= 2 \qquad \text{result; } \tan\left(\frac{3\pi}{4}\right) = -1$$

The equation of the graph is $y = 2\tan(\frac{3}{2}t)$.

Check ▶ With the WINDOW set to match the given graph $\left(\text{Xmin} = -\pi, \text{Xmax} = \pi, \text{Xscl} = \frac{\pi}{6}, \text{Ymin} = -3, \text{Ymax} = 3, \text{and Yscl} = 1\right)$, the calculator produces the GRAPH shown in Figure 6.94. The graphs match. ✓

6.4 EXERCISES

▶ CONCEPTS AND VOCABULARY

Fill in each blank with the appropriate word or phrase. Carefully reread the section if needed.

1. The period of $y = \tan t$ and $y = \cot t$ is _____. To find the period of $y = \tan(Bt)$ and $y = \cot(Bt)$, the formula _____ is used.

2. The function $y = \tan t$ is _____ everywhere it is defined. The function $y = \cot t$ is _____ everywhere it is defined.

3. Tan t and cot t are _____ functions, so $f(-t) =$ _____. If $\tan\left(-\frac{11\pi}{12}\right) \approx 0.268$, then $\tan\left(\frac{11\pi}{12}\right) \approx$ _____.

4. The asymptotes of $y =$ _____ are located at odd multiples of $\frac{\pi}{2}$. The asymptotes of $y =$ _____ are located at integer multiples of π.

5. Discuss/Explain (a) how you could obtain a table of values for $y = \sec t$ in $[0, 2\pi]$ from the values for $y = \cos t$, and (b) how you could obtain a table of values for $y = \csc\left(\frac{3}{2}t\right)t$ in $[0, 2\pi]$, given the values for $y = \sin\left(\frac{3}{2}t\right)$.

6. Explain/Discuss how the zeroes of $y = \sin t$ and $y = \cos t$ are related to the graphs of $y = \tan t$ and $y = \cot t$. How can these relationships help graph functions of the form $y = A\tan(Bt)$ and $y = A\cot(Bt)$?

▶ DEVELOPING YOUR SKILLS

Draw the graph of each function by first sketching the related sine and cosine graphs, and applying the observations from this section. Confirm your graph using a graphing calculator.

7. $y = \csc(2t)$

8. $y = \csc(\pi t)$

9. $y = \sec\left(\frac{1}{2}t\right)$

10. $y = \sec(2\pi t)$

11. $y = 3 \csc t$

12. $g(t) = 2 \csc(4t)$

13. $y = 2 \sec t$

14. $f(t) = 3 \sec(2t)$

Use the values given for sin t and cos t to complete the tables.

15.

t	π	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$
$\sin t = y$	0	$-\frac{1}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{\sqrt{3}}{2}$	-1

$\sin t = y$	-1	$-\frac{\sqrt{3}}{2}$	$-\frac{\sqrt{2}}{2}$	$-\frac{1}{2}$	0
$\cos t = x$	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	1
$\cot t = \frac{x}{y}$					

25. Given $t = \frac{11\pi}{24}$ is a solution to $\tan t \approx 7.6$, use the period of the function to name three additional solutions. Check your answer using a calculator.

26. Given $t = \frac{7\pi}{24}$ is a solution to $\cot t \approx 0.77$, use the period of the function to name three additional solutions. Check your answer using a calculator.

27. Given $t \approx 1.5$ is a solution to $\cot t = 0.07$, use the period of the function to name three additional solutions. Check your answers using a calculator.

28. Given $t \approx 1.25$ is a solution to $\tan t = 3$, use the period of the function to name three additional solutions. Check your answers using a calculator.

Verify the value shown for t is a solution to the equation given, then use the period of the function to name all real roots. Check two of these roots on a calculator.

29. $t = \frac{\pi}{10}$; $\tan t \approx 0.3249$

30. $t = -\frac{\pi}{16}$; $\tan t \approx -0.1989$

31. $t = \frac{\pi}{12}$; $\cot t = 2 + \sqrt{3}$

32. $t = \frac{5\pi}{12}$; $\cot t = 2 - \sqrt{3}$

Graph each function over the interval indicated, noting the period, asymptotes, zeroes, and value of A. Include a comparative sketch of $y = \tan t$ or $y = \cot t$ as indicated.

33. $f(t) = 2\tan t; [-2\pi, 2\pi]$

34. $g(t) = \frac{1}{2}\tan t; [-2\pi, 2\pi]$

35. $h(t) = 3\cot t; [-2\pi, 2\pi]$

36. $r(t) = \frac{1}{4}\cot t; [-2\pi, 2\pi]$

Graph each function over the interval indicated, noting the period, asymptotes, zeroes, and values of A and B.

37. $y = \tan(2t); \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

38. $y = \tan\left(\frac{1}{4}t\right); [-4\pi, 4\pi]$

39. $y = \cot(4t); \left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$

40. $y = \cot\left(\frac{1}{2}t\right); [-2\pi, 2\pi]$

41. $y = 2\tan(4t); \left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$

42. $y = 4\tan\left(\frac{1}{2}t\right); [-2\pi, 2\pi]$

43. $y = 5\cot\left(\frac{1}{3}t\right); [-3\pi, 3\pi]$

44. $y = \frac{1}{2}\cot(2t); \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

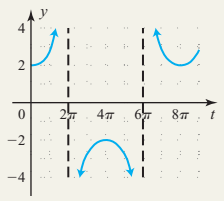
45. $y = 3\tan(2\pi t); \left[-\frac{1}{2}, \frac{1}{2}\right]$

46. $y = 4\tan\left(\frac{\pi}{2}t\right); [-2, 2]$

47. $f(t) = 2\cot(\pi t); [-1, 1]$

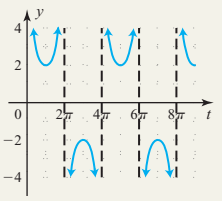
48. $p(t) = \frac{1}{2}\cot\left(\frac{\pi}{4}t\right); [-4, 4]$

Clearly state the period of each function, then match it with the corresponding graph.



49. $y = 2\csc\left(\frac{1}{2}t\right)$

50. $y = 2\sec\left(\frac{1}{4}t\right)$



51. $y = \sec(8\pi t)$

52. $y = \csc(12\pi t)$

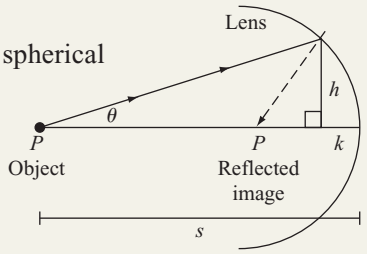
59. Given that $t = -\dfrac{\pi}{8}$ and $t = -\dfrac{3\pi}{8}$ are solutions to $\cot(3t) = \tan t$, use a graphing calculator to find two additional solutions in $[0, 2\pi]$.

60. Given $t = \frac{1}{6}$ is a solution to $\tan(2\pi t) = \cot(\pi t)$, use a graphing calculator to find two additional solutions in $[-1, 1]$.

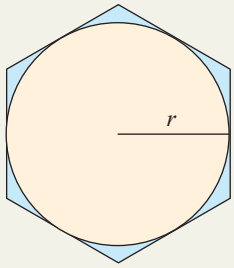
▶ WORKING WITH FORMULAS



61. The height of an object calculated from a distance: $h = \dfrac{d}{\cot u - \cot v}$

The height h of a tall structure can be computed using two angles of elevation measured some distance apart along a straight line with the object. This height is given by the formula shown, where d is the distance between the two points from which angles u and v were measured. Find the height h of a building if $u = 40°$, $v = 65°$, and $d = 100$ ft.

62. Position of an image reflected from a spherical lens: $\tan\theta = \dfrac{h}{s - k}$



The equation shown is used to help locate the position of an image reflected by a spherical lens, where s is the distance of the object from the lens along a horizontal axis, θ is the angle of elevation from this axis, h is the altitude of the right triangle indicated, and k is distance from the lens to the foot of altitude h. Find the distance k given $h = 3$ mm, $\theta = \dfrac{\pi}{24}$, and that the object is 24 mm from the lens.

▶ APPLICATIONS

63. Circumscribed polygons: The *perimeter* of a regular polygon circumscribed about a circle of radius r is given by $P = 2nr\tan\left(\frac{\pi}{n}\right)$, where n is the number of sides ($n \geq 3$) and r is the radius of the circle. Given $r = 10$ cm,

Exercises 63 and 64

- **a.** What is the circumference of the circle?
- **b.** What is the perimeter of the polygon when $n = 4$? Why?
- **c.** Calculate the perimeter of the polygon for $n = 10$, 20, 30, and 100. What do you notice? See Exercise 61 from Section 6.3.

64. Circumscribed polygons: The *area* of a regular polygon circumscribed about a circle of radius r is given by $A = nr^2\tan\left(\frac{\pi}{n}\right)$, where n is the number of sides ($n \geq 3$) and r is the radius of the circle. Given $r = 10$ cm,

- **a.** What is the area of the circle?
- **b.** What is the area of the polygon when $n = 4$? Why?
- **c.** Calculate the area of the polygon for $n = 10$, 20, 30, and 100. What do you notice?

Coefficients of friction: Pulling someone on a sled is much easier during the winter than in the summer, due to a phenomenon known as the *coefficient of friction*. The friction between the sled's skids and the snow is much lower than the friction between the skids and the dry ground or pavement. Basically, the coefficient of friction is defined by the relationship $\mu = \tan\theta$, where θ is the angle at which a block composed of one material will slide down an inclined plane made of another material, with a constant velocity. Coefficients of friction have been established experimentally for many materials and a short list is shown here.

Material	Coefficient

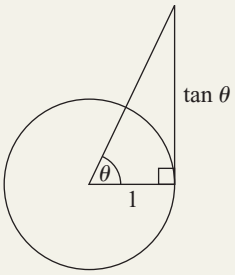
copper on steel	0.68
wood on wood	0.5



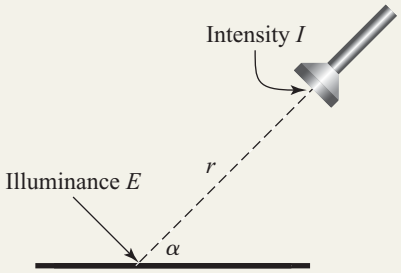
65. Graph the function $\mu = \tan\theta$, with θ in degrees over the interval $[0°, 60°]$ and use the intersection-of-graphs method to estimate solutions to the following. Confirm or contradict your estimates using a calculator.

- **a.** A block of copper is placed on a sheet of steel, which is slowly inclined. Is the block of copper moving when the angle of inclination is 30°? At what angle of inclination will the copper block be moving with a constant velocity down the incline?
- **b.** A block of copper is placed on a sheet of cast-iron. As the cast-iron sheet is slowly inclined, the copper block begins sliding at a constant velocity when the angle of inclination is approximately 46.5°. What is the coefficient of friction for copper on cast-iron?
- **c.** Why do you suppose coefficients of friction greater than $\mu = 2.5$ are extremely rare? Give an example of two materials that likely have a high μ-value.

66. Graph the function $\mu = \tan\theta$ with θ in radians over the interval $\left[0, \frac{5\pi}{12}\right]$ and use the intersection-of-graphs method to estimate solutions to the following. Confirm or contradict your estimates using a calculator.

- **a.** A block of glass is placed on a sheet of glass, which is slowly inclined. Is the block of glass moving when the angle of inclination is $\frac{\pi}{4}$? What is the smallest angle of inclination for which the glass block will be moving with a constant velocity down the incline (rounded to four decimal places)?
- **b.** A block of Teflon is placed on a sheet of steel. As the steel sheet is slowly inclined, the Teflon block begins sliding at a constant velocity when the angle of inclination is approximately 0.04. What is the coefficient of friction for Teflon on steel?
- **c.** Why do you suppose coefficients of friction less than $\mu = 0.04$ are extremely rare for two solid materials? Give an example of two materials that likely have a very low μ value.

67. Tangent lines: The actual definition of the word *tangent* comes from the Latin *tangere,* meaning "to touch." In mathematics, a tangent line touches the graph of a circle at only one point and function values for tan θ are obtained from the length of the line segment tangent to a unit circle.



a. What is the length of the line segment when $\theta = 80°$?

b. If the line segment is 16.35 units long, use the intersection-of-graphs method to find the value of θ.

c. Can the line segment ever be greater than 100 units long? Why or why not?

d. How does your answer to (c) relate to the asymptotic behavior of the graph?

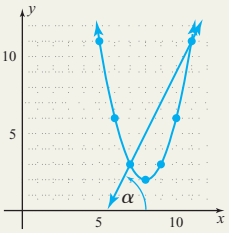
68. Illumination: The angle α made by a light source and a point on a horizontal surface can be found using the formula $\csc\alpha = \dfrac{I}{r^2E}$, where E is the illuminance (in lumens/m^2) at the point, I is the intensity of the light source in lumens, and r is the distance in meters from the light source to the point. Use the graph from Example 1 to help determine the angle α given $I = 700$ lumens, $E = 55$ lumens/m^2, and the flashlight is held so that the distance r is 3 m.

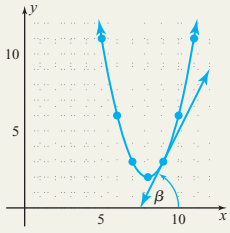
▶ EXTENDING THE CONCEPT

69. The golden ratio $\dfrac{-1 + \sqrt{5}}{2}$ has long been thought to be the most pleasing ratio in art and architecture. It is commonly believed that many forms of ancient architecture were constructed using this ratio as a guide. The ratio actually turns up in some surprising places, far removed from its original inception as a line segment cut in "mean and extreme" ratio. Given $x = 0.6662394325$, try to find a connection between $y = \cos x$, $y = \tan x$, $y = \sin x$, and the golden ratio.

70. Determine the slope of the line drawn *through* the parabola (called a **secant** line) in Figure I. Use the same method (any two points on the line) to calculate the slope of the line drawn **tangent** to the parabola in Figure II. Compare your calculations to the tangent of the angles α and β that each line makes with the x-axis. What can you conclude? Write a formula for the point/slope equation of a line using tan θ instead of m.

Figure I





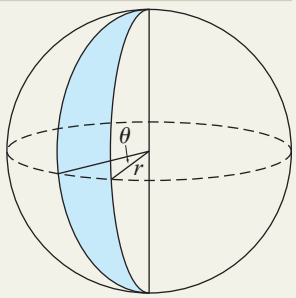


Figure II

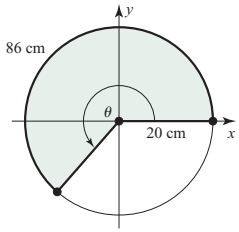
▶ MAINTAINING YOUR SKILLS

71. (6.1) A lune is a section of surface area on a sphere, which is subtended by an angle θ at the circumference. For θ *in radians,* the surface area of a lune is $A = 2r^2\theta$, where r is the radius of the sphere. Find the area of a lune on the surface of the Earth which is subtended by an angle of 15°. Assume the radius of the Earth is 6373 km.

72. (4.4/4.5) Find the y-intercept, x-intercept(s), and all asymptotes of each function, but do not graph.

a. $h(x) = \dfrac{3x^2 - 9x}{2x^2 - 8}$ **b.** $t(x) = \dfrac{x + 1}{x^2 - 4x}$ **c.** $p(x) = \dfrac{x^2 - 1}{x + 2}$

73. **(6.2)** State the points on the unit circle that correspond to $t = 0, \frac{\pi}{4}, \frac{\pi}{2}, \pi, \frac{3\pi}{4}, \frac{3\pi}{2}$, and 2π. What is the value of $\tan\left(\frac{\pi}{2}\right)$? Why?



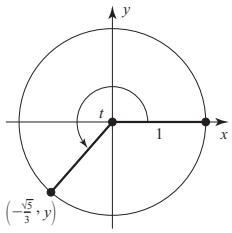
74. **(5.5)** The radioactive element potassium-42 is sometimes used as a tracer in certain biological experiments, and its decay can be modeled by the formula $Q(t) = Q_0 e^{-0.055t}$, where $Q(t)$ is the amount that remains after t hours. If 15 grams (g) of potassium-42 are initially present, how many hours until only 10 g remain?

MID-CHAPTER CHECK

1. The city of Las Vegas, Nevada, is located at 36° 06′ 36″ north latitude, 115° 04′ 48″ west longitude. (a) Convert both measures to decimal degrees. (b) If the radius of the Earth is 3960 mi, how far north of the equator is Las Vegas?

2. Find the angle subtended by the arc shown in the figure, then determine the area of the sector.

Exercise 2



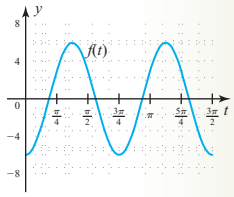
3. Evaluate without using a calculator: (a) cot 60° and (b) $\sin\left(\frac{7\pi}{4}\right)$.

4. Evaluate using a calculator: (a) $\sec\left(\frac{\pi}{12}\right)$ and (b) tan 83.6°.

5. Complete the ordered pair indicated on the unit circle in the figure and find the value of all six trigonometric functions at this point.

Exercise 5

6. For the point on the unit circle in Exercise 5, use the intersection-of-graphs method to find the related angle t in both degrees (to tenths) and radians (to ten-thousandths).



7. Name the location of the asymptotes and graph $y = 3\tan\left(\frac{\pi}{2}t\right)$ for $t \in [-2\pi, 2\pi]$.

8. Clearly state the amplitude and period, then sketch the graph: $y = -3\cos\left(\frac{\pi}{2}t\right)$.

9. On a unit circle, if arc t has length 5.94, (a) in what quadrant does it terminate? (b) What is its reference arc? (c) Of sin t, cos t, and tan t, which are negative for this value of t?

10. For the graph given here, (a) clearly state the amplitude and period; (b) find an equation of the graph; (c) graphically find $f(\pi)$ and then confirm/contradict your estimation using a calculator.

Exercise 10

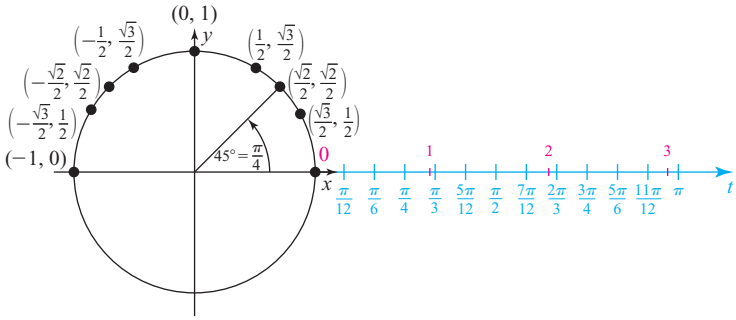
REINFORCING BASIC CONCEPTS

Trigonometry of the Real Numbers and the Wrapping Function

The trigonometric functions are sometimes discussed in terms of what is called a *wrapping function,* in which the real number line is literally wrapped around the unit circle. This approach can help illustrate how the trig functions can be seen as functions of the real numbers, and apart from any reference to a right triangle. Figure 6.95 shows (1) a unit circle with the location of certain points on the circumference clearly marked and (2) a blue number line that has been marked in multiples of $\frac{\pi}{12}$ to coincide with the length of the special arcs (integers are shown in red). Figure 6.96 shows this same blue number line wrapped counterclockwise around the unit circle in the positive direction. Note how the resulting diagram confirms that an arc of length $t = \frac{\pi}{4}$ is associated with the point $\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$ on the unit circle: $\cos\frac{\pi}{4} = \frac{\sqrt{2}}{2}$ and

$\sin\frac{\pi}{4}=\frac{\sqrt{2}}{2}$; while an arc of length of $t=\frac{5\pi}{6}$ is associated with the point $\left(-\frac{\sqrt{3}}{2},\frac{1}{2}\right)$: $\cos\frac{5\pi}{6}=-\frac{\sqrt{3}}{2}$ and $\sin\frac{5\pi}{6}=\frac{1}{2}$. Use this information to complete the exercises given.

Figure 6.95



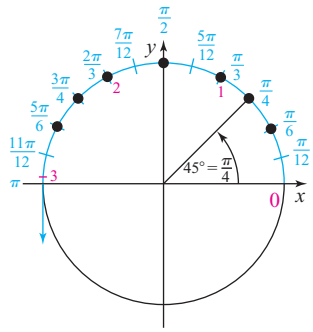


Figure 6.96

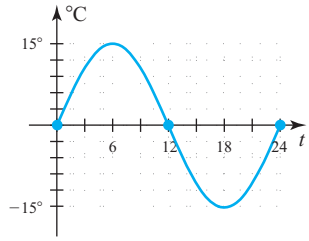
1. What is the ordered pair associated with an arc length of $t=\frac{2\pi}{3}$? What is the value of cos t? sin t?
2. What arc length t is associated with the ordered pair $\left(-\frac{\sqrt{3}}{2},\frac{1}{2}\right)$? Is cos t positive or negative? Why?
3. If we continued to wrap this number line all the way around the circle, in what quadrant would an arc length of $t=\frac{11\pi}{6}$ terminate? Would sin t be positive or negative?
4. Suppose we wrapped a number line with negative values clockwise around the unit circle. In what quadrant would an arc length of $t=-\frac{5\pi}{3}$ terminate? What is cos t? sin t? What positive rotation terminates at the same point?

6.5 Transformations and Applications of Trigonometric Graphs

LEARNING OBJECTIVES



In Section 6.5 you will see how we can:

- ❑ **A.** Apply vertical translations in context
- ❑ **B.** Apply horizontal translations in context
- ❑ **C.** Solve applications involving harmonic motion
- ❑ **D.** Apply vertical and horizontal translations to cosecant, secant, tangent, and cotangent
- ❑ **E.** Solve applications involving the tangent, cotangent, secant, and cosecant functions

From your algebra experience, you may remember beginning with a study of linear graphs, then moving on to quadratic graphs and their characteristics. By combining and extending the knowledge you gained, you were able to investigate and understand a variety of polynomial graphs—along with some powerful applications. A study of trigonometry follows a similar pattern, and by "combining and extending" our understanding of the basic trig graphs, we'll look at some powerful applications in this section.

A. Vertical Translations: $y = A\sin(Bt) + D$ and $y = A\cos(Bt) + D$

Figure 6.97

On any given day, outdoor temperatures tend to follow a **sinusoidal pattern,** or a pattern that can be modeled by a sine function. As the sun rises, the morning temperature begins to warm and rise until reaching its high in the late afternoon, then begins to cool during the early evening and nighttime hours until falling to its nighttime low just prior to sunrise. Next morning, the cycle begins again. In the northern latitudes where the winters are very cold, it's not unreasonable to assume an average daily temperature of 0°C (32°F), and a temperature graph in degrees Celsius that looks like the one in Figure 6.97. For the moment, we'll assume that $t = 0$ corresponds to 12:00 noon. Note that $|A| = 15$ and $P = 24$, yielding $24=\frac{2\pi}{B}$ or $B=\frac{\pi}{12}$.

If you live in a more temperate area, the daily temperatures still follow a sinusoidal pattern, but the average temperature could be much higher. This is an example of a **vertical shift,** and is the role D plays in the equation $y = A\sin(Bt) + D$. All other aspects of a graph remain the same; it is simply shifted D units up if $D > 0$ and D units down if $D < 0$. As in Section 6.3, for maximum value M and minimum value m, $\dfrac{M - m}{2}$ gives the amplitude A of a sine curve, while $\dfrac{M + m}{2}$ gives the **average value** D.

EXAMPLE 1 ▶ Modeling Temperature Using a Sine Function

On a fine day in Galveston, Texas, the high temperature might be about 85°F with an overnight low of 61°F.

a. Find a sinusoidal equation model for the daily temperature.

b. Sketch the graph.

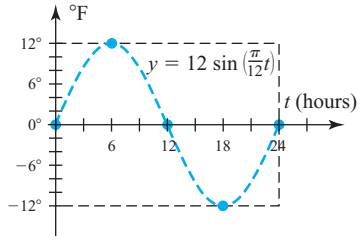
c. Approximate what time(s) of day the temperature is 65°F. Assume $t = 0$ corresponds to 12:00 noon.

Solution ▶

a. We first note the period is still $P = 24$, so $B = \dfrac{\pi}{12}$, and the equation model will have the form $y = A\sin\left(\dfrac{\pi}{12}t\right) + D$. Using $\dfrac{M + m}{2} = \dfrac{85 + 61}{2}$, we find the *average value* $D = 73$, with amplitude $A = \dfrac{85 - 61}{2} = 12$. The resulting equation is $y = 12\sin\left(\dfrac{\pi}{12}t\right) + 73$.

b. To sketch the graph, use a reference rectangle $2A = 24$ units tall and $P = 24$ units wide, along with the *rule of fourths* to locate zeroes and max/min values (see Figure 6.98). Then lightly sketch a sine curve through these points and within the rectangle as shown. This is the graph of $y = 12\sin\left(\dfrac{\pi}{12}t\right) + 0$. Using an appropriate scale, shift the rectangle and plotted points vertically upward 73 units and carefully draw the finished graph through the points and within the rectangle (see Figure 6.99).

Figure 6.98



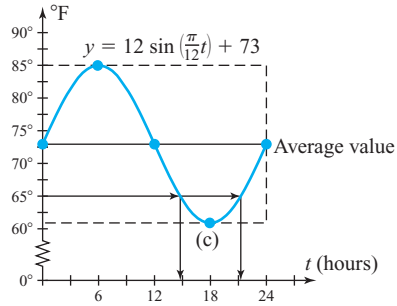


Figure 6.99

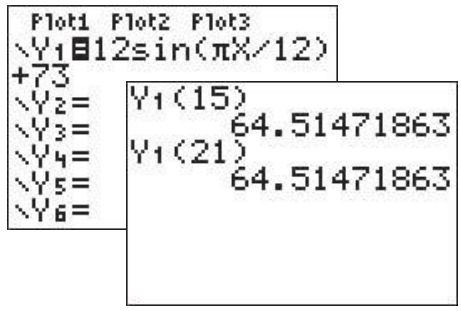
This gives the graph of $y = 12\sin\left(\dfrac{\pi}{12}t\right) + 73$. Note the broken-line notation "≷" in Figure 6.99 indicates that certain values along an axis are unused (in this case, we skipped 0° to 60°), and we began scaling the axis with the values needed.

WORTHY OF NOTE



Recall from Section 2.2 that transformations of any function $y = f(x)$ remain consistent regardless of the function f used. For the sine function, the transformation $y = af(x \pm h) \pm k$ is more commonly written $y = A\sin(t \pm C) \pm D$, and $|A|$ gives a vertical stretch or compression, C is a horizontal shift opposite the sign, and D is a vertical shift, as seen in Example 1.

c. As indicated in Figure 6.99, the temperature hits 65° twice, at about 15 and 21 hr after 12:00 noon, or at 3:00 A.M. and 9:00 A.M. This can be verified by setting

$$Y_1 = 12\sin\left(\frac{\pi}{12}X\right) + 73,$$

then going to the home screen and computing $Y_1(15)$ and $Y_1(21)$ as shown in Figure 6.100.

Figure 6.100

Now try Exercises 7 through 18 ▶

Sinusoidal graphs actually include both sine and cosine graphs, the difference being that sine graphs begin at the average value, while cosine graphs begin at the maximum value. Sometimes it's more advantageous to use one over the other, but equivalent forms can easily be found. In Example 2, a cosine function is used to model an animal population that fluctuates sinusoidally due to changes in food supplies.

EXAMPLE 2 ▶ Modeling Population Fluctuations Using a Cosine Function

The population of a certain animal species can be modeled by the function $P(t) = 1200\cos\left(\frac{\pi}{5}t\right) + 9000$, where $P(t)$ represents the population in year t.

Use the model to

a. Find the period of the function.

b. Graph the function over one period.

c. Find the maximum and minimum values.

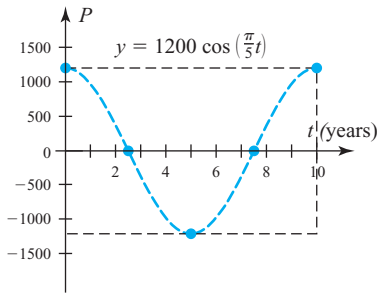
d. Use a graphing calculator to determine the number of years the population is less than 8000.

Solution ▶

a. Since $B = \frac{\pi}{5}$, the period is $P = \frac{2\pi}{\pi/5} = 10$, meaning the population of this species fluctuates over a 10-yr cycle.

b. Use a reference rectangle ($2A = 2400$ by $P = 10$ units) and the *rule of fourths* to locate zeroes and max/min values, then sketch the unshifted graph $y = 1200\cos\left(\frac{\pi}{5}t\right)$. With $P = 10$, these important points occur at $t = 0$, 2.5, 5, 7.5, and 10 (see Figure 6.101). Shift this graph upward 9000 units (using an appropriate scale) to obtain the graph of $P(t)$ shown in Figure 6.102.

Figure 6.101



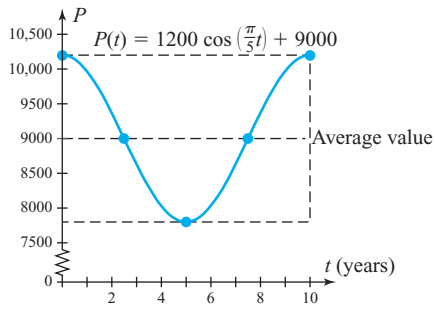


Figure 6.102

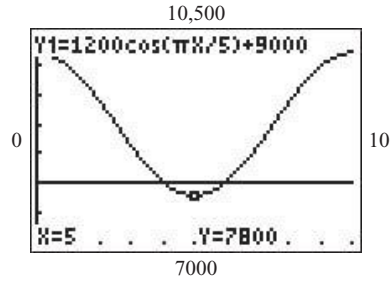
c. The maximum value is $9000 + 1200 = 10{,}200$ and the minimum value is $9000 - 1200 = 7800$.

d. Begin by entering $Y_1 = 1200\cos\left(\pi\frac{X}{5}\right) + 9000$ and $Y_2 = 8000$ in a graphing calculator. With the window settings identified in Figure 6.103, pressing GRAPH confirms the graph we produced in Figure 6.102. The intersection of Y_1 and Y_2 can be located using the 2nd TRACE **(CALC) 5:intersect** feature. After identifying Y_1 and Y_2 as the intersecting curves by pressing ENTER twice, the calculator asks us to make a guess. A casual observation of the graph indicates the leftmost point of intersection occurs near 4, so pressing 4 ENTER will produce the screen shown in Figure 6.104. With a minor adjustment, this process determines the rightmost point of intersection occurs when $x \approx 5.93$. We can now determine that the population drops below 8000 animals for approximately $5.93 - 4.07 = 1.86$ yr.

Figure 6.103



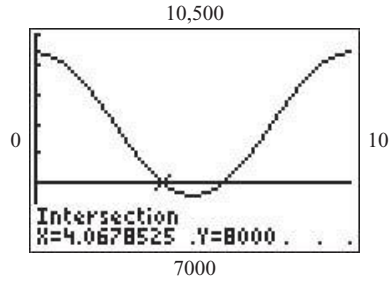


Figure 6.104

A. You've just seen how we can apply vertical translations in context

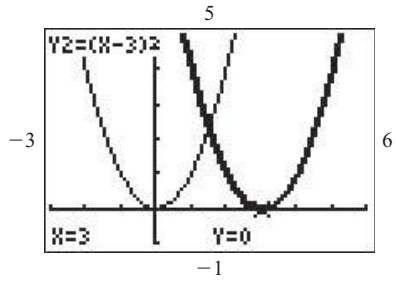
Now try Exercises 19 and 20 ▶

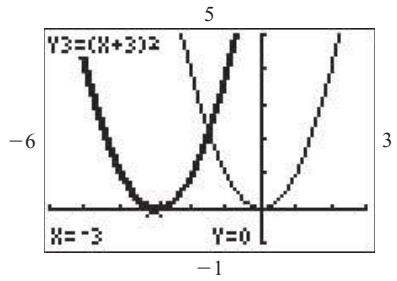
B. Horizontal Translations: $y = A\sin(Bt + C) + D$ and $y = A\cos(Bt + C) + D$

In some cases, scientists would rather "benchmark" their study of sinusoidal phenomena by placing the average value at $t = 0$ instead of a maximum value (as in Example 2), or by placing the maximum or minimum value at $t = 0$ instead of the average value (as in Example 1). Rather than make additional studies or recompute using available data, *we can simply shift these graphs using a horizontal translation*. To help understand how, consider the graph of $Y_1 = X^2$. The graph is a parabola that opens upward with a vertex at the origin. Comparing this function with $Y_2 = (X - 3)^2$ and $Y_3 = (X + 3)^2$, we note Y_2 is simply the parent graph shifted 3 units right (Figure 6.105), and Y_3 is the parent graph shifted 3 units left or "opposite the sign" (Figure 6.106).

While ***quadratic functions have no maximum value if $A > 0$,*** these graphs are a good reminder of how a basic graph can be horizontally shifted. We simply *replace the independent variable x with $(x \pm h)$ or t with $(t \pm h)$*, where h is the desired shift and the sign is chosen depending on the direction of the shift.

Figure 6.105





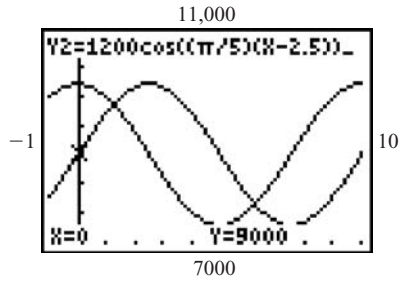


Figure 6.106

EXAMPLE 3 ▶ **Investigating Horizontal Shifts of Trigonometric Graphs**

Use a horizontal translation to shift the graph from Example 2 so that the average population begins at $t = 0$. Verify the result on a graphing calculator, then find a sine function that gives the same graph as the shifted cosine function.

Solution ▶ For $P(t) = 1200\cos\left(\frac{\pi}{5}t\right) + 9000$ from Example 2, the average value occurs at $t = 2.5$, and by symmetry at $t = -2.5$. For the average value to occur at $t = 0$, we shift the graph to the right 2.5 units. Replacing t with $(t - 2.5)$ gives $P(t) = 1200\cos\left[\frac{\pi}{5}(t - 2.5)\right] + 9000$.

A graphing calculator shows the desired result is obtained (see figure). The new graph appears to be a sine function with the same amplitude and period, and in fact the equation is $y = 1200\sin\left(\frac{\pi}{5}t\right) + 9000$.

Now try Exercises 21 and 22 ▶

Equations like $P(t) = 1200\cos\left[\frac{\pi}{5}(t - 2.5)\right] + 9000$ from Example 3 are said to be written in **shifted form,** since changes to the input variable are seen directly and we can easily tell the magnitude and direction of the shift. To obtain the **standard form** we *distribute the value of B*: $P(t) = 1200\cos\left(\frac{\pi}{5}t - \frac{\pi}{2}\right) + 9000$. In general, the *standard form* of a sinusoidal equation (using *either* a cosine or sine function) is written $y = A\sin(Bt \pm C) + D$, with the *shifted form* found by factoring out B from $Bt \pm C$:

$$y = A\sin(Bt \pm C) + D \rightarrow y = A\sin\left[B\left(t \pm \frac{C}{B}\right)\right] + D$$

In either case, C gives what is known as the **phase angle** of the function, and is used in a study of AC circuits and other areas, to discuss how far a given function is "out of phase" with a reference function. In the latter case, $\frac{C}{B}$ is simply the horizontal shift (or phase shift) of the function and gives the magnitude and direction of this shift (opposite the sign).

Characteristics of Sinusoidal Equations

Transformations of the graph of $y = \sin t$ can be written as $y = A\sin(Bt)$, where

1. $|A|$ gives the *amplitude* of the graph, or the maximum displacement from the average value.
2. B is related to the *period* P of the graph according to the ratio $P = \frac{2\pi}{|B|}$.

Translations of $y = A\sin(Bt)$ can be written as follows:

WORTHY OF NOTE

It's important that you don't confuse the standard form with the shifted form. Each has a place and purpose, but the horizontal shift can be identified only by focusing on the change in an independent variable. Even though the equations $y = 4(x + 3)^2$ and $y = (2x + 6)^2$ are equivalent, only the first explicitly shows that $y = 4x^2$ has been shifted three units left. Likewise $y = \sin[2(t + 3)]$ and $y = \sin(2t + 6)$ are equivalent, but only the first explicitly gives the horizontal shift (three units left). Applications involving a horizontal shift come in an infinite variety, and the shifts are generally not uniform or standard.

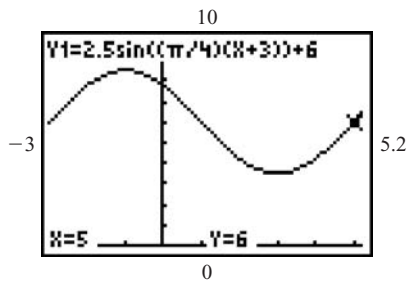
Standard form	Shifted form
$y = A\sin(Bt \pm C) + D$	$y = A\sin\left[B\left(t \pm \frac{C}{B}\right)\right] + D$

3. In either case, C is called the *phase angle* of the graph, while $\pm\frac{C}{B}$ gives the magnitude and direction of the *horizontal shift* (opposite the given sign).
4. D gives the *vertical shift* of the graph, and the location of the average value. The shift will be in the same direction as the given sign.

Knowing where each cycle begins and ends is a helpful part of sketching a graph of the equation model. The **primary interval** for a sinusoidal graph can be found by solving the inequality $0 \le Bt \pm C < 2\pi$, with the reference rectangle and *rule of fourths* giving the zeroes, max/min values, and a sketch of the graph in this interval. The graph can then be extended in either direction, and shifted vertically as needed.

EXAMPLE 4 ▶ Analyzing the Transformation of a Trig Function

Identify the amplitude, period, horizontal shift, vertical shift (average value), and endpoints of the primary interval.



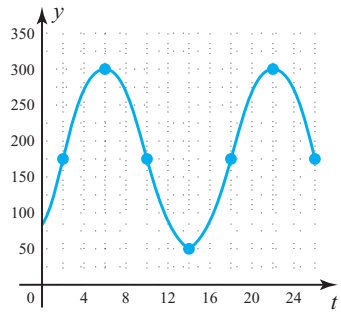
$$y = 2.5\sin\left(\frac{\pi}{4}t + \frac{3\pi}{4}\right) + 6$$

Solution ▶ The equation gives an amplitude of $|A| = 2.5$, with an average value of $D = 6$. The maximum value will be $y = 2.5(1) + 6 = 8.5$, with a minimum of $y = 2.5(-1) + 6 = 3.5$. With $B = \frac{\pi}{4}$, the period is $P = \frac{2\pi}{\pi/4} = 8$. To find the horizontal shift, we factor out $\frac{\pi}{4}$ to write the equation in shifted form: $\left(\frac{\pi}{4}t + \frac{3\pi}{4}\right) = \frac{\pi}{4}(t + 3)$. The horizontal shift is 3 units left. For the endpoints of the primary interval we solve $0 \le \frac{\pi}{4}(t + 3) < 2\pi$, which gives $-3 \le t < 5$.

Now try Exercises 23 through 34 ▶

The analysis of $y = 2.5\sin\left[\frac{\pi}{4}(t + 3)\right] + 6$ from Example 4 can be verified on a graphing calculator. Enter the function as Y_1 on the Y= screen and set an appropriate window size using the information gathered. Pressing the TRACE key and -3 ENTER gives the average value $y = 6$ as output. Repeating this for $x = 5$ shows one complete cycle has been completed (Figure 6.107).

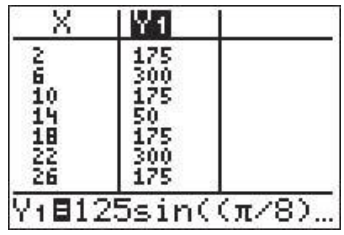
Figure 6.107



To help gain a better understanding of sinusoidal functions, their graphs, and the role the coefficients A, B, C, and D play, it's often helpful to reconstruct the equation of a given graph.

EXAMPLE 5 ▶ **Determining an Equation of a Trig Function from Its Graph**

Determine an equation of the given graph using a sine function.



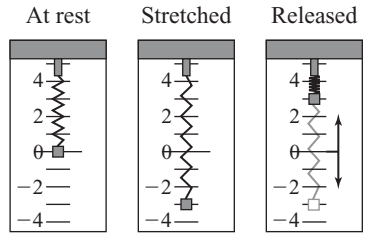
Solution ▶ From the graph it is apparent the maximum value is 300, with a minimum of 50. This gives a value of $\frac{300 + 50}{2} = 175$ for D and $\frac{300 - 50}{2} = 125$ for A. The graph completes one cycle from $t = 2$ to $t = 18$, showing $P = 18 - 2 = 16$ and $B = \frac{\pi}{8}$. The average value first occurs at $t = 2$, so the basic graph has been shifted to the right 2 units. The equation is $y = 125 \sin\left[\frac{\pi}{8}(t - 2)\right] + 175$.

Now try Exercises 35 through 44 ▶

In addition to the GRAPH of $Y_1 = 125 \sin\left[\frac{\pi}{8}(X - 2)\right] + 175$ from Example 5, the table feature of a calculator can provide a convincing check of the solution. After recognizing the average, maximum, and minimum values of the given graph occur at regular intervals (as is true for any sinusoidal function), setting up a table to start at 2 with step size of 4 units will produce the 2nd GRAPH **(TABLE)** shown in Figure 6.108. Note the screen shown contains the coordinates of all seven points indicated in the graph for this example.

Figure 6.108

B. You've just seen how we can apply horizontal translations in context



C. Simple Harmonic Motion: $y = A \sin(Bt)$ or $y = A \cos(Bt)$

The periodic motion of springs, tides, sound, and other phenomena all exhibit what is known as **harmonic motion,** which can be modeled using sinusoidal functions.

Harmonic Models—Springs

Consider a spring hanging from a beam with a weight attached to one end. When the weight is at rest, we say it is in **equilibrium,** or has zero displacement from center. See Figure 6.109. Stretching the spring and then releasing it causes the weight to "bounce up and down," with its displacement from center neatly modeled over time by a sine wave (see Figure 6.110).

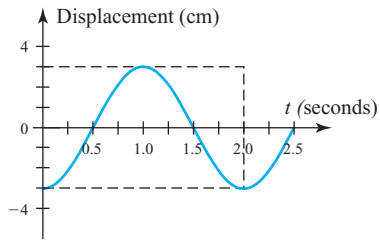


Figure 6.109

For objects in harmonic *motion* (there are other harmonic models), the input variable t is always a time unit (seconds, minutes, days, etc.), so in addition to the period of the sinusoid, we are very interested in its **frequency**—the number of cycles it completes per unit time. Since the period gives the time required to complete one cycle, the frequency f is given by $f = \frac{1}{P} = \frac{B}{2\pi}$.

Figure 6.110

Harmonic motion

EXAMPLE 6 ▶ **Applications of Sine and Cosine: Harmonic Motion**

For the harmonic motion of the weight modeled by the sinusoid in Figure 6.110,

a. Find an equation of the form $y = A\cos(Bt)$.

b. Determine the frequency.

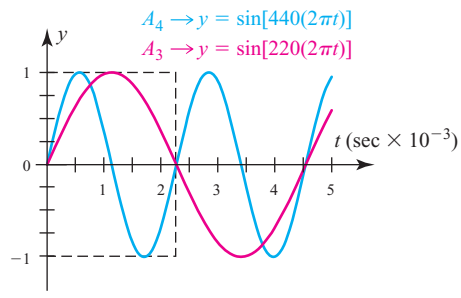
c. Use the equation to find the position of the weight at $t = 1.8$ sec.

Solution ▶

a. By inspection the graph has an amplitude $|A| = 3$ and a period $P = 2$. After substitution into $P = \dfrac{2\pi}{B}$, we obtain $B = \pi$ and the equation $y = -3\cos(\pi t)$.

b. Frequency is the reciprocal of the period so $f = \dfrac{1}{2}$, showing one-half a cycle is completed each second (as the graph indicates).

c. Evaluating the model at $t = 1.8$ gives $y = -3\cos[\pi(1.8)] \approx -2.43$, meaning the weight is 2.43 cm below the equilibrium point at this time.



Now try Exercises 55 through 58 ▶

Harmonic Models—Sound Waves

A second example of harmonic motion is the production of sound. For the purposes of this study, we'll look at musical notes. The vibration of matter produces a **pressure wave** or **sound energy,** which in turn vibrates the eardrum. Through the intricate structure of the middle ear, this sound energy is converted into mechanical energy and sent to the inner ear where it is converted to nerve impulses and transmitted to the brain. If the sound wave has a high frequency, the eardrum vibrates with greater frequency, which the brain interprets as a "high-pitched" sound. The *intensity* of the sound wave can also be transmitted to the brain via these mechanisms, and if the arriving sound wave has a high amplitude, the eardrum vibrates more forcefully and the sound is interpreted as "loud" by the brain. These characteristics are neatly modeled using $y = A\sin(Bt)$. For the moment we will focus on the frequency, keeping the amplitude constant at $A = 1$.
